Refuging and Centering Housing in Political Economy

The issue of “housing” has not been granted an important role in post-war political economy. Housing as policy was relegated to social policy analysis and to a growing field of housing studies that have both shown little interest in the issues that political economists are usually interested in. Housing as market was likewise relegated to mainstream economists. The latter’s obsession with “free markets” and the lack of analysis of state involvement beyond the statement that it hampers the functioning of markets, has also broken ties with an integrated analysis of housing as a crucial part of political economy. In recent years, there has been a growing recognition of the increasing centrality of housing to the political economy of advanced capitalist societies. Yet we still lack a coherent and relatively comprehensive conceptualization of the “place” of housing in the contemporary capitalist political economy.

This paper seeks to offer that – partly to help bring together existing but typically self-standing arguments about different elements of the political economy of housing, and partly to help frame and connect up ongoing research in this area. It argues that housing is implicated in the contemporary political economy in numerous critical, connected, and very often contradictory ways. It makes this argument – and offers its conceptualization – by going back to what it is arguably the central category of political economy, capital, and identifying the multiple (and even more varied) roles of housing when “capital” is considered from the perspective of each of its four primary, mutually-constitutive guises: as social relation, as process of circulation, as accumulated value, and as ideology.

Political Culture and Communication: A Study of Forthcoming General Elections of India

The paper makes an effort to present the cultural and communication perspective of the general elections of India scheduled to be held in 2014. However, its preparations are on full swing and the political alignments are on for the political battle between the two arch rivals of contemporary Indian poltics is going to affect the power structure and corresponding cultural texture of the society at large. Hence, the situation demands a splitting analysis of the culture and communication of the political forces shaping and sharing power.

The paper tries to encompass the bipolar political structure and the probability of the emerging two arch rivals. The Third Front in coalition era at the centre. The political compulsion of different political parties to align themselves to mainstream national interest is something that Indian politics has yet to negotiate. India appears to be a cake being disrupted over by the BJP and the Congress.

The paper reflects the stakeholders of politics being at different camps and at loggerhead for political gains, putting the nation state at stake. The paper also makes an effort to look into the political dynamics having bearings on the functioning of the nation state and its future course of action. The exploratory research design in combination with clinical method is adopted to look into the political forces generating a particular political culture and communication.

Conceptual Foundations for Assessing the Meaning of Wellbeing

For a survey to have content and construct validity, it is first necessary to establish a clear understanding of the concept being measured. Although studies attempting to measure wellbeing in many different disciplines and settings abound, conceptual and theoretical development of the construct has been lacking. This paper reports the methods used, outcome, and benefits of undertaking systematic foundational research to develop a contextualised concept of wellbeing in each of two quite different workplaces. Abbey’s phenomenographic, concept-building approach used innovative interview methods from marketing and education to tap into participants’ experiences of wellbeing in their workplaces. The projective value of visual images (selected by participants) as metaphors communicated social meaning, thought, embodied experience and emotions (Zaltman, 1996).

Questions based on Sykes et al. (2006) study of Learning from Past Success elicited schematic personal wellbeing experiences. Resulting data were analysed to derive a multilevel, multidimensional concept of wellbeing for each workplace. Comparison of the concepts suggested that wellbeing in work settings is best understood as a class of concepts with a constant structure of three domains – a structure that is comprised of locally contextualised common elements and one domain that clearly differentiates sites. Cross-national survey development can benefit from understanding this domain structure and how elements within it might vary according to site. More critically, the study points to the value of undertaking foundational research in any site to tap local subjective meaning. This will ensure the concepts to be derived from quantitative devices have clearly identified boundaries and constituent elements.

Social Quality in Times of Recession

The economic recession has had an impact on the economies of the EU27 countries. Although the impact has not been felt to the same extent in all countries there has been an increase in unemployment and financial distress in all of them. Apparently the economic downturn has not resulted in a significant decline in people’s social satisfaction across the EU as a whole. Comparing mean scores for subjective satisfaction for the EU27 using the data from the European Quality of Life Surveys (EQLS) for 2007 (before the onset of the economic recession) and 2011 we find that country mean scores have significantly increased in some countries, decreased in others and remained unchanged in some. The pattern of change is not explained by the differential impact of the recession in different countries. We also find that the Social Quality Model explains variation in subjective satisfaction for all countries for both 2007 and 2011. In other words across both time and space the same variables explain the variation in social quality.

In this paper rather than look at differences between countries we will look at differences between groups for whom the economic recession may have had a differential impact namely gender, age and economic circumstances. We will consider differences in life satisfaction between socio-economic groups and then undertake a social quality analysis to examine the ways in which the context of the lives of the members of groups for whom subjective satisfaction changed significantly between 2007 and 2011. The index of social quality includes measures of economic security, social cohesion, social integration and empowerment. It defines the socioeconomic space within which people live their daily lives.

The Promise and the Reality: Women’s Empowerment in Rwanda

This paper will discuss the reality of the lives of the vast majority of women in Rwanda, a society that remains patriarchal. It will discuss the progress that Rwanda has made for its progressive stance on women’s empowerment by becoming the first country in the world to achieve MDG target 3 for more than 50 per cent of members of parliament being female. The 2003 Constitution guarantees gender equality and the country’s Vision 2020 and Economic Development and Poverty Reduction Strategy make strong commitments to gender equality and women’s economic empowerment. Girls now outperform boys in primary and junior secondary education, employment legislation outlaws gender decimation in employment and at the workplace and 30 per cent of senior positions are reserved for women. There have been progressive reforms including legislation on gender based violence and land reform giving women the same rights to own land as men. Drawing on data from the 2010/11 Integrated Living Conditions and Household Survey, the 2012 Rwanda Demographic Health Survey, the 2012 FinScope Survey as well as quantitative and qualitative data collected by the author over the last five years the paper will look at the reality of the lives of ordinary Rwandan women. The majority of Rwandan women work as small farmers, dependent workers on family farms and as agricultural labourers. They have not benefited from Government programmes to transform agriculture and create more non-farm employment to the same extent as men. They are poorly educated with high rates of illiteracy, lack access to basic productive resources and face the double burden of productive and reproductive labour. Women are expected to be submissive and there are high rates of domestic violence.
“Smelly Mouths”, Moral Selves, and the Management of Olfactory Transgressions in Everyday Life

Socially constructed meanings behind odours in everyday life are highly contextual and dependent on how social actors interpret smells. Through these interpretative processes, odours are perceived as fouls, which can eventually be a social impetus and repel anyone pursuing him or her. This paper focuses on the sociocultural forces that affix persons with ‘smelly mouths’ and bad breath – or halitosis – as deviant and interrogates the implications these constructions have on various dimensions of their social life. Within this web of construction, I discuss three interconnected dimensions related to such olfactory transgressions. First, odours are important markers of moral status. Second, odours are imbued with connotations of social class and with these concomitant notions of lifestyle and presentation of self. Third, and given the often strong responses against persons with bad breath and the disruption to social interaction, I show how persons with bad breath respond to such ‘disruptions’ by invoking discourses from biomedical institutions and treatment interventions which appropriate and regulate such perceived transgressions as ‘medical problems’ that have primarily been dominated by rational, scientific models. By closely unpacking these processes, I attempt to demonstrate how and why the basis of the taboo of bad breath is not so much a ‘natural’ illness per se, but rather a response borne out of contextual, everyday life ‘sensory scripts’ as circumscribed by different social actors and institutions. This therefore lends support to the notion of the socially constructed roots of halitosis rather than its nature as an inherent, medically treatable illness.

LOCAL COMMUNITY RESILIENCE IN THE CONTEXT OF GLOBAL CLIMATE CHANGE: A CASE FROM MALUKU INDONESIA

This study driven by two research objectives: to observe the risk and vulnerability of the northern coastal region of Ambon Island due to climate change from the subjective point of view of the Asilulu's fishermen community in particular; to analyze the adaptation strategy and resilience of the Asilulu’s fishermen and the northern coastal region of Ambon Island. The research was carried out through qualitative approach with specific observation on fishermen community of Asilulu Village of the Leihitu sub-District, Central Molucca District of Molucca Province, as a case study. Two important results arise from the research. First, over the years local fishermen have developed adaptation strategy to cope with the risk related to climate changes such as adapting the fishing period to changing season, temporary seeking demersal fish, reduce sailing risk by fishing together in groups, use of new type fishing boat, develop new fishing gears, revitalize local institution, develop livelihood strategy and social security networks, as well as strengthen the responses against persons with bad breath and the disruption to social interaction, I show how persons with bad breath respond to such ‘disruptions’ by invoking discourses from biomedical institutions and treatment interventions which appropriate and regulate such perceived transgressions as ‘medical problems’ that have primarily been dominated by rational, scientific models. By closely unpacking these processes, I attempt to demonstrate how and why the basis of the taboo of bad breath is not so much a ‘natural’ illness per se, but rather a response borne out of contextual, everyday life ‘sensory scripts’ as circumscribed by different social actors and institutions. This therefore lends support to the notion of the socially constructed roots of halitosis rather than its nature as an inherent, medically treatable illness.

Peer-Surveillance and Management of Uncertainty through SNS in Japan: Obligation of Keeping Good Company and Its Impasse

When the usage of the Internet became prevalent in 1990s, scholars and critics envisioned a coming future where people can expressively interact to each other as Netizen (netizen). As two decades have passed since then, many of the Internet dreams have come true thanks to rapid innovations of information and communication technologies. But, the reality of the Net in which we now live is a little bit different from the hopeful vision that the enthusiastic proponents of the digital dream have proposed.

The rapid diffusion and prevalent usage of SNS can be regarded as the realization of long-lasting digital dream. However, paying close attention to what is actually going on through the usage of SNS, we come to discuss the dimension of peer-surveillance that goes with the ideal of free, open and autonomous communication.

The usage of SNS seems to be a sort of ritualized practice of everyday life among the younger generation in Japan. As the previous studies have clarified, the on-line relationship formed in SNS has closely related to the social activities practiced off-line. For many users of SNS in Japan, the main purpose of engaging in SNS is more to keep good company through checking and surveilling the detail of everyday life practice to each other rather than to express their opinions and discuss with other people on the Web.

In this paper I will discuss how university students perceive the meaning of their using the Net and in what sense it makes them feel obliged to engage in SNS so that they can keep on good company with off-line friends. Even though they sometimes feel reluctant to keep on ritualized practice of SNS, it is almost impossible for them not to participate in that as it causes the rising sense of uncertainty in making relationship with friends.

How Does Environmental Education Affect the Environmental Attitudes?

Previous studies have clarified three effects that promote a particular pro-environmental behavior: situational understandings, action costs, and norms. We can assume, in addition, the general attitude toward environment which promote the behavior no matter what the behavior is: ecocentric attitude, anthropocentric attitude, and environmental apathy. The general attitude is also assumed to be formed by education at school as well as at home. This paper thus explains the effects of environmental education on some aspects of environmental attitudes. Moreover, it specifically explores the influence of attitude on pro-environmental behavior. To this end, we conducted a survey in Minamata, Japan in November 2010. Respondents are all 3rd-grade junior high school students and their parents in that city. Our results are as follows: 1) Between parents and children, the correlation of attitudes toward the environment is weak; 2) the actions of families favorable to the environment and environmental study in school have a positive effect on ecocentric attitudes and the anthropocentric attitudes; 3) the pro-environmental actions of families, experiences in nature, and environmental study in school have a negative effect on environmental apathy; and 4) among the three environmental attitudes, ecocentric attitudes have a positive effect and environmental apathy a negative effect on pro-environmental behavior. Therefore, ecocentric attitudes are significantly improved and environmental apathy significantly reduced by experiences in nature, environmental study in a school, and the action of families.

Language Endangerment : The Example of Yoruba and Igbo Languages in Africa

This paper explicates how societies thrive amidst a multiplicity of languages in particular cultural, social, economic, political and religious contexts, resulting, invariably in linguistic inequality which affects language attitude, language shift and subsequently, language endangerment. Using 2 major Nigerian languages, namely Yoruba and Igbo, the paper picks the UNESCO (2003) overview of language endangerment, among others; underlying ideology; attitude of the speakers of both languages; and a checklist modified for the purpose of this study to place language endangerment in its proper perspective. Literature reviews cover historical, cultural, religious and social aspects as well as selected previous studies on this subject. The peculiar challenges presented by religious-cultural and socio-political practices to language use in a country like Nigeria are highlighted particularly when the society is expected to ensure that languages change to outwit change in terms of adequate allocation of functions. The paper observes that indigenous languages in Nigeria have become endangered while English language continues to flourish.

Addressing Domestic Violence in Canada and the United States: The Uneasy Co-Habitation of Women and the State

For decades, feminist sociologists, activists and the anti-violence movement have drawn attention to how violence against women is closely linked to structural
and cultural factors that subordinate women. We have underscored how gender inequalities intersect with other forms of inequalities, such as, for example, those due to immigration or minority status; how limited rights, lack of equal access to resources and exclusion from participation in decision making processes impede the elimination of violence against women at the micro, meso and macro levels. In this paper we investigate the role of the state in addressing domestic violence, especially in the context of immigration in the neo-liberal era. By doing so we problematize state regulation of gender itself. Mobilization by the battered women’s movement in the last few decades, increased media attention, and legislation at the state / provincial and federal levels have increased both government awareness and support to address violence against women. However, activists and researchers have also critiqued the problems with invoking the power of the state in seeking a solution. Drawing on a multi method approach, we critically examine how Canada and the U.S approach the problem of domestic violence. In particular, we focus on how domestic violence has been framed: how the US and Canada engage at the micro, meso and macro level in ending domestic violence; how abused women and mainstream and immigrant organizations that address domestic violence encounter the state; and what are the most common forms of intervention and outcomes. Finally, what the gaps in the discourse are as they emerge from the experiences of domestic violence in the US and Canada.

The Role of Reciprocity in the Creation of Reputation

We seek to identify social mechanisms which explain the production of reputation in economic relationships between actors. Reputation is often assumed to be freely available in social systems. However, since people have to give away exclusive information the production of information is not for free per se. The higher the costs of producing reputation, the stronger is the necessity to overcome this obstacle by appropriate incentives. Since reputation has been shown to play a crucial role in economic and social systems, the identification of such mechanisms is crucial for our understanding how exchange between actors work. We argue that reciprocity can be a strong driver for information transfer in social systems. Based on the idea of an effective norm of reciprocity in social and economic systems we derive hypotheses on the role of reciprocity for the production of reputation in small networks. We distinguish between direct and general reciprocity and argue that both may foster the flow of information about exchange partners. Moreover, we examine the interdependency between competition and reputation. In this setting, multilevel model panels reveal that direct as well as general reciprocity are important drivers for the transfer of information about a seller among a group of buyers. Moreover, competition damps the production of reputation considerably.

A Factorial Survey on the Inheritance Tax and Compliance Norms

This paper builds on the tax compliance (evasion) literature as initiated by the work of Alyingham and Sandmo (1972). Within the last decades a vast empirical and theoretical literature evolved, incorporating norms as an important determinant of tax compliance behavior. We add to the literature, which is mainly focused on income tax evasion, by providing an evaluation of the inheritance tax. It is shown that closeness of relationship (family principles), type of inheritance, scope of evasion and income of heirs play a role for the judgment on acceptability of evasion, which is in line with theoretical predictions. The results indicate that a general compliance norm can be abated by conflicting norms, such as fairness considerations, equity principles or family principles.

Obstacles To Childcare Services For Low Income Families: How Important Is The Cost Of The Service?

Recent research has highlighted the existence of a social bias in the extent to which children have access to childcare. In general, children living in higher income households are more likely to be cared for in childcare centres.

While the existence of a social bias in access to childcare services has been clearly demonstrated, we currently lack a clear explanation as to why this is the case. This paper uses a unique dataset based on survey data collected specifically to study patterns of childcare use in the Swiss canton of Vaud (N= 1,900). The paper takes advantage of variation in the fees that parents have to pay for using childcare services. Childcare is a municipal policy, as a result of which there are 28 different systems in operation in the canton. Fees are progressive everywhere, but variation is nonetheless substantial. For exactly the same household income and same service, the parental contribution can vary by a factor of 1 to 5.

The paper analyzes patterns of childcare use and identifies the factors that influence the decision of parents to use childcare services. It identifies the importance of variation in the cost of service for parents as a determinant of childcare use. The paper will test the hypothesis that the cost of service is a major obstacle to the use of childcare services by low-income families, in spite of the fact that fees are progressive. It will use a multilevel design, with the first level of analysis represented by households, and the second by childcare systems.

Expected findings: an initial exploration of the data suggests that the pro-rich bias in childcare service use is strong in the canton as a whole, but that in a few municipalities where for various reasons fees for low income people are particularly low, the bias concerns only the upper half of the income distribution.

ABREU, ALICE* (Federal University of Rio de Janeiro, aliceabreu@gmail.com)

Enabling Policies: Capacity Building and Gender in Science and Technology in Brazil

Brazil has today one of the most ambitious capacity building program in Latin America. In 2012 it has conferred 42 thousand MSc and 12 thousand PhD titles in all scientific areas. An interesting feature of the Brazilian system, however, is that women are the majority of both MSc and PhD graduates: in 2008 women accounted for 54% of MSc and 51% of PhD graduates. This paper will look at the reasons for this success and discuss whether this has resulted in a full and equal participation in the science and technological system of the country. The paper will look at the extensive graduate system and discuss its characteristics and specificities that lead to the massive presence of women scientists. It will show that large number of women are present in the entry levels of the system, but that their participation...
at the higher positions is still weak and that differences in pay are important when they enter the workforce. It will conclude that in spite of a complex and sophisticated policy framework put in place in the last sixty years, further steps should be taken if Brazil wants these highly trained women scientists to participate fully and to be involved in the highest decision making positions of the system.

Gender Equality in Science and Technology in Brazil: Successes and Remaining Challenges

The paper will discuss the policies, factors and actors in the Brazilian national STI systems which affect the participation of women and girls, using the framework on Gender Equality and the Knowledge Society. In the last decades, Brazil has advanced considerably towards addressing social issues and reducing social inequalities, although there are still many problems to be dealt with. With a steady economic growth and contained inflation since 1994, Brazil has managed to uplift 35% of its poorest inhabitants out of poverty and has vastly increased its middle class. It is also today an urban country, with 85% of its population living in urban areas, 30% in metropolitan areas. Brazil is today a thriving democracy, with free universal elections for president every four years and an active congress, both at the lower house and the Senate. Women economic, political and social rights are guaranteed by the 1988 Constitution, which ensures complete legal equality between men and women in public and private life. So Brazil stands out well in the majority of the indicators, including education, where women are the majority of graduates at all levels. Brazil is today one of the few countries in the world where women are the majority of PhD graduates, the result of a steady effort of capacity building in the last sixty years. However, when you look at the higher decision making positions of the STI systems, women are still few in number. The paper will make an attempt to understand why this is so and what are the steps needed to have women participating fully in the Brazilian knowledge society.

Racism in Children’ Advertisements: Two Content Analysis Studies in Brazil

The main objective of this research is to understand representations of Afro-descendants in advertisements directed at children in Brazil. Two studies of content analysis were applied to evaluate the advertisements in our sample. One of the studies investigated advertisements in children comic magazines and the other one assessed television ads exhibited while children programs were presented. SPSS TREE analysis was conducted on the data and the results revealed that this ethnic group is portrayed in secondary roles, in non-family relationships, in business or social contexts and less frequently represented as adults.

Investigations related to representations of Afro-descendants in the media in Brazil are welcome because, in spite of this group constituting 50.7% (being that the Mulattoes are 43.1% and Negroes 7.6%) of the population of the country (Varella, 2011), most studies have demonstrated that compared to the composition of the population, it is still, percentage wise, little portrayed in the media (Araújo, 2000; Barbosa, 2004).

In general, the results of these investigations reveal that roles associated with the Afro-descendants are impregnated with social stigmas (Barbosa, 2004; Carvalho, 2003; Rodrigues, 2001). Moreover, analyses of speech demonstrate that there is a depreciation of this ethnic group in the media. In fact, research on the subject has identified that the new stigmatization strategies of Afro-descendants in the media are subtle and complex. Studies on the subject pointed out that messages in mass communication reflect the racism that is ingrained in Brazilian society (Araújo, 2000; Carone and Bento, 2003; Carvalho, 2003; Rodrigues, 2001).

It is on this context of concern that the present investigation is founded. The goal of this research is to examine how portrayals of Brazilian Afro-descendants in children’s advertisements (those which appear in children comic magazines and those presented while children’s programs are been broadcasted) are displayed to children.

Roles Portrayed By Women: A Content Analysis in Brazilian Television Advertisements

The main purpose of this paper was to examine female roles portrayed by advertising. More specifically, the questions that motivated this research project were “What messages about women have been given to society through advertising?” and “Have these portrayals been changed during the past decades?” The study consisted of a systematic content analysis of Brazilian commercials from 1973 to 2000. The population from which this sample was drawn consisted of Brazilian commercials which got an award in international and national festivals. A probabilistic sample procedure was employed. Ninety five pieces were selected. The categories and operational rules used in the study were developed based on previous research. This study has proposed that female images in advertising are depicted in three different ways: stereotyped, idealized, and plural portrayals. Our results have revealed that some female images have changed, however, they continued to be stereotyped and idealized.

Research related to female portrayals in advertising has been the focus of attention of many academic studies because mass media messages about women have often depicted them in a stereotypical manner, such as women are irrational, fragile, not intelligent, submissive, and subservient to men (Courtney & Lock-eretz, 1971; Venkatesan & Losco, 1975; A. Belkaoui & J. Belkaoui, 1976; Goffman, 1978 Blackwood, 1983; Breit & Cantor, 1988; Jolliffe, 1989; Luebke, 1989; Kang, 1997). In addition, these investigations have shown that these portrayals haven’t reflected changes in female roles in modern societies. Indeed, mass media has concocted women’s image mainly as sex object, wife, and mother whose primary goal in life is to look beautiful for men (Kosimar, 1971).

Employment Crisis and Instability Among YOUTH: A Comparative Analysis Between Formal and Informal Economy in Mexico 1995-2013

The global financial crisis that began in 2008 has caused negative imbalances in all economic areas, both in developing and developed countries. Specifically in global labor markets, decline in job creation has driven high unemployment rates and overall precarious working conditions. International reports indicate that young people (15-24 years) have been most affected by job insecurity. Specifically in Latin America the youth employment situation is alarming in the short term and urgent inclusive policies are needed. In the case of Mexico, in this study, we demonstrate a comparative analysis between formal and informal economy, that the instability of youth in the labor market may not be as extensive and damaging, as affirmed by international reports. Early results indicate that youth labor instability coincides with international studies as the same stratus pushes to work in informal economy, however, when reviewing the labor dynamics there are some typical issues which are undervalued by the international studies. According our analysis, population occupied in informal economy recorded lower rates of imbalances compared to population occupied in formal economy or underemployed. Youth occupied in informal economy indicates that they have good and stable prospects of labor.

Socioeconomic and Health Condition of Elderly Migrants in Monterrey City, Mexico

Present paper attempts to analyze the socioeconomic condition of elderly migrants and their impact on health status. About 156 Mexican elderly migrants were interviewed in Monterrey Metropolitan Region during 2010-12. The study found that, majority of elderly migrants in search of a better economic opportunity in urban areas. Once they arrive to city, they absorb in informal economic sectors. Our results indicate that most of the elderly do not have any job contract as well as they also earns very less compared to younger migrants. Most of the time employers ask them to work more hours without extra salary, which has adverse effect on their health. Elderly migrants were reported numerous health problems, whereas many of them were suffering from high risk diseases such as heart problem, obesity, high & low blood pressure, asthma among others. Pres-
ent study concluded that socioeconomic difference has great impact on health status of the older population.

Use of Education and Inclusion Subsidies By Children in Low-Income Families: Who Is Left behind?

Economic deprivation among children and adolescents is a highly relevant issue in Germany, as children face a high risk of living in relative poverty and their poverty rates are even on the rise. Therefore, Germany increased political efforts to overcome this problem. In 2011, the Federal Government introduced “Education and Inclusion Subsidies” for children in low-income families. These additional means-tested benefits are aiming at improving material welfare as well as social inclusion, e.g. through covering costs for school trips, daily meals or cultural activities. From the very beginning, the question was raised whether the new benefit program really meets its objectives. One major problem is that complex and restrictive bureaucratic procedures of the program may provoke serious inequalities in terms of access to subsidies due to lack of information and opportunity costs. Claiming for subsidies may require substantial resources, such as knowledge of eligibility rules, expenditure of time as well as availability of participation opportunities at the place of residence. Thus, claimants with a low level of resources might be less likely to get access. Our main research questions are as follows: Are descendents from immigrant parents with limited knowledge of German and children with several siblings underprivileged groups who are left behind? Do the usage patterns differ across urban, suburban and rural regions? The analysis is based on representative micro-level data from the most recent wave of the German Panel Study “Labor Market and Social Security” (PASS), which is available from October 2013. PASS is a novel dataset in the field of labor market, welfare state and poverty research in Germany. The questionnaire includes several items concerning knowledge and usage of “Education and Inclusion Subsidies” for the first time. It also contains comprehensive information on the income and living conditions of different types of households.

Changing Reproductive Behaviour and Migration As Response To Climate/Environmental Change: Evidence From Rural Northern Ghana

The Upper East Region is one of the poorest regions in northern Ghana. With a predominantly rural population, over 70% of the population is engaged in agriculture and its related activities. As a pro-natalist society, the area is characterised by high fertility levels and large family sizes. Aside the population density in the area which has led to pressure on the existing limited arable land, climate change over time have resulted in rainfall variability, prolonged dry spells, environmental degradation and loss of soil fertility with implications for agricultural production and yields. The physical-environmental stress being experienced in the face of population growth have undermined the livelihoods of the people and exacerbat-

ent the already appalling poverty and food security situation.

With the Bongo District as the study area, the study draws on the ‘theory of multiphase response’. It is noted that aside the many responses that households make, it has been observed that people also migrate to southern Ghana and have changed their reproductive behaviour by reducing their fertility levels. Using qualitative interviews and secondary statistical data, the study highlights the role of rainfall variability, environmental degradation, crop failure in the face of population growth in influencing migration and fertility change in northern Ghana. This work is an explanation for finding a seeming lack of correlation between fertility change and contraceptive usage in northern Ghana and also contribute to theongoing population-environment nexus debate.

Keywords: Upper East Region, Bongo District, Migration, Population Growth, Fertility Decline, Environmental Degradation, Climate/Rainfall Variability, Floods, Agriculture

Negotiation of Gender Roles Among Young Muslim Women in Britain: Career, Family, and Faith

The purpose of this presentation is to investigate how British Muslim women manage plural social roles and identities, and to scrutinise the negotiation strategies which they adopt in this process of integration. Consequently, the presentation discusses young (aged 16–35 years) Muslim women’s attitudes regarding career, family, and on the basis of interview data collected in England. Overall, the research participants are able to make their own choices regarding their career and future. Furthermore, the data demonstrate that the younger the participants are, the more frequently they think that their family accepts their choices. It also shows that the development of religious institutions, such as mosques and madrasas, in communities and the use of information technology influence the participants’ attitudes about gender roles. These developments increase the chances of their participation in the wider society as Muslims by making them more knowledgeable about Islam. The knowledge of Islam helps the participants distinguish religious practices from cultural ones, some of which...
are perceived as being oppressive to women. Some participants use Islam to nego-
tiate with their family about the duties imposed on women and to justify their
own life and career choices. This does not necessarily mean that the participants
are critical of all ethnic and cultural practices; rather, they recognise some social
and emotional advantages to their ethnic backgrounds. By referring to Islam, they
find compatibility between following some gender roles assigned by their family
and building a career. The analysis results provide a complex picture of young
British Muslim women, who endeavour to negotiate their gender roles and par-
ticipate in modern society as Muslims. The presentation also contributes to the
sociological theory on reflexive modernity, which emphasises the importance of
agency and information to reproduction and change of identity and society.

“Sem Medo De Ser Feliz!”: Brazilian Horsewomen, Cowgirls and Equestrian Leisure

Equestrian sport and leisure activities are often praised for their ability to “dem-
ocratically” integrate different types of people. Women and men of all ages, with
differing levels of physical ability and often from different social backgrounds,
may find a place for themselves within equestrian cultures, which include a wide
range of modes of practice. In Brazil, although there has often been a space for
activities with elites or well-off members of urban middle classes who take part
in dressage and show jumping, our own research has shown popular equestrian
traditions engage people from across the social spectrum, men and women, girls
and boys, riding from casual leisure to competitive levels. Furthermore, the ideas
that are so often expressed in popular international literature - whether fact, fiction, or lying somewhere in between - claiming women’s special connection to horses, or women's “empowerment through horses” - are also disseminated in Brazil. In this research, we focus on women and leisure riding activities. Taking off from our own previous researches looking at three different Brazilian equestrian milieu and gendered interactions therein, this paper works with the life stories of women who vary in terms of class, generation, educational, occupational and marital status, looking at what horses represent in their lives, and what kinds of conflicts they face as they negotiate access to the time and resources their equestrian activities demand. Their struggles are poignant testi-
monies of both persistent inequalities and prejudice, and current gains relating to
gendered structures of leisure and the pursuit of happiness and well-being.

“Construct Metro Not Roads”

Middle East Technical University (METU), (Ankara, Turkey) is located in a 45 km² forest campus planted by the students, academics and the military in 1960. The reforestation program, which received Aga Khan Award in 1995. One of the few green areas in the city, the university campus is under the threat of destruction - with rapid urbanization and road based transportation policies by various road construction plans in 1983, in 1994 and the most recent in 2013. The first era of environmental movement in 1994 “Protect METU No to the Highway” led by university students and local environmentalists was successful. In 2013, the mayor of Ankara insists on constructing an 8 lane highway that passes through the forest and another highway which will cross the campus via tunnel. Consequently, 3000 trees, the nearest neighbourhoods and the wildlife in the forest will be affected severely. The Prime Minister in response to the movement declared that “If you want forest, go and live in the forest. Road is civilization.” The study will focus on comparative framing and discourses of 1994 and 2013 movements. In addition, it will discuss various relationships around road construction of the students, NGOs, the university and the major. The study will further explore the motivations of participants and the impact of the movement on the daily transportation
behaviour. Most research on the social backgrounds of environmental activists has concluded that they are disproportionately highly educated and employed individuals, leave workers almost totally at the mercy of employers who put the health
and lives of workers in jeopardy. The end result is that the lot of the working
people has worsened under the neo-liberal economic agenda. It is thus concluded
that Gøsta Esping-Andersen’s notion of “de-commodification” (and “commodifica-
tion”) in characterising social collectivisation of risk misrepresents the processes
involved. While driven more by Karl Polanyi, Esping-Andersen, nonetheless, sug-
gests that he drew from the other Karl (Marx).

First, the idea “commodification of [the] workers” is misleading. Second, trans-
former income in welfare regimes involves, in large part, ensuring that people contin-
ue to engage in commodity relations. Third, even from the side of social services,
the proposition that something stops being a commodity because you are not
paying for it at the point of consumption misses, fundamentally, the point about
circulation of capital across various departments. Here, Polanyi becomes less
helpful. We must turn to Marx, and when does the worker win? This is in the
idea of “generalised commodity relations”: at best an ideal-type capitalism
but which should not be confused for actually existing capitalism, economy, or
society.

As a starting point for rethinking the conceptual foundations of Social Policy we are
rather than Polanyi, generating a framework that can be usefully illustrated in
the discussion of a conceptual handle on the processes are at work: “entitlement”, ‘capacity’, ‘functioning’, concerns with substantive equality, and Public Reasoning. Sen, we propose may offer a better inspiration for making sense of what encompassing and transformative social policy are (and should be) about. We supplement the conceptual offerings from Sen with insights drawn from social practices that we often characterise as
“non-formal” social policy, especially around the norms of solidarity and social
reciprocity.

Exploring the Narratives of Sociology in 21st Century Nigeria: Some Prospects and Challenges

The trajectories of Sociology as an externally induced discipline in Nigeria are
the production of theories and methodologies equal to the European tendencies
and ideas as well as the knowledge of domination initiated from outside. How-
ever, these trajectories have created avenue for serious crisis of relevance to the
extent that the discipline now has more critics than admirers. Some of the major
challenges that face the discipline include the belief that it contributes little to
to nation building in terms of policy formulation and implementation, as well as pro-
duction, consumption, and social change. In this regard, the paper suggested the paradox of entrepreneurial sociology as a viable option for making the discipline more relevant both as an academic, practical and pro-people ori-
ented discipline. Challenges that may face new option are also addressed.

Workers’ Rights in the Era of Globalisation: How Protective Are International Labour Standards

International labour standards, codified in Conventions and Recommendations, remain the main instruments employed by the International Labour Organisation (ILO) to ensure that people work in dignity to offer by way of gainful employment
and as such constitute a problem to the society. For Sociology to overcome these
 criticisms, there is the need to assess critically the past, present, and future op-
oportunities open so as to make the discipline attractive both as an academic and
timeless discipline. To demonstrate the utility of Sociology, this paper consid-
ered two fundamental intellectual dispositions of practitioners to societal issues
which are scientism and criticalism. The paper argued that contemporary Nige-
rian situations tend to push the discipline more towards practical and cultural
hemisphere rather than the present practice of recycling pure externally created
theoretical and methodological perspectives. Against this background, the paper
suggested the paradox of entrepreneurial sociology as a viable option for making
the discipline more relevant both as an academic, practical and pro-people ori-
ented discipline. Challenges that may face new option are also addressed.

Rethinking The Conceptual Foundations Of Social Policy: Theoretical Insights and Lessons From The Global South

This paper starts with a set of arguments regarding some of the contempo-
rary foundations for Social Policy theorising. We commence with the proposition
that Gøsta Esping-Andersen’s notion of “de-commodification” (and “commodifica-
 tion”) in characterising social collectivisation of risk misrepresents the processes
involved. While driven more by Karl Polanyi, Esping-Andersen, nonetheless, sug-
gests that he drew from the other Karl (Marx).

First, the idea “commodification of [the] workers” is misleading. Second, trans-
fector income in welfare regimes involves, in large part, ensuring that people contin-
ue to engage in commodity relations. Third, even from the side of social services,
the proposition that something stops being a commodity because you are not
paying for it at the point of consumption misses, fundamentally, the point about
circulation of capital across various departments. Here, Polanyi becomes less
helpful. We must turn to Marx, and when does the worker win? This is in the
idea of “generalised commodity relations”: at best an ideal-type capitalism
but which should not be confused for actually existing capitalism, economy, or
society.

As a starting point for rethinking the conceptual foundations of Social Policy we are
rather than Polanyi, generating a framework that can be usefully illustrated in
the discussion of a conceptual handle on the processes are at work: “entitlement”, ‘capacity’, ‘functioning’, concerns with substantive equality, and Public Reasoning. Sen, we propose may offer a better inspiration for making sense of what encompassing and transformative social policy are (and should be) about. Gender Inequality In Party Politics In Nigeria: Insights From South-West Nigeria

Abstract

Gender inequality has remained a persistent phenomenon in many developing countries. Even in the developed countries, some countries still grapple with gender discrimination and women marginalization in politics. In but the poverty-stricken African nations, gender inequality is more of a serious development issue. The reason is that, many women still remain trapped in age-long discrimination in national politics occasioned by traditions, colonialism and imperial capitalism. This paper argues that, gender inequality is still a serious problem in the South-Western Nigeria using Lagos, Oyo and Osun States as case studies. The paper reports a survey carried out on women politicians of two major political parties in the South-West i.e the ACN and the PDP. The survey was carried out between the year 2007 and 2012 in three South Western Nigeria. It was complemented with 20 In-depth Interviews of women politicians. Findings from the study showed that, gender inequality, gender discrimination and marginalization are still the major constraints to women participation in Nigerian politics. Based on these findings, the paper recommended greater emphasis on the “Affirmative Action” recognized by Nigerian laws.

Key Words: Gender Inequality, Women, Politics, South-West, Nigeria.

The Middle and Political Transformation In Nigeria: A Critical Appraisal Of The Role Of Asuu and Nba

Abstract

Since the end of the Cold War in 1989, many African countries have come to the conclusion that, political transformation is an inevitable process of attaining political and economic development. This process, is expected to engender economic growth, guarantee their citizens’ unfettered access to good governance and sustainable democracy. In order to achieve these objectives, many African countries have embarked on deliberate reforms of basic state institutions like the judiciary, the Police, the education sector, the oil and gas sector, the banking industry, the aviation industry, the electoral process, as well as the legal system. In these transformations, many state actors and non-state actors have participated nationally and internationally in order to ensure that African countries are re-democratized. With concrete empirical data and qualitative interviews, this paper argues that, the middle class in Nigeria, has been very central to hitherto Nigeria’s political progress. The paper argues that the Academic Staff Union of Universities (ASUU) and the Nigerian Bar Association (NBA) are some of the forces behind the current Nigeria’s political change. The paper averrs that, despite its contributions to national development, the middle class has remained one of the most marginalized classes in the federation.

Key Words: Middle Class, Political Transformation, State, Nigeria, ASUU, NBA

ADOLF, MARIAN* (Zepelin University, marian.adolf@zu.de)

New Modes of Integration: Individuality and Sociality in Digital Networks

The proposed paper connects some of the loose ends of current debates regarding the social impact of the new media with a discussion of social integration in contemporary modern societies. Globalization, individualization, diverging interests of increasingly detached social groups and miseries, it is feared, lead to a fragmentation of contemporary democratic societies and render them unstable in a socio-cultural sense. Contemporary media change, i.e. the ascent of digital fragmentation of contemporary democratic societies and render them unstable in a socio-cultural sense. Contemporary media change, i.e. the ascent of digital media is often blamed for contributing to the downfall of communicative social integration and the decline of the public sphere.

The paper provides a theoretical framework for researching how digital media may contribute to social cohesion by providing communicative references and new forms of sociation. The latter depend on referable sets of culturally available signs, traditionally provided by central social institutions, especially the mass media. While the advent of decentralized, highly variable media usage in the wake of digitization has initiated new patterns of communication and social interaction, these new phenomena are not necessarily detrimental to social integration.

The contribution suggests that we are witnessing an important moment in the organization of communication given the current conjuncture of long-term socio-structural change processes with the advent of new technological and individual ways of communication. Contemporary internet-based media technology – above all Social Network Sites (SNS) – may provide the groundwork for a new form of communicative integration through the emergence of what may be called Networked Individualism. This amounts to a restructuring of the way the structure of social communication as social media and their technology enable an exchange-based mode of sociation. Based on a discussion of classic and contemporary sociological theory, some of the central mechanisms of the new societal exchange-based mode of sociation are sketched out, and subsequent potentials and risks for this new mode of sociation are discussed.

‘Kalboj’ or ‘Sanitary Management Assistant? Precarious Work at the Bottom of the Occupational Ladder

Some see an increasing polarization between attractive jobs and jobs at the bottom in Western labour markets. Indeed, there is evidence that jobs that fall between these two extremes, have become less important in recent decades. Some juxtapose interesting jobs with a corresponding salary, job security, prestige, career opportunities and attractive working conditions against precarious jobs where people are expected to work in flexible work schedules with little chance to develop skills, all that in return for a low salary. Some denounce these bad jobs as ‘precarious’.

What is missing in this literature, is a reliable job level empirical approach of the growing numbers of workers in the precarious. This contribution reports on a research into an previously neglected occupation: lavatory attendants. Their job is to exist to low paid and flexible work with limited social protection, low employability and non-existing prospects of a career. There is a stark parallel between the lack of social-scientific interest and the apparent social unease about this job. For instance, the Polish ‘kalboj’ contaminates the Polish word for a sanitary attendant with phonetics for excrements (kal). Other terms cloak the job in vague terms (the ‘sanitary management assistant’).

With the help of standardized questionnaires and in-depth interviews taken from a sample of these workers in Belgian cities, we document the score of lavatory attendants on precariousness, job status, access to collective bargaining and social benefits, income, skill utilization and job strain. Also, because agency and self-assessment is so important to understand processes of polarization and precariousness, toilet attendants are asked what they see as the main problems of their jobs and status. The results of this survey allow us to partially evaluate the effects of the Belgian flexicurity policy, aiming to provide workers with social security while allowing for flexible labour market policy.

ADRIAENSENS, STEF* (KU Leuven, stef.adriaenssens@kuleuven.be)

‘Pacta Sunt Servanda’: Contract Breach and Contract Enforcement in Prostitution

The bulk of the social-scientific attention paid to the regulatory aspects of prostitution shows signs of a rigid judicial centralism. Usually one focuses on formal laws regulating the position of commercial sex. This means that the discussion of criminalization or liberalization of sex work gets most of the attention. However, there is more law and regulation concerned with sex work than just the formal aspects.

One important question is how relations between sex workers and clients are governed by contracts. Prostitution implies that people are engaged in commercial transactions where physical sexual services are exchanged for money. Because the relationship between a sex worker and his or her client is organized as an exchange, it necessitates a contract. These contracts, however, are virtually always of an incomplete nature. For one thing, written contracts are absent. Also, the incompleteness is strengthened because parties do not even orally agree upon essential aspects of the contract. Usually there is no more than a vague agreement about the price and the services provided. Misunderstandings and disagreements therefore occur frequently. Quite often these disagreements may increase the risk of violence used.

This contribution is built on a quite unique dataset documenting (more than 35,000) exchanges in commercial sexual encounters in the Low Countries (the Netherlands and Belgium). The analysis builds on a quantitative analysis of the causal factors behind these breaches of incomplete contracts. Privileged hypothetical factors are the private and public order institutions allowing for contract enforcement, unilateral enforcing power of contracts, reputation mechanisms and socialization. Estimation is performed with multilevel logit analyses, both random effects Bayesian estimations and fixed-effects regressions.

Shifting Identities: The Emerging Roles of the Armed Forces of the Philippines

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
Since the 1950s, the Armed Forces of the Philippines (AFP) have been utilizing civil-military operations (CMO) as one of the main strategies in combating local insurgency. The diversity of insurgency movements with its complex cultural, religious and historical origins necessitates the evolution of CMO strategies implemented through the years. In the latest Internal Peace and Security Plan of the AFP (January 2011) called “Bayanihan,” the role of the non-combat civil-military operations and development oriented activities of the AFP was once again reiterated.

Broadly, this paper examines how the emerging CMO technology being adopted by the AFP impacts on the construction of the self-identity of the members of the Philippine Marines. The study finds the shifting of identities from that of a “warrior” primarily concerned with the management and application of violence to that of a “protector” defining themselves as primary agents of peacekeeping and humanitarian work. At the same time, these reformulations of identity also provide the avenue for the members of the AFP to redefine the character and nature of their relationships with the other agents and institutions of the Philippine state.

Gendered Life Courses and Personal Networks in Switzerland

Individual life courses may be defined as sequences of status profiles. They are multidimensional in the sense that they unfold simultaneously in various interdependent life domains such as family and occupation. In the Swiss welfare state system, family is considered as a private matter and only limited extra-familial childcare facilities are provided. Hence, in Switzerland, transition to parenthood often leads to life course gendering regarding these two central domains. While most men follow full-time employment trajectories, most women withdraw, temporarily or not, from the labor market by choosing part-time jobs that are structurally more compatible with raising children. Correlatively, the personal networks of relationships in which individuals are embedded are also gendered. Fostering relationships, either with family members or with other close people, has often been described as a woman’s role. This gendered social participation of women and men further leads to the development of differentiated social resources and relational interdependencies. This raises several questions. What are the main differences between personal networks of women and men? To which extent are these differences explained by gendered life courses? Do women following full-time employment trajectories develop similar networks as men do?

Based on a representative sample of 803 individuals living in Switzerland and belonging to two distinct birth cohorts (1950-55 and 1970-75), this communication explores women’s and men’s personal networks in light of linked occupational and familial trajectories. First, using multichannel sequence analysis, we create bi-dimensional typologies linking occupational and familial trajectories. Second, using personal networks composed of the very significant others, we provide the avenue for the members of the AFP to redefine the character and nature of their relationships with the other agents and institutions of the Philippine state.

Empowering Indigenous Communities Against The State and The Business To Tackle Group Conflict: The Roles Of NGOs In Balancing Power In Democratized Indonesia

After independence in 1945 the state power was strengthened in Indonesia, while the power of civil society was weakened. Before that, the society was strong marked by its elements struggled against colonizers in any islands. After independence and during New Order their power was deteriorated by the state, while the state grew much stronger in power. That socio-political condition created deep political power inequality in the country between the society and the state and the business. This is responsible for the happening of political crises and communal violence during 1998-early 2000s. 1998 was the watershed of democratization in Indonesia leading to decreasing political power inequality. Based on research in the field of agrarian conflict this article is to show how the deep political power inequality between the society and the state as well as the business created wide spread social unrests and the increasing balance of power among them contribute focus group interviews collected over several years of fieldwork. I first would also scrutinize the role of NGOs in empowering society against the state and the business to create just and peaceful Indonesia. The argument of this article is that the creation of equal political power between the society and the state as well as the business is prerequisite of justice in the utilization of agrarian resources and NGO contribution is vital to that.

Women's Religious Authority in a Sub-Saharan Setting: Dialectics of Empowerment and Dependency

The western scholarship on religion and gender has devoted considerable attention to women’s entry into leadership roles across various religious traditions and denominations. However, very little is known about the dynamics of women’s religious authority and leadership in developing settings, especially in sub-Saharan Africa, a region of powerful and diverse religious expressions. Guided by a conceptual model that intersects religion, gender, and power, this study analyzes women’s religious authority and leadership in a predominantly Christian yet denominationally diverse setting in southern Mozambique. It uses a uniquely rich combination of household and institutional survey data with in-depth and participatory fieldwork to identify and compare the prevalence and patterns of women’s formal leadership across different denominational groups. The study examines and defines four main pathways and forms of women’s church-based authority: office authority gained on their own merit; office authority gained by virtue of association with husband congregation leadership; charisma-derived authority acquired through proselytizing; and agency-based authority gained through church women’s groups. In conclusion, I reflect on how these forms of women’s authority both defy and reassert the gendered constraints of the religious marketplace and the broader gender ideology in this developing setting.

Transformation of Medical Professionalism in Turkey: Erosions and New Divisions in the Wake of Reforms

This paper aims to examine the impact of recent market reforms in the Turkish health care system on medical professionalism and identifies new divisions within the medical profession. The research team carried out 60 interviews in the summer of 2010 in Istanbul, Turkey, at two different public hospitals. The findings suggest that the new economic and social context of medicine, which is marked with marketization, consumerism and managerialism, is significantly transforming medical professionalism in Turkey. Physicians indicate growing frustration as the reforms such as introduction of pay-for-performance methods or practice of full-time employment of physicians in public hospitals are being implemented and public hospitals are reorganized as autonomous entities. Physicians report lower levels of professional status, lack of respect on the part of the patients and policymakers and increased violence from patients and their relatives. Many physicians blame the government for erosion of the public trust in physicians and growing violence, claiming that the reformers undermined the credibility of the physicians by designating them as “service providers”. Institutional complaint mechanisms that have recently been established as part of the reforms appear to strain the doctor-patient relationship even more. On the other hand, physicians who occupy managerial positions in the same hospitals provide a somewhat different assessment of the reforms. The discourse of these physician-managers include lower levels of professional status, lack of respect on the part of the patients and policymakers and view some steps like pay-for-performance payments as useful incentives to get their colleagues work more efficiently, they hesitate to embrace the reforms aimed at granting autonomy to public hospitals. They also agree with their colleagues that the patient complaint mechanisms are not working properly. The paper highlights serious threats to erosion of professional status of physicians and emergence of new hierarchies among the practicing physicians and physician-managers in Turkey.

Same-Sex Sexual Relationships in South African Female Prisons

Although same-sex sexual relationships in female prisons have been a topic of scholarly discourse, they have mostly been concentrated in the United States of America. Same-sex sexual relationships between females in African prisons have received little attention by researchers since studies on prison sex in Africa tend to focus on the sexual relationships between male prisoners, especially the coercive nature of such relationships in male prisons.

Drawing on the retrospective narratives of five female ex-prisoners, this study examines same-sex sexual relationships in South African female prisons. The dynamics and socialization process involved in such relationships, as well as the different forms that it takes are analysed. Specifically, research participants discussed the prevalence of same-sex sexual relationships in female prisons.

The findings of this study show that sexual relationships among females in South African prisons can be either consensual or coerced. Some of the participants believe that the motivations for female prisoners' engagement in sexual relationships with other females in prison are the desire to satisfy material and sexual needs. However, other participants opined that the motivating factors for participating in same-sex relationships in female prisons include not just material and sexual needs, but also emotional needs, and the desire for friendship and companionship. Some of these relationships are characterised by jealousy and violence. The reactions of female prisoners to same-sex sexual relationships behind bars vary from indifference to amusement and dislike.

Technologies De Communication Et Inégalités En Côte D'Ivoire

La question des non-usages des media est complexe en Côte d’Ivoire. L’accessibilité de tous aux media qui était vue sous le seul angle de la démocratie et des droits de l’homme la notion de dispositif numérique d’action conjointe (Foucault, Widmer) et des logiques d’action.

La Compabilité Des SHS Et Des STIC Pour Une Analyse Des Usages

L’objectif de la communication est de montrer que les inégalités d’usages et d’appartenance dépendent d’une double analyse : celle des objets techniques (STIC) et celle des représentations et/ou compétences liées aux usages (SHS). Des lors, le problème vient de la multitude des approches SHS possibles et de leur réduction à une modélisation (STIC) dans un objet technique et son cadre d’utilisation. L’usage est donc d’abord une vue de l’esprit qui associe les interactions humaines, la médiation des outils, la cognition et les intentions qui permettent à l’utilisateur d’agir sur des problèmes concrets. Au-delà d’une faiblesse évidente de la méthode qui se base sur le principe de la correspondance linéaire descriptique de l’usage (Agboffi-Joachim, Widmer) comme celui de l’indice de couverture de traitement de l’information (Foucault, Widmer) qui crée un dédoublement du social qui fixe à la fois les règles et les ressorts qui l’en trouve dans les usages.

Le corpus théorique proposé pour l’analyse des usages articule l’approche des outils (Simondon, Norman), celles des représentations (Goody, Vergès) et l’analyse de l’âge de la tâche et du matériel (Leplat, Hoc). Elle met clairement en évidence la relation qui existe entre la représentation que l’on d’un objet technico et les compétences mises en œuvre pour son appropriation. Nous y discutons particulièrement la notion de dispositif numérique d’action conjointe (Foucault, Widmer) qui crée un dédoublement du social qui fixe à la fois les règles et les ressorts qui l’en trouve dans les usages.

La méthode présentée reprend une expérimentation dont la finalité est la construction de l’interface d’une application pour le web qui doit aider des décideurs à mieux comprendre un équipes projet. Nous y discutons notamment de la question de la coordination qui sert à calculer et mettre en place le dispositif numérique d’action conjointe (Foucault, Widmer) qui crée un dédoublement du social qui fixe à la fois les règles et les ressorts qui l’en trouve dans les usages.
The Constitution of India not only grants equality to women but also empowers the State to adopt measures of positive discrimination in favour of women for neutralizing the cumulative socio-economic, education and political disadvantages faced by them. However, the ground reality of the socio-cultural reality shows heavy gender based inequality in occupations, particularly legal professions. This further jeopardizes any effort at effective empowerment of women. The proposed paper attempts at a critical sociological analysis of the situation. This is would be specifically justified in view of the following statistics for instance:

A total of 20.4% women were employed in the organized sector in 2010 with 17.9% working in the public sector and 24.5% in the private. The labour force participation rate of women across all age-groups was 20.8 in rural sector and 12.8 in urban sector compared with 54.8 and 55.6 for men in the rural and urban sectors respectively in 2009-10 (NSS 64th Round). The female share of total Central Government employment stood at 10.0% in 2009. The share of female employees in the scheduled commercial banks was 15.9% in 2009 which rose slightly to 16.6% in 2010.

In 2012, women occupied only 8 out of 74 Ministerial positions in the Central Council of Ministers.

There were 2 women judges out of 26 judges in the Supreme Court and there were only 54 women judges out of 634 judges in different High Courts.

The paper discusses the reemergence of social movements in Brazil, to include the women's movements, pointing to the processes of institutionalization of the early organizations that were born after the military dictatorship, during the forging of the 1988 Brazilian Constitution, built with participatory ideals. It depicts what happened to the early women's movements that appeared at a time of democratic construction, their priorities and professionalization, to comprise their official inclusion in the governmental apparatus, achieving Ministerial Status during the Worker's Party presidential election victories, discussing the parallel process of elitization and autonomization of party politics, the exclusion of women of parliamentary representation and the voice given to religious fundamentalist groups in the Chamber of Deputies and Senate. It also discusses the changes undertaken by the movements that helped to forge the 1988 Constitution and their transformation into NGOs. The enlarged participation in the executive has been achieved through careers in the administrative machinery rather than in women's parties. The paper portrays the Women's movement's movements: some independent of party politics and with high international influence; other with national concern, tied to party politics; or to rural trade-unions, and discusses each of these organization's priorities and how they stand in relation to feminist issues and the response given by the political system: the parliament, the women's secretariat; the women's police stations, in the case of violence against women; murder cases and rape, discussing the action of fundamentalists so as to propose strategies to withdraw some of the conquests made by women related to cases of rape and abortion. It also portrays the response of the women's movement to these political challenges, and some of the still incipient concrete propositions of reform, widening women's representation in parliament, while women's issues can only be politically debated through participatory practices.

**Specialization in Caregiving Networks**

Decades of change in marriage, divorce, and cohabitation have resulted in diverse social support networks for aging individuals. The extent to which these growing networks of weak ties can provide needed care to older persons with chronic disabilities has been called into question. Research has shown pronounced differences in caregiving to fragile families. The NHAHTS data provided us with the opportunity to study families as a whole at the crossroads of end of life and the transition from care to support for family caregivers.

This study uses new nationally representative data from the U.S. National Health and Aging Trends Study (NHATS) to examine the extent to which caregivers work alone or share tasks, and the characteristics associated with caregiver specialization in caregiving. The NHAHTS data was designed to help understand the consequences of late-life disability for individuals, as well as comprehensive networks of their families, social networks, and helpers who assist older persons with self-care, mobility, household, and medical care tasks.

Multilevel models are used to examine characteristics associated with the propensity of caregivers to work alone or to share tasks with others, controlling for shared family characteristics, and the health needs of the older person.

Results show the majority are sharing with other caregivers (70%) though almost one-third are the only caregiver, and a small number (about 5%) work alone even though there are other caregivers. Spouses are more likely to be solo caregivers and children more likely to share tasks. Stepchildren are minimally involved in care to their stepparent and when they provide care they are more likely to act as a “backup,” sharing a single task with other helpers.

Political Empowerment and Social Transformation

Local self government known as Panchayati Raj institutions are vital for self-governance at the grass-root level and provide an ideal forum for decentralised planning and implementation for development work in accordance with people's needs and aspirations. With this assumption the government of India made 73rd Constitutional Amendment in December, 1992. An important radical measure underlying this legislation is regarding the reservation for women, scheduled castes (SCs) and scheduled tribes (STs) not only in membership but also in positions of office such as sarpanches/pradhan. It was expected that this new amendment would usher in a era of egalitarian society in place of the present unequal, stratified and hierarchical society. The main focus of this paper is to address the question of empowerment of the hitherto excluded categories, the scheduled castes and women. How the process of their inclusion in the local self government transformed their social position in society?

Postmodern Organization and Service Delivery: An Empirical Exploration of Structural Transformation in the Nigerian Banking Industry

ABSTRACT

Post structural banking has employed electronic based practices that have challenged the continued dominance of the traditional Weberian bureaucratic model to improve service delivery. These global practices are anchored in postmodern organization, in a bid to be globally compliant and to improve on service delivery, the Nigerian banking industry adopted a postmodern structure in its operation in spite of the country's low technological and infrastructural development. Postmodern theory, Structuration theory and theory Z were used to explain structures of postmodernism, extent of postmodern organization, employees' actions within in the work environment, the role of external environment and effect of postmodern organization on service delivery. The study was conducted in six banks selected from the twenty one existing commercial banks in Nigeria. It employed both quantitative and qualitative methods of data collection and analysis. The findings suggest that the adoption of postmodern organization by the banking industry in Nigeria has significantly improved service delivery, though implementing some key features of postmodernism as such, decentralization and employee empowerment have created local contradictions leading to poor integration of existing traditional structures with postmodern features. The role of the wider Nigerian socio-cultural, technological and infrastructural environments in the emergent scenario is highlighted. It was concluded that the level of technological development of a society has bearings with the level of success achievable in the adaption of postmodern organization for banking.

Japanese Women Professional Wrestlers’ Embodied Experiences and Their Identities

Women professional wrestlers in Japan develop muscles as well as fat for professional wrestling. As a result, their bodies are very different from the ideal female body in Japan (i.e., thin bodies without muscles and fat). The author conducted in-depth interviews with 25 women wrestlers between 2004 and 2005. Through interpreting women wrestlers’ narratives, the author explains how the bodies of women wrestlers provide them with physical and/or mental strength. Women wrestlers who acquire physical strength are indeed “empowered” based on the definition of empowerment. Kubota (2005) argues that “empowerment” means the process where people who have been prevented from fulfilling their potential regain it. In the current Japanese society, most women cannot reach their potential in terms of physical strength. In contrast, women wrestlers have obtained a physical strength not yet acquired by most women in Japan. Therefore, women wrestlers are in fact empowered. On the other hand, some women wrestlers face several conflicts because their bodies disturb the normative sex-gen boundary which requires that if one is a biological female, one has to adopt “feminine” clothes, hair style and physique that let others perceive that one is a female. First, some cannot fit into cute clothes sold in Japan that are targeted only for the ideal female bodies. Second, they do not take it seriously because they gave priority to becoming a wrestler. Second, some are mistaken for men in daily lives. The reason, they believe, is that they have specific physical characteristics such as short hair, casual clothes and big bodies. Since they deliberately identify themselves as women, they want others to perceive them as women regardless of their physical appearance. They, however, do not attempt to change their bodies to let others perceive them as women. Therefore, they unintentionally challenge the normative sex-gen boundary.

Eléments De Reproduction De La Division Sexuelle Des Rôles Domestiques. Enquête Menées Auprès D'Un échantillon D'Étudiants Universitaires Japonais

“Pourquoi vous ne voulez pas vous marier ?” Cela a été la question la plus fréquente parmi celles que le groupe d’étudiantes japonaises de l'université de Saga a posé à ses collègues français, au cours d'une série de rencontre qui ont eu lieu à l’université de Toulouse II (le Mirail) en février 2013. Mon après avoir assisté à un séminaire du sociologue Daniel Welzer-Lang ayant su jet la situation actuelle de la vie en couple en France, ces étudiantes japonaises ont du mal à imaginer que cela puisse leur arriver un jour : au cours d'une enquête que nous avons mené à l'université de Saga auprès d'un échantillon d'étudiants en couple, nous avons pu remarquer leur quasi complète confiance dans le mariage en tant qu’élément de consolidation de leur liaison. Pourtant, le mariage au Japon signifie aussi, en bonne partie, assumer une spécifique division sexuelle des rôles domestiques et familiales ; en effet, le 51,6% des japonaises (48,4% parmi les femmes et 55,1% parmi les hommes) considèrent que les femmes mariées devraient rester à la maison. Au cours de notre communication, nous ironiserons les résultats de notre enquête menée auprès d’étudiants japonais, celle qui vise en premier lieu à analyser la dynamique de reproduction de la division sexuelle des rôles domestiques.

Financial Trading for the Masses: An Ethnographic Study of Independent Israeli Day-Traders

Sociologists and anthropologists of finance have noted the development of a mass financial culture that is marked by a widespread involvement in and a popular infatuation with financial markets. Most ethnographic studies on the topic have focused on professional financiers and elites. This paper makes a postmodern and atic and can only constitute a partial depiction of financial market cultures which have spread far beyond the bounds of professional contexts and elite networks. Presenting data from an ethnographic study of the day-to-day lives of independent, non-professional Israeli online day-traders, this study explores the complex set of cultural orientations which inform and shape these traders’ understandings of financial trading, their beliefs about and imageries of the market and market processes, and their experiences with speculation. Relying on in-depth interviews, offshore and online fieldwork in sites such as trading courses for the general public and financial blogs, forums and internet trading rooms, this paper maps out the terrain of popular, online day-trading in this context. Moreover, it discusses the types of self- and social-awareness that are implicated by the traders’ speculative enchantments and financial dealings and preoccupations. It shows how market outcomes become a form of self-reflexive grammar through which the traders face several conflicts because their bodies disturb the normative sex-gen boundary which requires that if one is a biological female, one has to adopt “feminine” clothes, hair style and physique that let others perceive that one is a female. First, some cannot fit into cute clothes sold in Japan that are targeted only for the ideal female bodies. Second, they do not take it seriously because they gave priority to becoming a wrestler. Second, some are mistaken for men in daily lives. The reason, they believe, is that they have specific physical characteristics such as short hair, casual clothes and big bodies. Since they deliberately identify themselves as women, they want others to perceive them as women regardless of their physical appearance. They, however, do not attempt to change their bodies to let others perceive them as women. Therefore, they unintentionally challenge the normative sex-gen boundary.
shaped by actual engagements in these markets. It presents data from an ethnographic study of the day-to-day lives of independent Israeli day-traders who pursue global online financial trading. Relying upon in-depth interviews, offline and online fieldwork in sites such as trading courses and financial forums, blogs, and internet trading rooms, the paper explores three interrelated questions: how are notions of national identity (re-)constituted by the discourse on global financial trading? How do the traders make sense of and experience the globality of the market? And what meanings do they attribute to nationality within the market? The findings indicate the traders’ sense of a meritocratic ‘freedom’ from the symbolic baggage of other national contexts. By their own sense of belonging, they develop a field of economic activity where one’s success is not dependent upon the politics of identity that is characteristic of global organizational contexts and paid work. Nevertheless, while in this sense losing significant symbolic weight as a marker of personal and social identity, national identity figures heavily in traders’ abstract, calculative evaluations of the value of financial assets and markets. The paper discusses the implications of this aspect of the financial and calculative reconstitution of the meaning of national identity within the global, computerized networks for our understanding of the impact of financial globalization on national imageries, cross-cultural perceptions, and ‘glocal’ market cultures.

*Who Is Responsible: Situating Mental Illness within the Family in Niger*

Most studies in social sciences (cf. theories of pathological communication for example, the school of Polo Alto, and these of labeling) concerned with understanding the relation between the family and the mental illnesses have been greatly influenced by the paradigm of family responsibility. These studies likewise did the contributors known under the umbrella of movement of de-institutionalization of the psychiatry in Europe and USA in the second half of twentieth century emphasized the family role by considering it as the main support of the individual patient. Following this lead, they paid attention to emotional and social aspects of the family as a relational entity. This body of knowledge foremost, however, not all, developed by sociologists, is characterized by a lack of attention paid to the every day interactions of the patient within a relational field of the family. This is what informs the perspective of my paper.

To this end, the empirical material collected between September 2011 and December 2012 in Niger, I will highlight the social consequences of the mental illness within the family. Using both an attentive approach to interactions at the quotidian and “long-term analysis” aiming at examining the personal biographies of the patient, I specifically interrogate the dynamics within the family resulting from the mental illnesses. I present several cases from my fieldwork to describe the ‘negotiated interactions’ of how relatives of patients deal with mental illness. Here, I centrally pay greater attention to economic, therapeutic and the choice of the place of residence defined by these. In fine, the paper shows how important is to place the family within an extended field of relation in order to comprehend its implications at practical and ethical levels and how these, ultimately influence the trajectory of the person ill.

*Comparative Study of Ability and Examinations in Post-Manufacturing Societies, from Interview Surveys in the United Kingdom and Japan*

In the 2000s, both British and Japanese societies were faced with new social changes caused by post-manufacturing industrialization. Education policymakers are changing and updating national examinations to measure the new skills needed in these societies.

Our interview survey was taken by various persons, including students, local government officers, company managers, school leaders, and local educational authorities in both the United Kingdom and Japan, over three years. From the results of this survey, we identified new relationships between examinations and these post-manufacturing societies. These new relationship have emerged in part as a way of trying to cope with social polarization and construct new school systems that sustain excellence and equality in society. In the present era, social polarization leads to a situation where that some people with high talents are educated to have very high levels of skill related to some professional role; in contrast, others learn attitudes towards work rather than advanced skills because they do not require such skills. Our survey supports the presence of this tendency in both societies; however, we find some differences between the societies as well. For example, Japanese voices often place importance on communication in and on proficiency in English or other languages. In contrast, British voices often emphasize more basic numeracy and literacy or their own (English) language rather than foreign languages. These differences may reflect the image of the skills needed to succeed in the workplace in each society.

*Does Embodied Musical Experience Remain in Children's Memory?: A Study of Longitudinal Analysis of Japanese Junior High School Students*

This study analyses whether embodied musical experience remain children's memory. To find out whether this premise is true, we examined the case of Japan's most famous classical music festival Saito Kinen Festival Matsumoto. Every year, this festival invites students of 70 junior high schools in the local area for...
of opera performances. Every year, around 6000 students get to attend the excellent opera performance, free of charge. We used an experimental design to collect data. Surveys were carried out three times in some schools, before and after the opera performance, and after six months. About 600 responses were collected who answered all three times. The survey questionnaire was designed to gauge students' attitudes in the performance, their musical or cultural interest, and their consciousness to music education or school learning. We analyse these variables related to their media environment, school achievement, family background, and economic and cultural situation.

According to our analysis, we observed the increase of the interest of opera just after the performance; however, this effect was diminished for many students after six months. But some students remain these interests for opera or classical music. The cause of the difference derived from the method of teaching to embody musical memory. That is to say, some teachers succeed that students embody musical experience through the lessons held before and after the opera performance. We will indicate these causes and effects by the longitudinal quantitative analysis and the interview views from school teachers.

Work-Family Conflict and Coping Strategies Among Women: Evidence from Commercial Banks in Nigeria

Work-family conflict has been an issue of concern to both employees and employers of labour, and occupies top priority in government and organisation agendas. Balancing family and work roles place serious demands on working women most especially in African traditional setting where women are by design home keepers. Work-family conflict remains a challenge for women employed in the Nigerian labour force especially the banking sector because of the time related stress arising from demands of both work and family roles. The paper investigates preconditions for family conflict and paid special attention to the coping strategies adopted by women especially in time demanding banking sector. The study adopted qualitative research method and structured face-to-face interview among female workers of randomly selected commercial banks within urban states in Nigeria. Data were analysed using univariate and multivariate regression analysis. The findings show that age of the respondents, children ever born (parity), marital status, staff category and religion are significant determinants of work-conflict. The study also revealed that although organizations have introduced a number of work-life balance policies, these policies have not cushioned the work-family conflict experience for working women making women to engage a range of individual coping strategies. The study recommends a purposeful and effective policy intervention from organisation and effective family support from the family base to reduce the complexities of balancing work-family roles.

Discursive Constructions of Borders in Online Feedback Platforms

This study applies Van Dijk’s (2001, 2004, 2006) socio-cognitive approach to Critical Discourse Analysis (CDA) to the study of discourse structures and patterns in online feedback platforms in Nigeria. An investigation of discursive constructions becomes necessary because it is observed that they are laden with ideological processes that reflect exclusion and resistance among Nigerians and therefore raises the question of oneness and unity in the nation, more especially in African traditional setting where women are by design home keepers. The study reveals that writers apply ideological discourse strategies in the expression of their interpersonal relationships and socio-cultural relations. These help to clearly negotiate social and ethnic borders. The study also shows that the new media (the Internet) has created platforms for border formation and maintenance amongst Nigerians.

The Variety of Influence of Social Capital on Health in Welfare State Regimes

The purpose of this study is to clarify the differences of influence of social capital on health in welfare state regimes. Recently, studies in sociology, political science, economics, and social epidemiology have addressed the relationship between social capital and health. Large number of studies have found that social capital improve health. However, the studies of social capital on health may differ in welfare state regimes, because there is a possibility that absence of state support is compensated by social capital. Therefore, we need research to identify the differences in the importance and meaning of social capital in welfare state regimes. This study examines the influence of formal and informal social capital on health varies among welfare state regimes through international comparative analysis of a multilevel model.

Using data from the 2007 International Social Survey Programme (ISSP), we analyze the individual-level data which have been linked with national-level data. The study of social capital on health, the random slope model to examine differences in the influence of formal and informal social capital on health among different regime types. Dependent variable is self-rated health, and independent variables as social capital are civic participation, generalized trust, informal social contact with family and friends.

This analysis produced two main results. (1) Informal contact with family has a stronger positive effect in the familialistic regime. (2) Informal contact with friends has a stronger positive effect in the post-socialist regime. These results demonstrate that there are the differences of the importance and meaning of social capital in welfare state regimes. Therefore, we need further research to clarify the differences of the mechanisms by which social capital compensate for the lack of welfare.
ant because the expression “social systems observe” is almost equivalent to the frequently used expression “realities are socially constructed”. By using systems approach, we will be able to define precisely what is meant by the term “social” in such context.

In Luhmann’s theory the component of social systems is not defined as action, but as cause of communicative event. However we consider the definition of observation, the unity of distinction and indication, is not satisfactory to define social system (i.e. system of communicative elements) as a particular kind of observer. We insist that the definition of social systems should imply duration or continuity of observation as with other observing systems. At last we conclude that, especially in the era of social media, we should distinguish between “the social (i.e. communication) as an element of social systems” and “social systems (i.e. system of communicative elements)”.

Systems Thinking and Sociological Thinking: Observing from an Asian Perspective

In this paper we raise a question: How can we connect systems theory to sociology properly and effectively? In the process of answering this question, we will examine whether the Asian tradition can contribute to develop sociological systems theory or not.

Generally speaking, systems theory offers us a tool to see things otherwise. Therefore it could be useful to develop sociological way of thinking. However, introducing systems theory to sociology is not an easy task. Here we regard it because of so-called “epistemological obstacle” in western way of thinking. To overcome this difficulty, we have to get rid of the obstacle.

It seems that non-western tradition does not have something new to develop systems theory itself. Rather, it could be bridge systems theory and sociology because systems theoretical perspectives are similar in some respects to the Asian traditional thought.

In conclusion, beyond the distinction between western and non-western, systems theory could be a tool to think sociologically but it needs something that has bridging function between systems theory and sociology. Asian tradition could serve a role of bridging the gap between them.

Kinship Networks and Pentecostalism in South-Western Nigeria

The increasing number of Pentecostal churches is having a divergence influence on the Protestant and orthodox churches. It focused on ways in which the Pentecostal practices marginalizes the old, poor and less educated. The problem of Pentecostal preaching’s, pamphlet etc. that urge Pentecostals to cast off ancestral curses and ungodly association to all kind, effectively excluding most people’s extended families, especially elder relatives. The perception of the non-Pentecostals by the Pentecostals was considered and what the elderly and illiterate as well as all the Pentecostals like Gbaweremesin. It also provides information on how the ignorant or unbelievers see the so called Pentecostals especially when speaking in tongues. The study, explained the influence Pentecostalism had or in having of kinship system in southwestern Nigeria. This study examined the relationship between kinship and Pentecostalism, the degree of effect of Pentecostalism on kinship. More so, the study examined the people’s orientation towards Pentecostalism, the influence of Pentecostalism on Development and impact of kinship on family. The research design comprised of four qualitative methods, which are ethnography (participant observation) for a long time in-depth interview (IDI) which were nine in number key informant interviewing (KII), and focus group discussion (FGD) which were Twelve in numbers with 30 respondents in total to understand the presence and impact of Pentecostalism and religion in Nigeria and the world at large.

Sustainable Development in Terms of Social Inequality

The evolutionary process is always the unity and interaction of two tendencies which balance each other - the stability and instability. Both groups in their contradictory unity are necessary for the development of the system. At the same time, there are various forms of conflict resolution between the above tendencies, and one of such forms is to achieve balance. But if one of the tendencies dominates the other, the development will stop. Even in the case when the stability prevails over the instability, the development of the system is exposed to an exceptional damage. The social history of humankind for centuries demonstrates a confrontation between two types of social dynamics. In one of them there is a strong guiding action to the ideas of natural selection and the struggle for existence as an engine of progress. Further ascent of humanity is seen by struggle and displacement of the weak and unfit forms. The purpose “to displace” and “to develop” won’t be able to ensure the survival in the long term. This is the technical dynamics, commercial, parasitic, leading to the establishment of a rigid unipolar world order. To achieve the harmonious development of humankind, the concept of sustainable development refers to the need to reduce the gap between the rich and poor, and make greater efforts to protect the environment.

Culture of Innovation in Higher Educational Institutions

In modern society one of the most significant goals of higher educational institutions is to support the development of innovative culture. The modernization of all sectors of economy and society depends on the formation of new skills and patterns of behavior for the new generation.

In Russia the culture of innovation is forming under the influence of rising territorial inequality, stratification of higher education institutions (the allocation of specific types of high schools), growing diversity in organizational, personnel, technological conditions in different types of schools.

The paper analyses the culture of innovation upon the integration of education and science. The positions of the two main subjects of innovative process are observed: teachers and students. It is based on the survey of academics and students from different types of universities (federal, research, regional – that types are result of the Russian education reform). Using the results of the survey, we can show what model of integration of education and science is emerging and what are the prospects of this interaction in building of innovative culture.

Filipina Wives in Rural Akita

This paper examines the migration and integration process of Filipina wives in rural Japan. Southern Akita in Tohoku Region has long been plagued by the stagnant economy, aging population, and out-migration. Since the 1990s a trickle of Filipina wives working as “talents” married local Japanese men, forming transnational families in the traditional agricultural community.

Through surveys and interviews with the wives as well as with local leaders and government officials, we look at how gender and family has played an important role in the migratory process of these women and the manner in which they were incorporated into the family structure of rural Japan, and by extension the local community.

Gender has at times constrained choices that these women can make, while it has also become an empowering factor, as Filipina and Japanese women meet in schools and local cultural institutions and forge bonds over childcare and care-giving in their families. Local language classes, staffed by volunteers (mainly local Japanese women) as well as support organizations (again led by local Japanese women) have played a critical role in the incorporation of Filipino wives into the local community.

Now one or two decades into their residence in Akita, these wives are facing a critical juncture, whether they be changes in their careers, the departure of their children from their homes, and the care of their now aged-in-laws. Once again, their position within the society, both in regards to their “foreignness” and their gender, is being tested. We will therefore add to the existing literature on Filipino wives by examining their experience in later stages of their life in Japan.

Workers of the Globalized World: Explaining Difference in Workers’ Attitudes to Globalization

Workers of the Globalized World: Explaining Difference in Workers’ Attitudes to Globalization

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
Without any doubt globalization affects the life and work of workers. Increasing international trade and labor mobility poses challenges to individual workers. Labor movements’ response to these developments are to protect national (and regional) labor markets through further regulation of labor markets, in order to soften the blow for those workers who are the ‘losers of globalization’. However, workers who are heterogeneous and the way in which globalization affects the life of workers is not equal for all workers: some groups of workers will have a lot to gain from globalization.

How do workers perceive the effects of globalization? In this paper we explain individual workers’ attitudes towards the impact of economic globalization on several aspects, such as their selves and his/her family, the organization they work for, national employment. We explain their attitudes by demographics, labor market positions, occupational variables and political affiliation and attitudes.

After a review of the literature, we formulate hypotheses on which workers will perceive economic development and cultural globalization in which workers see that globalizations is a positive development for different aspects of their lives, their career and employment.

For the empirical analysis we use data from the web based survey “Distributonal Conflict in a Globalized World, 2011”, a representative survey of the Dutch population (N=600).

Our study contributes to our understanding of the consequences of globalization by analyzing individual level attitudes of workers. In an era of continued trade union decline, knowledge of different types of workers attitudes towards globalization may better enable the labor movement to represent the interest of all workers. Knowing which workers view globalization as a threat, and for whom globalization offers opportunities, helps labor organizations to developed more informed and differentiated mobilization campaigns.

The Environmental Refugees: A Comparative Study of Displaced Women in the Coastal Districts Khulna and Bagerhat, Bangladesh

It is well recognized that unsustainable development projects all across the globe, especially in the developing global South, have resulted in various kinds of ecological hazards like salinity, floods and so on displacing a huge chunk of population, known in the current text as the "environmental refugees" from their ancestral homes and conventional livelihoods. In this context, it has to be kept in mind that all people who are displaced and are termed as ‘environmental refugees’ do not migrate. The decision to migrate in crisis situations like environmental hazards depends on a host of institutional and structural factors. Thus, not only the degree of vulnerability of an individual or a family in crisis situations depends on the institutional and structural factors as observed by various studies, but the capabilities and opportunities for mobility also depend to a large extent upon these factors. Keeping this in mind, the present paper through an ethnographic field study in a few salinity-prone villages of the most backward coastal districts (in terms of Gender Development Index and Human Development Index) of Bangladesh, namely Khulna and Bagerhat districts, tries to find out how institutional and structural factors affect the migration decision of women belonging to various social and economic groups. The cases of Khulna and Bagerhat represent a unique situation of displacement of huge number of population, caused partly by the salinity due to sea level rise and partly by the cyclone Aila and Sidr. The main finding of the study is that migration in many of the cases, especially for the women-headed household, has often proved to be an enabling experience. The study also investigates whether the government’s response to these developments (in terms of Gender Development Index and Human Development Index of Bangladesh, namely Khulna and Bagerhat districts, tries to find out how institutional and structural factors affect the migration decision of women belonging to various social and economic groups. From a sociological perspective, the funeral is a rite of passage in which the deceased individual is symbolically excluded from the world of the living and transferred to the realm of the dead. While the goods necessary to perform this transition were for a long time collectively provided by members of the family and community, funeral goods are nowadays produced by professionals for a profit and are exchanged on markets. But due to the structural and moral specifics of this market, buyers and sellers cope with action is highly constrained. There are strong social taboos against many strategies of profit maximization that are used in other economic fields such as extensive marketing and price competition. Despite of this, funeral directors must take measures to attract customers and to gain advantages over competitors. In this analysis I look at how morticians in Germany circumvent the moral taboos in the market in order to establish trust and construct and communicate quality. I argue that the structural and moral specifics of this market create opportunities for entrepreneurs to deceive customers in order to achieve the goals of profit. This analysis therefore addresses key issues in economic sociology concerning the assessment of quality in markets and the translation of value from one scale of value to another. In doing so the study helps us to better understand the moral preconditions and social constraints to the operation of markets in modern capitalist economies. Data for the analysis stem from participant-observation, expert interviews, and document analysis.

Testing Agnew's General Strain Theory on Drug Use Among College Students

This study aimed to examine the core assumption of Agnew's General Strain theory in drug use among University of Jordan students. It aims to identify level of strains among students such as (failure in achieving the goals of positive value, negative emotions, loss of positive emotions, negative feelings) among students of Jordan University. A social survey was conducted, and a questionnaire was developed by Al-Badayneh (2012) was used in this study. A random sample of (965) students from the University of Jordan was selected. Findings supported the Agnew's core assumption of the general strain theory in drug use. A significant positive relationship was found between the negative emotions and strains (the failure to achieve the goals), and the loss of positive Stimulus, having a negative Stimulus r = 0.419; 0.357; 0.269, and 0.18 respectively. Negative emotions also found correlated with drug use.

"Last Year Your Answer Was ...:”. The Impact of Cognitive Effort, Life History, and Dependent Interviewing on Measures of Change

Longitudinal surveys allow for studying response change within respondents not possible in cross-sectional studies. Prior studies, however, suggest reports of change in longitudinal studies are potentially error-prone. Proactive dependent interviewing (DI) reminds respondents of previous answers, asking if there has been any change since the last survey, and is a possible method to reduce errors by assisting recall and reducing cognitive burden. However, DI also may lead to satisficing, allowing acquiescence by stating that the situation is the same when it is not, leading to underreporting of change. The Innovation Panel (IP) survey in the UK has conducted experiments on wording of several DI questions (both subjective/objective and categorical/continuous) across 5 waves. The first two waves asked questions independently (no DI); waves 3 and 4 asked two versions, reminding respondents of previous answers and asking if the "same" or "has changed"; Wave 5 (mixed-mode face-to-face and web) includes both wordings as well as two forced choice versions including same/changed options.

Results indicate that first, DI does not always produce lower levels of change compared to independently asking questions. Second, asking the unbalanced "still the same" version leads to less change in general than other versions, suggesting possible acquiescence in DI. Third, the web survey elicited significantly more acquiescence in DI compared to independently asking questions. This paper outlines current thinking on the research and reflects critically on the key theoretical and methodological issues. The paper also presents emerging findings from the fieldwork.

There has been limited research conducted on women in tourism entrepreneurship and this has made it difficult to identify key emerging issues surrounding this field for women. There is also scant research that has looked specifically at female tourism entrepreneurs in Muslim countries. One key emerging issue that has been frequently addressed in existing studies is women empowerment through tourism entrepreneurship. However, a critical analysis of tourism entrepreneurship opportunities for women and the subsequent implications of these opportunities is needed in order to determine the potential for tourism entrepreneurship to empower women. The experiences and meaning of empowerment for female tourism entrepreneurs in Muslim countries may have distinctive characteristics due to their social status. Such empirical evidence can further develop existing knowledge regarding women empowerment through tourism entrepreneurship. Thus, the study aims to explore the nature and experiences of female tourism entrepreneurs in Muslim countries with particular regards to empowerment.

The fieldwork for this research will take place in Oman during 2013-2014. Tourism entrepreneurship is a fairly new activity in Oman and there is a small number of women whom are involved in tourism entrepreneurship activities. The participants of the study will include two groups of collective entrepreneurs and a number of solo entrepreneurs involved in tourism entrepreneurship activities. The theoretical paradigm that guides this study is critical theory and a case study methodology will be used to design the research. Information about the women will be collected through the use of participant observations and interviews in order to develop different case studies.

AL-MAZRO'EI, LUBNA* (University of Strathclyde, lubna.al-mazo-ei@strath.ac.uk)

The Experiences and Meaninging of Empowerment for Omani Women in Tourism Entrepreneurship

This paper describes a doctoral study, which focuses on female tourism entrepreneurship in Muscat and the cultural context. The paper outlines current thinking on the research and reflects critically on the key theoretical and methodological issues. The paper also presents emerging findings from the fieldwork. In this analysis I look at how morticians in Germany circumvent the moral taboos in the market in order to establish trust and construct and communicate quality. a female descendant (second or third generation) of migrant families resident in
Germany, this paper looks at the asymmetrical power relations between the cou-
ple(s) (pertaining to the citizenship, labour market, language competency, knowl-
dge of dominant norms and rules of the receiving country) and examine how
the notions of womanhood and manhood will be renegotiated in the context of
transnational intimate relations. Thus, drawing on the concepts of transnational
family networks and the concept of world-families combined with the insights of
sociology of intimacy (Eva Illouz 2012), the paper raises the question whether the
male marriage migration might be ending up in the change of constellation of
familial power relations, and in gender relations between married couples, hence
denoting the reversal of gender order in migration context. The paper is based on
biographical-narrative interviews conducted with Turkish and Moroccan couples
in the frame of the research project "Reversal of the Gender Order? Male Marriage
Migration to Germany by North African and Turkish Men".

Exploring Factors Associated with Willingness to Donate Organs
Among Migrants Adults in Lisbon: A South Asian Comparison

This study represents a community-based death perspectives assessment of
a hard to reach population in Lisbon. It aims to attain a South Asian comparison
concerning willingness to donate organs, while exploring gender, age, educational
and religious-related differences.

A cross-sectional population-based study was conducted among immigrants
from Bangladesh, India and Pakistan. Snowball non-probability sampling tech-
nique was used, through interviewers with privileged access to the target-popula-
tion. Between November 2012 and February 2013 trained interviewers collected
qualitative and quantitative data through face-to-face interviews, namely socio-
demographic characteristics and health conditions, willingness to donate organs
(subjects were asked if they would like to have their organs donated; ‘yes’, ‘no’, ‘in-
different’, ‘don’t know/don’t answer’) and other attitudes towards death. Logistic
regression was performed to identify factors associated to willingness to donate
organs in univariate and multivariate-adjusted models for each population and
gender.

Willingness to donate organs was higher among the Indian (41.7%), namely Hindus,
and lower among the Bangladeshis (9.5%) and the Pakistanis (15.8%). For all
the three populations, a bad/very bad self-rating quality of life was associated
to willingness to donate organs. Bangladeshi women were more willing to donate
organs than men, while among the Indian and Pakistani, educational level was a
more important variable in what concerns the explanation of organs donation
among women.

Between November 2012 and February 2013 trained interviewers collected
qualitative and quantitative data through face-to-face interviews, namely socio-
demographic characteristics and health conditions, willingness to donate organs
(subjects were asked if they would like to have their organs donated; ‘yes’, ‘no’, ‘in-
different’, ‘don’t know/don’t answer’) and other attitudes towards death. Logistic
regression was performed to identify factors associated to willingness to donate
organs in univariate and multivariate-adjusted models for each population and
gender.

Willingness to donate organs was higher among the Indian (41.7%), namely Hindus,
and lower among the Bangladeshis (9.5%) and the Pakistanis (15.8%). For all
the three populations, a bad/very bad self-rating quality of life was associated
to willingness to donate organs. Bangladeshi women were more willing to donate
organs than men, while among the Indian and Pakistani, educational level was a
more important variable in what concerns the explanation of organs donation
commitment phenomenon. Among the Bangladeshi men, migration length was
also related to willingness to donate organs; and an increased number of self-re-
ported diseases among women.

Models by country of origin highlighted inter-and intragroup differences. There
were gender-based differences on organs donation among the groups. Religious
commitment was not an explicative factor.

Previous studies indicate that the act of organ donation can be perceived as
involving personal costs, namely costs related to religious beliefs, and that the
meanings of organ donation is more than just being and having a body (Hayward,
2003).

Language, Informational Capitalism and Industrial Relations.
A Study on Linguistic Autonomy of Workers and Collective Bargaining

This paper shows how linguistic criteria have become central when defining job
categories in the Call Centres sector in coordinated economies. It is well known
that language adopts a central role in the production processes of informational
capitalism, even though how linguistic production affects collective bargaining,
its arguments and outcomes is unknown. This paper argues that, even when lin-
guistic criteria are already a key part of the collective agreements, social part-
ners still try to introduce different types of argumentation. Trade Unions push to
reproduce Fordist arguments along with linguistic criteria (the greater the argu-
mentative independence from the script, the higher the level of the occupational
category) to build high skill categories on the sector, while employer’s aim is to
use economic decision autonomy to define job categories.

Several methods were used to carry out the investigation: in deep interviews
and documentary analysis. Workers holding different job categories from the
largest companies in the sector were interviewed (31). Social partners who have
participated in Call Centre Collective bargaining were also interviewed (7). Several
documents were analysed: the five Call Centre collective agreements, Company
Agreements, five judicial rulings concerning the relationship between linguistic
autonomy and occupational categories, conversation scripts, protocols and train-
ing documents. This research is funded by the Spanish Ministry of Economy and
Competitiveness (FIJ2012-33316).

Diferentes significados da a chamada Agricultura Moderna: El caso brasileño

Nos proponemos discutir el concepto de “modernización”. En el caso brasileño
los conceptos de “agricultura moderna” “complejo agro industriales” y “agrone-
gócio” han sido utilizados generalmente como sinónimos, no obstante, aunque
sus fronteras pueden parecer ténues, de hecho retienen a realidades socio-eco-
nomicas y políticas diferentes.

El uso de insumos modernos y de maquinas es una presencia constante en los
tres casos, no obstante el énfasis en la exportación no tiene en los dos primeros
el mismo peso que en el último. La integración agricultura-industria no estaba
en gran medida cuando se hablaba de agricultura moderna en los años 70. Por
otra parte, el gerenciamento de un negocio que supone mucho mas que una
planta industrial o un conjunto de unidades agrícolas es una de las tóicas de
la idea de “agronegocio”.

Finalmente, aunque en todas las situaciones, la gran propiedad territorial está
asociada a las formas, en el caso del complejo agro-industrial está asociada
también, mediante la “integración” a los pequenos productores, y en el último
caso, aunque las grandes propiedades son una marca del “agronegocio”, la refer-
encia a la propiedad territorial desaparece en las formulaciones de sus técnicos
que la asocian a determinadas maneras de producir.

The Struggle for the Public SPACE in the Historical Center of
Latinamerican Cities. the Case of Mexico City and Sao Paulo

The struggle of the public space in the historical center of Latin-American cities.
The case of Mexico city and Sao Paulo

The expansion of the street hawkers in many cities of the emerging countries
is the last link of a legal and illegal commodities value chain coming from Asia
through the “glocalization from below”. Informal economies have multiplied and
internationalized as a result of local, national and global political, economical and
social interactions: economic liberalization and crisis, demographic growth and
migration, social inequality, poverty and unemployment.

Low income population has adapted to these changes by creating survival jobs
as local distributors of global production. However, these activities are in conflict
with many local and national laws, and confront governmental and private inter-
ests set upon the “renewal of the historical centers”.

These paper aims to analyze the corporatist and clientelist relationship be-
tween the hawkers’ organizations and the government as well as the use of toler-
ance and repression tactics from the local authorities regarding the use of public
spaces in the center of the cities.

A Decade of Turbulence and Mismatch—Changing Child Care Policies in Changing Economic Times in the Canadian Context

This paper brings together findings from two studies that I have been working on that focus on child care in Canada. The first study (with Professor Rauhala in Ryerson's School of Journalism) maps the coverage of child care over the first decade of the 21st century in four Canadian daily newspapers. It shows that the voices of mothers and child care providers are virtually absent from policy discussions. The second study involves interviews with mothers and child care providers in two policy jurisdictions with two very different approaches to child care in the provinces of Ontario and Quebec in Canada. This paper provides a look at the impact of the rise of women's non-standard, service sector employment on gender roles, identities and relations, and compares the complex task of creating and managing formal and informal non-parental childcare in rural and semi-rural communities in two policy jurisdictions (Provinces of Ontario and Quebec). It seeks to understand the ways in which the neo-liberal reconfiguration of local economies impact on the experiences of employed, non-urban women with young children—mitigated by provincial policy decisions—through documenting the strategies mothers adopt to cope with new and increasing challenges when managing this family-market-state nexus. This paper focuses on some of the unique challenges some rural mothers encounter and the strategies they develop to manage their changing child care needs. It also shows how absent these realities are from the coverage of child care in Canadian newspapers.

The main argument highlights the need for unions to make their structures more porous and develop forms of 'contingent membership' able to accommodate the organizing tools and cultures that diasporas bring with them was higher.

ALBERTI, GABRIELLA* (Leeds University Business School, g.alberti@leeds.ac.uk)
Organizing Intersecting Identities: Trade Unions and Precarious Migrant Workers Across the Atlantic

A key challenge for trade unions in this period of globalization is not only the need to rebuild power and survive as organizations, but also to overcome workforce divisions in fragmented labor markets where migrants tend to be employed under poor and precarious conditions (Alberti et al. forthcoming; Standing 2011; Wills et al. 2009). This paper draws from a comparative study on union strategies towards immigrant workers across four countries: Germany, France, the United Kingdom and United States conducted between 2008 and 2011 (Adler et al. 2014). It explores the ways in which migrant workers' identities are mobilised and become 'strategic' in labour organising campaigns. Three campaigns where unions collaborated with community groups to advance the working lives of low-paid migrants have been selected, namely: the CLEAN Carwash campaign in Los Angeles and the 'Justice for Cleaners' and the 'Hotel Workers' campaigns in London. The findings point to the persistence of barriers to migrants' involvement in unions with a strong industrial tradition, i.e. those that target industrial sectors in which immigrants happen to be found rather than identifying their specific issues (e.g. language, legal advice, immigration problems, temporary contracts). In contrast, positive examples emerged where unions engaged with workers while taking account of their migrant background through a mix of individual case-work and collective mobilisation; where a clear choice was made to collaborate with migrant-based organizations such as worker centres; and where unions' receptivity of the organizing tools and cultures that diasporas bring with them was higher.

The main argument highlights the need for unions to make their structures more porous and develop forms of 'contingent membership' able to accommodate the specific demands of precarious migrants and diasporas that are still 'in transit', while valorising the political and educational baggage held by those who are part of already organized communities.

A Decade of Turbulence and Mismatch—Changing Child Care Policies in Changing Economic Times in the Canadian Context

ALDAVE, MA. LEAH CZARINA (Social Weather Stations)
LICUDINE, VLADYMIR JOSEPH* (Social Weather Stations, vlad.licudine@sws.org.ph)
Measuring Homophobia in the Philippines

In June 2013, local media reported a survey done by US-based Pew Research Center that ranks the Philippines among the most gay-friendly in the world. In the report entitled "The Global Divide on Homosexuality", only 17 countries had...
majories that agreed with the statement that homosexuality should be accepted by the society, with the Philipinens ranking 10th among the 17 countries. Filipino gay rights groups, however, were not impressed with the survey, which they believe are based on the perception of accepted stereotypes of gays. They mentioned that once a gay is outside of the accepted stereotypes, that is where they encounter rejection.

In June 2013, Social Weather Stations (SWS), a non-stock, non-profit research institution, developed questions in order to look deeper at how to measure homophobia in the Philippines. This survey was conducted among Filipino adults 18 years old and above. It found that Filipinos believe that: a) gays and lesbians have the right to be protected against any form of discrimination, b) they contributed a lot in the progress of the society, and c) being gay and lesbian is not a form of mental illness. But the most notable finding that the survey found is majority believe that when they have a gay or lesbian in the family, they would like to change them to become straight men and women.

The paper will also delve into new topics in the forthcoming SWS nationwide survey to be conducted in December 2013. The new topics will measure agreement/disagreement with the following statements: Being gay or lesbian is contageous; Acquired Immuno Deficiency Syndrome or AIDS can be considered as a sickness; and existing quantitative datasets. The comparative perspective allows an inter-disciplinary and cultural analysis.

ALDRIDGE, LYNLEY* (University of Leeds, sslja@leeds.ac.uk)

**Overseas Gap Years and Working Holidays in the UK and Japan: Insights from a Comparative Approach**

The overseas “gap year” has emerged recently in Japan as a topical issue. In the UK, the benefits of “structured” and “constructive” gap years for education and employment are often emphasised in government, employer, university, provider and media discourses. In Japan in recent years, a number of government committees, employer stakeholders, and universities have drawn on this UK example, and advocated the promotion of such gap years. A tension has, however, been identified between discourses about the benefits of international mobility on the one hand, and its possible negative consequences in Japan on the other.

Building on this, my doctoral research involves comparative analysis of discourses about the “gap year” and “working holiday” in the UK and Japan; qualitative interviews with former working holidaymakers, careers advisers and employers; and existing quantitative datasets. The comparative perspective allows an explicit consideration of the influence of socio-cultural factors on the motivations, experienced outcomes and contemporary forms of youth mobility. More broadly, I am interested in how young people are enjoined to, and aspire to, develop their selves in each context.

In this paper, I highlight how the comparative approach has strengthened the research and facilitated a more rigorous approach to analysis. First, it has required me to explore and specify more precisely the characteristics of working holidaymakers and their positioning within each socio-cultural context. Second, it encouraged a focus not on unelaborated generalities about “cultural” differences, but on specific factors (e.g., recruitment practices) that may be associated with differences in each context. Third, the research design allowed the identification of important factors in societal discourses in each context; to be used as sensitising concepts for interviews across contexts. I illustrate these arguments using preliminary data from interviews conducted in both the UK and Japan.

ALESSANDRI RIBEIRO, VÍTOR EDUARDO* (Univ Federal do Rio Grande do Sul, vealexandri@gmail.com)

**The Reform of Policing in China: Continuities and Discontinuities Under New Challenges**

This analysis approaches the problem of policing in China, rendering focus on the process of policing reform not isolated in itself but rather embedded in the social context. This analysis allows for the envisage of the complexity implied in the broader institutional reform setting in China from 1978 to the present day. Continuities and discontinuities in relation to some past practices are the stakes of this phenomenon. As new normative and legal measures might offer some restraints to the “rule of men”, policing reform is followed tentatively by the Chinese Communist Party and agencies. This process is oriented towards a discrete and gradual – but not inexorable – abandonment of essentially ideologically driven practices within institutions of social control. The idea which has guided this research is that the modification in both the organization and the operational policing practices in China was necessary to deal with the ongoing broader reforms the country has been faced with.
a study of the Australian mining industry that investigates the complex overlap of multiple inter-organizational networks and additional linkages with inter-personal networks. There is a large amount of information available from industry handbooks and we report on methods for coding and categorizing inter-organizational relationships for the purpose of subsequent network analysis and the integration of personal network data in this framework. The dominance and centrality of global corporate players in the inter-organizational networks is mirrored in the memberships and networks of industry associations across the mining industry. Finally we report a case study of industry mobilisation against the Rudd government’s proposed Resource Super Profits Tax (RSPT) in May-June 2010. This case study illustrates the dominance of the global corporates in framing an ‘industry’ strategy for dealing with the government but also their success in creating a comprehensive and appealing self-identity for the industry and its workforce that glosses over the actual divisions within the industry.

Capitalism and Injustice As Seen through the Lens of Massive Inequality and the Marikana Massacre

Capitalism and Injustice - As Seen Through the Lens of Massive Inequality and The Marikana Massacre

The paper explores the relationship of capitalism and injustice, doing so through the lens of South Africa's massive social inequalities and the 2012 massacre of 34 strikers by the South African Police. These inequalities are extreme but they are not unique, and apart from among others, now have a higher rate of unemployment than South Africa. Treated as what William Sewell defines as, an 'event, the massacre is used to reveal key aspects of structural difference. Different meanings of 'injustice' are discussed and these are related to the workings of capitalism.

ALEXIS, GWENDOLYN YVONNE* (Monmouth University, galexis@monmouth.edu)

By Any Other Name: Neoliberalism, Post-Secularism, and Establishment Religion

"...The paramount goal is compassionate results, and private and charitable community groups, including religious ones, should have the fullest opportunity permitted by law to compete on a level playing field, so long as they achieve valid public purposes, such as curbing crime, conquering addiction, strengthening families and neighborhoods, and overcoming poverty."...George W. Bush in 2001[1]

Then-President Bush made this statement in connection with establishing a White House Office of Faith-Based and Community Initiatives ("WHO-FBI") to cultivate contacts with the religious sector. Under massive "welfare reform" legislation, U.S. welfare recipients may only remain on the welfare rolls for a two-year period, after which time they have to enter the workforce. It was the task of the WHO-FBI to recruit religious groups as third-party contractors to provide job-readiness skills to the nation's welfare recipients. Whatever euphemism one uses — be it "massive welfare reform," "Compassionate Conservatism," or "Neoliberalism" — the retrenchment of the welfare state from providing a safety blanket for society's downtrodden has pushed religion to the forefront of the public sphere.

By drawing upon the U.S. experiment with "colonizing the poor" under the recent administration of President George W. Bush, the paper explores the diminution of religious pluralism occurring as minority religious groups vie for space in a public square in which a majority religion has served as the prototype for what constitutes religion and religious practice.

Democracy Light: Religious Liberty in The Coe Community

Being resolved, as the governments of European countries which are like-minded and have a common heritage of political traditions, ideals, freedom and the rule of law, to take the first steps for the collective enforcement of certain of the rights stated in the [UN] Universal Declaration.....

The above quote from the European Convention on Human Rights ("the Convention") sets forth its intent to carry out in the context of a newly integrated Europe the proclamations of the UN Universal Declaration of Human Rights ("Universal Declaration"). Indeed, under the Convention, the 47 European countries constituting the membership of the Council of Europe (COE) covenant to uphold fundamental rights such as the right to religious liberty provided for in Article 18 of the Universal Declaration. Here, it is noteworthy that except for the inconsequential rewording of three words, Article 9(1) of the Convention is a verbatim adoption of Article 18. Nonetheless, the quality of religious liberty enjoyed by residents of the various COE states is uneven. Whereas Muslims residing in Scandinavian countries can manifest their religious beliefs through modes of attire, Muslims residing in France or Switzerland are prohibited such overtly visible modes of religious expression. There is also disparate treatment within the COE community of Jehovah Witnesses; those residing in Greece, do not fare well raising conscientious objection claims to avoid military service and they are prohibited from publicly bearing witness for their religious beliefs. This paper will focus on the inability of religious minorities to obtain equal protection of the laws within the newly integrated Europe and analyze its implications for COE's claim to be a democratic union of states.

Social Capital, Governance, and the West; The Paradoxes of Civil Society in the Arab Region

Many societies around the world have adopted—either by choice or by force—liberal democratic systems of governance, often to the detriment of their pre-existing social structures. This process has been driven by the worldwide spread of the liberal democratic principle: that the power of the state must be limited by laws established by the people. Yet, in the Arab region, where regulations are devolved to the tri-state alliances on the one hand, and tribe-state alliances on the other. Many Arab societies reject the concept of civil society as a foreign philosophy that has stemmed from liberal democracy rather than their Arab literature to which they are strongly connected. The paper argues that Arab societal ideologies and tribal structures have fundamentally shaped understandings of civil society and social capital, and how these ideas play out on the ground.

Keywords: Social Capital, Civil Society, Collective Society, Arab countries, autocratic government.

Religious Minorities in Post-Soviet Lithuania: Some Aspects of Social Exclusion

The paper discusses the aspects of social exclusion of religious minorities within homogeneous religious field of post-Soviet Lithuania. Academic literature states that main agent of social exclusion is considered to be the society. Social exclusion of religion manifests in governmental and spatial spheres and on the individual level through religious discrimination.

The paper is based upon the data of research that was conducted in 2012 in Lithuania. It consisted of participant observation, semi-structured interviews and survey of religious minorities (N=372). The research data allows stating that in the governmental and spatial spheres the regulation of activities of religious communities in Lithuania reveals the privileged position of Roman Catholic Church and other so-called traditional religious communities. At the same time so-called non-traditional religious communities are marginalized, dislodged to the peripheries of public life. According to research data, on the individual level members of non-traditional religious communities experience religious discrimination through stigmatization, psychological and physical violence.

ALLASTE, AIIRI-ALINA* (Tallinn University, alina@iiss.ee)

The LGBT Activism in Estonia: Gender Perspectives

The history of the gay movement in Estonia is largely undocumented, since during the Soviet period, gay networks were completely underground, no official organisations existed, and accordingly, no official records of it were available. During the Soviet period, homosexuality was illegal; male homosexuals were
decriminalised only in 1992. There were signs of an emergent movement since the late 1980s and a number of pioneering NGOs were established in the 1990s, although a strong umbrella organisation remained absent. In the most recent period several NGO-s have been established but subsequently closed down for various reasons.

Today, Estonia’s LGBT activism is very much a youth movement, rather lesbian-centred, loosely connected and with a number of distinguishable clusters of activism. Different NGO-s focus on various issues and in some represent smaller groups. A specific cluster in the movement is related to political art and feminism, which is becoming rather visible in Estonia. Theoretically Estonian LGBT movement is conceptualised as identity-based movement insinuate of strategies of involvement.

The empirical part of the paper considers the findings of participant observation in various events organised by LGBT activists in 2012-2103, and in-depth interviews with them. In particular, the paper considers: how LGBT activism is defined by individual participants involved at the moment; explanations of the female-centeredness in LGBT activism, and gender specific differences on these explanations.

ALLEN, HENRY LEE* (Wheaton College, hank.allen@wheaton.edu)
The Future of Teaching and Research in Universities: Global Transformations

Around the world, global transformations have been affecting the structures, dynamics and outcomes of universities. Indeed, acute transformations in information and communication technologies (ICT) have reshaped academic labor via MOOCs, distance learning, assessment, and for-profit higher education. In the United States, for example, the professoriate has become dominated by contingent labor rather than full-time employment. Outside a core of prestigious research universities, academic labor has been progressively marginalized. Even within universities, academic capitalism or commercialization has proliferated, spreading a virus that has distorted humanistic and scientific learning away from basic research or theoretical questions. Academic freedom is precarious, compromised by the dictates of applied research. Public higher education has been engulfed in this tsunami of social change for decades, carrying along the academic professions in the merry-go-round of politics.

Two decades of sociological research exists on these matters by this author and other scholars in The Almanac of Higher Education published during 1993-2004 by the National Education Association of the United States. Thus, this article will examine data sources from the National Center on Education Statistics, the National Science Foundation, the Royal Society of the United Kingdom, the Office of Economic and Cooperative Development, the European Union, the United Nations, the National Study of Postsecondary Faculty, the Library of Congress of the United States, and other venues to provide a scientific analysis of future trends or scenarios transforming research and teaching in universities. While ideas and evidence will center on conditions in the United States, international comparisons will be made wherever possible. In the same way that alert climatologists monitor climate change, sociologists must continuously investigate ‘academic climate change’ on a global scale.

ALLEN, SUMMER* (Michigan State University, ollemun6@msu.edu)
GUAGNANO, GREG (George Mason University)
Ecological Identity: Underpinnings and Expressions

In a presentation to the National Congress on Behavior Change for Sustainability, Stern (2010) suggested that private sphere behaviors such as recycling have large intent quotients but relatively minor actual impact on environmental quality. Activism, on the other hand, has an ability to influence governmental and corporate policy and may be the most impactful activity. It is also an activity that requires a critical mass of public support to achieve that impact. To change policy or behavior, the activist relies on the power of mobilizing public opinion or resources to force accommodation from a government or corporate entity. One potential way to achieve and sustain that critical mass is through identity-based group formation. Membership in such a group may also increase the likelihood of an individual participating in public activism.

In the research reported here, identity connected to environmental concern was explored in a small (125) cohort of environmentally-committed respondents. Specifically the relationships between pro-environmental values as an enduring basis for an identity, experimental experiences, the presence of an “ecological identity” (Thomashow, 1996) or self-identification with nature, and the management of that identity as a social role were examined. Using measures from Stern, Dietz & Guagnano (1998); Burke & Stets (2009); Clayton (2011); and our own experience items, we found that environmental experiences and pro-environmental values coincide strongly with the presence of an ecological identity, but that nei-ther have a significant effect on how an individual manages the expression of that identity in relation to other identities held.

ALLUM, NICK* (University of Essex, nollum@essex.ac.uk)
CONRAD, FRED (University of Michigan)
An Evaluation of the Effect of Mode-Switching in Panel Surveys Using Recall Data

A key concern about the web survey data quality is difficulty garnering a probability sample because there are no good frames of email addresses for a general population. In a panel survey, it is possible to switch respondents to web mode after a series of failed recruitment via face to face methods (FTF), thus mitigating the problem of sample selection and allowing the collection of rich information at lower marginal cost. However, web respondents generally seem more likely to take short-cuts than respondents in interviewer-administered modes (e.g., Heerwegh and Loosevelt, 2008). This may even be exacerbated by switching from FTF to web: by contrast to an interview, self-administration feels particularly “unsupervised”, and, without an interviewer to motivate them to be conscientious, web respondents may take shortcuts and minimize their effort compared to their style of participation in previous FTF interviews. This raises the more general issue of whether it is possible to maintain the integrity of time-series in which there is a midstream mode switch (FTF to web). In this paper, we report results of an experiment in a panel survey (the UK Household Panel Survey Innovation Panel (UKHLSIP)) that compared the accuracy of past event recall, validated by responses at previous interview, comparing respondents who were switched to web mode with those that were interviewed in person. Results suggest that careful answering might mitigate any potential loss of data quality resulting from switching to web. More generally, our results allow us to understand a little better how mode-switching interacts with cognitive processes underlying survey response to produce data of varying quality.

ALLWOOD, CARL MARTIN* (university of gothenburg, cmo@psy.gu.se)
Social Science in Development: The Indigenous Psychologies and the Concept of Culture

The so-called indigenous psychologies are currently a lively reaction to mainstream psychology, mostly in Non-western countries (Allwood & Berry, 2006). Their origins can to a large extent be seen as a post-colonial reaction that became clearly visible after the independence of many Non-western countries after World War II. What they react to is basically what is seen as the culture basis of mainstream psychology and their aim is to develop a psychological science that is based on the cultural features characteristic of their own society. The indigenous psychologies aim to be pragmatically relevant to their domestic society and to be rooted in the culture of their own society. In this presentation I will review some recent debates in English written literature on the indigenous psychologies on the consequences of being rooted in the culture of one’s own society in a way that makes one’s research applicable to one’s own society in the way that it can help solve societal problems. The first theme to be discussed is the idea held by some researchers in the indigenous psychologies of letting the social organization of the specific local indigenous society be designed according to principles derived from the indigenous researchers’ conceptions of their own culture. This theme hooks in to the second theme that relates to the type of culture concept most useful given the goals and assumptions of the indigenous psychologies. Here the question of whether an empirical oriented culture concept or a more traditional culture concept held by many researchers in the indigenous psychologies that argue for a more collective clustered and abstract culture concept is best suited for the indigenous psychologies will be dealt with. Consequences and tentative conclusions from these debates with respect to the universality of research in psychology and research in general will be drawn.

Young College Students: Within Physical and Numerical Territories, Different Processes for Individuation

The intention of this research is to present the results of the comparative study made between young college students connected to two Brazilian universities: a public-state university located in an urban environment marked by agribusiness;
the other being a public-communitarian institution located in an urban-metropolitan environment, marked by a strong and vigorous industry base. The two groups that were studied circulate in physical territories, as well as in numerical/digital territories. In the socialization and sociability processes that they experience, they reveal circulative practices marked by similarities and differences. The majority of the youngsters connected to the public-state university exercise a student-life in a style that is termed “social moratorium”, circulating through the territories of family-home, university and cyber space. Many of them undergo transient or permanent migratory processes. On the other hand, a significant percentage of youths connected to the public-communitarian university combine their university-student condition to a job, where they work, and this is why they add working time/space to the circulative processes experienced by the public-university youth. Thus, if there are intersecting points that mark the condition of these young college students, there is also a diversity of juvenile experiences that differentiate the young people from each other, despite the social differences/circulative styles caused by gender, race/ethnicity and place of abode. Therefore, throughout their student life cycle, they demand distinct “supports” and experience dissimilar individuation processes.

Complementary and Alternative Medicine and the Reprofessionalisation of Medical Doctors in Portugal

The aim of this paper is to present an ongoing project entitled ‘Towards the camisation of Portuguese healthcare, having acupuncture and homeopathy as two case studies. It also developed the concept of ‘camisation’, which refers to the process of legitimising CAM treatments and solutions for everyday human problems. Furthermore, it analysed the attitudes of key actors within healthcare towards camisation. For example, although the position of the Portuguese medical profession towards camisation has been fluid and changeable over time, there has been a growing number of medical doctors incorporating CAM into their practice. CAM practitioners’ encounters with the healthcare system, the national healthcare system, the national healthcare system, and the healthcare system, have been facilitated by the increasing interest in CAM among patients. Acupuncture and homeopathy, for example, have been incorporated by Portuguese medical profession both at the institutional and interational level. This paper aims to theoretically explore the consequences of medical incorporation of CAM for the medical profession, from the point of view of the sociology of professions. The topic of reprofessionalisation of medical doctors who committed themselves to CAM therapies is under-explored in the sub-field of sociology of CAM and might be useful to understand recent trends within the medical profession in Portugal. Reprofessionalisation means the restructuration of education and redefinition of boundaries of knowledge. This paper discusses the extent to which the incorporation of CAM by the medical profession can be viewed as reprofessionalisation, in order to meet new challenges and threats posed by camisation and CAM therapies.

ALMEIDA, JOANA* (Royal Holloway University of London, joana.almeida.2007@live.rhul.ac.uk)

Theorising Camisation: The Case of Acupuncture and Homeopathy in Portugal

The aim of this paper is to present an ongoing project entitled ‘Towards the camisation of health? A theoretical and empirical framework for analysis’. My previous research focused on the countervailing power of complementary and alternative medicine (CAM) practitioners in relation to Portuguese mainstream healthcare, having acupuncture and homeopathy as two case studies. It also developed the concept of ‘camisation’, which refers to the process of legitimising CAM treatments and solutions for everyday human problems. This process is closely related to the concept of ‘medicalisation’, the process whereby human problems come to be defined in medical terms. In Conrad’s (2007:5) words, ‘the key to medicalisation is definition. That is, a problem is defined in medical terms, described using medical language, understood through the adoption of a medical framework, and treated with a medical intervention. In a similar way, the key to camisation is also definition. CAM language, its framework and interventions are major elements in this process. Furthermore, while medicalisation has been encouraged by a faith in science and the prestige of the medical profession, camisation has been encouraged by the opposite tendencies, i.e. a lack of faith in science and the erosion of the medical authority in society. Camisation can thus be seen as a counter trend to medicalisation and a step toward demedicalisation (although at the same time reinforcing medicalisation (Lowenberg and Davis,1985); further more, growing ‘incorporation’ (Saks,1995) of CAM in allopathic medical practice can also be leading to remedicalisation, by restoring the medical definition of certain health conditions. I want to develop this conceptual framework further. I also want to discuss the role of key actors in healthcare (the medical profession, the State and supra-State agencies, the lay populace and health corporations) whose countervailing actions can legitimate (or not) camisation and promote the demedicalisation or remedicalisation of certain health conditions in Portuguese society.

Fathers, Work and Family in Sweden and the US

This paper investigated Swedish and US fathers’ experiences of work-family conflict, possible solutions, and actual changes to their work situation in relation to becoming a parent. The Swedish data were drawn from interviews completed in 2008 with 16 fathers with a child born in 2005 or 2006. The US data came from interviews conducted between 2005 and 2007 with 26 fathers with at least one child age five or younger. The semi-structured interviews were analyzed according to grounded theory. In terms of conflicts, half of the Swedish fathers mention time pressures or stress, with some referring to work-life balance as a puzzle. Findings indicate that the US fathers think that they work too much overtime as well as shift hours, and they also mention arguments with their partner about responsibility at home. At the same time, a majority of both US and Swedish fathers emphasize family as a priority over work. In terms of possible solutions, a common theme among Swedish fathers is to mention that ideal work hours would be less than their current hours, with some wishing for a shorter work week (e.g., 4 days) and others a shorter work day (e.g., 6 hours). US fathers most commonly wish for a more flexible work-life situation. In terms of actual changes, several fathers adjust their work lives in response to their family life. Among Swedish fathers, the most common changes involve working fewer hours, adjusting their start and end times, and taking advantage of flexible hours. Swedish fathers also emphasize trading off with their partners, including ‘shift parenting.’ As for US fathers, some have changed their job to be more at home, some changed from working three shifts and some fathers solved the situation by intense work during a limited time.

ALONSO-FRADEJAS, ALBERTO* (International Institute Social Studies , fra-dejas@iss.nl)

Politics of Land Grab-Driven Agrarian and Labor Regimes Change in Guatemala
Changing land resources access and control relations due to sugarcane and oil palm agribusinesses-led land grabbing since the mid-2000s is a major catalyst of political contention in the Maya-Q´eqchi´ populated Guatemalan northern lowlands. Arguably, such contention does not have to do so much with a Polanyian (1944) counter-movement against land and labor commodification as with a contestation of the ways in which such commodification is happening. The combination of Market-Led Agrarian Reform and freehold land titling on facilitating access to local land resources for “outsiders” with the international politico-economic scenario of multiple crises which sees land resources as global commodities has allowed for the mobilization into mushrooming informal research since 2006 this paper argues how Maya-Q´eqchi´ lowlanders’ unrest is rooted in historical agrarian grievances and in those emerging from the “terms of incorporation” (Du Toit 2004:1003) to the emergent, hyper-commodified “labor regime” (Bernstein 1988) into which many feel have been adversely incorporated through flexible labor arrangements either as plantation workers or as contract farmers. Such grievances are amplified by narrowing or breaking inter-class reciprocity mechanisms (Thompson 1971, Scott 1976) which if anything allowed for the continuous renegotiation of minimum survival standards between dominate and subordinate classes. Unrest is turning into practices of resistance framed as “defense of territory” and articulated through a repertoire including “everyday” and more militant forms of contention. Dominant state and social actors frame their governable space-making efforts as “developmental” and “responsible”, employing a repertoire based on “divide and win” and “rule of law” strategies articulated through Visser 2018’s legitimization in the prevention and violent mechanisms. Indeed, land grab-driven agrarian change has triggered a new cycle of contention (Tarrow 1998), its outcomes being not a story foretold but the becoming of multiple politics between, across and within state and social actors in contention at different scales and places.

Inequality in Social Capital Transition within Family: Time Diary Evidence

In this paper we investigate inequality in social capital transition to children using time diary evidence from American Heritage Time Use Study (2003-2012). We first identify set of activities that are particularly salient in social capital acquisition and examine whether parents involve in these activities together with their children in daily life. Specifically we look at absolute and relative differences in parental time spent in (i) leisure activities at home (ii) out-of-home leisure activities (iii) meal time together and (v) volunteering activities. We also look at time spent in watching TV as this is identified as one of the reasons in decline in social capital in the US (Putnam 2000). The study shows significant inequalities in social capital transition by parental education and ethnic background. Low-educated parents spend more time in the presence of their children in absolute and relative terms (total number of minutes) and relative terms (in proportion to total time in watching TV). For example, ceteris paribus, white mothers with post-college degree spend 50 minutes less in watching TV daily while they have their children in care. The corresponding figure for white fathers is 37 minutes. On the other hand, high-educated parents are far more likely to involve their children in their out-of-home leisurely activities relative to their low-educated counterparts.

GERSHUNY, JONATHAN (University of Oxford)

Young People's Time Use Patterns and Future Labour Market Outcome: Does Studying Pay-off?

Time use data is not adequately exploited to understand adolescents’ time patterns (Furstenberg 2000) and life course perspective is, “nearly absent in time use research” (Gauthier and Furstenberg 2002:155). In this paper we address this gap and investigate the effect of young people's time use patterns through life course perspective using a rich dataset and our research is its longitudinal study and time diary evidence.

We exploit the four-day time diary survey collected for the 1970 British Cohort Study (BCS70) respondents in 1986, linked to previous and subsequent waves of BCS70. We test hypotheses linking the accumulation of various sorts of embodied capitals (social, cultural and economic) out of daily activities, to the result of deployment of these capitals later in life. We ask, for example, whether time spent in school-related human capital formation activities at the age of 16 predicts earnings or probability of being in employment at later ages; and whether this effect varies by gender and class.

Preliminary findings suggest that regular studying in adolescence positively affects future earnings even after controlling for parental background. However, the effect of time spent in school related activities has a stronger effect on future earnings of those coming from better-off households. The effort in adolescence is not enough to compensate for gender inequality in earnings later in life.

Are We Protected? Model for Predicting the Level of Perceived Secrecy in the Face of a National Emergency in Israel

Introduction: National emergencies are characterized by a destructive potential of causing a severe damage to a community's social fabric, worsening the psychologic well-being of citizens and even causing death. A war and major earthquake are among the most relevant types of national emergencies in the Israeli case. Aim: The aim of the current research was to construct an innovative comprehensive analytical model for understanding the mechanisms that characterize human perceptions of national emergencies prior to their occurrence. Towards a broader understanding of the phenomenon, a novel measurement tool and a new holistic concept of “perceived secrecy”, that encompasses both risk perception and perceived preparedness, were created. Results: The results of this first of its kind analytical and empirical study indicate that regarding an earthquake in the Israeli context there were found strong and significant relationships between the three dimensions of perceived secrecy: national and local (r=0.86, p<0.001), national and household (r=0.79, p<0.001), and local and household (r=0.82, p<0.001). However, the results regarding a war reflect a different pattern: the relationship between national and local perceived secrecy was found insignificant (r=0.08, n.s.) as well as between national and household secrecy (r=0.08, n.s.), while the relationship between local and household secrecy was found strong and significant (r=0.93, p<0.001). In addition, all the cross-context (earthquake, war) relationships between the perceived secrecy’s dimensions were found insignificant. Conclusions: The novel parsimonious concept of perceived secrecy was found to be context- and dimension-sensitive. In terms of context, it distinguished between an earthquake and war and in terms of dimension, it distinguished between the national, local and household level. Consequently, it may serve as an effective tool for scientific analysis, risk communication monitoring and public policy consolidation.

Justice, Legality and Legitimacy: Youth Sense and Use Of Legal Norms In Urban Contexts In Latin America

In the midst of an extremely violent war against drugs, against gangs and organized crime, Latin American elites have implemented a series of disputable institutional reforms to the justice and legal systems. This implementation has been corroded by the inability of the same elites to perform and even respect these regulations, because there is strong corruption and impunity mainly among the political elites.

In the middle of these battles, youth population has been targeted—blamed for the major crimes that are committed by different armed legal actors. One important issue is youth involvement in these illegal activities. Another is juvenile perception of characteristics of the justice system and acceptance of the new limited legal norms (such as the provision policies against drugs).

This paper will present a result of a comparative study of youth conceptions of norms and their sense of legitimacy and justice in 10 Latin American cities. This paper claims that in spite of the sociological general opinion about legal cynicism, juvenile population in Latin America knows and even accept legal norms, and use them to a certain point in more practical terms than the rhetorical strict social behavior. But they contested certain conceptions that they consider unfair and unjust. They know that laws and regulations are very limited, some of the unfair, particularly when they target-label youth people as potential criminals. They consider this new context unfair, discriminatory, but they tend to accept and aspire to an overall fair and equal system of justice, a regime that political elites and regulations have not been able to provide for this population. The paper is based in focus groups and surveys develop in 2012 in 10 Latin-American cities, about the uses and acception of legal norms.

Bodily Practices of Elderly and the Methodology of Oral History

The category of bodily practices refers to phenomena that are shown primarily in body, of which concerning mental expressions and are expressed as a form of language (FALCÃO & SARÁVIA, 2009). It is also understood that the bodily practices refers to social phenomena such as dances, games, leisure, physical exercise, sports, the gymnastics, martial arts (LAZZAROTTI, 2010).

Brazilian public policies and social programs aimed at health promotion that have bodily practices as an axis, in general, they have been structured with the anatomical and physiological issues as central references. (SILVA & DAMIANI, 2005) This character is also present in programs offered specifically for the elderly who, in general, only strictly biophysiological goals are important to be conquered in order to combat the physical declines that come with advancing age.

Opposed to this narrow look of the body presentation in these program offerings, the category of bodily practices seems to offer us the opportunity to think about the bodily expressions beyond of their biological condition. This category has been increasingly defined making use of theoretical and methodological frameworks from the social sciences and humanities in order to look for a body that also presents a condition that is social, historical and cultural.

Reflecting on the possibility of enhancing the bodily experience of an old person, in other words, looking beyond the achievement of goals that only combat physical decline, one can think of the potential of the memories in order to know about bodily practices that this old person experienced along his life by making use of the methodology of Oral History (VON SIMSON, 2003). Memory narratives produced in the elderly can evoke about how bodily practices may vary by gender, culture context, social class and education in a life course, producing different body experiences at this stage of life.

Language and symbolic thought in Albert Einstein's relative space-time: new interdisciplinary perspectives in Einstein's Mechanics of relativity

Our paper discusses Albert Einstein's conceptual ontology with special focus on the grounding of RELATIVE SPACE TIME concept. It understandsthat Einstein's ontology given its tropological nature, it builds essentially the concept of relativity among the relations between language and thought according to a semiotic perspective. So, the main objective of our paper intends to analyze Einstein's Relative Space according to Semiotic approach when it intends to discuss the role of language and thought in Albert Einstein's categorization, figurativisation, metaphorisation of relative space-time. The second objective aims to present new interdisciplinary perspectives between Anthropology and Semiotics, when it analyses Einstein's innovative method in Modern Physics. Einstein's method verified in 1919, in Sobral, Brazil, as it took a total eclipse of the sun as a new method of investigation in Modern Physics. Our approach takes an interdisciplinary perspective, and it considers the main contributions of prominent theorists in Structural Anthropology, Hermeneutics and Semiotics, such as Charles Sanders Peirce, Ferdinand De Saussure, Emile Benveniste, G. Frege, Claus Emmeche, Winfried Noth, Claude Levi-Strauss, Gaston Bachelard, Gilbert Durand, Clifford Geertz, and Paul Ricoeur in order to discuss the role of language and symbolic thought in the modes of reality comprehension, taking Einstein's relative space-time conceptualization, figurativisation and metaphorisation. Since Einstein's innovative scientific experience is considered to be one of the most important contributions to Modern Physics, we argue that our confirmations so far obtained and here presented on the Physics of Einstein, if they do not completely solve Einstein's long standing enigma of relative space-time conceptualization, they point at least to some beacons in this very much complex but fascinating field in the relations of man-language-myth-world relations.

Leadership Development Programs in Organizations: New Dimensions, Impact and Evaluation

We want to identify how the concept of leadership has evolved in recent years, the implications of that evolution for managers’ work, and the impact of leadership development programs on the lives of organizations and their employees. We will describe the main sources of evaluation of the effectiveness of these programs. We will focus on the learning transfer process from the classroom to the
companies and people in the real world. Leading change in organizations entails changing people's behaviours and, in order to do that, appropriate metrics and rewarding mechanisms need to be developed.

Leadership development interventions will be analysed and their forms of assessment such as: interviews, feedback forms, in-depth consultation. Participants in those programs are facing a very interesting conclusions contrasting their newly acquired knowledge with their previous first hand life experiences. Implications for business schools, universities and learning institutions in general are also to be considered, particularly with respect to their role as change agents and mobilizers of knowledge.

We will describe the new leadership dimensions and how they affect the roles and responsibilities of those holding a leadership position. Is there a change in the role and purpose of business leaders? What are the main characteristics of that change? Does this change extend beyond business boundaries? What are the effects of these changes for people in organizations? We will further, analyse concepts such as Community and Collective Leadership, Distributed and Shared Leadership, and others closely related to them: corporate social responsibility, coaching, relational management, motivation, communication, empathy and personal connection, commitment, engagement, career development, work/life balance.

Our investigation will be based upon the last five years' published research from Ashridge Business School, a very well recognized institution for translating theoretical organizational knowledge into best practices in organizations.

TORTEROLA, EMILIANO* (University of Buenos Aires, etorterola@yahoo.com.ar)

GRONDONA, ANA LUCIA* (University of Buenos Aires, antrondona@hotmail.com)

The paper that we hereby present looks into the singular ways in which the problematization of Gemeinschaft-Gesellschaft was "translated" into Argentinian sociology in the 1940s, prior to its institutionalization as a scientific discipline in the context of the University of Buenos Aires (UBA).

In our work we test, in a preliminary way, the hypothesis that, in this conjuncture, more prone to essayist writing than to methodical and scientific inquiry, "community" acquired a "culturalist", "essentialist" or "primordialist" meaning, closely related to the concepts of "nation" and "pueblo".

To carry out this task, we will explore, fundamentally, some works of the Argen- tinian Alfredo Povia and the Spanish Francisco Ayala.

The first of them, Alfredo Povia, presents a changing profile, mainly regarding his political orientation from the first attempts close to Peronism and then to authoritarian projects of communitarian spirit, such as the J. C. Ongañia's dictator- ship (1966-1970). He developed his work, mainly, in the National Universities of Córdoba and Tucumán. In particular, we will analyze his presentation for the First National Congress of Philosophy in 1949 in Mendoza ("The sociological idea of community"), as well as his work Ontological Sociology Issues, published that same year.

On the other hand, Francisco Ayala, a Republican exile, played, from the Na- tional University of the Litoral, a prominent role in the Latin American academia; at the same time "translator" (among others, of F. Tönnies's Commu- nity and Society) and as a producer of texts. Among the latter, his work around the "sociological concept of Nation" (1941) stands out and will be the focus of our analysis.

New Citizenship, New World, a Theoretical Analysis of the Last Social Movements in Spain (2003-2013)

Citizenship was articulated as a social science concept by the differentiation between civil, political and social rights that Marshall proposed in 1950. Neverthe- less because of globalization, translational migrations, new social movements and the transformations of identities and their referents, Marshallian citizenship has been questioned. New claims, new demands of recognition and new social prac- tices have transformed the classic references on which citizenship relays, such as time, space or nation. In this paper we explore the different academic proposals and we will revise at least three major perspectives of analysis (structuralism, the liberalism and social actors) that aim to address the future of citizenship, social movements and political practices and systems of Western liberal democracies. We will focus our analysis in the Spanish context and the last well-known social movement as the "15-M or "No a la Guerra", but always talking into account the complexity of the local-global realities.

Constructing Cultural Identity, Displaying Belonging. The Role of Positioning in Migrant Children’s Cultural Identity

In the last years the sociology of childhood has introduced relevant issues concerning children’s active role in social processes. However, despite the proliferation of studies which call into question the idea of universality of childhood (Prout, James 1990; Holloway, Valentine 2000), the perspective of children in migration studies remains still marginal.

So far, studies concerning children and migration have privileged the issue of second-generation’s integration in multicultural societies (Baraldi, 2010), rarely focusing on children’s voices and the relationships they maintain with their parents’ countries. On the other side, works that focus on migrant children’s cultural adjustment or their sense of belonging, as well as dominant discourses inside schools, construct them as subjects stuck amongst cultures, forced to choose a cultural identity. This perspective is derived from a reified and essentialized idea of culture as well as identity, that takes both of them as given (Piller, 2007), denying individuals the possibility to be active participants in social processes.

This paper aims to investigate how children living place polygons (Beck 1999), due to experiences of temporary return to their family’s countries, actively participate in the discursive construction of their cultural identities in the interactions.

Cultural identity is here observed from the perspective of the Positioning Theory, thus highlighting its processual and relational nature. This perspective allows us to observe cultural identity not as a final product, defined by the belonging just to one place, but rather as a discursive construction, which gives rise to several possibilities as in perpetually negotiation. In this process migrant children are active participants showing their social competences.

Desafíos Éticos De La Circulación Internacional y Acceso Abierto Al Conocimiento Científico y Tecnológico

En el marco de las políticas de integración económica mundial, y de integración regional y nacional de los sistemas de ciencia y tecnología (CyT), se han propuesto políticas para impulsar la circulación internacional del conocimiento científico y tecnológico que están transformando los procesos y las prácticas de información y comunicación de la investigación científica. El propósito explícito de las políticas mundiales para promover la circulación internacional del conocimiento es la integración de un sistema mundial de información de acceso abierto (open access) a la investigación científica para cerrar las brechas cognitivas entre países desarrollados y en desarrollo. Sin embargo, las complejas relaciones entre la circulación internacional y el acceso abierto a la investigación científica y tecnológica, que caracterizan el nuevo paradigma de información y comunicación, plantean desafíos éticos a los investigadores de diversos campos de conocimientos. La presente exposición da un aporte de una investigación sobre las redes internacionales de conocimiento de los científicos jóvenes de la Universidad Nacional Autónoma de México. La estructura de la argumentación se presenta con base en tres ejes transversales de análisis: a) las políticas mundiales de información y comunicación de la investigación científica de la última década; b) las reformas a la Ley de Ciencia y Tecnología en México para garantizar el acceso abierto a la información científica; y c) las declaraciones de investigadores, expertos y profesionales sobre los desafíos éticos del nuevo paradigma de circulación internacional y acceso abierto de la investigación científica mexicana.

AMAT, AMANDINE* (Amup-Insa de Strasbourg, France, amandine.amat@hotmail.fr)

Leaning Against the Wind or Sailing with It?

Global warming or climatic change rests on two main strategies: mitigation and adaptation. Both raise some important issues such as monitoring the relation between a society and its environment. Does the transition from one stage to the next denote a “normal” gradation in monitoring “our” relationship with the environment or does it mean an inflexion, even a rupture, of it? To answer this question, we will provide further clarification on both strategies to identify their similarities and their differences. Mitigation as adaptation goes together with the recognition of climate change. While mitigation aims for the preservation of our current climate states, adaptation works on the degradation of the current climate. In this perspective, mitigation and adaptation are linked in time as a logical succession. Nevertheless, their relationship isn’t such evident because of the uncertain surrounding adaptation. If mitigation works on the reduction of the greenhouse gases, the goal of adaptation stays obscure: “Who should adapt and which direction should be taken?” Mitigation’s strategy clearly aims for a stable stage while adaptation goes together with the idea of perpetual change. It integrates the principle of climate change. This distinction matches an inflexion of “our” relationship with global issues such as climate change. Mitigation keeps the myths of struggle going while adaptation breaks with this imaginary. Adaptation opts for a new horizon, a new frame that fits, depending of how you look at it, with a certain sense of reality or for helplessness. Does adaptation signify that “we give up the fight” or does it set up a new understanding of the possibilities that are still available? However, much more ambitious in its approaches? This is the question we would love to kick in the discussion.

AMELINA, ANNA* (Goethe-University Frankfurt, amelina@soz.uni-frankfurt.de)

Reconstructing the Multiple Meanings of Belonging: Some Notes on the Power of Definition, Regimes of Translation and the Researcher’s Positionality

In their recent studies scholars of transnational migration identify various categories of belonging (including gender, ethnicity, class, sexuality, disability and age) as becoming crucial for the formation actors’ subjectivity. Moreover, some scholars indicate that mobile individuals who simultaneously log on and off the receiving locality experience the so-called double location, meaning that they may have different positions in the hierarchies of the sending and the receiving countries. For example, migrant care workers from the Ukraine who reside in Germany may experience a subordinated position in terms of gender, ethnicity and class in the receiving setting, but are perceived as having ‘made it’ in the Ukraine. In other words, the gender-related (or other) categories may have different meanings in different national and also transnational contexts (such as diaspora, for example).

The paper suggests combining the intersectional analysis with cultural sociological, transnational, postcolonial studies and reflections on the researcher’s positionality, in order to be able to reconstruct the (potentially) multiple interpretations of categories of belonging. Three questions are of particular importance: First, how should we reconstruct the multiple interpretations of belonging without essentializing them and binding them to the particular national setting? How do diasporas and other cross-border actors develop the ‘regimes of translation’ of particular categories of belonging?

Finally, we need to clarify the question of who carries out multiple interpretations: the researcher or the researched subject? This reflection should not only include the obligatory disclosure of the researcher’s subjectivity, but also a careful self-reflection of positioning towards the sociological discourses on belonging and identity.

Difficulty in the Implementation of Land Reform in Africa: The Case of Tanzania

Property rights in Tanzania –former socialism country in East Africa having diversity of ethnic groups including of nomadic hunter-gatherer tribe– provided in the new land law particularly with regard to the “customary right of occupancy” and differ from limited rights, known as the “commons” of community members in villages.

The World Bank’s land policy has considerably affected Tanzania and other African countries. An overview of the World Bank’s land policy, a shift from the traditional theoretical of new development economics to the recognition of an informal system is presented in this article. Although there has been strong pressure by the World Bank and other donors to implement the Village Land Act since the enactment of the Act, practical enforcement has made little progress in Tanzania. This article examines two projects for the promotion of titling in villages. In general, village authorities and the land sector are largely being left behind by the Local Government Reform Programme and all levels of government, except the central government, which is eager to create a progressive agenda on land reform. For example, many pilot projects for titling have been conducted and have become successful; however, these projects have never been spread to the villages. From this conclusion I could mention that

* denotes a presenting author. Abstracts are organized by first presenting author’s last name. 28

Table of Contents” XVIII ISA World Congress of Sociology
Decentralization on land titling has not led to the enforcement of the Village Land Act.

Practical enforcement has been little seen as mentioned however established “Village Land Act, 1999” has been very unique and ideal for current stage of Tanzania. I would like to introduce this Tanzanian Village Land Act that is based on informal customary law and indicate to be ideal for current stage for other post-socialist countries including Africa.

Good Press: Why Movements Get Covered and with Substance

When and why do movements and SMOs sometimes gain sustained newspaper coverage and when and why is this coverage sometimes substantive? Our story-centered argument holds that the social organization and operating procedures of the news media account for its differential treatment of institutional political officials and movements, but also provide openings for sustained and substantive coverage for movement actors, a potential cultural consequence for movements. We argue that the main routes to both sustained and substantive coverage are for movements to mimic and challenge institutional political actors and processes, such as by conducting petitions; presenting legislative process and litigation; and launching court cases. Other routes include mounting successful strikes and waves of protest. Routes to sustained coverage that are not expected to be substantive include investigations, trials, violent opposition, and occupations. We use the data from the Political Organizations in the News project to identify the longest sustained coverage “runs” for SMOs across the twentieth century. The results show that 37 high-profile SMOs gained sustained coverage 302 times. Analyses of the subjects and the assignments of authors in these coverage runs provide preliminary support for our story-centered arguments.

Transmuted Inequalities of Class, Race, Religion and Nation among South Asian Migrant Workers to the Middle East

This paper examines the intersectionalities of class, race, religion and nation among migrant workers from South Asia going to the Middle Eastern and North African countries. In particular, it examines how the class positions of the migrant workers in the “destination societies” are racialized and how exclusions experienced in this racialization process impact on the religious and national identities of migrant workers. By focusing on South-South migration processes regarding religious and national identities, this paper adds to the literature on identity and migration which has primarily focused on South-North migration dynamics. This paper thus explores how South-South migration impacts religious and national identity and the consequent politics of belonging in both sending and receiving countries. The analysis is based on data collected from 2011-2012 from 275 migrant workers from Bangladesh, India, Nepal, Pakistan and Sri Lanka to the Middle East. We found that South Asian migrant workers, shared an experience of racialization and exclusion in relation to the host country populations, whose content was based on religion and national identities. Exclusion had similar implications for Muslim and non-Muslim migrant workers by shifting their religious and national identities to become more important and adding a critical dimension to their national identities, while also increasing the sense that their national cultures were better in terms of status given to women and the treatment of strangers. Using the intersectionality framework for analysis, the paper concludes with discussions of how inequalities of class and nation are transmuted into inequalities of religion and race and how these transmutations are impacting on the societies of origin of the migrant workers. This paper thus allows us to understand how inequalities in the societies of work/destination shape and produce inequalities in the societies of origin.

Linking Socio-Technical Vulnerability to Socio-Political Environment: The Case of Fukushima Nuclear Disaster

This presentation revolves around the sociotechnical system that generally characterizes the functioning of modern infrastructures. It departs from one central question: Where does vulnerability originate from in the sociotechnical realm? The primary objective of this study is to identify and explain how vulnerability emerges and propagates in a sociotechnical system leading to disastrous outcomes. Searching for the origins of sociotechnical vulnerability allows us to recognize critical areas within complex infrastructure system where vulnerability is likely to emerge due to a combination of technical, social, cultural, and political factors. Furthermore, this study seeks to reveal how the development of vulnera- bility at the micro level where human operators and technical components interact is tightly linked to the socio-political environment at the broader level. Drawing on an empirical study in the Fukushima nuclear crisis, two main hypotheses are set for examination in this study. First, it is posed that vulnerability is a pro- cess that unfolds over time. As a complex system, the fragility of sociotechnical system is emergent in nature. The more structurally coupled and sophisticated a system, the more fragile it is. Second, vulnerability is likely to be hidden due to the socio-political environment in which conflicted interests may entail pressures to ignore or downplay risks of systemic failure. The significance of the proposed study lies in its contribution of a new understanding on the origins of vulnerability and how it is hidden from our observation caused by socio-political structures. Integrating concepts from the sociology of disaster and science and technology studies (STS), this study develops a model of socio-technical network linked to the socio-politi- cal environment to describe how vulnerability is materialized into a disaster with profound consequences.

Neither Here Nor There: Transnational Identity Of French Immigrants Employed In Israeli-French Companies

Recent waves of French immigration to Israel exhibit the unique characteristics of a transnational movement (Bowen, 2004). This movement is distinct in the immigrants’ strong and continued affinity to their country of origin, despite efforts to integrate. The “Third Culture” has become the host country’s job market and form cultural communities. This pattern of immigration invites scholars to rethink concepts such as: integration, assimilation and national identity, and perhaps even replace them with the terms “global nomads”, cosmopolitan, and “children of the third culture”. These terms seem to better describe the existential limbo these immigrants experience (and even foster deliberately) (Bell-Vilida, Sichel, 2011). We thus feel that a better understanding of life on the borderline between cultures is warranted.

In our case, the hybrid identity cultivated by the French immigrants is maintained and even fortified by their preference for working in French speaking organizations. The research reported here examined the formation of trans-national identity among French immigrants employed in companies providing services in French to French audience. Many of whom are employed in telephonic call-centers, where vast aspects of the work is technologically mediated, and workers are employed under various forms of non-standard employment which deprive them of job security. The present study asks how this employment pattern, and work environment impact the manner in which immigrants relate to the Israeli culture, construct their identity, form communities of belonging, and integrate into the Israeli society.

Based on 40 in-depth interviews with French immigrants working at various French oriented companies we show how the sense of temporariness and insta- bility characterizing their field of work contributed to their construction of a hy- brid ethnic identity. The francophone identity provided an important social and cultural resource that many immigrants felt they should preserve.

AMO, KAE* (EHESS, CEAF, kaekae855@hotmail.com)

Islam, Public Space and Cosmopolitanism in Senegal: Between Local, National and “Universal”

In Senegal, as well as in other sub-Saharan countries, Muslim communities have been contributing to a development of public spaces. In capacitabilities like Dakar, Bamako or Niamey, Muslim dynamics framed by various Islamic events (conferences, religious meetings or festivals) take place in different areas in the city, new mosques are inaugurated every year in suburbs, Islamic television and radio networks diffuse their own programs and sometimes broadcast live differ- ent activities and rituals (prayers, pilgrimages), etc. Some recent works analyze this trend as an emergence of new modern “public islam” developing in West Africa, promoting Islamic moral and social values through younger generation (Samson) and, in some cases, connected to universal religious revival or “reform- ism” in Arabic countries (Hoder). Today, Islamic dynamics are changing the whole social landscape of African societies, promoting both local and national identity. Developing transnational networks, adapting to various influences and thus, improving what we can even call, new Islamic cosmopolitanism.

Based on case studies in Senegal, this paper analyzes the roles of Islamic dy- namics and their symbolic performances in the recent political and social change in Senegal. The reconstruction of public spaces by Muslim communities and their cosmopolitanism can be seen as a solution to various problems that State and soci- ety are facing today in the process of political modernization.

What are the features of new (local, national or transnational) Islamic dynamics and what are their roles in the (re)construction / (re)organization of public spaces in Senegal? What are the relations between the state politics, Islamic transna- tional networks and the local initiatives? How local, national or “universal” Islamic
identities are bounded each other through public spaces? What kind of theoretical work can be possible to analyze these socio-cultural and political trends?

Internal Migration Among the Women and Street Trading Activity: A Poverty Elevation or Reduction Strategy?

A major ingredient for unabated increase in street trading activities within urban centers of developing countries has been the need to migrate from the harsh effects of poverty from the poor households or family and rural communities. Ironically, the activity is shrouded with myriad of challenges and robust arguments on financial benefits or welfare improvement accruing from the activity are very rare. This study therefore poses the question of urban street trading in welfare improvement and probes into its possibility of aggravating the burden of poverty among women who are the most vulnerable. Data was extracted from a pan-Nigeria street trading survey funded by Covenant University Centre for Research and Development (CUCERD). The study locations consist of randomly selected Central Business Districts (CBDs) in three major cities across three geopolitical zones in Nigeria. Data were analyzed using univariate and binary logistic regression analysis. The result indicated that the average daily needs of a migrant woman is far above daily income and that higher education is significantly related to higher income among the migrant women (p-value ≤ 5%). A daily income level above N2500 would likely enhance a positive change in welfare status of an average woman street trader, the study concludes that women migration and street trading could be escape routes from unemployment but not an escape status of an average woman street trader. The study concludes that women migration is not significantly related to higher income among the migrant women (p-value ≤ 5%).

Care Time Diamond and Its Applications to Seven Asian Societies

This paper suggests a quantitative way of analyzing welfare mix in care provision. It is conceptualized as care time diamond which indicates the distribution of care provision between state, market, community and family, measured in time. Welfare states not only de-familialize the caring function of family but also familialize it. The degrees in which the informal care is formalized may be mediated by familial practices and notion or preference towards provision of care. Care time diamond is an effective tool to understand relationship among the four pillars in care provisions and its changes over time.

As a way of applying the approach, it is suggested to distinguish cared time from caring time and gross care time from average care time. We tried to collect care time data from seven Asian societies but only Japan, Korea and Thailand have developed time use survey which is prerequisite for utilization of the approach (on caring time), and Thailand’s data is only about elderly care. Some societies have gross cared time data, and others have gross caring time data. In the mean time, some societies do not have care time data but have another variable, data of gross number of children/elderly cared in each sector. Therefore, our discussions focus on Japan and Korea but we draw upon its implications for other societies in Asia. All in all, we highlight the usefulness of the approach as a way to understand the care mix in societal level.

AN, MI YOUNG* (Kookmin University, myam@kookmin.ac.kr)

Familialism in Transition: The Development of the Chilcare Regime in Korea

This paper traces the development of the state’s intervention in childcare in the Republic of Korea. Building on Leitner’s typologies of familialism, the paper shows how Korea has altered childcare arrangements over time. The paper argues that state intervention in childcare in Korea has strongly relied on defamilialisation, characterised by selectively subsidised market provision. The reforms of recent years have signalled a move away from selectivity and towards universality, and the redistribution of care costs have encouraged the role of the family as a childcare provider. These continuities and discontinuities are attributed to a top-down policy process and are driven by the imperatives of economic development and electoral competition. The paper also considers the implications of the childcare regime, with a focus on gender equality. The paper questions whether the market mechanism is the most effective method for facilitating women’s paid work and for achieving a regime centred on gender equality, and asks whether more attention should be paid to the redistribution of time, rather than money.

Natural Resource, Economic Opportunities and Population Dynamics Among Badjao Informal Settlers in Batangas City, Philippines

The dynamic formation of informal settlements are important to consider in analyzing environmental and developmental issues due to its implications for sustainable development and social well-being. Additionally, understanding environment and resource dynamics requires critical consideration for populations

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
involved within that particular environment. Of particular concern for this study are the Badjao, indigenous maritime people originally from the southern Philippines, but some have since migrated toward other parts of the country. One of the cities where the Badjao peoples have migrated to is Batangas City, a city in the north-central part of the country with an average income of $400 million pesos or more. As a result of the presence of the Badjao community, issues and concerns have been raised by the city local government unit (LGU). At the same time, the Badjao also experience social, economic and environmental problems in the city. Using key informant interviews, focus group discussions (FGDs), critical review of related government agency reports and documents, and field observations, this paper examines migration patterns of the Badjao peoples and its nexus with the existing environment and economic conditions present in the area.

Home Owners As the New Precariat: The Mobilization for Dignified Housing in Spain

Since 2008, there has been a sharp increase in the number of house evictions in Spain and mobilizations in favor of "dignified housing" (vivienda digna) have multiplied. They are mostly based on unemployed home owners facing downward mobility that depart from the traditional profile of radical youths active in the squatters’ movement (okupa) or the global justice movement. We contend that these home owners constitute a new segment of the precariat (Standing 2011). They are middle and working class people that benefited from easy access to housing in Spain in the 2000s, during the real estate bubble. When the bubble burst and they lost their job, they became unable to pay their mortgage and faced eviction threats from the banks. In order to explain the mobilization of urban centers in favor of "dignified housing," we focus on a particular organization created in 2009 in Barcelona and which has become the most visible and influential actor of this movement: the "Platform of people affected by mortgages" (Plataforma de los Afectados por la Hipoteca, PAH). We argue that the growth of the PAH is not a mere side-effect of the crisis. Many other categories of people are affected by the crisis but do not mobilize as much. We need to look at (1) local legacies, (2) the internal dynamics of groups and networks, and (3) national structural as well as institutional configurations.

Improved Ethnographic Observation in Barcelona in 2013

Highly Skilled Migration, Race and Economic Integration

The intended paper will explore the links between the rhetoric of Canada’s skilled immigration policy and the realities of highly skilled visible minorities. Canada under the Federal Skilled Worker program, a persuasive media and the need to compete globally for talent embodied in people selects those believed can integrate into Canadian society based on language accessibility, prior work experience and education. The Federal Skilled Worker program is couched in expansive, inclusive, meritocratic and colour blind language that belies the realities of highly skilled visible minorities.

UNDERCUTURIZATION of highly skilled immigrants’ skills and education is a significant issue for those who have gone through Canada’s Federal Skilled Worker program. For immigrants of colour there continues to be barriers to gaining employment commensurate with their education, prior experience or skill. This is compounded by the oft requested and elusive concept of ‘Canadian Experience’. The pernicious impact of implementing a colour-blind immigration policy is evidenced in subtle micro-aggressions and a refusal to acknowledge race related experiences in the request of “Canadian Experience” from potential employers of highly skilled immigrants.

There is decline in the economic integration of immigrants relative to that of native Canadian’s with immigrants facing more of a bleak future prospect despite increase in high skills since 1990s. If this results in feelings of alienation that negatively affects the financial, mental and emotional health of skilled immigrants. As a result, economic integration and inclusion remains an enormous challenge.

We argue that non-recognition of international credentials and prior work experience is attributed to a deficit model of difference. That non-recognition negatively affects skilled visible migrants regardless of their gender. In a country such as Canada, the social science that underlies itself, one of the tenets of the society is its commitment to cultural pluralism, but Canada’s endorsement of pluralism is superficial.

The Resonant Places of Transnational Union Struggles: Reflections on the Organising Strategy of the International Transport Workers’ Federation

This article explores a dilemma at the heart of union organising in Transnational Corporations, namely, how to circulate union power across a broad spatial terrain when actually existing labour struggles are generally restricted to single sites? Reflecting on the experience of the ITF, this paper argues that single site campaigns have been the most tangible aspects of federation’s organising campaign so far. It is noted that these struggles are resource intensive, and have few ‘spillover effects’ (Lipshutz, 2004) within the TNC. At the same time, it is argued that the work the federation that defines these struggles is rare, and as such they should be theorised foundational ‘resonant places’ in a wider global organising strategy.

Combining Economic Trend Data with Suffering Narratives for Disaster-Struck Nations

Some scholars of suffering have noted that the most intense moments of suffering not only cannot be quantified, but the experience cannot be described in the sense that it is not reducible to the extent that this is true, empirical generalizations about intense suffering can only be inferred from subjective observations or experiences. Yet, instances of national disaster such as Rwanda’s mass genocide, where upwards of a million people were killed with huge knives in 1994, beg to be understood within the quality of life (QOL) framework. Can such instances of mass suffering be reduced to established measures of negative-QOL? And can their effects be observable in national economic trend data? This study attempts to answer both questions using trend data from the Human Development Index as well as narrative descriptions of major national disasters such as Rwanda's 1994 genocide, Zimbabwe’s political violence and refugee crisis in the past decade, Japan’s 2011 earthquake and tsunami, and Tajikistan’s civil war after independence. In these instances of social and political chaos, we find evidence of significant economic downturns but not always in the aftermath of a disaster. And while we find considerable repugnance to the atrocities, world attention to a crisis is sometimes very short-lived or negligible. Speculations will be offered on how wide variation in global attentiveness to human atrocities affects the perception of QOL. This analysis is premised on the need for indicators of human progress that differentiate social change at the...
negative end, as well as the positive end, of societal attributes such as civility and social solidarity.

Purposefulness, a Key to Happiness in Selected Developing Nations

Researchers have long puzzled over the high level of life satisfaction, happiness, and optimism found in most Latin America and several African countries. In these nations, indicators of happiness and well-being are high but economic, education, and health indicators low. Existential psychology claims that meaning and purpose are the central ingredients of personal happiness. Research has found that Latin American adolescents have a stronger sense of meaning than other ethnicities. Observers of Latin American culture claim that close family relationships are a key to understanding the Latin American character: their social values, interaction patterns, and culture. This presentation applies the Gallup World Poll data on responses to the question “Do you feel your life has an important meaning or purpose.” Latin Americans were more likely than any other sector of the globe to say “yes.” A very large share of the people, 89% across all countries surveyed, claimed to have a purposeful life. None-the-less, there is enough variation across countries and regions, that the patterns add to our understanding of the role of purposefulness in people’s lives. Using data from the Human Development Report (HDR 2010), this paper shows that Latin American purposefulness provides a partial explanation for their extreme happiness compared to other global regions. On the other hand, perceptions of social support do not account for happiness or national well-being. If Latin Americans are more likely as individuals to have a sense of meaningful purpose in life, this probably translates into contentment and happiness. Large differences in meaning and social life exist both between and within Latin American countries, which will be examined as well. A taxonomy of meaningful purpose will be offered to help clarify the relationship of purpose and happiness.

Why Inequality Matters

Sociologists tend to assume inequality matters; economic liberals tend to assume it does not, saying inequality generates dynamic incentives in competitive markets. It is not that there is nothing to this argument, as regards mild degrees of inequalities. However grave inequality has a corrosive effect on social foundations. Why is it that there is a consensus of the need to eliminate poverty, but division over the need to address serious inequality? Beyond this, what are the key reasons for grave inequality being anti-social? This paper engages the economic liberal paradigm, arguing that grave inequality is as socially incapacitating as, and often constitutive of, extreme poverty. It makes a distinction between the ‘foundational’ problems of grave inequality and its consequential effects.

The foundational problems are that grave inequality: denies the social identity and agency necessary for realising the right to self-determination; blocks individual citizens’ active participation in society, necessary for democratic development; excludes citizens as respected members of society; and is constitutive of poverty and similarly incapacitating. The consequential problems (both as effects and as feedback to the foundational problems) are that grave and persistent inequality: is perceived as illegitimate and thus generates resentment, crime and insecurity; creates disadvantage in a range of key social fields such as education, health and social security; and it drives anti-social feedback effects by undermining social cohesion and entrenching inequity across generations. Identifying these principal or ‘foundational’ anti-social features of grave inequality, this paper argues, is important to building a broader on the idea that inequality does matter.

Deconstructing Racial Boundaries: Case Study of an Emerging Urban Movement in Tel Aviv

During the last few years, Israel has been witnessing an unprecedented level of racism against the African refugee community. Not only immigrants are racialized as the “threatening other”, but also the spaces they create and inhabit are codified as racialized. The marginalized low-income neighborhoods of South Tel Aviv, the new home of the asylum seekers, became the primary arena of struggles, conflicts, tensions and intolerance. I draw on ethnographic research conducted in South Tel Aviv, to examine the ways in which an emerging social movement, “Power to the Community” attempts to provide a radical alternative by constructing a bridge between the Africans and the veteran residents and thereby turning the “place of fear” into a “home for all”. I look at the innovative tactics the movement uses to reshape symbolic, relational, and physical boundaries in the community. In particular, I investigate the renewed victimization and vilification discourses and the ways in which the movement gives voice to insofar silenced concerns about the broader socio-demographic status quo within the city of Tel Aviv and Israel in general. I combine insights from work written on framing, tactics and innovation in the social movement literature with studies of NIMBY-ism and urban geography.

Analyzing the Internal Votes in the French Political Parties

Analyzing the internal votes in the French political parties

Since about fifteen years, the political parties multiplied the procedures of internal votes of their members. Then they opened primaries to the non-members. It aims for objective – at first – the revival, the innovation - and the consolidation - of democracy in political organizations. According to organizations, the project of paper suggests reviewing the diverse procedures of vote : nature of the electorate, objectives of the votes, chronology, modalities of vote, participation in intra-party elections, official results and analysis, possible disputes. Beyond an empirical research – which concerns procedures and electoral data – the paper will also review the evolution of the relations between the « party in central office » (politician elites) and the « party on the ground » that shows the development of these votes. Which changes introduces the development of internal votes in relations top-down and bottom-up ?

From a more theoretical point of view, it will be important to analyze how these procedures question the oligarchical tendencies of the parties. Besides, in what and how these procedures question the evolutions of parties analyzed more recently by A. Panebianco or P. Mair and R. Katz who underline a professionalization of parties or a monopolization of resources - of all kinds - by elites ?

Transforming the SnCF - French State-Owned Company : From Historical Unilateral Model to Multiparticulate Enterprise

Since 1970s, the French railway sector has undergone massive changes. The European institutions have demanded the opening of the rail transport market. The sector also faced competition by other means of transportation (especially trucks).

In this context, SNCF (the national state-owned railway company) endeavoured to adapt itself to policy reforms and the competitive environment. The company partially replaced its former model of development (based on public service à la française, i.e. offering low-price tickets and committed to egalitarianism) with a new model, identical to that of private companies. The new model transformed the internal functioning of the company (type of employment contract, pay scale, and nature of industrial relations) as well as market strategies (economic model, pricing strategy).

Changes introduced by the SNCF top management encountered resistance from employees, trade unions, transport users associations and some high-rank transport officials. The struggle between all these actors resulted into a hybrid organization of the railway sector. By now, each activity of the SNCF works autonomously; the various divisions of the company develop their own work modalities and have their proper representations etc.

What is the nature of this new heterogeneous organizational model ? How does national railway company, which transformed after structural improvements, strategic realignment, restructuring of networks and product offerings, internationalization, and efficiency improvements, adapted to structural shifts and uncertain economic and legal context ? Which divisions of the company are the most affected by change ?

This paper will attempt to answer these questions, by examining the deconstruction of an old organizational model and its transition and transformation into new one. Our focus, while analyzing the structural shifts, will be on the description of internal conflicts and representational gaps among different SNCF stakeholders and their effects on the functioning of the company.
The private sector plays an active role in implementation of mechanisms concerning the mitigation of climate change, including the Kyoto Protocol. In spite of that, the corporate actors play a limited direct role in international arenas when it comes to negotiating the design of climate regime. The climate governance United Nations system remains state-centric, but the active participation of corporate actors in climate policy regimes is essential to increase the efficiency of the climate governance. Business is not just a subject of a regulatory climate and energy imposed by the state; rather, business is an intrinsic part of the fabric of climate governance, as “rule maker”. This article analyses the role of the private sector— which has been played in the global climate governance. The focus of this study is an analysis of the ways in which the private sector responds to the agenda of climate change and climate governance. The private sector does not only play a “rule taker” role in the climate change regime, as it does not seem to act as passive observer. The results suggest that the private sector is able to play a key role in the changing architecture of global climate governance based on the principle of multi-stakeholder participation in global decision-making.

The Political, Economic and Social Crises and the Creative Sponsorship of Young People in the Carioca Slums – Rio de Janeiro/Brazil

This abstract arises from the extension of the research in Cultural identity performed since 2004 by University of Rio de Janeiro State (UERJ) with teenagers and youngsters at the Cartola Cultural Center (CCC), in Mangueria’s Favela. The main results are published in the book “Pink and Green Territory: psychosocial constructions at the Cartola Cultural Center”. Alongside the worldwide economic crisis, which has also ravaged Brazil in the form of a lower growth rate than expected, unemployment and violence, the city of Rio de Janeiro is experiencing a housing crisis of devastating social consequences. In the turn of the 19th to 20th century the occupation of the hills of the city began, giving birth to the so-called favelas. Since the beginning the favelas draw the attention of the government, which tried to come up with a solution to put an end to those types of dwellings. Despite government investment, they survived and today have more than 100 years of history founded on cultural and political creativity, and identity coming from: the period of its founding, type of occupation, economy, origin of its inhabitants and their relationships, not to mention the intense social life fostered by the cooperation and collective effort of the residents associations, churches and NGOs. The most recent chapter in the story of the favelas has been about the return of the State to the territories theretofore dominated by drug trafficking. In 2010, the occupation control of Complexo do Morro da Alemao*** was transmitted live by TV broadcasters from around the world with direct comments from residents using the internet. By using blogs and creating profiles and discussion forums, the young people of the carioca favelas put their stamp on, and build, creatively, a new perspective for facing economic, political and social crises.

Between Project Enthusiasm and Routine Demands: Conflicting Logics and Unintended Consequences of e-Health Innovation and Diffusion

For a long time, and in most corners of the world, great promises have been maintained from ICT innovations in health care, both in regards to quality and efficiency. A related challenge for social science has been to explain the details of ICT diffusion; what makes some ICT innovations succeed and other disappear. In studying a wide range of such innovations (e-health, telemedicine) and diffusion processes in Norway, we have identified a conflicting logic - between innovation enthusiasm and routine responsibility - as a major explanation of how promising projects only rarely are transformed into normal routine. Understanding the detailed aspects of project organisation and enthusiasm-based driving forces, and how these act as system correction/critique, is necessary to comprehend what needs to be done to make these projects work as intended. A thorough investigation of what innovation projects, in the making, bring with them on a managerial level in health care institutions. We have observed that the heterogeneity between innovation and routine within health-care delivery is handled by separating project management/funding from continuous organisational practice. While this separation eases both normal routines and innovative projects, it also delays expected diffusion. What may be technological successes may therefore be organisational failures. Unintended consequences from innovation projects - including learning and understanding action alternatives - are seldom bases for assessment. The paper suggests that a sociological exploration of logics, including financial, professional, technological, as well as organisational, needs to be tighter connected to innovation.

Andrejuk, Katarzyna* (Polish Academy of Sciences, katarzyna.andrejuk@gmail.com)

Defining National Belonging in the Post-National Era: The Case of Polish Repatriates and Privileged Naturalisation in Poland

European countries are subject to many processes which deconstruct the traditional category of “national belonging” and make the political community more inclusive towards foreigners (developing the category of the European Union citizens, mass migration flows). However, the notion of an ethnic community and the importance of ethno-national dimension still prevail. This is confirmed by political and legal measures, enacted by different European states which aim at equitable education for all students. Laws and policies have been implemented to address these concerns, yet inequalities and inequities persist. Policy implementation usually resides with those in education administration – a profession influenced by many different management and leadership theories. There are scholars who have argued for studies of educational administration that examine institutional processes, ways that schools and universities are organized, how services are delivered and such, however, few have considered the role that Institutional Ethnography (IE) can play in rethinking and reworking administrative practice. At the same time, IE scholars remain puzzled with leadership and management theories and practices as they relate to ruling relations and the organization and coordination of people’s everyday work, work that people in places like public schools do. The paper will explore the missed opportunities to show just how inequalities and inequities actually happen given current educational leadership theory and practice, and suggest ways to improve administrative practice and outcomes by including key elements of IE.
for some groups of immigrants coming to Poland. The analysis will focus on the normative features of the privileged naturalisation and how they are interpreted by state officials. Various conditions of being acceptable for privileged naturalisation are depicted in the Law on Repatriation and include a mix of objective and subjective criteria which refer to ethnic, cultural and historical aspects of a nation. The measures, addressed to the descendants of Polish exiles, indicate how the category of “belonging to a nation” is constructed on the political and legal level. The presentation, set in a comparative perspective, also aims to answer the question why the policies of privileged naturalisation are commonly accepted in some countries (Poland) and contested in others (Hungary, Germany).

ANDREJUK, KATARZYNA* (Polish Academy of Sciences, katarzyrna.andrejuk@gmail.com)

European Educational Migrants on the Labour Markets. Europeanised Professionals or Workers of the DDD Sector?

The presentation will investigate the question whether the higher education received in the host country facilitates immigrants’ access to the primary segment of the job market. According to a prevailing conviction and empirical research, immigrants are most likely to be employed in the secondary segment of the labour market, where they perform works which are described as “DDD”: dirty, dull and degrading. However, this finding may be inaccurate in case of educational migrants, who also work while they study and after graduation. The aim of this presentation is to analyse the situation on the foreign labour market and career paths of mobile Europeans who migrated to take up education abroad. This question is especially intriguing in the light of the European Union attempts to standardize the educational qualifications in Europe. I will explore the problem basing on qualitative and quantitative inquiry: interviews with Polish students abroad and data from POLPAN (Polish Panel Survey 1988-2013) questionnaires describing the situation of educational migrants from Poland to various countries. The findings will provide an answer to the question whether migrants who receive higher education abroad are able to overcome the pitfalls and limits, imposed on foreigners on the labour markets of the receiving countries.

ANDRIKOPOULOS, APOSTOLOS* (University of Amsterdam, a.andrikoopoulos@uva.nl)

Mobility, Family Life and European Citizenship: Marriages Between Legally Precarious African Migrants and Peripheral Europeans

Transnational marriage has become a door opener to international mobility and migrant legality and, as is well documented, aspiring migrants can achieve geographic mobility through marriage by claiming their right in family life. This paper examines the marriages between West African migrants and EU citizens in the Netherlands and analyses a reverse strategy in which international mobility is the means to secure family life and legality. The Netherlands, as many other countries, has imposed many restrictions on family migration (provisions for family reunification) making this process more selective, difficult and costly. Of course, these regulations apply only at the national level. At the same time, EU citizens and in extension their family members can exercise their rights to intra-European mobility, residence and employment. On that basis, legally unauthorized African migrants can legalise their stay in Europe either by getting married in the Netherlands to a non-Dutch EU citizen, commonly Eastern or Southern Europeans, or moving with their Dutch spouses to another EU country (often known as ‘the Belgian route’). In this pattern, marriage and family is not a condition that precedes international mobility but the opposite. citizens must move to another EU country in order to claim not as national but as EU citizens their right to stay and work in another EU country along with their family members. In this instance, European citizenship is valorized higher than national citizenship but in order for Europeans to make use of their rights as EU citizens they have to move out of their home country to another EU country. This paper examines ethnographic material collected in multi-sited fieldwork in the Netherlands, Ghana, and Greece and engages into a theoretical discussion over mobility, citizenship and marriage in the EU context.

Ethno Enclaves: Restrictions on Muslim Women’s Spatial Mobility

Abstract: RC 32 ISA

Ethno Enclaves: Restrictions on Muslim Women’s Spatial Mobility. There has been a visible increase in the incidents of violence against minorities, more specifically against Muslims, the violence itself has become more intense and frenzied. The minorities particularly Muslims are moving to areas where they are already in comfortable number.

Muslim women’s minority location qualitatively transforms their experiences and perceptions in very distinct way, since their community is one that particularly feels under threat and surveillance, the issues surrounding Muslim women’s access to the public and sexual safety become all the more complex. In fact, the restrictions imposed on Muslim women by their own com-munity are closely linked to the exclusion of the Muslim community as a whole. The fact that their entire community is looked upon with hostility and habitually fears violence, means that Muslim women not only have less of a chance to venture out of community boundaries but also that their movements and behavior are more closely policed by their families and their community.

This paper attempts to examine how being a member of a particular religious minority community impacts a woman's access, experience and negotiation of public space. Inquires The areas of concern in the paper are – whether living in ‘ethno enclaves dominated by their own community has a bearing on Muslim women’s spatial mobility; if the controls wielded by neo-fundamentalist groups limit their participation in public space; if wearing the veil in fact facilitates movement; how the issue of civic safety is framed in the context of Muslim women whose entire community’s safety is often at risk; and finally, in what way does their community’s growing exclusion from the everyday civic and political life of the city impact them.

The Second Mortality Transition: A New Look at Long Term Trends in Mortality Decline

Demographic transitions occur in stages. We argue that there have been two mortality transitions, and that the European and European-overflow countries for which reliable long-term mortality data exist completed the first stage of the
mortality transition around the middle of the twentieth century. In the first stage, or First Mortality Transition (FMT), from the nineteenth to the middle of the twentieth century, mortality decline occurred mainly at younger ages, survivorship to age 50 increased, and there was a secular growth in the rate of ageing (the rate of mortality increase) over and above that due to the decline in the mortality rate at age 50. By 1950, however, this transition was more or less complete, and the underlying level of survivorship to age 50 began to stabilise. In the Second Mortality Transition (SMT) the main weight of mortality decline thus shifted to older ages, above age 50, and the secular trend in the rate of ageing now shifted from positive to negative, offsetting the continuing decline in the rate of mortality at age 50. There are important differences between countries in the patterning of these changes, and in particular, the patterns differ for males and for females. However, the changes over time have been identical for both sexes. Analysis of country-level variations, by sex, will enable us to understand further the reasons for this shift from the First to the Second Mortality Transition and the differences in the pace at which it has occurred.

Lessons from Field Resistance

Close-up examinations of economic life are necessary to understand the complex dynamics and cultural meanings of commerce. But what happens when these inquiries apparently fail? Put otherwise, what happens when a scholar is faced against a grid and with strong resistance from field participants to the point of almost derailing a project? Relying on a comparison of forms of resistance in three field-settings that I investigated, my paper aims to draw lessons from field resistance that go beyond any given inquiry and argues that a better understanding of forms of resistance can advance our scholarly work. The diversity of settings discussed (e.g., an aeronautics factory, whole-body donations programs, and a business school) as well as the variety of forms of resistance encountered (e.g., aggression, threats, and silence) motivate, in part, this analysis. The first example entails a study of factory theft and centers on retirees of a French aeronautics plant. The second example is an examination of commerce in human cadavers for medical education and research in New York State. And the last example looks at faculty socialization dynamics at the Harvard Business School, one of the U.S. centers of business education. Overall, the goal is not only to classify forms of resistance in ethnographic inquiries, but also showcase how such a classification exercise illuminates the broader pursuit.

Sociological Evaluation of a Serious Game Designed for Building of Epistemic Competency of Military Students

Serious game applied in education and training is relatively new. Some skills needed for military action could be acquired through traditional (real) training methods, but, at the same time, as the computer games has been evolved, some skills can be obtained through the serious game as attractive and efficient method – virtual method. In terms of costs and risks, using a training solution based on a games scenario is also advantageous. This study evaluates a serious game (SG) that is being applied in a Romanian Defence University context. It was designed in order to enhance the epistemic competency of the future military commanders at all levels of decision making process. Evaluation is conducted summative, after development of it; the study examines whether the serious game is efficient, appropriate for training goals and well accepted by the learners. The findings provide evidence that serious game is genuinely beneficial for anticipated learning and training results and it could be used in future training process to assure required skills for new defence missions. Introducing games in the military training is based on all these advantages revealed through the evaluation.

The epistemic competency obtained using serious games can provide necessary knowledge to action in a real experience.

Towards a Multi-Plebiscitarian and Multi-Populist Collective Action?

Introduction

The aim of this paper is to analyze the transformation of populism and charismatic phenomena in contemporary societies. The argument is that the effects of diffusion of new technologies and structural changes in the functioning of social systems are ceding to increased fragmentation of democracy.

Main Results

Contemporary social, economic and cultural transformations have been driving society to both a new public sphere and relationship between populism and charismatic power. Simplifying analytically, on one hand, as a matter of fact, a layer of population, mainly old and/or with a limited cultural capital, lives (almost) exclusively inside the public space created by mass media, by other collective intellectuals and by the most important public intellectuals. On the other hand, following the prompt coming from new intellectual systems that operate through the Net, there is a multiplication of niches of consumption, of ways of living, of political opinions. The possibility of the synthesis declines in this new public sphere. On the contrary, the space of “charisms” grows up. In add, economic dynamics and neo-liberalism thinking makes a pressure to existence in decision-making processes: the myth of the “strong man” rises. Nevertheless, each kind of media advance a different kind of charismatic leaders: thus, we have got several charismatic leaders for each communication and social target group. Charismatic power is not more opposed to rational-legal power: a multiple charismatic groups and leaders represent the normal work of the post-democratic political system. Populism is universal style of this multiple-charismatic politics in contemporary societies. In fact, Populism is not only communication technique but a replacement demand of democratic participation too in a run-way world.

ANTONIONI, STEFANIA* (University of Urbino Carlo Bo, stefania.antonioni@uniurb.it)

The Advertised Crisis: How Advertising Is Facing the Issue of Social and Economic Crisis

This period is collecting different types of storytelling concerning social and economic crisis the world is facing with, depending on which media and which particular gaze they reflect. We can quote, of course, not only what the media, and especially those that operate in the new sphere, is telling us about crisis, but also movies, tv fiction, contemporary literature, and so on are depicting a shared frame on it. But it could be of particular interest analysing how advertising deals with this issue, particularly because it has to talk and engage consumers differently from the past and from its usual patterns. A traditional way to conceive advertising's message is based on the assumption that it has to create and develop a reality totally positive, where everything is at its best in every shade. This led J. Baudrillard to call this totally different reality “hyperreality”. But nowadays consumers aren’t so well disposed towards this kind of advertising that has to rethink itself in a different way, being more respectful and loyal with consumers, their lives and their feelings.

So I’ll mention in this paper different cases and different manners with which economic, social and political crisis enters also the advertising stories and became part of its narrations. We can call it synchronization between social system and advertising (Luhmann; Antonioni) and maybe it could be the right key to the effectiveness of the latter. So I can say that the semantic of crisis affects also advertising, its storytelling and its working routines at different levels that this paper will try to enlight.

"Is That Me?" Images of Ageing and the Underestimated Role of Active Ageing in Advertising

The concept of complexity is one of the most useful to describe contemporary society, because it implies also the leading role of communication and of its dedicated system, that is to say mass media system (Luhmann). But, or in accordance with this perspective, another helpful description could be the one that defines our society as based on images, referring to the primacy of the visual sphere. This premise leads us to consider the production of images not only as one of the most important for the reproduction of society, but also as one of the most

* denotes a presenting author. Abstracts are organized by first presenting author's last name.

Book of Abstracts XVIII ISA World Congress of Sociology
compelling for individuals and the construction of their composed identities. Following this theoretical background, we have to consider the role of advertising and its peculiarity of constructing an imagery ready to be socially diffused, but also the peculiarity of absorbing – sometimes – the ideas, perspectives and feelings emerging from society or different social groups.

In this sense, it would be of particular interest observing how advertising depicts the reality of ageing, if and in which manner gives back a heterogeneous picture of the different ways of being aged. This kind of research, in fact, tries to clarify which kind of imagery regarding ageing is offered and spread within society in general, but it could also test if the concept of active ageing is practiced in advertising. So in our paper we will present the results of a qualitative research on images (one of the main traditional research stream of visual sociology) (Grady), taken from the advertising field. The research results will concern the Italian context, trying to compare it with an international context and producing a specific typology. Is our aim also to test this typology with a sample of aged interviewees, trying to prove if they recognize themselves in it or not.

Psychological Effectiveness of Interactive Advertising in Russia

Purpose. The investigation was aimed to check the hypothesis that the interactive advertising is more effective than usual one. As the criteria of psychological effectiveness of advertising we allocated trust to advertising and active personal position. So the hypotheses were that during perceiving the interactive advertising the respondents show: 1) the higher level of trust; 2) the higher level of “active personal position”.

Design/Methodology. 109 respondents were tested online. The control group consisted of 43 people, and the experimental group consisted of 66 people. The experiment included three stages: 1) the respondents viewed the advertising in two variants: a) interactive advertising for experimental group; b) usual advertising for control group; 2) the respondents answered the questionnaire which included the questions about attitudes to the advertising and associations about advertising. The technique of A.Kupreychenko “The trust / distrust of person to other people, the world ‘yourself’ and the scale of psychological effectiveness of advertising elaborated by A.Kupreychenko; 3) 12 people were interviewed to get more information.

Results. The hypotheses were partially confirmed. We have shown that there is no difference in the level of trust to the interactive advertising as compared with the non-interactive one, but the respondents perceive it more personally, are involved into the interaction with the characters, and act as if it were the reality. We can conclude that the psychological effectiveness of interactive advertising is higher.

Limitations. It remains to be tested if the results will be the same for another countries and cultures.

Research/Practical Implications. The results can be used in the development of advertising products for Russian consumers.

ANUGWOM, EdlyNE* (University of Nigeria, Nsukka, okommmri@gmail.com)

The study focused on the impact of economic recession on labour conflict resolution under the military in Nigeria. The data show that the military presence did not significantly affect the labour conflict resolution scenario even though a combination of economic recession and repressive military rule produced a tense labour conflict situation in Nigeria between 1984 and 1992. Thus, there was no difference in the number of conflict, tools of conflict expression and mechanisms of conflict resolution between the pre-recession and recession periods. In spite of this, the data conceal the fact that the fear of military repression affected labour conflict and the economic recession had an inverse relationship to conflict. Moreover, the military in the period of economic recession made glaring use of corporatist strategy in caging labour. Insightfully, corporatism as a tool of labour-government relations has continued even in Nigeria's current democracy and has implications for the development of a responsive civil society critical in the sustenance of democracy and development.

The Uending Matrix: NEPAD, Globalization and African Development

The paper examines the development prospects of the continent in the prevailing globalisation order under the NEPAD. It argues that the NEPAD while in practice in pursuing the development question in the continent, a significant part of public discourse falls short of effectively coming to terms with the challenges of modernization and the position of the continent in the world order. Thus the NEPAD in spite of its lofty goals resembles in so many troubling ways a rehash of the modernization ideology of development that has been the bane of the continent since the 1960s. In precise terms, its goals even though well intentioned cannot be accomplished by the development vision it canvasses. In view of the above, the paper suggests that the NEPAD must relate radically to the historical and current constraints imposed by the prevailing international order or globalisation and in a self-reflective manner relate itself to the daunting domestic weaknesses and challenges confronting the continent. It must therefore envision a development process hinged on a focused and critical engagement with the external world on terms genuinely defined by Africans and African needs.

Societal Perception of Breast Cancer Amongst Elderly Women: Implications for Management and Intervention Programmes in Nigeria

The study drawing from a sample of over 1000 respondents in Southeastern Nigeria investigated the influence of socio-cultural factors on the perception of breast cancer amongst elderly women in Nigeria. It discovered a significant variation in perception between rural and urban respondents. However, a general lack of inadequate knowledge about the nature and impact of breast cancer was prevalent in both groups of respondents. The study also discovered that such social attributes as age, education and income are critical determinants of the perception of breast cancer amongst elderly women. Crucially the study found out that over 30 per cent of the respondents were unaware of the occurrence of breast cancer among elderly women. Also, a majority of the respondents were ignorant of the existence of medical services for early detection and management of breast cancer. The health belief model was especially relevant in the explanation of the perception of breast cancer. Thus, only women who feel susceptible to the disease take actions towards both detection and management of the disease in Nigeria. Interestingly, medical services for the disease were found grossly inadequate and professional social work services are scarcely available. Therefore, the perception of breast cancer amongst elderly women; and the extension of social work services beyond traditional concerns to include breast cancer management and care especially for the elderly who are often neglected from formal health provisioning in Nigeria.

Health Inequity Reduction in Thailand: On the Way Toward Healthy Public Policy

Recently, health inequity initiatives introduced by the World Health Organization emphasizes actions on social determinants of health with collaboration across research disciplinary and organizational boundaries in relatively innovative approach. The recent tackle of health inequity initiatives in Thailand, SIRNet – Social Inequity Reduction Network, illustrates a good instance of this kind of effort. This paper describes the development of the three years collaborative projects among five organizations in Thailand and its attempt to address social determinants of health and formulate a set of effective policy recommendations based on real-world problems in Thai context. The study examines working models across academic and organizational boundaries focused on researches linkage, professional practices, communities and networks creations, retraining medical services to focus on broad-based cancer services that include elderly women; and the extension of social work services beyond traditional concerns to include breast cancer management and care especially for the elderly who are often neglected from formal health provisioning in Nigeria.
Emergence by Design project, FP7-ICT-2011-C program. The DE approach is based on the complex systems approach and on the hypothesis that the iterative generation of feedback loops, contribute to the construction (and enactment) of shared narratives that can help in dealing with unpredictable settings, where goals and consequences are emerging and changing rather than predetermined and fixed.

SARDO, STEFANIA* (European Centre for Living Technology, stefania.sardo@unive.it)

Constructing Shared Narratives of Sustainable Local Development

Contemporary societies are facing and generating social and environmental crises, which involve multiple dimensions and different actors at various levels. Policies have to deal with them and guide communities transformations. Therefore, in developing as well as in Western countries, it is not just a matter of finding and providing financial resources, but to tailor them according to contexts and addressing communities' governance and capabilities building. Moreover, policies’ orientations and goals should always consider the consequences and transformations (material and immaterial) that can be induced by their implementation – and that cannot be foreseen a priori – and therefore should develop the capacity of being adaptive and self-reflexive. How to? And how can local communities participate in the design and implementation of their own change?

The aim of this paper is that of providing some theoretical and methodological reflections on how to conduct and proactively observe local development processes, focusing on two case studies based in Southern Italy’s mountain and rural areas: the Green Communities (GC) project, a one year long project, top-down driven, funded by the Italian Ministry of Environment and the EU, and Rural Design, a bottom-up driven project initiated by some of the political representatives, technicians and “active citizens” previously involved in the GC project. Through them we will discuss different orientations to sustainable local development, but also a new evaluation approach, the Dynamic Evaluation (DE), developed within the Emergence by Design project (FP7-ICT-2011-C program). The DE is based on the complex systems approach and on the hypothesis that the iterative generation of feedback loops contribute to the construction (and enactment) of shared narratives that can help in dealing with unpredictable settings, where goals and consequences are emerging and changing rather than being predetermined and fixed.

ANZOISE, VALENTINA* (European Center for Living Technology, valentina.anzoise@gmail.com)
SARDO, STEFANIA* (European Centre for Living Technology, stefania.sardo@unive.it)

Narrative Analysis of Local Resources Management

The aim of this contribution is to provide a methodological reflection on the following issues: how to frame and conduct local development and innovation processes dealing with cultural and environmental resources, and how to proactively observe them and evaluate their impacts? How to take into account all the people and organizations that will be affected by their consequences? To what extent the current trends in research and evaluation methods are providing outcomes and feedbacks that can be constructively used to design and implement policies?

The Green Communities project, a one year long project, funded by the Italian Ministry of Environment and EU, based in the mountain and rural areas of Italy, will be analyzed and discussed.

The broader aim of the project initiators was that of providing local communities with new tools and procedures to identify and manage natural and cultural assets, and to deliver pilot feasibility studies on buildings’ energy efficiency and functional sustainable management from where communities could start a sustainable process of change. Nonetheless, the project team underestimated the importance of communities’ engagement in the construction of a new collective perspective that could “ensure” they could take charge of the project’s outcomes after its official end of the project, in December 2012. Conflicting orientations and needs undermined the full deployment of the project’s generative potential.

Therefore, in the paper we will discuss the need for a different approach to innovation processes evaluation, the Dynamic Evaluation (developed within the Emergence by Design project, FP7-ICT-2011-C program). The DE approach is based on the complex systems approach and on the hypothesis that the iterative generation of feedback loops, contribute to the construction (and enactment) of shared narratives that can help in dealing with unpredictable settings, where goals and consequences are emerging and changing rather than predetermined and fixed.

ization of a group, and finally accounts for the collective violence. This paper applies Tilly’s perspective — identity-polarization nexus — to explain the choice of violent action forms by Korean student movements.

This paper conducts discourse analysis in three levels. At the first level, the statements and memoirs of the activists establishing new student organizations will be analyzed to reveal if inclusive/exclusive collective identity accompanies polarizing of student movements. And the second level, the statements on violent and non-violent events exercised by these student organizations analyzed will be dissected to confirm if the exclusive identity activates the violent actions. Finally, this paper examines collective identity of student movements under the authoritarian regime and the democratic regime to analyze its historical continuance and distinction.

National Leisure Policy in Japan from 1966 to 1974

In Japan the first national leisure policy was made from 1966 to 1974. Before 1966, it was a regulation of manners and customs. Moreover, it was divided vertically into divisions. However, in 1966 Japanese government began to pay attention to leisure as a social phenomenon. Finally, government made special leisure departments at the Ministry of International Trade and Industry (Tsuyoshi Sango Syo) and the Economic Planning Agency (Keizai Kikaku Cyo) in 1972. It had three purposes. First, in those days, rapid industrial development caused urbanization, rationalization and mechanization. Human alienation was increasing that juvenile delinquency was one of the social problem, and productivity at factories was falling. Government estimated that leisure can restore national humanity. Humanity was thought as the base of productivity and much pleasure from leisure activity expected to satisfy young desires.

Second, at that day, farming, fishing and heavy industries had been replaced by tertiary industry. That means Japanese government had to spread domestic market. For that purpose, government thought that leisure industry is a good new market. For that purpose, government thought that leisure industry is a good new

Lastly, the leisure policy is the start of “disciplinization”. In this policy, “Whole-some leisure” is an important keyword. Government assumed that tourism and sport were good leisure for people, but gambling and watching TV were type of unwholesome leisure, because they were decadent and defensive. In short, Japanese government tried to enlighten Japanese people in leisure policy. Today we are forced to have self-responsibility for our daily life and self-defense from social problem such as poverty. It is a result of national leisure policy from 1966 to 1974.

Climate Change Governance and Media: Media Exposure, Public Opinion and “the Most Important Issues,” By the Japanese Public

This paper explore the relationships among media exposure and public perception towards the climate change issues, to understand the role of the media and public opinion for better climate change governance of Japan. After the Great earthquake in March 2011, it is said that public has lost their interest with climate change issues, but for the Japanese government, the nexus of climate-change-energy option-nuclear power has been paid more attention than before. Using the results of our public opinion survey in 2008, 2012, 2013, and monthly survey from 2005, we discuss the role of media, economy, and nuclear power generations from the Japan’s climate governance point of view.

In addition to the earthquake and climate change, the perceived importance of the national and global economic situation also changed over time. During our survey period, the world experienced a serious economic crisis after the collapse of Lehman Brothers. These events with global impacts clearly revealed the environment-economy trade-off. After the earthquake and tsunami on March 11, 2011, Japan’s economic situation worsened. However, the nuclear accident at the Fukushima plant forced the Japanese people to think about energy issues, which are closely connected to climate change mitigation.

Reversal of the Gender Order? Male Marriage Migration to Germany By North - African and Turkish Men: New Forms of Gendered Transnationalization of Migrant Generations in Europe

Marriage migration is today the main possibility of legal migration from outside the EU to EU countries. Studies of marriage migration published in recent years focused on women of migration background. Although these studies all notice that men as well as women are migrating, there is no study focussing exclusively on migrating men in the context of marriage. My paper—in contrast—presents the results of an investigation regarding the phenomenon of transnational migration of male Muslim migrants.

My hypothesis is that this marriage migration does not necessarily have a traditional background. On the contrary: women of the second or third generation of well-integrated migrant families within Western EU countries are hoping for a realistic chance of establishing a family and bringing up children by marrying a partner from the country of origin of their parents or grandparents, while men notice that women as well as men are migrating, there is no study focussing exclusively on migrating men in the context of marriage. My paper—in contrast—presents the results of an investigation regarding the phenomenon of transnational migration of male Muslim migrants.

By means of the biographical analysis of narrative interviews with male marriage migrants from North Africa and Turkey and their spouses, the related ongoing research project at Frankfurt University (2011-2014) is dealing with the debates about problems of language and integration into the labour market, gender relations and dynamics within the migrant family, (un)changing conceptions and visions of manhood in migration processes and the contestation/negotiation of migrant masculinities.

Coping with Climate Change: The Role of Local Knowledge in Rural and Peri-Urban Communities in the Eastern Cape, South Africa

National and continental studies on climate change in Africa mostly measure the extent of climate change and its related impacts. Little attention is paid to how local knowledge helps communities to cope with adverse environmental conditions. Despite the wide-ranging contestations about the role of indigenous knowledge, studies conducted in Mexico and some Asian countries reveal that one of the factors that have increased people’s vulnerability to the adverse impacts of climate change is the low priority that policy makers and environmental institutions attach to indigenous knowledge, especially in the planning and management of climate change responses. This factor combines with others such as political

Disrupting Professional Hierarchies: New Interprofessional Collaboration Between Artists and City Planners

Urban projects are political, technical and social entities where public authorities and urban planners work with a growing number of stakeholders such as property developers, non-governmental organizations and citizens, who have different professional cultures and academic training. Thus urban projects are multi-actor systems where interprofessional collaborations occur at different levels:

- among professionals from different technical fields (architects, landscape architects, urban planners and engineers),
- among professionals of different affinities (public or private),
- among professionals from different competences (political, technical and social).

The relationships between these different stakeholders remain largely hierarchical in spite of the literature that advocates for collaborative and heterogeneous processes. A recent phenomenon, the introduction of artists to this system, not as a creator of art works in public space, but as an actor of the urban project process itself seems to shake up established order and existing professional hierarchies. This paper presents the results of a research based on five case studies where artists have worked with urban professionals on issues related to urban projects in France such as architectural heritage, uses of the public realm, risk awareness. We will first discuss on how the implication of artists in the project disrupts internal hierarchies inherent to political and administrative structures in charge of the project. How does the implication of artists transform relations within and between technical departments and among different hierarchical levels? We will then show how the artists question the relations between the contracting body and the service providers. How do artists (i.e. the service provider) manage their relations with the contracting body (i.e. the city officials) and his requirements? In which way this disrupts professional routines of the contracting body?

El Uso De Las Tecnologías De La Información y La Comunicación En El Alumnado Universitario

Introducción

Desde la generalización del término “nativo digital” (Prensky, 2001) se da por supuesto que las generaciones nacidas bajo la influencia de las nuevas tecnologías de la información y la comunicación (TIC) presentan patrones similares tanto en la comunicación interpersonal como en el proceso de aprendizaje.

Objetivo

Describir el uso y apropiación de estas tecnologías por parte del alumnado universitario, analizando su presencia en las actividades cotidianas así como en el desarrollo de su proceso formativo.

Metodología

Encuesta personal en una muestra aleatoria (N = 920) de la población matriculada en la Universidad Complutense de Madrid (España), curso 2012-13. Seleccionó según cuotas de sexo y área de conocimiento. Análisis estadístico mediante el programa SPSS v.20.0.

Resultados

Se evidencia un importante y constante uso de las TIC en la vida cotidiana, tal como el teléfono móvil de último año. No hay diferencias significativas según sexo o edad, siendo los indicadores parejos. Con respecto a la plataforma virtual de la Universidad, sí se muestran diferencias significativas en su acceso y uso según área de estudio: mientras que el alumnado de las humanidades y ciencias jurídico-sociales lo utilizan preferentemente para tareas de carácter administrativo (inscripciones y matrículas, consulta de agenda y calificaciones), los estudiantes de las carreras experimentales y técnicas lo emplean también para descargar material de lectura y apoyo en el proceso de formación, trabajar colaborativamente o participar en foros, chats o blogs mantenidos para la comunicación entre alumno-profesor.

Conclusión

Más que a la generación de pertenencia o al sexo, la utilización de las TIC está claramente asociada a la adscripción de los alumnos a una rama determinada de conocimiento. No obstante, nuestro estudio no permite conocer si ello es achaicable al perfil tecnológico docente, más débil quizás entre los profesionales de las humanidades y las ciencias jurídico-sociales, lo que resultaría en una menor motivación para su incorporación y uso generalizado por parte del alumnado.

Nose Picking in Vietnam: A Comparison of Colonial and Post-Colonial Practices

This paper clarifies the social perspective of youth subcultures with a focus on nose picking, a regularly observable occurrence in Vietnam. Elias said that in the civilizing process self-regulation is a gathering force and the act of nose picking is not perform in public. To better understand the reasons why nose picking is a regularly observable occurrence in Vietnam, I analyze content from Thanh Nghi, a magazine published from 1887-1945 during the French colonial era and created by Vietnamese intellectuals to further the spread of French civilizational ideals. This study has two purposes: first, it clarifies the role of Thanh Nghi as an intellectual proponent of French colonialism. Second, it explores different aspects of the civilizing process. By achieving these two aims, the study illustrates the effectiveness of the civilizing process in colonial society.

Youth Choosing Bad-Careers for Social Success: Youth Subcultures Referenced in Gyaru and Gyaru-o Tribes

This paper clarifies the social perspective of youth subcultures with a focus on members of tribes formed by youth referred to as gyaru and gyaru-o. The author spent 5 years participating as a member of a gyaru/gyaru-o tribe that conducted club events held in the streets. Afterwards, through 10 years of participation-based observation as a researcher, the author conducted quantitative research to form the following opinion.

These tribes practice heterosexual lifestyles, committing anti-social acts to the extent that will not result in arrest. They live lifestyles based on “bad” values and seek to gain attention through provocative means. They view these “bad-values” as a career that will lead to future self-realization.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
They believe that establishing both the “bad” career gained through their activities and an official career will lead to future social success. And they hold dramatic, story-like image for self-fulfillment wherein embracing these careers will lead to success in normal society.

The youth observed in this research have been deemed to be passive towards what is generally considered success in normal society. However, this research has shown that these youth are proactive towards self-fulfillment in terms of forming careers that will lead to future social success.

In previous research into youth subcultures where it is has been shown that youth believe their “bad-careers” as something that will benefit their success in general society, thus as something that transcends the framework of any phase or subculture.

However, this research brings a new view to youth subcultures research in showing that these youth view their “bad-careers” as something that will benefit their success in general society, thus as something that transcends the framework of any phase or subculture.

The Power of Wives of Merchant Families

In this presentation I will describe the wives of merchants in Osaka and the changes they underwent with the modernization of the merchant business. The Osaka area had been the center of business in Japan, Osaka has been known for commerce since the 16th century. Many people had come to Osaka to be merchants from about the 17th century to the middle of 20th.

Traditionally, the wives of the Osaka merchants had great influence and considerable power in the management of the family business. In Osaka merchant stores, the merchants’ families lived with their employees, and the workspace was also the living space. The wives of merchants had the role of caring for, disciplining, and managing the boy apprentices both in the house and the store. Especially, the women’s role of providing discipline to make the apprentices good merchants was very important for the family business. These relationships between the wives of merchants and the employees continued for a long time. Under these circumstances, it seems inevitable that women took on a dominant role in the management of the household, as well as the store. It was this merchant family system that gave them much power.

The merchants in the Osaka area continued to operate under this family business system for a period of twenty years (1900-1920), the end of the Second World War. However, as the merchants adapted to economic development, along with democratization and rationalization after the war, they chose the modern management system of separating their homes from the store. Owners and employees began living separately, and the roles of the husband and wife changed with the husband working and the wife staying home. As the stores became larger, the wife stopped being involved in the business and instead focused on being a housewife.

Mental Health of Immigrant Adolescents in Spain

This paper explores and explains migrant-native differentials in psychological health of adolescents in Spain. As a recent immigration country, research on integration outcomes in Spain is attracting, significant levels of international academic attention both because Spain was the second largest destination of international migration only after the US from 2000 to 2007 and the impact that the Great Recession is having among migrant families and other disadvantaged groups.

Our paper is inspired by a growing body of research from United States showing that Latin American-origin adolescents tend to show highest risks for mental health even after controlling for age, gender and socioeconomic status. Despite of the large number of Latin American immigrants in Spain, research on immigrants is underinvestigated and more importantly, research on mental health and psychological wellbeing of immigrant youth is particularly limited due to the absence of appropriate datasets.

In this paper we take advantage of a special data set, the *Chances* (2011) survey, which sampled schools and students enrolled in the 3rd and 4th grades of secondary education within the municipality of Madrid (n=2,734). The survey includes a large number of immigrants and information on the life of adolescents, including their mental health and other socioeconomic outcomes, relation with their families, friends and school mates. The Chances data also allows us to examine the impact of contextual factors such as schools and neighbourhoods. The data also include information about family conflict and other family characteristics collected from parents.

Our findings suggest worse mental health outcomes of children of migrant families compared native families in Spain. Using several indicators of mental health outcomes (e.g. difficulties to concentrate, sleep) as dependent variables, the paper examines the effect of parent characteristics, family conflict, and school and neighbourhood context on adolescent mental health.

ARAUJO, KATHYÁ* (Universidade Academia de Humanismo Cristiano, kathyaaraaujo@yahoo.com.ar)

Differentiation and Individualization

Social differentiation has been identified since the so called sociological “classics” (Durkheim or Simmel) as one of the most important structural features of the emergence of modern societies and modern Individual. The evidence of this theory has been thoroughly questioned despite by historians, and especially that by anthropologists. Departing from empirical evidence resulting from a study on individuation processes in current Chilean society, this paper aims to discuss in which sense and under which parameters it is possible to identify relationships, groupings and social differentiation. Based upon our results we will specifically discuss four theoretical – methodological issues: (1) The relationship between social differentiation and social complexity. (2) The sociological registers of individuality. (3) The relationship between structural changes and forms of individuality (in a sociological sense). (4) The meaning that the individual has to structural differentiation.

This discussion should lead us to the basic argument of this paper: It is necessary to interpret the sociological forms of individuality taking into account the plural modalities that structural complexity acquires in each society, and, consequently, the plurality of experiences confronted by individuals. This does not imply that everyone is modern, as supporters of globalization or multiple modernities due to different reasons seem to affirm. This demands us to understand how in every society, at present or in the past, at the “center” or at the “periphery”, social structures - due to their distinctive features in each one of them - induce divergent social forms of individuality. The former implies that we might understand the foundational sociological narration about differentiation and individualization simultaneously as a general interpretative model and a very specific historical path.

Gender Wage Gap: The Impact Of Capital Human, Cultural and Social Capital

The average wage gap between men and women is well known. The wage inequality between men and women across the income distribution is, however, an enigma, at present or in the past, at the “center” or at the “periphery”, social structures - due to their distinctive features in each one of them - induce divergent social forms of individuality. The former implies that we might understand the foundational sociological narration about differentiation and individualization simultaneously as a general interpretative model and a very specific historical path.

Differentials in Labor Market Outcomes in Brazil – 2000-2010

In past research (Guimarães, Barone, Alves de Brito, 2013) we argued that the transformations that the Brazilian labor market went through in the past 50 years (from 1960 on) meant the consolidation of a movement towards “marketization” of the labor market. This movement seems closely related to an estimated 60% of the population that counted the plural modalities that structural complexity acquires in each society, and, consequently, the plurality of experiences confronted by individuals. This does not imply that everyone is modern, as supporters of globalization or multiple modernities due to different reasons seem to affirm. This demands us to understand how in every society, at present or in the past, at the “center” or at the “periphery”, social structures - due to their distinctive features in each one of them - induce divergent social forms of individuality. The former implies that we might understand the foundational sociological narration about differentiation and individualization simultaneously as a general interpretative model and a very specific historical path.
shows how, in a scenario of employment retraction, the sex and color attributes tend to have a very important role in determining wage differentials, we wanted to analyze how the effects of those attributes vary in a context of increasing formal employment, like we observed in Brazil between 2000 and 2010. With our current research we had seen that the chances of labor market participation between women had drastically changed and with this proposal we want to go further in that investigation in order to access what kind of effects this change in the chances of entering the labor market meant changes in labor market outcomes between men and women.

Preparing for a Career in the Sociology of Aging

Session Organiser: Sara Arber, Professor of Sociology and Co-Director, Centre for Research on Ageing and Gender (CReAGH), Department of Sociology, University of Surrey, Guildford GU2 7XH, Surrey, UK (s.arber@surrey.ac.uk)

Session Chair: Anne Martin-Matthews, Professor of Sociology, University of British Columbia, 6303 NW Marine Drive, Vancouver, BC, Canada. V6T 1Z1 (amm@mail.ubc.ca)

Abstract: This session is targeted to trainees and early career researchers in the sociology of aging. A panel of RC11 members (with editorial board experience and experience on research grant making bodies) will make brief presentations on key issues in successful publication and grantscraft in the fields of sociology of aging and in social gerontology. Issues of disciplinary strength and multidisciplinary collaboration are discussed.

Confirmed presenters:
Merrill Silverstein, Syracuse University, USA; Editor, Journal of Gerontology: Social Sciences
Christina Victor, Brunel University, UK; Editor, Ageing & Society
Anne Martin-Matthews, University of British Columbia, Canada; past Editor, Canadian Journal on Aging
Sara Arber, University of Surrey, UK; Co-Director, Centre for Research on Ageing and Gender; Member of various Grant funding bodies.

An open discussion session with opportunities for input by all session participants follows.

Sleep As a Potential Mediator Between Marital Status, Marital Relationship Quality and Health

A wealth of literature suggests a link between marital status and health. Consistently, and across populations, evidence has shown that married people live longer, happier, and healthier lives than their unmarried counterparts. However, much of this literature has conflated marital status with marital quality and nearly all studies have ignored the role of sleep as a potential mediator. This paper examines the following research questions: (1) How is marital status and marital relationship quality associated with health in the UK? (2) How do marital status and marital relationship quality influence sleep? (3) To what extent does sleep mediate the link between marital status, marital relationship quality and health, and how does any mediation by sleep differ by gender?

The paper analyses data from a nationally representative UK survey (Understanding Society, n=34421), 2009-10. Mediation models are run using SPSS. The independent variable is a derived variable which merges marital status with a ‘perceived quality of relationship’ scale (giving the categories, ‘single’, ‘married and in unhappy relationship’, ‘married and in happy relationship’, ‘separated but legally married’, ‘divorced’, ‘widowed’, ‘lives with partner and unhappy’, ‘lives with partner and happy’). The dependent variable is self-reported health. Findings highlight how significant the role of sleep plays as a mediator differs for men and women. This is most notable for those who are divorced, where sleep takes on a greater role in the pathway for women.

Changes in Exposure to Industrial Air Pollution Across the United States from 1995 to 2004

At the basis of a large part of the environmental justice literature is an interest in understanding how exposure to industrial toxins varies by race and class in the United States. However, since the beginning of this field deindustrialization has created dramatic declines in industrial air pollution, the toxicity levels of these pollutants, and shifts in the spatial patterns of racial and economic groups. Current work in this field has rarely taking these trends over time into account. Because environmental justice theories in this area are based on industry and how it puts some populations at risk more than others, to understand how these industries are changing over time is important for evaluating the continued usefulness of current environmental inequality theory. This paper addresses these limitations by examining the annual exposure to 572 industrial chemicals weighted by their toxicity to human health across the United States for the years 1995 to 2004. Results show that greater socioeconomic success does not translate into increased protection from exposure to industrial toxins in the same way for African-Americans, whites and Hispanics. These results provide an argument to amend current environmental justice theory to consider how federal environmental regulation of industry interacts with changes in demographics.
Life-World of Youth in Japan: Focusing on the Social Attitudes and Social Consciousness

It is often pointed that the transition process has become unstable and the individualization has become one of the dominant key words in modern society. And it is said that the individualism and individuality among people has become serious issues. With these as a background, this study focuses on social attitudes and social consciousness of young people in Japan, for the purpose of understanding more about their current life situation.

The data we use is Youth Cohort Study of Japan (YCS), which monitors the educational and occupational trajectories of young people and surveys their attitudes once a year in autumn. With this data, we analyze sense of self-responsibility, praise of meritocracy, a feeling of dissatisfaction with the government and/or social welfare system, recognition of opportunity and needs for redistribution. And we consider who might be more precarious and difficult situation among the young people.

To analyze the differences among the young people, we focus on some factors, such as gender, educational background, job status and trajectory patterns. Then, we get some findings from the analysis, for example, levels of sense of self-responsibility increased during 2008-2011 especially among secondary school graduates and jobless people, who were less satisfied with their current situation. We can see that some young people who experience difficulty might strengthen the consciousness of self-responsibility instead of sense of social welfare and redistribution.

Practices for Fertilization of Life in a National Sanatorium for Hansen's Disease

The purpose of this study is to clarify the various aspects of communal life practices of patients in a national sanatorium for Hansen's disease in Japan. I take up an example of small groups which lived in a national sanatorium called Touhouki Shinsen-en in the 1960-70s in order to describe the characteristics of communal life practices of the patients under heavy segregation policies.

The Japanese government's policy towards the patients of Hansen's disease was very cruel in the past. Almost all these patients were obliged to be segregated in national sanatoriums. However, the patients kept struggling for creating better living conditions. In order to make this sanatorium a better place, they had recourse to various activities among themselves, often taking informal, sometimes even non-admitted methods.

Besides clarifying the processes of the creation and development of such communal life practices, this study also examines the effects and meanings of these practices for the participants. The case in this study shows light upon that these hopes with other patients, (3) the third one pertains to the extension of their living area by making contacts between patients and non-patients. By understanding the meanings of these practices through which the patients of Hansen's disease attempt to fertilize their lives, we become able to explore new aspects of their extremely difficult every-day life.

Figuring out the "Figuration" of the Kishiwada Danjiri Festival

The purpose of this paper is to clarify the "Figuration" (Elias 1969) of the Kishiwada Danjiri Festival, focusing on its management, by tracking competition within and around the organization as well as the members' career paths in the festival.

The Kishiwada Danjiri Festival is one of the most famous float festivals in Japan, known for its dangerous performances. Running in rhythm to the music of bells, flutes and drums, about a hundred people tow the three- to four-ton floats (named danjiri) as fast as possible. The highlight of the festival is called Yarimawashi, wherein the float turns the corner without slowing down. To achieve the perfect Yarimawashi, the team members are required to have strong ties of solidarity and flawlessness techniques.

The festival is managed by two organizations, one that tows the float and another that controls the whole festival. The former is called cho-nai, which recruits members from neighboring districts to perform Yarimawashi; the latter is called nen-ban, which selects and associates members from the cho-nai organizations to run the festival. Examining these two organizations, the cho-nai organization is vertically structured, based on seniority, and the nen-ban organization is horizontally structured, based on the members' careers.

This paper analyzes every aspect of competition between organizations, groups, and individuals. Because the festival is run by two organizations, a unique and original career path is created and produces "festival-elites." These elites alternate between and experience both organizations to develop a network and skills by competing with others, to obtain "capital" and become the future leaders of the festival.

In addition, we reveal that the mechanism of this festival has a nested structure in which competition and solidarity coexist. This paper shows the figuration of the festival as a complex and dynamic cultural event.

Further Thoughts on Developmental Patterns in the Islamicate Civilization

At the last World Congress of Sociology in Gothenburg, I proposed historicizing our paradigm for analyzing the relation between Islam as a world religion and the Islamicate civilization that grew around it from the Nile to the Oxus. Among other things, the proposal required moving away from the monistic and ahistorical, one ideal-type one-religion approach followed by Weberian, and applying instead Max Weber's own notion of developmental patterns to axial civilizations in their formative period(s) and beyond. In this paper I explore the implications of this historicizing approach in connection with a pluralistic conception of axial—in my case, Islamicate—civilizations as consisting of normatively autonomous (eigengesetzlich) domains, each with its own developmental pattern that can interact or conflict with those in other domains. Each domain, is furthermore, capable of engaging in encounters with other civilizations largely in its own terms. I will illustrate my analytical framework with examples from the interlinked religious and political domains concerning the legitimacy of monarchy and the normative regulation of power and order. My aim will be to demonstrate how these two domains are brought into a measure of meaningful consistency (Sinnzusammenhang) in the context of the historical contingent developments in the Islamicate civilization.

ARJOMAND, SAID* (Stony Brook University, said.arjmand@stonybrook.edu)

Revolution and Constitution-Making in the Arab World and Iran

Considering constitutions as the formalization of the political reconstruction and the establishment of new ruling bargains for regimes, constitution-making in the three countries where the Arab revolution of 2011 succeeded in toppling old regimes: Tunisia, Egypt and Libya. The paper compares the pattern of constitutional politics in these countries as the struggle for the new political order among competing social and political groups and institutions that will entrench
the emerging ruling bargains by making new constitutions. The comparisons are centered around four sets of variations: variation in the traditions of the rule of law and those in the character of the old states and the power structures sustaining them, a distinction between negotiated revolutions, where the old state persists and negotiate a new ruling bargain with the opposition, and the ones in which the opposition is destined and the revolutionary power struggle among competing groups determines the outcome of the revolutionary process. The mode of negotiation for the new ruling bargain differs considerably in the two cases. Tunisia and Egypt fall into the first category, Libya, in the second. The last comparisons concern the constitutional placement of Islam between Iran and its Islamic revolution and the 1979 Constitution of the Islamic Republic of Iran, and the role of the Islamist parties in the constitutional politics of the Arab revolutions of 2011. The Iranian constitution was based on a clericalist Islamic ideology that made Islam the basis of the new political order and its constitution, whereas, with the passing of time and the possibility of Islam being proposed by the Arab Islamist parties in the suspended Egyptian Constitution of 2012 and in the Tunisian constitutional laws as a limitation on the legislative power of the state and not the basis of a new democratic political order.

ARMESTO, ALEJANDRA* (Universidad Autónoma Metropolitana, alejandra.armesto@gmail.com)

Voters' Mobilization Where Partisan Attachments Are Weak. Mayors and Electoral Mobilization in Mexico

Political parties are expected to play a central role in mobilizing citizens to participate in elections. Are new democracies, where party arrangements are weak and parties and elections might lack legitimacy, the absence of a stable party membership makes canvassing efforts more difficult. In nascent democracies that have undergone decentralization, electoral mobilization is likely to rely on local level politicians, who are responsible for providing basic services crucial to citizens' well-being. I explore this proposition by looking at the influence of mayors on electoral results in Mexico, a polity that has recently experienced transition to democracy and remarkable fiscal decentralization. Because of their expenditure responsibilities Mexican mayors have comparative advantages relative to other local politicians who are not directly responsible for delivering policy benefits (e.g., local legislators and city council members). Besides, mayors who perceive closeness to their constituencies, mayors are stronger vote brokers than local politicians with executive powers but whose constituencies are larger or more diffuse (i.e., the state governor). The hypothesis is tested by analyzing the effects of mayor's party on the electoral results obtained by the three main Mexican parties, PAN, PRI, and PRD between 1990 and 2012 in all elections (federal, local, executive and legislative). The analyses control for the socio-economic determinants of the vote and for historical voting trends. The causal mechanisms are explored through in-depth interviews with 20 local politicians. The results show that mayors have a positive and significant effect on the vote shares obtained by each party in all elections. These findings contribute to the discussion about voter mobilization in new democracies.

ARMENIN, ILKKAA* (University of Helsinki, ilkka.arminen@helsinki.fi)

On the Sociological Relevance of Ethnomethodological Conversation Analysis

Ethnomethodological Conversation Analysis has occasionally been criticized of lack of sociological relevance. However, I will suggest that it has minimally sociological potential because of three grounds: 1) ability to identify and detail social action, 2) ability to discover and analyze micro linkages between action and social structure, and 3) be sensitive to social change by identifying new kinds of actions. CA analyzes the ways in which participants in interaction form a joint focus of attention, where the perception of perceiving formation of a joint focus forms the basis of a joint social action in election. Therefore, the analysis of a sequential accomplishment of action in interaction allows CA to explore emerging social actions. Most of the CA studies decipher and reverse engineer the constitutive sociostructural resources for the activities in interaction, they themselves provide evidence of the structuration in force. The analysis of the ways in social structures become demonstrably relevant and consequential for formation of action, provides CA's answer to the duality of social structure, i.e., that structure exists only through its structuration (e.g. Knorr-Cetina on global micro-structures). The sensitivity to the defining details of the constitution of social action enables CA to become sensitive social action. Following strictly its procedures, CA ends up describing in detail the semiotic resources that become relevant in the formation of situated social action. This situated sensitivity to details of social action makes possible to discern new kinds of actions indicating social change, or its potential (i.e., Licoppe on connected presence, Kitzinger on heteronormativity in interaction).

Online Screen-to-Screen Interactions and Their Interface to Face-to-Face Interactions

The development in the analysis of social interaction in the 1960's was made possible by a meeting of intellectual advancements and emerging new data management technologies. Currently, online social interaction still waits for a formulating of research interests that would transform the abundance of new data into sets of findings. There is not yet available any systematic methodology for the scrutiny of online communicative behavior. I will focus on three central interrelated issues: 1) the construction of an online communicative act, 2) the nature of screen-to-screen interaction, and 3) the interface between screen-to-screen and face-to-face interactions. The establishment of a research field requires a distinct perception of the research objects, that is, the units of analysis, a theory about their systemic relationships and positioning of the field within established fields. For instance, the well-known simplest systematics of turn-taking (1974) formulated conversations as a research object consisting of turns at talk with systemic relationships, and a relative autonomy. As for online communication, we may explore the sequential units, such as turns in a chat or a forum thread, as independent units. Alternatively, the communicative acts may be inspected contextually as a part of a situated offline activity. Both positions are sustainable, but distinct and alternate. It would be tempting to unite them, but that may not be feasible in terms of resources, or efficacy. As for the systemic relationships between online communicative units, Karen Knorr-Celina's notion of synthetic situation is fascinating providing some methodological hints for the advancement of the area. Finally, irrespective whether we start from the autonomous units or contextual reflection, we end up inspecting the embeddedness of online interaction to offline world, which forms the ultimate challenge for studies on online communication. Instead of a final solution, I will discuss some examples with the help of which we may address the interface between screen-to-screen and face-to-face interactions.

ARMSTRONG-HOUGH, MARII* (Meiji University, majoh@meiji.ac.jp)

Performing Prevention: The Construction of Risk and its Consequences in Japan during H1N1 2009

Japanese policy makers and health care providers mirror American Centers for Disease Control (CDC) recommendations for most public health matters, frequently citing them as the gold standard for best practices. In the case of influenza, however, standard Japanese recommendations and practices significantly diverge from the U.S.-based recommendations. While the CDC recommends that individuals wash their hands frequently and avoid contact with infected people, the Japanese medical associations add frequent gargling and the use of surgical-style masks. The order of priority groups for immunization have also historically differed. Drawing on approximately 89 semi-structured interviews with patients and medical professionals in Japan and ethnographic fieldwork during the H1N1 outbreak of 2009, this article elaborates on the work of theorist Anthony Giddens to examine continuing differences in prevention practices in the face of communicable disease outbreaks like H1N1. The concept of risk creates the possibility for prevention—behaviors intended to "reorganize the future of suffering" (Frankenberg 1993); Giddens calls this the "colonization" of the future (Giddens 1991: 111). But the risk society also necessitates the development of techniques for maintaining ontological security. I argue that faith-like acceptance of recommendations produced by systems of expert knowledge such as medicine and public health is one way to maintain ontological security when normalcy is interrupted, as in the pandemic H1N1 influenza outbreak during 2009.

A Study of Organizational Coping and Resilience: An Academic College Under Fire

Our research is a case study of organizational coping with a state of war at an academic college in Israel's northern periphery. We defined this situation as an unexpected crisis caused by an external factor beyond the college's control. The study focused on the coping processes initiated by college leaders in their attempt at crisis management. A qualitative retrospective case study design was chosen to explore the ways in which the different sectors in the college perceived,
experienced, responded to and influenced the organization’s efforts to deal with and adapt to the threat. Our goal was to describe the organization’s coping during the crisis situation by tracing the chain of events, the stages of crisis management, understand issues related to leadership and analyzing the fulfillment of major tasks involved in dealing with crisis and uncertain situations. Based on gaining insights through understanding the main themes of this case study we sum up what we have learned and propose practice guidelines for future situations of organizational crisis of uncertainty.

Organizational coping under uncertain and risky circumstances is a recognized topic for research and discussion. However, coping by an academic institution under fire is a rare topic for academic research and discussion. Unfortunately such situations are not unusual in many war regions throughout the world. By this study we throw light on an important topic in higher education managerial policy. Such case studies along with comparative studies of this topic may contribute to the understanding of this unique phenomenon.

JS-32.4

ARNON, SARA* (Tel Hai College, armons@mgamla.co.il)
Relocation of Families after Uprooting with and without the Help of Community

The paper deals with the question: Does the community’s social capital strengthen the practical resilience and emotional wellbeing of its citizen families and support them to establish psychological and social harmony in their lives after a traumatic stressful event? This question was investigated among Israelis who were evacuated from their homes and communities as part of an Israeli government peace process initiative. Some of the families chose an individual way of life after evacuation and most of them relocated with their former evacuated community friend families. The research compared these two groups, investigating their success in recovering from the evacuation trauma and effectively adjusting to the change in their lives. Data was collected by face-to-face mixed structured and open interviews with a sample of 120 people.

The general finding was that the “individualistic” group coped better than the “community” group, both with the practical aspects of life such as working and building a new life, and with the emotional wellbeing ramifications of uprooting. They approached a new sense of balance in their new lives earlier than those who chose to conserve the community continuity.

Thus, in contrast to general theory, a community is not necessarily a guarantee in advance for better coping of families with situations of pressure, stress, and crisis. Its embrace may be double edged and may have two different contradicting influences: It may be a positive influence which strengthens and empowers its members. But it also may be a restricting element that limits and inhibits flexible and innovative functioning and may inhibit establishing new healthy psychological and social life.

The Leisure Commons: The Making of a Democratic and Global Fantasyscape in the Digital Age

Within the United States, there are now more than 400 ‘Disneyesque’ amusement parks and if we are to look at Europe, we would find 300 such parks scattered across its terrain. Even the emerging markets have jumped on the bandwagon, in spite of their economic slowdown and continuing issues with infrastructure. At least eight theme parks have opened or are scheduled to open in West Africa on, in spite of their economic slowdown and continuing issues with infrastructure. Eastern Region (DONER) openly declared India’s North-eastern region with its undulating topography containing numerous perennial rivers (such as the Brahmaputra and Teesta) to be India’s future powerhouse. This region has a hydroelectric power potential to generate 34,020 MW and governments are pursuing a hydraulic model of development for financing human development and alleviating poverty.

More recently, much debate has been engendered on how green are dams and hydropower? Do dams and hydropower projects constitute a renewable source of energy and exemplify sustainable development? This paper reviews the inter-connections between global and local contours of this debate, and the impact of resistance to dams and hydropower projects on the local-global perception of hydropower as solution to the energy crisis. Based on fieldwork and review of relevant literature, I analyze the hydropower projects located in Sikkim, Manipur and Arunachal Pradesh located in Northeast India to understand the divergences in the development vision of the government and the affected local ethnic groups. On the one hand, the power companies, development experts, and the government are advocating the hydraulic model of development and energy security, while on the other hand there is a vocal criticism of such policies and programs by various other experts, environmental activists, and the affected locals (villagers and tribes) whose land and rivers are proposed or already have been acquired and nationalized. This paper highlights the competing visions of poverty alleviation and energy security and the contradictions within the trope of environmentalism and its effective use as a tool for imposing and resisting hydropower projects.

Is There a Digital Divide Among University Students?

Introduction

Under the term “digital native” (Prensky, 2001), it is widely accepted that generations born into lives heavily influenced by extensive and intensive use of information and communication technologies (ICT) have similar patterns in interpersonal communication as in the learning process.

Target

Describe the use of ICT’s by university students, analyzing their presence in their everyday activities and in the development of control of their learning process.

Methodology

Personal survey research conducted using a random sample (N = 920) of students enrolled in the Complutense University of Madrid (Spain) in the academic year 2012/13. Students were selected according to gender quotas and area of studies. The statistical analysis was performed using SPSS v.20.0.

Results

The results show a significant use of ICT in everyday life e.g. the use of smartphones and households’ availability of various devices (pcs, laptops, tablets). No significant differences according to gender or age were found. Regarding access to the virtual platform at the University, it shows significant differences in their use depending on their area of study; humanities and social science students use it mainly for administrative tasks; students in the experimental and technical degrees also use it for support for the training process, collaborative work or to participate in forums or blogs maintained for communication between students and teacher.

Conclusion

Rather than the generation or gender they belong to, the use of ICT is associated with the assignment of students to a particular branch of study. However, our study does not reveal whether this is attributed to the background in the use of technology among professors, which is perhaps weaker among professionals in the humanities and social sciences.

Cuerpo, Subjetividad y Construcción De Identidad En La Vejez Avanzada: El Caso De Adultos Mayores Físicamente Dependientes

El estudio explora la dimensión subjetiva del cuerpo en la vejez y su relación con la conformación de la identidad individual y social en adultos mayores que cursan estados de dependencia física y falta de autonomía para las actividades básicas de la vida diaria. En la vejez, el cuerpo se le relaciona principalmente con la enfermedad, con la falta de capacidades necesarias para la formación de la identidad que representa el cuerpo. En nuestro estudio, la discapacidad y dependencia física, como consecuencia de la enfermedad crónica, producen un cuerpo frágil de los ancianos, cuyas imágenes se construyen en torno al dolor, a la falta y/o deficiencia. Desde la metodología cualitativas, se emplearon entrevistas profundas a 20 hombres y mujeres mayores de contextos rurales y urbanos. El análisis de los significados del cuerpo, en los participantes, se centró en torno a la relación discurso/enfermedad/representación del cuerpo, en los cuales destacaron aspectos subjetivos (imágenes, representaciones) y aspectos objetivos (enfermedad, limitaciones funcionales). En los resultados, el uso de metáforas, para expresar la imagen corporal y cómo la representan, da cuenta de la percepción que tienen de su cuerpo enfermo y la constante lucha con un "ideal" del cuerpo que predomina de manera hegemónica en nuestra cultura y que ellos han dejado atrás hace muchos años.

ARRUABARRENA, BEA* (Université de Paris 8, arruabea@gmail.com)

Augmented Self: Digital Quantified-Self Practices As Socio-Cognitive System of Self-Regulation

With the evolution of mobile technologies, digital quantified-self practices have increased considerably, particularly in the field of health (to record walk, weight, sleep, etc.). The measures of self and its performance are not new. The fields of Sport and medical Self-tracking (Wiederhold, 2012) have included the value of these practices for a long time. The new is their generalization to the general public, and their features more and more simple and sophisticated of recording, storing, datavisualization and sharing data to evaluate its progressions and to change their own behaviors (Arruabarrera & Quettier, to be published). The Quantified self is a new form of self-attention (Pharabod, 2013) mobilizing the body and human cognition mediated. It is first an act of measurement to digitalize body and cognitive data. But it is also a "performance experience" over time linking, lost to yourself, and the peer to your society (Escobar, 1967). On the one hand, Quantified self crystallize"successes states of self" (Bergson, 1888), usually invisible in the stream of consciousness. On the other hand, thanks to the features of sharing data, the relationships peer-to-peer between users through social networks have a significant influence on motivation, but also on the ability of users to change (Lewin, 1967). The QS-technologies allow users to reclaim their social time, and in the reflexive way, their biological, cognitive and social rhythms. This communication will expose a research program based on the ethnographic study of digital quantified-self practices as socio-cognitive system (Quettier, 2007). This approach to the embodiment of the dualisms between body-mind to focus on the self as a mode of knowledge. The aim of this research is making sense to how are articulated socio-technical and symbolic mediation in the self-regulation, and in wider sense the construction of self.

Personnel of Innovative Economy: The Search for Solutions

An innovative economy demand from employee to:
-ability to work in conditions of uncertainty;
-the ability to find creative non-trivial solutions;
-skills for work in a team;
-aiming at result (result orientation);
-ability and willingness to training throughout their working activities.

Obviously, the system of general and vocational education doesn't give such competences; it is not its main task. Using the test and examination scales, it only fixes the academic progress and intelligence, believing that this is sufficient for a professional career.

Where and how to generate the desired qualities of an employee? What conditions and skills are necessary for their formation? J. Raven, investigating the formation of competency, highlights some of the necessary conditions. According to J. Raven, the main condition is developing environment. In this paper we would like to show the first practical results of the implementing of social policy aimed at improving the quality of labor potential, on the formation of employee competencies required by the innovation economy. To achieve this goal, the city Novosibirsk has created a municipal institution “City Center project creation” for the implementaion of the program “Early training of innovative personnel”.

In this program, 700-750 school students and 250-300 students of various higher education institutions of the city annually participate.

During the project sessions to solve the paradoxical task participant is in a situation of uncertainty. Resolving the contradiction contained in the task, the student learns to:
- to form an opinion;
- to perceive the opinion of the opponent;
- to conduct discussion taking into account opinion of the opponent.

According to the results of the program can be unambiguously talk about the growth of intellectual and social activities for studying youth and a realization of its creative potential.

ARTEAGA BOTELLO, NELSON* (Fac Latinoamericana Ciencias Sociales, arnelson@yahoo.com)

Footage Surveillance, Social Sorting and Crime Narratives

The use of surveillance footage by the police for solving crimes is discussed here focusing on marginalized neighborhoods. It examines how the processes of stigmatization and criminalization of these sectors are justified as well as explaining their social sector condition of being at “constant risk” or “unavoidable risk”, depending on the social environment in which they live. This enables a discussion which tends to naturalize the violent conditions they suffer through. This discourse contrasts with that which is constructed for other social sectors, in which victims are perceived as having a status of “avoidable risk”, while their vulnerability is attributed to “external” factors to their way of life.

The 132 Movement in Mexico: How Students Changed the Presidential Election

This paper examines how a political performance becomes an effervescent social space that feeds the formation of binary discourses in electoral confrontations, and how this opens doors to political change. It is intended to establish the force of an event within the hierarchy and political structure; how the influence of political performance can reach a broader social scale. It analyzes the university student movements called 131 and YoSoy132. They were structured from the performance of the presidential candidate Enrique Peña Nieto of the Institutional Revolutionary Party during a campaign meeting with students. Different political and media actors defined their position regarding the movements, sometimes classifying them as democratic, and in other cases as political gimmicks to benefit a political party. This allowed the formation of a binary narrative or discursive field ranging between integration and exclusion of movements during the electoral scene. In this sense, the paper shows how political performance may give rise to the creation of icons and referents for social change.

ARTEGUI ALCAIDE, IZASKUN* (University of the Basque Country, irtargi@hotmail.com)

Exploring the New Generation: The Role of the Past and the Future in the Formation of Identity

Recently, the field of identity configuration has diversified. On the one hand, social cognitive and discursive processes of identity construction are being de-standardized. On the other hand, individualization means that subjects are being made responsible for their own decisions. From this perspective, a number of scholars are exploring the idea that identity is nowadays the result of a process of reflexivity. The aim of this paper is to show that the degree of reflexivity depends, more specifically, on the relationship which subjects have with their past and future. To test this hypothesis, we use data produced by twenty-four in-depth interviews where we study the discourses of young people who are in the last phase of the transition from youth to adulthood.

Although it is true that the transition from youth to adulthood is a decisive stage in the formation and establishment of identity, one factor makes the stories of young people who are in this vital phase especially relevant at the present time: this generation, which has been socialized in the ways of identity construction characteristic of the first modernity, is now facing identity configuration modes of the second modernity (standardized identity vs diversity of identities). The struggles and contradictions generated between the stories that they were told in the past, on the one hand, and their living experiences, on the other, allow us access to where the identities of the new generations are coming up for debate and, in turn, to observe young people’s degree of reflexivity in shaping their identity.
of communication or observation of decisions, opinions and behaviour of
the significant others.

In the last fifty years science research activities have grown from localised activities of small groups of scientists and research laboratories or little science, to large groups of scientists working in huge research facilities and groups, spanning different countries and spread over several years, also referred to as big science. What is the significance of the reference groups for
scientists pursuing little science and those pursuing big science, as reflected in their direct and indirect communications? In this exploratory study an effort is made to understand the nature of reference groups and
research communities based on interviews of senior scientists who have been associated with little science as well as big science projects.

Housing and the Crisis: Changing Housing Positions of Younger Households in Europe

Over the past several decades, advanced economies have seen a dramatic shift towards homeownership. Alongside a shift in preferences, government policy in many countries has heavily promoted homeownership. With housing property being the most important source of individual wealth and in the face of diminishing state support, homeownership is seen as key towards securing future household welfare. Nonetheless, housing wealth and access to home purchase remains uneven. A rollback in certain homeownership subsidies, continued relatively high property taxes, lack of pre-approved access to mortgage refinancing and fragmented career and education paths have all contributed to difficulties in accessing homeownership, especially among younger people. The financial crisis of the late 2000s has only exacerbated these trends. Using cross-national datasets, the research looks at the situation of homeownership access for younger people across Europe before and after the crisis and evaluates how these changes have potentially contributed to inter-generational inequalities. The study examines variations across countries and attempts to understand these differences with regards to varied macro social and economic experiences of the financial crisis.

ARUNDEL, ROWAN* (University of Amsterdam, rarundel@uva.nl)
The Role of Intergenerational Wealth Transfers and Family Support in Shaping Housing Positions

In the past few decades, there has been a strong shift towards increasing home ownership rates across many developed countries and housing has taken on the role of the most important source of individual wealth and in the face of diminishing state support, homeownership is seen as key towards securing future household welfare. Nonetheless, housing wealth and access to home purchase remains uneven. A rollback in certain homeownership subsidies, continued relatively high property taxes, lack of pre-approved access to mortgage refinancing and fragmented career and education paths have all contributed to difficulties in accessing homeownership, especially among younger people. The financial crisis of the late 2000s has only exacerbated these trends. Creating Learning Opportunities, Creating Protection: Migrant Learning Centers in Thai- Burma Borderlands

This paper presents results from the study of learning centers, their roles and effort in the education and protection of migrant children and youth around Thai-Burma border in Mae Sot District, Tak Province of Thailand. The past decades saw frequent migration of people from several ethnic groups from Burma into Mae Sot District. Many of these migrants are children and youth whose illegal status deprives them of legal protection. From 1998-2012, the number of migrant learning centers was continuously on the rise to accommodate the flow of migrant children into Mae Sot area. These learning centers have a major role in protecting migrant children. Centers become social institution to provide...
Health reforms targeting universal coverage have intensified in Nigeria since the 1980s and in the process has introduced user-fee, experimented with various forms of health insurance, and encouraged public-private partnership towards improving health equity and accessibility with the overall aim of achieving universal coverage. Fiscal constraint, starting from the 1980s, which necessitated a partnership with the Britton Woods’ institution leading to varying structural adjustment programmes, have conspicuous effects on health care delivery in all countries of the sub region. This paper describes health reforms embarked upon by sub-Saharan countries and chronicles public health care evolution with reference to key features of actors, process, design and context. A comprehensive review of the literature and relevant documents forms the basis for analysis and discussion. The review is guided by three overarching questions: What social and economic conditions necessitated health reforms in SSA? How well have health reforms addressed issues of health quality, accessibility, and equity? How have the reforms improved or worsened health conditions of citizens? Salient lessons drawn from the thirty years experience of SSA on health care delivery are highlighted and the future prospects are discussed. It is noted that efforts to meet IMF conditions, the World Health Organization’s millennium development goals, and other international health partners’ demands without the required capacity and structural machinery to match the design and execution of health reforms serve to unveil the dismal performance of health sector reform in SSA. It also brings to bold relief the need for the sub-region to take ownership of health programmes by designing health policies that are both endogenously crafted and sensitive to local conditions and contexts.

**Interrogating Tourism As an Anti-Poverty Strategy in Middle and Low Income Countries of Africa**

This paper considers the proposal of tourism as an anti-poverty strategy used by African countries to increase foreign revenues and create job opportunities for their citizens. The ability of tourism to attract foreign revenue into middle income countries in Africa is creatively projected through international mass media in the form of adverts and documentaries. The mass media, using picturesque scenes of nature, encourage foreigners to seek for leisure and enjoyment away from their home countries. The philosophy that leisure costs money and must be invested, planned and saved for makes tourism a very attractive option for bringing in foreign revenue into Africa.

This paper interrogates this notion and questions just how effective it has been in eradicating/reducing poverty in middle income or even low income countries in Africa. The paper considers inequalities that arise due to tourism in the creation of fantasy scenes and relaxation spots that separate the tourist from the realities of the host country. The economic condition of the host countries means that majority of its citizens cannot afford the leisure and educational benefits their fellow tourists enjoy. The paper analyzes the organizational structure of tourism and argues that, as with other foreign investments in Africa, the exploitation of the economy, land and people brings to the front burner, questions of inequalities and oppression in the continent. The question projected is how much of the revenue that accrues from tourism goes into alleviating the poverty level of the population who live around the tourist site. Secondly, how much of the accrued revenue does the government of the host country actually use in developing the country’s physical infrastructure, man power, economic advancement, and national growth as a whole. It concludes by suggesting the development of blueprints for tourism that would ensure poverty alleviation, sustainability and national development.

**Health for All: The Nigerian Experience with Health Insurance**

Health reforms targeting universal coverage have intensified in Nigeria since the dawn of the new millennium, and the National Health Insurance Scheme, in particular, has been hailed as the panacea for and appropriate framework towards realizing the desired goal of “Health for All by 2015”. Two years to the target however, the reality is bleak and the task of achieving the goal more daunting than ever with a significant cohort of the population still excluded from the health scheme and from accessing health services. Explanations for difficulties in meeting health targets are discussed, pointing to weak governance, economic challenges, and socio-cultural variables as important interacting factors slowing down the process. The paper concludes by outlining some important emerging possibilities for strengthening the health system, including the liberalization of the health sector, strengthening intersectoral cooperation, enhancing public-private partnership, and for policy makers and international technical partners to recognize key socio-cultural factors in designing health policies towards achieving health goals.

**Resilience Strategies Carried by the Residents and Volunteers: A Study of Great East Japan Earthquake**

OTSUCHI-cho, IWATE prefecture suffered a heavy damage by the great tsunami caused by Great East Japan Earthquake in 2011. According to the population census of 2010, there were 15,000 people in OTSUCHI-cho. Approximately 1,700 people became dead person or were missing, by the great tsunami. The Volunteer Center of Meiji Gakuin University began the reconstruction support project, named “Do for Smile at East Japan”. The center called for volunteer center to school children and faculty members, and composed some volunteer teams. The teams have regularly visited KIRIKIRI, which was one region of OTSUCHI-cho, from April 2011. The purpose of this study is to report resilience strategies that were carried by the residents of OTSUCHI-cho and volunteers, and to analyze socially the meaning of the strategies.

At first, the Volunteer Center began the fund-raising, as the emergency-relief work. The donation was spent as the travel expenses for the teams to go to KIRIKIRI. We helped the KIRIKIRI’s residents to move the evacuation center from KIRIKIRI Elementary School to the old KIRIKIRI junior high school, which was not used as a school at that time, and helped teachers to reopen KIRIKIRI elementary school. These activities can be regarded as the despite care in a wide meaning. As the support activities for the residents who have lived in the provisional housing, the members of the teams were taught how to cook the local cuisine, named “KOMAJOMARU”, by the residents. The reason why the activity to learn how to make local cuisine from residents functions as supportive activity will be explained by the activity theory in social gerontology. Volunteers helped with the reproduction of “the KIRIKIRI dictionary” most of which had been carried away by the tsunami. This activity gave the residents the pride for the KIRIKIRI.

Reconstruction of Life and Mental Health in High School Students at Two Years after the 3.11 Disaster in Fukushima

Although Act Concerning Support for Reconstructing Livelihood of Disaster Victims was enacted in 1995, life reconstruction of victims from the 3.11 disaster is progressing very slowly.

Under the social condition high school students living in disaster stricken areas would have experienced changes in three domains of their life such as school life, family life, and community life. Impact of life changes related to the disaster may damage their mental and physical health. Differences in processing life reconstruction may influence their mental and physical health in different ways.

We assume that students who are victims from nuclear meltdowns of three of six Fukushima Daiichi Nuclear reactors are less likely to reconstruct their livelihoods, so that their mental health would be poor.

We performed a questionnaire survey to examine associations between reconstruction of life and mental health in high school students after almost two years since the disaster. Five hundred and eighty one out of 627 students in a high school responded. About half of the total was suffered from tsunami and earthquake: 11.7% the total were victims from meltdowns and radiation with or without tsunami and earthquake: fortunately 34.3% reported that they have no damage from the disaster. Thirty percent to 40% out of all students report they feel their current living situation is difficult, and they are still influenced by the disaster. About 56% of the students are sensitive to a lesser tremor because they concern a big earthquake may occur. By our preliminary analyses, mental health assessed by CES-D was related to unstable economic condition in a family, life changes in a family life, insufficient community resources, and changes in community life.

In our presentation, we will show how students experienced the reconstruction of life and how their experiences are related to their mental health.

Challenges in Human Resource Development for Rural Leisure Activities in Japan

This study offers a brief general description of rural leisure activities in Japan. Japan has less land area than many of countries in Asia, but the landscape of the archipelago has a rich and varied terrain broken up by sea, mountains and rivers. This small land itself comes in many varieties, and differs between Hokkaido (in the far north) and Okinawa (in the far south). This variety has aided the growth of various types of rural leisure activities. Mountain villages and small islands offer rural experiences that are unfamiliar to most urban people.

On the other hand, in rural areas, there are some serious issues in the management of rural areas. The Ministry of Public Management, Home Affairs, Post and Telecommunications (Shou Sho) has established an initiative called Chiki-kokushi Kyouryoku-tai (Supporters of Regional Revitalization). In addition, some prefectural and municipal governments have established support organizations aimed at rural activities.

This study explores a few cases in Yamaguchi Prefecture (the far west of Japan) to assess potentials and challenges. The Yamaguchi Prefectural Government is allocating some of its budget for volunteer activities in rural areas. Due to depopulation, volunteers from urban areas are increasingly needed to support rural leisure activities. However, the small number of repeat volunteers from urban areas poses a key problem in developing sustainable rural leisure programs.

Leisure Activities and Civic Engagement in Japan

The research question in this presentation is:

RQ1: Is there a positive relationship among Japanese youth between being a participant in a leisure group activity and civic engagement? RQ2: What conditions affect that relationship?

In this presentation, the focus is on the function of groups for leisure activities. Putnam argued that in societies where people participate in various voluntary associations, including those for leisure activities, they are also active in social, political or civic activities. That is because, according to Putnam, interaction between people with different backgrounds in these associations develops a general trust.

Since Putnam proposed his thesis about voluntary associations and civic engagement, a lot of researchers have tried to examine it. Some of them could find a positive relationship between membership in such associations and civic engagement, others either could find no connection or a very weak connection. What about Japanese youth? That is the question in this presentation.

How Do Local Community Members Accept the Usage of Commons By Nonlocals in the Under-Used Commons? : An Approach Based on Agent-Based Simulation

Many Japanese common forests are underutilized due to the increase in imported wood. Furthermore, depopulation in mountainous areas has accelerated the underutilization of common forests. Thus, users of common forests need to accept nonlocals who pay usage fee to access common resources.

Hayashi et al. (2013) compared the usage rules of commons for nonlocals in 10 common forests at Tadami Town, Fukushima prefecture of Japan. They found that communities could be classified by two types according to how they dealt with nonlocals. The first one has institutions to accommodate nonlocals’ entrance, and the second one has institutions to exclude nonlocals’ entry. Why do some communities actively accept nonlocals, and some communities exclude nonlocals? Most previous studies do not consider the situation of under-use of commons.

This study examines the effect of usage rule of commons on welfare of local community members in under-use situation, using an agent-based simulation. Here, I consider three types of rules: (a) <Accommodate I>, which has entrance fee system by voluntary monitoring staff and the entrance fee share local community members evenly, (b) <Accommodate II>, which has entrance fee system but entrance fee is distributed among monitoring staff, (c) <Exclusion>, which exclude nonlocals by voluntary monitoring staff. The simulation shows that the difficulty of monitoring nonlocals determines the benefit of usage rule for local community members. First, <Accommodate II> operate in favor of local community members’ payoff when it is difficult for local community members to monitor nonlocals. Second, <Accommodate I> is more efficient than <Accommodate II> as the difficulty of monitoring is removed. Third, <Exclusion> works well when it is easy to monitor nonlocals.

Over-Qualification / Under-Qualification of Care Work in Ageing Asia: Towards Regional Framework of Care Provision Regime

Skills harmonization is one of the urgent challenges in international migration of healthcare workers. This is significantly due to the increase of de facto care worker migration in Asia. The under-qualification of care work, nursing and even nuptiality corresponding to ageing. The complexity of care worker migration is because of absence of equivalent qualifications of care workers between the sending and receiving countries. This absence in migration trigger in a dual sense. One is under-qualification of care work, such as a domestic worker engaging in a skill-required home care such as suction, NGT, stoma and so forth. The belief of domestic work as naturalized among women is also another factor in the facilitation of the under-qualification and hence legitimate familial caregiving provision from the viewpoint of welfare regime. On the other hand, over-qualification is overt especially in institutional care to secure qualified care. This is why nurses in the sending countries are recruited to destination countries. More than 20% in Taiwan and surprisingly more than 90% of care workers in Singapore are nurses from the sending countries. This is not merely a deskilling of individual nurses but also creating insufficient allocation of nurses in the region even though most of sending countries run short of nurses especially in the rural area. Since the current bilateral agreement framework of care work migration is not endowed with a sustainable migration system, multi-latral or regional framework for the management would be necessary.

ASAYAMA, SHINICHIRO* (Tohoku University, asayama@cneas.tohoku.ac.jp)

Leisure Activities in Japan: Towards Regional Framework of Care Provision Regime

It is particularly interesting because, although Japan has been known as a politically inactive society since the end of the 1960s, after the big earthquake and the accident in Fukushima Daiichi Nuclear Powerplant in 2011, many people began to take to the streets and organize various forms of demonstrations ranging from the traditional to newer types like musical parades.

The dataset in this study was collected online. The respondents are around 2000 contracted monitors for a research company. They all live in Tokyo. Their ages range from 20 to 59. The questionnaire is designed to examine the relationship between leisure activities and civic engagement in a broad sense, with some variables that are controlled for.

To summarize the results, participants in leisure group activities are more likely to participate in civic engagement. I will also show what conditions affect the relationship between these two variables.
From Cosmopolitan Ideal to Nationalistic Calculus: Discursive Change of Japanese Media Framing on the Kyoto and Copenhagen Climate Conferences

Recently the studies on media coverage of climate change have increased significantly. Many scholars have extensively analyzed "framing" of climate change in the media. However, the focus of existing literature is only limited on the "science" of climate change, and not on the "politics". In light of "mediatized politics", the media has become part of the fundamental nature of contemporary politics, and therefore media coverage can have a significant impact on policymaking processes. The international negotiations at the UNFCCC/COP has been one of the important spheres of climate discourses, can be seen as a "critical discourse moment" which transform and create public discourses on climate change. Both COP3 in Kyoto and COP15 in Copenhagen have marked a significant momentum to adopt international agreements. While the former succeeded in achieving the legally-binding agreement, the Kyoto Protocol, the latter has resulted in "failure" which only contained a legally-binding agreement of the京都 Protocol. In this study, we explore how the Japanese media represent COP3 and COP15 negotiations, and try to identify the dominant media frames regarding the COP negotiations and negotiating parties. Methodologically, we apply discourse analysis of the three most circulated Japanese daily newspapers: the Asahi Shimbun, Yomiuri Shimbun, Mainichi Shimbun. Our analysis reveals the responsibility and conflict are the dominant frames both in COP3 and COP15 coverage, which emphasize the responsibility of international communities to achieve the legally-binding agreement and pay closer attentions to controversy among parties. Moreover, there is the discursive shift of media frames from COP3 to COP15: in Kyoto the media is engaged in the cosmopolitanism discourse to imply the media's idealistic hope toward the international negotiations whereas in Copenhagen the media rather focused on the realistic condition of negotiations to imply the nationalism discourse that criticizes the "ineffectiveness" of the Kyoto Protocol.

We contrast two successful cases of populist mobilization in the Eurocrisis context: the Independent Greeks and the True Finns, which, while unfolding within different environments, present striking affinities in discursive produce. Our methodology comprises of a content analysis of party documents and speeches, within which we identify and assess 'populist frames' and their composition. We find that, given the opportunity, populist discourse which pits the 'moral people' against the 'corrupt elite', can be constructed in countries with widely diverging political, cultural, and economic conditions, with equal success. Populists in Greece and Finland may well understand each other as foes, with the True Finns portraying Southern Europeans as economically reckless recipients of undeserved aid, while the Independent Greeks argue against Northern Europeans who blatantly intimidate the Greek folk with cruel austerity demands. However antithetical these populist framings may seem, containing opposite constructions of 'the enemy', they are indeed identical in terms of structure, configuration and encompassing the significance of the moral distinction between 'people' and 'elites' when it comes to forming populist discourse. Having shown what dissimilar contents populism can accommodate, we contribute to the literature on the concept by comparatively illustrating the importance of this discursive structure. Thus, we argue for a focus on the form, rather than the specific content of populist appeals.

ASCHELOV, NADIA* (St.-Petersburg Branch of the Institute for the History of Science and Technology, the Russian Academy of Sciences, simar@bk.ru)

Research Career Development in the BRICS Countries: Comparative Analysis of National Academic Systems

Last decade the BRICS countries have been catching up rapidly in terms of both economic growth and investment in knowledge, as expressed by investment in tertiary education and R&D. These countries adopted policies to promote science, technology and innovation as the result of greater recognition by governments of the crucial importance of science for socio-economic development. The BRICS countries are investing considerable heavily in the R&D sector to improve their position in the scientific output. For these reasons it is of strategic importance that a satisfactory recruitment of talented people to the science sector is secured, that the scientific profession is attractive for (potential) researchers. Employment opportunities, payment conditions, research facilities, career prospects are of major importance for career development. Academic careers considerably differ between national science systems. This paper presents the results of a research conducted by the Center for Sociology of Science and Science Studies, Institute for the History of Science and Technology, St. Petersburg Branch, Russian Academy of Sciences, whose main interest was to examine the social context, factors and mechanisms of the academic career development in the BRICS region; to analyze the impacts of international mobility on the professional trajectory of researchers, his/her career development. The paper will also highlight the policies for research career development in the BRICS nations, the special features of academic job market, the mechanisms of reproducing scientific elite and academic leadership.

We argue for a focus on the form, rather than the specific content of populist appeals.

Liquid Stability in Theory and Society

The legitimization of sociological theoretical knowledge cannot be provided by just a simple logical proof of its categorial system. It is provided by the presence of a relevant system of meanings and denotations, objectified in the practices of everyday life. Specialized sociological theories designate different social objects, and by so doing constructing connections between these objects and offering interpretative models of the social world - i.e. define the project of social reality - to the individuals acting in the world of everyday life.

In simple and traditional societies, presuming high stability level, the institutionalized monopoly on the projection of social reality was possible and also determinate as a factor of social-structural stability. Their models of official symbolical universe were resistant enough to withstand emerging "hersies" (alternative symbolical projects) suppressing them through the therapy and the denial.

This paper argues that contemporary societies as complex "life worlds" are being dominated by "liquid stability" and "politicized" illusionary reality. Their models of official symbolical universe were resistant enough to withstand emerging "hersies" (alternative symbolical projects) suspending them through the therapy and the denial.

**Risk and Reform in the Japanese Education System**

This paper argues that the Risk Society paradigm developed by Ulrich Beck provides a framework that can reconcile the twin developments affecting Japanese education at the start of the 21st Century: the parallel trends of individualization and globalization. In Japan, education reform proposals from the 1980s onwards have aimed at encouraging a freer educational environment that can nurture strong individuals and future entrepreneurs. The Ministry of Education has also consistently argued for reforms that can better prepare young people for the challenges of globalization. Traditionally, however, educational practice in Japan has stressed group harmony and cooperation and so the forces that resist change are considerable. Most efforts to reduce pressures to conform to the group, therefore, have had disappointing results, as have programs designed to encourage greater communication with foreigners.

The government has tried to bring about meaningful reform to the education system has resulted in a failure to prepare young people for the challenges of contemporary society. Young people who do not have the skills to negotiate the new social and economic landscape are increasingly falling into low-paid, insecure employment, or withdrawing completely from society. This has given rise to the phenomenon of hikikomori; wherein large numbers have confined themselves to their rooms and cut all connections with the outside world. Also, many young people are deciding against having children – a trend which has resulted in a crisis of low fertility and a shrinking population. To use Beck's terminology, these are people who have been unable to adapt to their role as 'risk manager' of their own life. The education system has failed to prepare them for this role because it is stuck in a prior phase of Japan's post-war development and is unable to adapt to social and economic transformations at the global and national levels.

**Structuring of Current Religious Practices in Polyconfessional Regions**

Start of XXI century synchronizes with the next stage of secularization, transition to new cultural policy in world’s social space. Oppositely, for Russian civilizational logic it’s a period when a religious identity is formed. It’s a time of rational religious self-identification, time of reflecting about personal relations with sacral. Simultaneously, we can trace two main trends. First, we fix the modeling of religious practices on the basis of extended submissions about correct religious behavior. Second, new practices, that represents religious-life intensions come into existence. Restoration of religious tradition base is going on. As an example we will take religious practices, connected with body. Body practices may be separated into two general groups: connected with body as such (body border demarcation, pose, purity), and connected with body’s life sustenance – especially nutritive practices. Practices of various ethnic communities, connected with nutrition, initially had definite religious sense that was gradually lost as secularization went on. Nutritive religious practices during religious control and religious traditions lost their significance had must been loose and even disappear, but no. Keeping of nutritive practice become one of the elements of religious identity, retaining of own chosen and upholded priorities. Important mark: either in islam and orthodoxy a tendency of forming the doctrinal basis of nutritive practices, earlier free of such a basis, exists. Religious practice, connected with everyday life can prevail over mystical practice. Everyday structures that work upon modeling religious practices may be described through the following characteristics: 1) Cyclicity; 2) Stereotypization/rating scale; 3) Temporal dimension; 4) Topological localization; 5) Individual route of everyday life.

**Interweaving Time and Space: An Analysis of Superflat and Japanese Lolita Fashion**

In recent years, Lolita, a Japanese youth fashion and community that emerged in the 1990s, has perplexed scholars. Its name mirrors the 1955 novel by Vladimir Nabokov, and yet, its members, while often dressing in childlike attire, starkly oppose reference to it. They borrow and allude to historical periods both from their own country and others. They selectively prune Victorian, Rococo, and Belle Epoque clothing, manners, and ideals. Simultaneously they reach back to shōjo, the girl culture that originated in the Meiji Era, which initially revolved around literature composed by and for female youth. In this paper, I will explore how their fashion relates to superfait, a term coined by visual artist Takashi Murakami, which examines the flattening of time and space in the contemporary era. Through the lens of superfait, I will investigate Lolitas’ allusions to historical periods in differing geographical locations, and how they integrate these allusions into their community, and the wider Japanese society, through material means as well as through performance.

**The Organization of Precarious Workers in Argentina: Between Marketplace, Workplace and Associational Power**

In the global context, previously accepted divisions between formal and informal employment are losing ground. The last three decades of neoliberalism, rather than reducing the gap between protected and unprotected workers, have made work more precarious. Not just workers traditionally employed within the so-called informal sector of the economies have increased in number. Precarious employment and employment instability is becoming the standard in formally regulated systems of employment and this across the Global North/Glocal South divide. Despite common tendencies, the possibility for collective organising among precarious workers however differs consistently, between countries but also between different economic sectors of activity within the same country.

Drawing on fieldwork research currently conducted in Argentina, the paper aims to give a country overview of the factors that can explain the forms and strategies adopted by different groups of precarious workers in their attempts at collective organizing. Argentina in the last two decades has passed through deep crises and economic recoveries, processes of de-industrialisation and part-time conversion to industrial production and has moved, in a relatively short time span, from a formalized and extended system of work protection and workers’ representation, close to the one existing in postwar Europe, to a system of employment that remains based, despite recent economic growth and government’s push on economic renaissance, the precariousness and informality of the majority of the working population. In this sense and for its history, Argentina might be considered as a good example of the way in which structural processes continuously shift the borders within which precarious workers’ action takes place. Socio-political context, institutional framework and history of workers mobilizations are the general factors that can be outlined. However, the level of precariousness, skills, strategic location and technological development of the sector in which workers develop their activities also profoundly affects possibilities for action.

**AUDEMARD, JULIEN** *(University of Montpellier, julien.audemard@yahoo.fr)*

**Using the Social Ties, an Ethnographic Analysis of a Snowball Sampling**

Modelized by James Coleman and others researchers of the Columbia University, the snowball sampling method is now neglected in the social networks analysis. In particular, this method is very difficult and hard to apply and the non-representativeness of the samples that it produces is well known. However, this sampling method presents many over kind of resources for ones who want to study social networks. First, when the limits of the groups are not know, it permits to identify chains of relationships in a more precise way that non-representative samples. Moreover, it is a very powerful tool to understand the logics of exchange and structuration which characterized the individuals and groups studied. A reflexive appraisal of the construction of the snowball sampling gives us an access to this kind of information.

The aim of this communication is to present the conclusions of a critical feed-back from a field experiment during which it produces snowball sampling wave were conducted between 2009 and 2012. The experience consisted in a transfer of questionnaires person-to-person within subjects’ social networks. The members of the first sample (N=10) have distributed some questionnaires to some of their relatives, friends, neighbours or co-workers who have done the same, and so on. The descriptive analysis of this sampling procedure shows us: 1) The motivations of the subjects to be involve in an active way in a sociological survey 2) The social logics which have oriented the transfer of the questionnaires.

This ethnographic feedback suggests that snowball sampling, beyond the question of statistical representativeness of the samples, maybe inadequate with the concept of social network, allows us to access to realistic networks data.

Caring Universities? Entanglements and Cavities of Politics of Gender, Excellence and Care in Austrian and German Academia

Models of the academic profession are under transition due to the recent economic shift in academia and democratization that opens up universities inter alia for women and other social groups. We argue that both processes become entangled, but also show cavities, nevertheless questions of care are placed on the agenda of universities.

In the international competition for ‘excellent’ scholars universities refer more and more on gender equality policies that stem from human resource strategies, like Diversity Management, to become attractive employers. These policies do not only aim for promoting gender equality, but also go along with the market-efficient re-organisation of universities. As one part of this also care responsibilities, for children fewer for elderly, are questioned.

Results of our qualitative research projects (documents and expert interviews) show how the entrepreneurial universities are transformed into (more or less) ‘caring’ ones, which are combining contradictory aims and concepts of gender, excellence and care politics.

In our conclusion we discuss the universities’ care concepts. They follow the tradition of social policies of the company. Recently a new mixture of caring activities can be recognized which is embedded in the entrepreneurial university’s care management and administration and in the welfare regime of the two countries.

In and Beyond the Crisis. the Relations of Gender, Race and Class in Care and Care Work Illustrated By the Austrian and German Case

The paper argues that in the contemporary crisis of finance, economy and the welfare state a fundamental problem of modern and especially capitalist societies arises in new forms: By prioritising the market economy capitalist societies are not able to care for their members in respect to life as the end of caring instead of caring as a mean of economy. In the first step this connex will be elaborated by a feminist and intersectional discussion of Marxist, Weberian and contemporary analysis of the relations between capitalism and crisis. Main issue will be the fundamental relations of gender, race, class, by which the division of the public and the private sphere, of paid and unpaid work, of different societal sectors are shaped. Second, the contribution focuses on the Austrian and German case and analyzes how care and care work are organized in and between the profit and non-profit sector, the public sector and the private household. Through the lenses of the approach of institutional logics and the concept of intersectionality and empirically the third step shows, how the economic shift is reorganizing the relations of these sectors; this process profiles care work in a wide range between its commodification / decommodification, professionalization / deprofessionalization, formal / informal organization and is underlaid by and embedded in gender and migration regimes. It can be shown, how these regimes economically, politically and culturally are regulating the division of labor between women and men, native and migrant people, skilled and unskilled work. By this way the Austrian and German care regimes can be considered as an example for dealing with the crisis by reorganizing the relations of gender, race and class.

In our conclusion we discuss the universities’ care concepts. They follow the tradition of social policies of the company. Recently a new mixture of caring activities can be recognized which is embedded in the entrepreneurial university’s care management and administration and in the welfare regime of the two countries.

The Site of Recapitalizing the Spiritual Capital of the City: Welcoming the Stranger with Intention and Architectural Edifice

Violence during the protests in Tahrir Square, buses driving through London that threaten undocumented foreigners with extradition, and xenophobic attacks in South Africa. These events divulge a spiritual capital bankruptcy in the city of our era. The dominant reaction to this spiritual bankruptcy is analysis, but the spiritual capital present in the city is not analytically-complicated, it is (counter)intuitively-complex. Rather than an Analyst narrative, we need the Lacanian opposite: a Master narrative, which offers solutions to the spiritual capital bankruptcy. In our paper we offer a Master narrative of spiritual capital that moves beyond the Analyst narrative. This we do by combining our two fields of study: Spirituality and Architecture. The Master narrative of spiritual capital comes in the form of the Stranger, who passes through the city. The Stranger, as political neighbour, has the potential to recapitalize the city spiritually. Then, we move to conceptualise and visualise an architectural edifice that can facilitate the spiritual recapitalization of the city in the Stranger’s movement in and through the city. This architectural edifice will aim to recover a historical aspect of spiritual architecture that has been neglected: architectural edifices as build expressions of kindness extended in acceptance to the Stranger. From the intricate systems of asylum offered by mediation institutions, to the social functions embodied in the Ottoman Külliye, spiritual architecture traditionally upheld the way of life of the place, while being open to the influence of the Stranger. The above-mentioned edifice will be conceived as a re-interpretation of Norberg-Schulz’s formulation of ‘belonging’ to the ‘vocation’ of the place, inspired by Heidegger’s concept of ‘sorge’ (care). As an expression of the art of care, the architectural edifice extends kindness to the Stranger and provide a location for the spiritual recapitalization of the city.

“We Target the World’s Worst Crimes”: Creating Symbols of Justice in Human Rights Watch’s Annual Report 2012

This paper examines how evocative and emotive images and text are deployed in human rights reporting as symbols of rights violation and protection, and considers how Human Rights Watch (HRW) locates itself in that figurative order as a necessary intermediary between wrongs and their redress. In its Annual Report 2012, HRW focuses on its involvement in “the international justice movement.” Images and textual descriptions of atrocity sit next to depictions of the work of law in the Report, of human rights abusers subject to adjudication in international courts and tribunals. Linking violation and justice in the Report is HRW, represented in words and visuals as ‘an effective force for justice.

Through an interdisciplinary methodology that brings a critical analysis of the Report’s rhetoric into dialogue with interviews with HRW report writers, this paper examines how the Report creates a narrative in which HRW symbolises an effective response to human rights violations. The Report employs a human rights aesthetic to create visual and textual symbols that denote the work of justice in a legalised, global form. Framing the organisation as part of an international justice movement, the Report positions HRW as exemplary within that movement, an actor who has proven to be indispensable in bringing about justice through its research into, and witnessing of, rights violations. My analysis will demonstrate how the Report’s creation of a symbolic lexicon of justice is co-constitutive with HRW’s own self-representation, a self-fashioning that produces the organisation as an ideal NGO within the international human rights regime.

Information and Communication Resources Is Laid the Foundation Stabilization of the Society

Global crises have contributed to the destruction of the basic values of capitalist civilization, which were based on the domination of the economic system over all others. The perception of the economy has been built on the theological principles. All sectors of society were directed to obtain the gross earnings. This contributed to a gradual merging of economic and political interests, which led to formation of the new political elite. A statesman is not a servant of the people», he becomes a businessman. This contributed to the rejection of society from the state, which leads to confusion.

Reduction of the growing resentment of the society about the established political system may contribute to make of bilateral open dialogue between the state and society. This is possible through using of information and communication resources. In addition, organization of communicative and informational process in correct form helps to establish trust between society and government that leads to creating an entirely new model of interaction of two opposite spheres. The possession of information allows both parties to navigate in a particular situation, change, it plan some actions, to monitor the effectiveness of solutions, avoiding a particular risk, control each other.

The modern society has new information technologies, which allows people always being in the process of communication. Development of communicative environment is developed public control, and also contributes to the formation of public opinion, which could resist the state will. Moscow is the initiator of the development of information and communication resources among the subjects of the Russian Federation. The government of Moscow created government portals aimed at the creation of direct communication of the authorities and the population. These measures have helped to increase the level of loyalty of the population to the authorities.

Inequality of the Russian Population: Quality of Life and a Preferred Social Order

Contemporary state of social inequality is especially dependent on level of life quality. One of the key factors is the correlation between social inequality and quality of life influence people's view of social order. Based on sociological surveys across Russia, analysis shows the current state of social inequality in the country depending on type of settlement and region. Used synergetic method showed different preferences of Russian citizens towards different types of social order, including social democracy, liberal democracy and "middle" type and their dependences on quality of life in these regions and settlements. Unequal social positions of different groups correlates with their choice of social order and, therefore, ways of increasing their quality of life. According to the theory the higher is the person's quality of life the less probability is there for him to change social order because this pattern is non-linear and multidimensional which current survey tends to prove.

Gender Inequality Through Sonography Centers In Maharashtra, India

Dr. Smita Awachar, Associate Professor, Dept. of Sociology, Dr.Babasaheb Ambedkar Marathwada University, Aurangabad, India. India has one of the worst gender ratios, indicating gross violation of women's rights in the world. The main reason behind this is the practice of 'Dowry System'. It is considered that the birth of a child girl in the family indicates the beginning of financial ruin and hardship. Indian society considers woman as burden on the family's resources. This attitude gives boost to avoid a girl child's birth. This problem is getting worst as scientific methods of sex determination and "middle" type are evolved and performance of abortions has greatly increased since last 25 years. This facility is easily available even in rural areas in India. Hence female fetuses are selectively aborted though Government of India and Maharashtra are trying to implement strict laws for the declining child sex ratio. As a result during 2012-13 several sonography centers in Maharashtra were sealed.

The attempt has been made in the paper to identify the gaps in implementation of law and how the sonography centers are affecting the child sex ratio. The content analysis has been done of different newspapers during May 2012 to July 2013. It has been suggested that the rigorous, fast and efficient efforts are required to control over the decaling child sex ratio by Government agency.

Leisure Time Activity of College Students New Experiment in Rural Maharashtra, India.*

Leisure or free time is time spent away from business, work and domestic chores. It also excludes time spent on necessary activities such as sleeping and, where it is compulsory, education.

College is a place where students are studying there higher studies. They don't have any specific role to play in society. Young age always known as age when person can do what where can do. This age is considered as period of preparation of future. With the degree which they acquired after the completing higher education they may fruitful role to perform.

But in college affiliated to Dr. B.A.M. University, Aurangabad, Maharashtra, India one experiment is going on from last few years. This experiment gives skills and exposure to various professions to the Students.

In this research paper authors are trying to evaluate this experiment. This paper is based on primary as well as secondary data. Last 10 years, Collegein, Jalana,
ed while seed firms, local intermediaries and international supermarket chains manage to accumulate capital. Thus the claim that contract farming manages to mobilise the poverty reduction mechanisms is far from the reality.

**Examining a Paradox: The Differential Effect of Years Lived in the United States on Birth Outcomes for Latina Women**

The unique stressors often faced by Mexican women living in the US, particularly for immigrant women, through limited financial resources, cultural beliefs regarding health and illness, lack of social support, and inadequate English language mastery, have been associated with poorer birth outcomes. Drawing from the Latino health paradoxes, birth outcomes are expected to be better for recent immigrants through health selection, health behaviors, or living in neighborhood ethnic enclaves. Conversely, birth outcomes are expected to worsen as Latinas acculturate within the US. This study examines the effect of maternal years lived in the US on birth weight. Data for this study come from a randomised control trial of 440 pregnant Latina women (81% Mexican origin) visiting a hospital that provides services to low income, prisoner, or immigration detainee populations. Upon enrollment, participants completed a baseline survey. Once the baby was born, medical outcomes from electronic medical charts were obtained on 322 of the participants. Using linear regression, the impact of the maternal number of years lived in the US on the baby’s birth weight was examined, and models controlled for number of contacts, income, age, number of pregnancies, and current cigarette and alcohol use. Results indicate a significant curvilinear relationship between years lived in the US and birth weight (R2=0.83, p<0.05), with women living in the US between 6 to 15 years having higher birth weight babies, while women living in the US less than 1 year and women born in the US having similar lower weight babies. While the majority of all births fell within the average full-term weight between 2700 and 4000 grams, these analyses point to the complexity of the Latino Health Paradox, as both recent immigrants and those born in the US had lower weight babies, an unexpected finding.

**Crime Location and Reporting Practices of Victims in Lagos, Nigeria**

Differential concentration by government of its development projects on urban areas at the expense of rural upgrade causes variation in the character of victimization and citizens’ responses to crime from rural, through semi-urban to urban communities. This paper examines the influence of crime location on crime reporting practices among residents of Lagos, Nigeria. Both quantitative and qualitative methods were adopted. Multistage sampling procedure was used in selecting 948 respondents for the survey. Six In-Depth Interviews, 12 Key Informant Interviews and 10 Case Studies were conducted with divisional crime officers, crime victims, victims’ relations, traditional rulers, landlord associations and religious leaders to elicit complementary qualitative data. Data analysis involved the use of simple percentages, chi square and content analysis.

Findings showed more respondents (62.5%) were victimised at public than other locations in the study area. Crime locations without light (49.3%) and those lacking network coverage for police notification by phone (49.3%) discouraged crime reporting. While 53.3% of respondents identified some crime incidents as too trivial to deserve reporting, fewer respondents (46.8%) insisted that serious crimes will be reported despite the crime location. About 59.1% rural, 47.1% semi urban and 46.7% urban respondents believed crime location influenced their crime reporting practices, implying that 40.9% of rural 52.9% semi urban and 53.3% urban respondents did not report their victimisation experiences. Chi-square analysis indicates that location and crime reporting were significantly related in the study setting (P value < 0.05).

The study concluded that disparity in resource allocation and security commitment to the diverse communities of Lagos accounted for respondents’ differing responses to crime through reporting. While public policy gives equal development and security concern to the communities in Lagos, the study suggests that police authorities should pay renewed interest to human safety to reduce residents’ vulnerability at public spaces in the study area.
welfare regime and its family policies are affecting the welfare of the different cohorts and genders. That is, it seeks to scrutinize how changing families affecting equity across gender and generations. This paper shows that despite important gender equity reforms and significant increase in women’s labour force participation, the Turkish welfare regime has still some inequality problems in terms of generations and genders also affecting the work-life balance of women.

Changing family structure and work-life balance will be analyzed in light of welfare regime theoretical framework. Turkey has revealed significant similarities with other Southern European countries through its familialistic structure, the residual nature of social assistance, and patronage. The methodology to be used in this paper depends on quantitative secondary data and previous studies on welfare states and family policies. I will use mostly comparative data on family policies, labour market, and demographic indicators from the OECD and the Turkish Statistical Institute to understand the transformation of the Turkish welfare regime and family structure.

A Global Profession: Pilots of Helicopters in Brazil and Mexico

La profession de pilote d’hélicoptère au Brésil et au Mexique est symptomatique des tensions qui prévalent dans la construction des normes péris. La bataille qui s’est nouée récemment au Mexique autour de la profession et la professionnalisation des pilotes. Il en ressort que la manière de gérer les dissensions diffère sensiblement d’un pays à l’autre.

Ainsi, même pour une activité professionnelle aussi normée que la navigation aérienne, soumise à des règles dictées par la législation internationale, le cadre réglementaire et institutionnel ne rend compte ni de la richesse des interactions ni des réalités. L’institutionnalisation de la profession fait appel à deux ordres différents. L’un, qui renvoie à la construction des normes, met en relief les tiraillements entre militaires et civils au Brésil, entre civils au Mexique ; il illustre les arènes institutionnelles propres à des arènes de pouvoir en voie de consolidation ou qui font encore l’objet de négociations. L’autre, celui des pilotes d’hélicoptère, fait appel à la consolidation de la profession dans un univers institutionnel instable ou en construction, rendu plus difficile par son caractère dispersé. La bataille qui s’est nouée récemment au Mexique autour de la profession est symptomatique des tensions qui prévalent dans la construction des normes et leur capacité à s’imposer.

Influences of Electric Media on Fanzines in Japanese “Otaku” Culture

Today, it is easy for ordinary people to widely disseminate their message and works over the Internet. Nevertheless, many people still disseminate information by paper media. For example, people known as otaku, who are fans of anime, manga, video games and so on, often create fanzines binding manga and novels which fanzines are sold. With the growth of the Internet, otaku also exhibit their works on the web. But many otaku still use paper media to publish their works. This paper considers the influences of electric media on paper media and the merits of paper media as a tool for personal publications, based on my interview research for otaku who create fanzines.

Originally, fanzines created by otaku have four functions: publishing fan works, informing others about their creative activity, discussing their favorite things. But paper media have advantages in publishing works and interacting with others. Paper media is more suitable for placing manga and treated better face-to-face communication with others. They can also directly gauge the reader’s response to their works. Although works created by fans are provided free of charge on the Internet, fanzines are traded with money. The people I interviewed who create fanzines regard receiving payment for their works as a sign of appreciation for them and feel strongly that their readers should accept their works. For these reason, the creative otaku I interviewed prefer paper media in the age of the rising Internet.

Restructuring Foreign Worker’s Policy in Malaysia

This paper attempts to analyze current regulations regarding foreign workers policy in Malaysia and how Malaysia can learn from the experience of several friendly-foreign workers countries. Malaysia is one of the most rapid growth economies in Asia and she is now facing shortage of labor to fulfill this growth. As far as current regulations and enforcement of foreign workers is concerned, Malaysia needs to reform these regulations, so that foreign workers can be fully integrated in the process of long-term economic transformation towards vision 2020. Empirical experience from friendly-foreign workers countries such as Canada and Sweden has shown that both countries benefited greatly from forming a dynamic policy and regulations governing foreign workers. This paper is based on secondary data from empirical studies of friendly-foreign workers countries and primary data from interviews foreign workers and local authority in Malaysia. The combination of both data will contribute to new inputs for restructuring of foreign workers policy in Malaysia. The result from this study shows that one of the conditions towards vision 2020 will be based on the superior of her labor market policy.

Socio-Cultural Influence of Gender Roles in Women’s Health Care Utilization in South-West Nigeria

Socio-cultural factors are threat to women’s health and well-being. A culture reinforces the gender role and life style of husband and wives. No matter how equipped a health facility is, it is the patronage that makes the difference to good health. People’s sociocultural background play vital role in seeking and acceptance of health care. The consequences of these factors on the use of health facility among pregnant women is a major cause of maternal morbidity and mortality and a powerful brake on the road to the achievement of MDGs as well as overall development. Maternal mortality in Nigeria is very high, with an estimated 52,900 Nigerian women dying from pregnancy-related complications out of a global total of 529,000 maternal deaths. It is not encouraging to note that 62 percent of births in Nigeria occur at home and 96 percent of women who received no ANC services delivered at home. Several factors lead to health care facility utilization and among these the less studied is the socio-cultural dimension and hence the focus of the paper. The study was carried out in Idi-Odo/Ota local government area with 260 eligible respondents, selected randomly from the eight wards in the local government. Interview approach was employed with the aid of structured questionnaire to elicit required information from the respondents and data analyzed using SPSS. The main objective of this study is to understand the influence of socio-cultural factors influencing health care utilization among women during pregnancy and child birth. The findings show that husband perception of pregnancy complications, age at marriage, who pays ante-natal bills, family type, treatment place decision are significant towards use of health care services by mothers. Paper provides recommendations for improving the use of maternal health delivery services in the study area and beyond.

BAAKLINI, JAD* (University of Edinburgh, jad.baaklini@gmail.com)

Mobilising Hope: Infrastructural Activism in Post-War Beirut

Lebanon has been described as “post-war,” but not “post-conflict.” A fragile peace has been held together since the early 1990s by a precarious network of elites in a power-sharing arrangement spread across the institutions of the state, the media, and the very surface of the earth, consolidating what architect Karl Sharro (2003) has called ‘warspace’ in peacetime. This atmosphere has made the work of rights-oriented urban activists very difficult; how does one advocate for territory-spanning policies and/or infrastructures when urban space appears so hopelessly fragmented and policed?

This paper, based on empirical research on the public transport sector, and taking ‘assemblage urbanism’ as a framework of analysis, will trace recent efforts to turn urban mobility in Beirut into a matter of concern. In turn, this investigation will highlight how a heterogeneous public is being formed around mass transit, the ‘public domain’ and their disjunctures.

The paper will argue that this creative public has enlivened the politics of urban development and infrastructure, and in so doing, provided a subaltern means for mobilising hope against a political arrangement built on the preservation of spatially-inscribed allegiances. However, by successfully lengthening some relations (e.g. embassies, media outlets, ‘creatives,’ etc) rather than others (e.g. trade unions, bus drivers, state employees, etc), this constellation of activists has yet to be successful in bridging the unequal ‘warspaces’ of Beirut, and hence pose a threat to ‘the regime.’ By telling this story, this paper aims to demonstrate how assemblage thinking, far from being merely descriptive, can be a form of critical political engagement or activism in itself.

BABONES, SALVATORE* (University of Sydney, sbabones@inbox.com)

Global Convergence in Economic and Social Structure

The macroeconomic structure of the modern world-economy has been incredibly stable over time. According to data from B. Maddison, the 188-year correlation of national income levels for the 8 major world regions is a remarkable r = 0.956. There has been virtually no change in relative incomes for at least two centuries. This structural stability contradicts both standard neoclassical convergence models and standard world-system mobility models. Nonetheless, structural convergence is occurring: convergence in the demographic, distributional, governmental, industrial, and other internal structures of countries around the world. These trends presumably create pressure for macroeconomic convergence, but monte carlo simulations suggest that any resulting macroeconomic convergence is likely to be very slow indeed. It is also likely to be very different in character from historical “catch up” models that presume convergence to US/EU standards of globalization.

The macroeconomic convergence of the BRICs since 1980 can all be seen as an observable force that has been a subterranean means of forming a “public domain” of national mobilisation. It has “spread” from country to country in recognizable trajectories. The “Four Tiger” economies of east Asia (Hong Kong, Korea, Singapore, Taiwan). The macroeconomic trajectories of the BRICs since 1980 can all be seen as disjunctures. Paradoxical attempts to construct collective entrepreneurship to achieve greater impact, exhibiting a very extensive and activist-oriented kind of entrepreneurship (Gawell, 2004), that might entail a number of different balancing acts. For instance, between open and democratic process at the grassroots level, while being also partially centralized and restrictive in various ways.

The World Social Forum (WSF) emerged as an alternative response and project to the World Economic Forum. It is envisioned and mobilized to construct “Other Worlds.” The World Social Forum (WSF) is considered as an undefinable notion that is developing a renewed form of global mobilization. The WSF is made of a great variety of alternative and grass roots movements, associations and peoples coming together in an ‘open space.’

This paper, based on empirical research on the public transport sector, and taking ‘assemblage urbanism’ as a framework of analysis, will trace recent efforts to turn urban mobility in Beirut into a matter of concern. In turn, this investigation will highlight how a heterogeneous public is being formed around mass transit, the ‘public domain’ and their disjunctures.

BABONES, SALVATORE* (University of Sydney, sbabones@inbox.com)

The Global Diffusion Of Inequality Since 1970

Since 1970 income inequality has been stable or rising in almost every country in the world. It has not, however, risen at the same time or at the same rate throughout the world. This suggests the globalization, skills premium, and technological change explanations that prevail in the economics literature are likely incorrect, since all of these processes should in principle have relatively uniform global impact. If this is the case, the positive correlation of inequality across countries probably bear the hallmarks of a diffusion model. Inequality has not arisen simultaneously around the world; it has “spread” from country to country in recognizable and sensible patterns. The diffusion model offers a simple, intuitively-appealing alternative to extraordinarily complex regression models of rising inequality. Diffusion can occur either through emulation (a macrophenomenological mechanism) or through coercion (a macrorealist mechanism). These two mechanisms are not mutually exclusive. Either or both can be used by national elites to effect major changes of policy regime. Diffusion by emulation and diffusion by coercion are two macro-level mechanisms that can be used as a template for understanding the implementation of inequality-increasing social and economic policies in diverse countries around the world. They can be differentiated through examination of the micro-level mechanisms through which diffusion occurred in specific historical cases. This injection of agency into the inequality debates requires extensive micro-level work on individual countries, but the clear existence of macro-level trends suggests that this micro-level work should be done within the context of some form of macro-level diffusion model.

The World Social Forum As A Transnational Agency and Process? - from a Perspective on Transformative Entrepreneurship

The World Social Forum (WSF) emerged as an alternative response and project to the World Economic Forum. It is envisioned and mobilized to construct “Other Worlds.” The World Social Forum (WSF) is considered as an undefinable notion that is developing a renewed form of global mobilization. The WSF is made of a great variety of alternative and grass roots movements, associations and peoples coming together in an ‘open space.’

This paper, based on empirical research on the public transport sector, and taking ‘assemblage urbanism’ as a framework of analysis, will trace recent efforts to turn urban mobility in Beirut into a matter of concern. In turn, this investigation will highlight how a heterogeneous public is being formed around mass transit, the ‘public domain’ and their disjunctures.

BABONES, SALVATORE* (University of Sydney, sbabones@inbox.com)

Global Convergence in Economic and Social Structure

The macroeconomic structure of the modern world-economy has been incredibly stable over time. According to data from B. Maddison, the 188-year correlation of national income levels for the 8 major world regions is a remarkable r = 0.956. There has been virtually no change in relative incomes for at least two centuries. This structural stability contradicts both standard neoclassical convergence models and standard world-system mobility models. Nonetheless, structural convergence is occurring: convergence in the demographic, distributional, governmental, industrial, and other internal structures of countries around the world. These trends presumably create pressure for macroeconomic convergence, but monte carlo simulations suggest that any resulting macroeconomic convergence is likely to be very slow indeed. It is also likely to be very different in character from historical “catch up” models that presume convergence to US/EU standards of globalization.

The macroeconomic trajectories of the BRICs since 1980 can all be seen as disjunctures. Paradoxical attempts to construct collective entrepreneurship to achieve greater impact, exhibiting a very extensive and activist-oriented kind of entrepreneurship (Gawell, 2004), that might entail a number of different balancing acts. For instance, between open and democratic process at the grassroots level, while being also partially centralized and restrictive in various ways.

The World Social Forum (WSF) emerged as an alternative response and project to the World Economic Forum. It is envisioned and mobilized to construct “Other Worlds.” The World Social Forum (WSF) is considered as an undefinable notion that is developing a renewed form of global mobilization. The WSF is made of a great variety of alternative and grass roots movements, associations and peoples coming together in an ‘open space.’

This paper, based on empirical research on the public transport sector, and taking ‘assemblage urbanism’ as a framework of analysis, will trace recent efforts to turn urban mobility in Beirut into a matter of concern. In turn, this investigation will highlight how a heterogeneous public is being formed around mass transit, the ‘public domain’ and their disjunctures.

BABONES, SALVATORE* (University of Sydney, sbabones@inbox.com)

The Global Diffusion Of Inequality Since 1970

Since 1970 income inequality has been stable or rising in almost every country in the world. It has not, however, risen at the same time or at the same rate throughout the world. This suggests the globalization, skills premium, and technological change explanations that prevail in the economics literature are likely incorrect, since all of these processes should in principle have relatively uniform global impact. If this is the case, the positive correlation of inequality across countries probably bear the hallmarks of a diffusion model. Inequality has not arisen simultaneously around the world; it has “spread” from country to country in recognizable and sensible patterns. The diffusion model offers a simple, intuitively-appealing alternative to extraordinarily complex regression models of rising inequality. Diffusion can occur either through emulation (a macrophenomenological mechanism) or through coercion (a macrorealist mechanism). These two mechanisms are not mutually exclusive. Either or both can be used by national elites to effect major changes of policy regime. Diffusion by emulation and diffusion by coercion are two macro-level mechanisms that can be used as a template for understanding the implementation of inequality-increasing social and economic policies in diverse countries around the world. They can be differentiated through examination of the micro-level mechanisms through which diffusion occurred in specific historical cases. This injection of agency into the inequality debates requires extensive micro-level work on individual countries, but the clear existence of macro-level trends suggests that this micro-level work should be done within the context of some form of macro-level diffusion model.

Reading the Past and the Present, Imagining (and living) the Future: The Practice of Mystic in Social Movements

Opposite to the so-called revolutionary strategy in two steps (first, to take the power-it means, to be the master; second, to change the world), social movements propose a process of social change from here-and-now, taking their experiences and practices as an advance of the new society to be built. In this scenario, we aim to analyse the role of the mystic as symbolic mediation between the past-the present where social movements come from, and the present-the future they try to configure. The mystic is one of the most particular characteristics of the Brazilian Landless Social Movement (MST) that has been extended to many other social movements, both in Latin America and worldly, and we will analyse it through the discourses on it. It is considered as an indefinable notion that mixes ethics, aesthetics, subjectivity, identity, feelings, emotions and ideas, and takes place through many artistic forms (dance, music, theatre, poetry, etc). A really transdimensional and complex practice that articulates the symbolic, emotional, thinking, communicative and socialising dimensions, the mystic offers an analytical scenario for understanding this creative temporal tension between past-present and present-future. Given its particular symbolic and emotional dimension, the mystic plays a core role in the process of creation, articulation and-what is more important- "imagination" of projects and visions of future, from a past-and-present based approach, and in the (emotional) mobilisation of individuals around those purposes and the unity for making it real. Finally, we aim to discuss how the mystic's special articulation of emotions and reasons, feelings and ideas, sensibility and reflexion -breaking traditional divides- becomes a central mediation (Barbero) in understanding the process of re-invention of new practices proposed by social movements.

Type 2 Diabetes Health Equity Audit in the Basque Public Healthcare Service (Spain)

Health equity audit (HEA) is a systematic procedure to identify inequalities in healthcare access and use, and propose interventions for their reduction. Type 2 diabetes (DM2) is one of the leading causes of disease burden nowadays in Primary Health Care (PHC), and has shown a relevant socioeconomic pattern. This paper aims to present the results of the “equity profile” conducted on secondary socioeconomic information for each individual was linked to the electronic clinic history of the public Basque Health Service. Age-adjusted prevalences and incidence rates for preventive counselling, screening, treatment, referrals to specialists and consequences were calculated. Moreover the relative index of inequality (RII) was calculated, adjusted for different confounding variables. Main results show that the prevalence of DM2 (men 5.8%; women 4.8%) followed a clear socioeconomic gradient (RII men = 1.35 [1.26-1.44]; RII women= 1.79 [1.66 1.94]), although the relationship varied with age. The poor metabolic control increased by deprivation especially in women (RII = 1.18 [1.02-1.28]), and the probability of having an annual analytical control (RII = 1.14 [1.04-1.25]), The referrals to specialists were more frequent among low socioeconomic groups, but the relationship disappeared when considering the metabolic control and complications. These results indicate that even if PHC attention is equitable, relevant inequalities in DM2 persist, which implies the need of looking for interventions to reduce them beyond the health service sector.

The Job-Seeker and The Data Double: How Employers Use Information Seeking On The Internet In The Recruitment Process and Its Consequences For Interaction With The Job Seeker

Over the past years it has become increasingly more common for employers to search the internet for information on job-candidates, creating a situation were the interaction between the job-seeker and the employer becomes influenced by the information that the employer have retrieved from the internet. The different types of information packages that an employer takes part of during a recruitment process can be understood by Goffman’s concept of roles. A person uses a number of different roles in daily life, the “authentic” and the other, but always more or less trustworthy in regard to the context of the performance. One can therefore understand the recruitment process as a process of evaluating if the candidate is likely to be able to deliver the role that the employer carries with it in a trustworthy manner. By using information from the internet, employers may come to see job-seekers in their other roles and in setting that can be characterised as front- as well as backstage, and job-seekers will be evaluated based on whether or not these roles are perceived as compatible with the role of being an employee in the organisation in question. In this paper we ask how employers interact with this “data double” and how the data double influences the interaction between the employer and the job-seeker. The study was conducted through qualitative interviews with employers from the private as well as the public sector in Sweden.

Mathematical Exclusion – Process of Escaping from Mathematics and Its Consequences for Young People Career Paths

In the Polish educational discourse there is a lot of concern about the problem of ‘overproduction’ of graduates of humanistic faculties and deficiency in the area of technical education. Recently even social campaigns were organized by the government, aimed at encouraging secondary-school graduates to choose technical specializations at universities. However, this revealed another problem: insufficient level of mathematical knowledge of candidates. Many studies show that the problem has to be handled at earlier stages of education. Mathematics as no other school subject evokes conflicting emotions and contradictory attitudes. Process of studying mathematics requires systematic practice and patience, as mathematical knowledge is of cumulative nature.

In case of mathematical education we can observe a process of abandoning mathematics by a part of students who start to consider themselves as “humanists”. It causes serious decisions about profile of education – e.g. class profile. This decision has numerous consequences, it may narrow down possible paths of future education and career, finally resulting in employment and income inequalities. This phenomenon can be named ‘Mathematical Exclusion’.

In the paper I intend to propose a description of the process of escaping from mathematics in terminology of behavioral economy - time-related preferences, time-discounting and the lack of self-control. I intend to show sources of abandonment of mathematics in negative attitudes towards mathematics and specific motivation of their knowledge. I will refer to selected results of two studies on Polish students – qualitative (2010) and quantitative (2011, N=3169).
Polpan 1988 – 2013: Challenges for Constructing Questionnaires for Longitudinal Researches of Social Structure and Inequalities

The Polish Panel Survey POLPAN is a unique program of panel surveys carried out since 1988 in 5-year intervals, and focused on describing social structure and its change during the last 25 years in Poland. The resulting POLPAN 1988-2013 dataset will be invaluable for the social sciences, as it will allow for testing hypotheses about the impact of intellectual and social resources on individuals’ biographies, and more importantly, how the latter shape the social structure. The project’s theoretical approach is based on major assumptions of the rational action paradigm and life course analysis developed by Blossfeld and Perin (1998), Mayer (2009), Goldthorpe (2006), diPrete (2006, 2007) and Breen (2010).

Last edition of the study, due to the decision to rejuvenate the panel and the initiation of a new panel cohort, necessarily involved the need for redefinition and restructured way of delving about research tools used in last waves.

Between 1988 and 2013 Poland underwent transformation - from the “old” and “new” elements in the social structure, differences in the standard of living, labor emigration on massive scale and its impact in understanding career and education paths, patterns of professional and family life with clear implications for social inequalities. In addition, the twenty-one-year-old of 1989 was a completely different person than his peer in 2013 - there was necessity of in-depth analysis of the meanings of questions self-evident in previous waves, take account of the changes of realities and consideration if questions posed during the communist era will be understood and does not change the meaning today. The challenge was to combine the necessary changes and the need of maximum comparability of panel waves.

In a paper I intend to describe most important of mentioned challenges and give examples of solutions worked by POLPAN team.

The Adoption of ISO 14001 Across Korean Business Firms

This study asks why Korean organizations adopt environmental self-regulation programs; I focus specifically on ISO 14001. My analysis draws on a unique longitudinal data set to offer a new institutional explanation of the spread of ISO 14001 across Korean business firms. I argue that Korean firms have adopted this program in response to the passage of The Promotion Act for Conversion to Environmental-Friendly Industry Structure of 1995. ISO 14001 is more to have been adopted when large firms in that industry have adopted it and when firms have a connection with management standards consultants who have marketed international standards. These findings extend recent theorizing about legal ambiguity and the mechanisms of “coercive isomorphism.”

Explaining Intellectuals: A Proposal

In this paper we assess the potential of positioning theory for explaining intellectual life. Positioning theory pays attention to how intellectuals, like other people, use various rhetorical and dramaturgical devices to position themselves vis-à-vis others. The positioning of intellectuals affects the extent and nature of their symbolic and institutional recognition, as well as the diffusion of their ideas. We illustrate positioning theory through a number of case-studies, at least one of which will be dealing with the realm of academia and one with the phenomenon of public intellectuals. We demonstrate the advantages of positioning theory compared to rival perspectives in the sociology of intellectuals such as Collins’ network approach and Bourdieu’s field approach, paying particular attention to the different ways in which the issue of agency is dealt with by these theories.

Family and Parenting Values of the Youth: Stability in Shifting Russia

In consequence of long-term depopulation tendency in Russia the issues of the importance of a family, quality of a parenting are actual. Their research assumes the analysis of valuable orientations concerning family and parenting. Studying of youth values is especially important because it is somehow possible to influence views of young people.

The article presents the results of qualitative research of young people’s opinion about family and parenting. We used biographical research method and analyzed 147 essays of Russian students at the age of 17-21 years. This survey was conducted in Russian cities in Ural region in 2013. The childhood and adolescence of respondents matched the difficult period of social and economic reformation.

The analysis of the papers revealed three categories of the respondents who had given different descriptions of a parental family: “gratitude-description”, “neutrality-description” and “problem-description”. There is a close interrelation between the inherited social experience of the relations in a parental family and image of their own future family. At the description of a parenting there are such words as “pleasure”, “happiness”, “care”, “responsibility”, “work”.

Results demonstrated the high value of a family in Russia today. Describing the desirable relations in the future family students emphasize stability and indisputable monogamy of its members. They deny divorce. The marriage unions of grandparents are often accepted as a model of marriage relations and positive experience.

Our results inspire a certain optimism about the demographic prospects of Russia. They show that the modern Russian youth who were born at the breaking point of Russian history successfully admitted traditional family values and behavior models. It creates conditions for carrying out the demographic policy oriented not only on growth of population, but also on improvement of quality of the human capital.

Leadership, Person-Organization Fits and Organizational Commitment

In the 21st century the world has become a constant changing and turbulent place. Moreover, the economic situation, in recent years, affects us all as private individuals and within organizations. We can reasonably expect greater needs for human resource and less funding to meet them. This study is offering a kind of leadership that develops organizational commitment (OC) not only by calculating the satisfaction of rewards, but also by psychological aspects: Moral and self-perception (level of value realization and level of self-identity expression). While the OC research literature deals a lot with needs satisfaction as a contributor to OC there is almost no theoretical reference to “self-processes” and no study examined there contribution to OC. This absence seems a bit peculiar given that the social psychology literature has devoted substantial attention to the “self” as a driver of behaviour.

The study examined the relationships of three aspects of person-environment fit (P-O Fit) that contribute to OC - degree of: Needs fulfillment, values realization, self-concept expression, with manifestations of OC: “Identification”, “contribution”, “presence”. The study was based on a questionnaire given to 444 respondents, all members of community organizations who also were workers in business/work organizations. Findings showed fulfillment of needs to be central in its contribution to OC manifestations, and that its highest contribution was to the component expressing “presence”. However, satisfaction with values realization and self-identity expression also contributed to OC. Moreover, The three types of P-O Fit were distinct from one another, they contributed differentially to the explanation of OC manifestations, and their respective contributions to the prediction of OC level were additive. Therefore, leaders of organizations that put emphasis on satisfying their worker’s needs but also allow realizing values and expressing self-identities should extract a higher degree of commitment from their members.

BAILLAT, ALICE* (Sciences Po Paris/CERI, alice.bailat@gmail.com)
Analysing Discourses - Analysing Future Politics. A Study of Discourses on Climate-Related Migration in Bangladesh

Discourses on climate-related migration have recently emerged in Bangladesh and haven gained a higher profile in the broader climate change discourse of this vulnerable country. More than 60 semi-structured interviews have been conducted in Bangladesh from 2011 to 2013 with a broad range of actors - political officials and stakeholders - including practitioners, bureaucrats, elected representatives, journalists, NGOs - that are involved in a field concerned with displacements due to climate change hazards (disaster management, migration management, development planning, etc). The analysis of these empirical data with a discourse analytical (framed analysis) give some interesting results to understand how and why these discourses are constructed depending on the social authority of the producers, their professional and individual background and their institutional constraints. This discursive analysis, that combines both quantitative and qualitative methods, also aims to draw a mapping of those discourses and to identify the motivations and intentions behind them.

Referring to a discourse analysis perspective – in particular the Critical Discourse Analysis perspective – seems particularly relevant to understand how climate-related migration are perceived in Bangladesh and how those discourses shape the future national policy response (or, on the contrary, the lack of policy interventions). In other terms, how those discourses, that are constructed or even manipulated, shape future climate-related migration scenarios and the policies tailored to these new challenges.
Finally, this paper explores – through an original discourse analysis - the importance of problem-framing and social determinants that influence the emergence (or the non-emergence) of a new public problem and its political aspects. Using a set of concepts and methods from different disciplines – sociology of organisations, sociology of public problem, political science, linguistic etc. - it also invites to transcend disciplinary boundaries and to develop an innovative thinking.

Lead Firms, Joint Liability and the Regulation of Work in Global Supply Chains

This paper examines how the concept of joint liability can be applied to labor organizing in the context of global supply chains. It does so by revisiting the history of jobbers agreements in the U.S. apparel industry. Jobbers agreements were collectively bargained contracts that were negotiated between jobbers—companies that marketed but did not make apparel—and the unionized workers employed by the independent contractors that filled their orders. The paper then explains how the jobbers agreement model is inspiring new efforts to negotiate “buyer agreements” with modern-day jobbers: brands and retailers such as Adidas, Wal-Mart, and Apple that sit atop global supply chains. Such efforts leverage creative forms of organizing and enlist students, activists, and other stakeholders to demand recognition of modern-day jobbers as de facto joint employers.

Disaster Governance for Resilience: From Concrete Ingredients Towards General Menus – a Post-Earthquake Christchurch Case-Study

Societies can be prepared for disasters, but uncertainties will nevertheless always remain. Although disasters impact all aspects of society, there is a social vacuum in international protocols for disaster management as they privilege a technocratic-oriented approach which proves insufficient, as systems are overwhelmed. The objective of this paper is to investigate sustainability transitions and governance practices towards resilient disaster-prone areas, based on insights from Christchurch, New Zealand.

The paper is structured in four parts. First, theoretical connections are drawn between the concepts of institutions, governance, resilience and disasters. We argue that it is impossible to create one recipe for disaster governance, since every context differs institutionally and has its own path-dependent characteristics. Therefore, we should think of governance approaches that proved to be general menus for sustainable recovery, instead of a tray of concrete ingredients that should work as a panacea.

Second, we present a framework for examining disaster governance from a multi-level perspective. The shift in disaster studies from management – emergency management and technocratic solutions – towards governance enables multi-level and multi-actor collaboration highlighting long-term recovery processes (Tierney, 2012).

The third part is devoted to the Christchurch case-study. In 2010 and 2011, Christchurch experienced multiple devastating earthquakes. While theories stress the importance of social engagement and multi-level governance in recovery processes for place attachment, people in Christchurch argue that this was not sufficiently central in the aftermath of the earthquakes.

The paper concludes with reflections on the share of governance responsibilities between states and markets, central and local governments and institutions (Ostrom, 2012). We argue that all actors are needed in the processes to reduce vulnerability and increase resilience. Questions remain however, when and how governance should be whose responsibility in order to create resilient pre- and post-disaster places.

Privatisation and Income Inequality in Western China

This article studies the relationship between privatisation and income inequality in Western China, based on survey from 11 Western provinces, collected in 2004-2005. The Chinese government in 2000 initiated a campaign to develop Western China and reduce local and regional inequality. Privatisation has been a central component in the campaign. A key question is therefore whether a higher degree of privatisation contributes to reduce income inequality. As a macro-level socioeconomic structure, privatisation may have great impact on individual social positions such as education and occupation. This can influence individual income levels, and be further aggregated to the outcome of income inequality. Inspired by Coleman’s theory of micro-macro relation, the study first explores the macro linkage between privatisation and income inequality. Using multilevel random coefficient modelling, it then studies how the impact of individuals’ education and occupation on their income level varies between different regions with different degrees of privatisation. Finally, it simulates the macro income inequality based on multilevel models. The study shows that income inequality appears to be higher in regions with higher degree of privatisation. Furthermore, the study confirms that individual income is strongly affected by education and occupation, which supports the market transition theory in the context of Western China. This relation varies across regions with different degrees of privatisation.

Agriculture-Supported Communities: Experiences in Consumer-Producer Relations in Hungary

This article presents the case study of a rather underdeveloped and experimental Hungarian CSA sector which gained recognition in recent crisis driven times to show how consumers, small agro-food businesses, non-profit groups and citizens radically enact sustainable food consumption in Hungary. Although their beneficial existence has been widely acknowledged in governance, their economic performance is still quite insignificant, while they also show a substantial awareness raising potential. This study examines the practices of CSAs to understand the economic, environmental and social motivations behind running or joining a CSA operation. Our findings are based on qualitative interviews and data from stakeholder meetings where we facilitated a structured vision to action workshop to identify the main mechanisms and strategies of building alternative food networks. The article presents results on the shaky, non-self-sustaining foundations of CSAs to analyse how they catalyse social change to enhance consumer-producer cooperation and regain control over the ways in which food is produced. The research found that current share prices of CSA farms do not reflect all of the costs of production, and hence might not be an economically viable approach to sustainable agriculture if CSA farms continue their current pricing strategy. This aspect has not received enough attention from scholars and local food advocates who tend to see CSAs as ideal examples of sustainable food systems. The study concludes by pointing at what role the strategies of building alternative food networks of the Hungarian food system by providing a model for more profound social transformation.

Achieving an Adequate ‘Distant Co-Presence’: Polymedia As Vibrant Matter in Transnational Family Life

Both mobility and technologies, and their intersections, need to be theorised as integral to transnational family relations. In this paper, I employ a framework of circulation (Baldassar & Merla 2013) as a methodological tool to ‘follow the thing’ that is, care, across distance and over time, as well as its intersections with various dimensions of social reproduction. I also apply Madianou and Miller’s (2012) theory of polymedia, combined with Jane Bennett’s (2010) notion of vibrant matter, to ask how communication technologies are not only sustaining, but transforming, circuits of distant care. These transformations in distant care begin to stretch the limits of some of our distinctions between proximate and distant family life, in particular through transformations in co-presence (the feeling of ‘being there’), which challenge the epistemology of intersubjectivity.

Perverting Autochthony: The Local Festa As a Rite of Institution Informing Public Debate on Migrant Belonging

The intersections of migrant, racialised, and autochthonous belonging were spectacularly evident during an altercation that took place at the annual patron saint festa in Prato, Italy, 2010. Home to one of the largest Chinese migrant communities in Europe, Prato has been living what the locals refer to as ‘a difficult moment’ in history. The economic context is shaped by a beleaguered historical textile industry perceived by locals to have been ‘stolen’ by a new cognate ‘ready-made fashion’ industry championed by the Chinese migrants. The left-leaning local government, in office for over 50 years, was defeated by a new right government (with links to the Lega Nord) on an overtly anti-Chinese migrant campaign, which appealed to notions of autochthonous centuries-old belongings. These political and economic tensions came to a symbolic head at the start of the annual historic procession through the streets of the medieval town center. The left-leaning Provincial Government invited migrants (many with Italian citizenship) to join their section of the procession. The Mayor intervened to publically forbid the migrants from participating, explaining that their presence perverted (snaturava) the historical ritual. Drawing on Bourdieu’s notion of rites of institution, I examine the local government’s representations of the local festa over the past few years to explore the shaping of public debate on Chinese in Italy.

Me? A Secretary? The Moderations of Class and Gender in India’s Elite Law Firms

Following market liberalisation in 1991, the Indian legal profession has had more demands for cross-national legal services than ever before. One of the ways in which the country has responded to this global work and clientele, is by reorganizing its professional spaces in new, competitive ways. On the one hand, there has been a burgeoning of new, elite law schools that train young lawyers in comparative, cross-national law and include rigorous clinical curriculum. At the same time, there have emerged, especially over the last decade, a set of big law firms that are, in the Indian context, relatively new legal organizations that deal primarily with transactional corporate work for large global and domestic corporate clients. These firms have expanded and grown institutionally in many unprecedented ways, but a striking feature of their emergence—especially among the largest and most successful firms in the country—has been the growth and success of their women lawyers. Preliminary interviews suggest that women in these big law firms are not discriminated against or disadvantaged as compared to their male peers in that they receive similar organizational rewards (pay, promotion, client attention) and interactional status among clients, peers and superiors alike. This is an intriguing finding in that it does not correspond to mostly gender-disadvantaged accounts of women in high status professions universally. We know that critical stratification scholars have long credited the unique power of gender within high status professional organizations. Put simply, it asks: is this unique “gender-neutral” advantage (to the extent it exists) limited to certain kinds of women?

BALLAKRISHNEN, SWETHAA* (Stanford University, swethaa@stanford.edu)

Women in Black: Gender Negotiation in India’s New Organizations

Over the last three decades, the feminization of the legal profession has been a consistent feature across the globe. This phenomenon has made it a prime exception to this trend has been in India, where women have consistently been less than 10% of the practicing Legal Bar. It is of especial contrast then, than in two most prestigious law firms in the country, women constitute about 50% of the workforce and record similar professional rewards and advantages as their male peers. Using in-depth interviews with past and present lawyers, this research will investigate comparative frameworks to test and explain this unlikely finding about institutional change. For instance, one reason for this advantage might be that both these unique firms emerged as new “global” workplaces following, and necessarily responding to, market liberalization in the early 1990s.

This project is empirically significant because its dissonance is unique to the Indian context as well as everything we know about women in prestigious workforces more generally. Investigating these organizations and women is theoretically significant because it speaks to important literatures on organizational emergence (Powell and Padgett: 2011), gender stratification (Ridgeway:2012) and the influence of globalization in emerging markets (Meyer & Rowan: 1977).

BALLANTYNE, GLENDA* (Swinburne University of Technology, gballantyne@swin.edu.au)

Mobile Ambivalence: Turkish Alevi in Australia

The idea of ambivalence has emerged as a particularly apt interpretive prism for analysing the experience of migration. The co-existence of contradictory emotions it speaks of provides an illuminating frame for analysing the feelings of loss and new possibilities that are frequently part of migrants’ lives, and as analyses in the area have shown, the lens of ambivalence has lent itself to interpretive nuance, distinguishing among both objects of ambivalence (place of origin and place of destination) and responses to ambivalence (negative, positive and mixed). In this paper, I attempt to delineate further distinctions within this framework, exploring a case of ambivalence associated with denigration in a place of origin that has been transported into, and affected feelings towards, a place of destination.

The case is that of the Turkish Alevi in Australia. The Alevi are a socio-religious minority in Turkey with a long history of fraught relations with the region’s religious communities and Sunni majority. Their markedly heterodox traditions, originating in Anatolia and rooted in but going beyond Shia Islam, have been subject to repression and denigration since the 16th century. Australia has been a significant destination for Turks emigrating in the postwar period, and Alevi are a significant proportion of them. My research into transformations of Alevi collective identity in Melbourne suggests that ambivalence towards Turkey stemming from this historical experience is replicated in feelings of ambivalence towards the broader Turkish community in Australia, adding a further layer of ambivalence to Alevi complex relationship with their country of settlement.

“Free Movers” and Exchange Students in Europe and around the Mediterranean Sea: Antagonistic Figures or Two Sides of the Same Coin?

The European student mobility Erasmus Programme, born 25 years ago, has arguably affected many major aspects of student life. This programme is multifaceted and can not be assimilated to a single type of mobility that could be qualified as “organised” or “institutionalised”. To consider the state of the art, on the injunctions and incentives to mobility in Europe and around the Mediterranean sea and the obstacles to students migration, will go back over the main research undertaken in recent years on the subjects in Europe (Erllich, 2012; Ballatore, 2010; Mazzella, 2009; Murphy-Leujeune, 2001; Aguilón, Xavier de Brito, 2009; Cammelli, 1999; Maiworm, Teichler, 1997; Jallade and al., 1996 ...).

First of all, we will take a particular interest in the construction of an European space of Higher Education and its historical link with the Mediterranean area, then we will pass through comparative analysis on European and Mediterranean student migrations, to finally look at projects, expectations and free movers’ and exchange students’ experiences. We will develop the idea that, general speaking, a part of the European research results leads one to believe that exchange programmes would only foster forms of “in-depth tourism” and would have little to do with others forms of “free mover” migration. The “acculturation” of students would be as temporary as the stay. We will wonder if this mobility could be predictive of other types of migration and conclude also underlining that in Europe
the competition paradigm seems to have won the pot over the cooperation one, which is at the base of student exchanges and that, even today, still lacks a lot of studies and reliable data which would allow one to compare “organised” and “non-organised” mobility, student and professional mobility, as well as more general research on particular types of migration in Europe.

BALLATOIRE, MAGALI* (GIRSEF-UCL, magali.ballatore@uclouvain.be)
Segmented Labour Markets and the Ongoing Blending of Cultures of the European Commission Skilled Workers

The European Commission of Brussels is often seen as a European-minded body of privileged civil servants. These civil servants hold varying positions varying between trainees, contractual staff, intern staff and experts. Looking closer at the diversity of the workers in terms of age, gender, social and schooling backgrounds and at the hybridization (In Globalization theory, the ongoing blending of cultures) inside this institution, we can see people performing their activities under different types of job contracts. These are increasingly influenced by the logic of the market and are becoming more precarious. In other words, today in the field of Eurocracy, there are deep differences between permanent and non-permanent positions. The gap between official and contractual staff did not exist previously and has tended to increase in recent years.

In this paper we focus on this new population of highly skilled workers, who invest their own resources, empathy and individual autonomy to try to enter this specific labour market. Doing so, we will try to construct a picture of the migratory paths and social backgrounds of these employees before they enter the institutional upswing a survey within the European Commission in Brussels. We will analyse 1234 questionnaires, 22 interviews and some direct observations to develop a critical discussion on the conditions faced by these knowledge workers. We will explore their representation, experiences and the way they see their future. Hence, we will address the question of spatial, national and social inequality for this newly formed European transnational elite.

How Professional Groups Defend Their Interests through Incentives to Parliamentary Members? the Cases of France and Germany

How do professional groups such as managers, artisans, employees or even unemployed people get in contact with parliamentary representatives and how do they succeed (or fail) to convince MPs to stand for their own interests? It appears that one of the reasons why professional groups succeed in having their interests defended lies on the nature of the incentives that these groups can propose. These incentives can take various forms: financial, symbolic, social or political. Therefore, we would focus on the sociological and political dimensions of the notion of “incentive” and “interest”. As a result, multiple questions arise. How do these groups introduce their interests to MPs? What type of arguments do they use? Where do MPs and professional groups meet? How do professional groups suggest their incentives to MPs? Is it necessary to propose powerful incentives to have their interests represented?

Through these questions we would like to propose an analysis of the processes during which professional groups develop the incentives and the interests introduced later to MPs. Also, we would like to propose a detailed answer of the question: Why do MPs agree to defend the interests of specific professionals groups against incentives? To do so, we would propose a comparative analysis between France and Germany based on 70 face-to-face interviews with institutional representatives of professional groups and MPs as well as observations led during meetings between these actors and archives (around 900 documents). By focusing on the financial committees in the Bundestag and the Assemblée Nationale, we would propose an analysis of the interactions between professional groups (through their spokespersons) and MPs on different issues related to taxes. More generally, the comparison would allow us to draw some national trends to understand how professional groups succeed in being politically represented.

Gendered Nationalism and Global Citizenship in Nigerian Beauty Pageants

This paper focuses on the Nigerian beauty pageant industry and its links to the development of Nigerian gendered nationalism. It focuses on the “beauty diplomacy” narrative used by Nigerian beauty queens to present themselves as worthy cultural citizens. This narrative connects them to other ordinary Nigerians and promotes their own voices and that of the public in the national arena. Beauty contestants insisted that they could use the attention garnered through pageants as a tool to amplify their voices, make a difference in the country, and reach for their goals. Throughout the course of the competition and during their subsequent reign, a beauty contestant’s sexuality is judiciously protected and projected as “pure.” This ‘purity’ is linked to their ability to be recognized as suitable role models in Nigeria whose charity, development, and goodwill is appreciated. Through their celebrity status they craft special platforms to address issues of national concern and do social work during their reign. These women are not only the face of Nigeria, but also groom themselves as “citizens of the world” through their travel and participation in major international contests. I focus on the complex process these contestants must navigate in representing and propelling their country’s progress to a global society. Contestants stress their own symbolic role in which showcasing their own positive attributes served a larger function of highlighting the good elements of Nigerian society both domestically and to the broader global community.

Aspects of Poverty in a Period of Recession in the Mediterranean Countries: A Gender Perspective

This paper aims to identify the impact of the economic crisis on women’s poverty in the Mediterranean countries, the most affected by the recession. The main research questions are: Is the crisis affecting women more than men? Do salary cuts and decreasing household incomes force women to turn into precarious and informal workforce? Do unequal sharing of unpaid care and housework burdens, gender roles and gender stereotypes compound to produce unequal life chances for women? Can gender perspectives in policy design be a response to the financial crisis?

Based on recent research, this paper’s objective is to depict the current position of women in poverty in a comparative perspective. The analysis focuses on the “traditional forms of poverty” from one generation to another and is mainly linked to gender differences; while the poverty risks are lowest among married women and dual-earner families. It seems that financial hardship is a major cause of family breakdown. Low-income parents are more likely to break up and to remain poor after the split than others. Consequently, poor economic conditions have strong impacts on fertility behavior.

The Impact of the Crisis on Child Well-Being and Poverty: A Challenge for Social Economy?

In Europe, around one in three children will experience poverty during childhood. For most, poverty will be transitory; however, for those growing in countries affected mostly by the crisis, poverty persists for many years. Children experiencing such a persistent poverty are more likely to be born into single-parent families, have mothers with low education level and to be unemployed or even in a low-paid work not guaranteeing a path out of poverty. Theories suggest that experiencing poverty during childhood may affect one’s life social and economic outcomes. Empirical studies confirm that deep and persistent childhood poverty is likely to be passed on to future generations, consolidated, hard to eradicate and traversing even more generations in the future.

In periods of recession, the social sector of economy can be the driving force for the social integration of children and poor families. Numerous initiatives at local level show that the involvement of actors, workers, stakeholders and beneficiaries in the “social enterprise”, can enhance their societal success and contribute to employment creation and to a fairer income distribution.
This paper is based on recent research on social enterprise and partnership initiatives to promote local development, regeneration and combat child poverty and social exclusion in the countries most affected by the financial crisis. The paper analyses the respective impacts of these new ‘business-community partnerships’, including their legal framework, financial resources and governance schemes on communities and ecosystems on relative poverty and social exclusion. Although this attempt is yet to be completed and the quantitative data are not enough to be able to draw any definitive conclusions, the key finding confirms that social economy enterprises can play an important role in improving equal access to numerous services for families and children, thereby preventing and providing solutions to the increasing poverty problem in society.

**System Theory, Computational Social Science and the Challenges of Zettabyte Era**

The volume of information available for research has grown rapidly in recent decades. According to the Cisco Systems, we are beginning the era of Zettabyte. The access and analytical treatment of this enormous amount of information has created a debate in social sciences about new methods, epistemological and theoretical concepts. This study is based on systems theory, sociocybernetics and new propositions of the computational social science. Four concepts connect the areas of knowledge involved in this project: system, complexity, emergence and evolution. The fundamental premise to make sense of the data is that a social organization evolves or transform over time. Data can be conceived as a registry of how systems are organized and how it changes over time. In the classical sociology, the same idea constitutes the fundamental concept of the social process, which can be identified through social patterns. It means that social phenomena emerge from social relations, even if individuals are rational agents of these changes. The methodological challenge consists in observing and selecting data to reveal patterns of social relations and unravel the interconnection between the components of a system. The intention is to understand emergence of social phenomena (migration, inequality, etc.) and the consequence change in the social system. This study, conduct by the Laboratory of computational sociology (Infosc - UEL), has approached agent-based simulations in comparison with observed data from social networks. The first conclusions are the volume of data is less significant than the analytical capacity to select specific data in order to identify social interconnections and find patterns of systems complexity.

**Sources and Prospects of the Anarchist Method in the Arab Spring**

Drawing on various reports and my own field observations, this paper aims at four objectives. First, it shows how the Arab Spring movements were characterized from their inception by a certain intuitive anarchist method. This method was evident in a general resistance to any collective leadership, and preference for loose coordinating structures in lieu of solid organizations. The paper introduces some propositions about the likely sources of this intuitive anarchist style (to be distinguished from anarchist intention). Second, the paper explores the ramifications of this anarchist style to political developments at the level of the state, arguing that it is likely to give rise to shifty political structures that are not aligned with the broad sentiments that had generated the Arab uprisings, suggesting further crises ahead. Third, the paper explores the long-term ramifications of this anar-chist style in the culture, showing that it is giving rise to a new culture of engagement and debate, in which individuals constantly revisit the original “meaning” of the revolution, as well as its status as a transformative life event at the individual level. These practices give rise to new realities and new perspectives from below that are missed in most reporting. Fourth, the paper ends by exploring the ramifications of this analysis to anarchist perspectives on social movements in general.

**The Social Role of Organic Intellectual: Four Amendments to Gramsci**

Based on a study of the social role of intellectuals in the Middle East, this paper explores evidence that suggest that the role of intellectuals in the public sphere can be analyzed with the aid of four important revisions to Gramsci’s old outline of the notion of the “organic intellectual.” First, while the organic intellectual may be a product of a social group, that figure may also be understood as a producer of such a group. Second, organic intellectual activity seems to be most effective when it is intertwined with the intellectual demands of complex everyday life, rather than with any specific ideological program. Third, the organic intellectual tends to have a nuanced connection to “high culture,” which such an intellectual tends to regard as a vehicle for one’s own social program, rather than as its own fetish. And fourth, the effectiveness of the organic intellectual can be measured in the extent to which the intellectual transfers the audience’s reality even as he or she claims to preserve it. At the end, the paper suggests that organic intellectuals ought to be seen in a more comprehensive way than in terms of standing in for a specific group. It also suggests that their social role is enhanced through a particular balancing of the dialectics of innovation and rootedness, a dialectic that the organic intellectual is more equipped to handle than any other.

**The Democratic Public and the Process of Experience. Towards a Pragmatist Theory of Recognition**

Theories of recognition are an important approach for the development and normative foundation of a critical social theory. One central thesis is here that the formation of a positive personal identity depends on the affirmation by others in contexts of mutual recognition and that this affirmation is the decisive normative criteria for the constitution of social institutions. But insofar as this personal identity is in many cases only conceived as an identification of the actor with his own qualities and abilities, it follows that the social context, in which this positive personal identity is achieved, remains arbitrary. The trouble is here that the affirmation of a certain personal identity may differ from the existing expectations of the actor and ensure his integrity, but at the same also reaffirm the power relations of the social context, in which this identity was formed. In the second part of my paper I would like to develop an account oriented towards the social philosophy of pragmatism, which avoids these problems. Recognizing has to be conceived not as a affirmation of an already existing identity, but as a social process. In this process the actors and social groups are always confronted with unintended social consequences of their actions for others and are therefore led to a crisis and reformulation of their actual practical identity. And this holds not only on the level of the individual, but also on that of institutions. The democratic public is the realm in which a common elucidation of problematic social consequences of the existing institutions takes place. This elucidation is then the background for a critical reflection on, and a reformulation of the guiding norms of these institutions. In consequence critique reflects to blockades of this process of experience, in which institutionalized rules are questioned and reformulated.

**Economic Attitudes in Postsocialist Countries**

More than two decades after the fall of communism in Central and Eastern Europe and Eurasia, and the collapse of socialist economies, these countries have undergone monumental transformations. The fall of socialism coincided with the rise of neoliberal policy, a comprehensive way of thinking, and many postsocialist governments have adopted neoliberal economic policies. In this paper we examine what extent the economic attitudes of citizens in these countries have changed over time, what the role of the recent economic crisis might have been, and how attitudes compare to those held by their Western counterparts. Using European Values Survey and Life in Transition Survey data, we test different hypotheses across time. And we examine citizens’ attitudes about economic governance, inequality, markets, welfare, unemployment, and corruption. We compare postsocialist countries that...
are now members of the EU with Russia and the CIS, and the Balkan postsocialist countries.

Headteachers’ Conceptions of the Professional Competence and Professionalism Among Newly Qualified Teachers

Education scholars globally are agreed that the teacher is the most important resource in ensuring quality delivery of education. Using data from a qualitative study, this paper focuses on the conceptions of headteachers of the professional competence and general professionalism of newly qualified teachers in secondary schools. Data were collected through interviews from eighteen headteachers. An analysis of findings revealed dissatisfaction from headteachers regarding the professional competence and professionalism of newly qualified teachers. The article’s analysis incorporates detailed examination of the concepts of professional competence and professionalism and offers explanations for their lack among newly qualified teachers. It identifies as a gap in teacher professional development the under-prioritisation of matters of professional ethics which lead to mostly newly qualified teachers having difficulties transitioning from being a student to becoming a teacher. It is further observed that training newly qualified teachers generally lacks regulatory and quality control mechanisms that many other professions are subject to. Inadequate training, uncoordinated professional and organisational socialisation all conspired to create several challenges to the system in general and for the newly qualified teachers in particular in the execution of their duties. There is no significant difference between males and females regarding both their levels of professional competence and attitudes towards professionalism. To address the identified challenges and improve professional teaching practice headteachers used several methods including Continuous Professional Development and deliberated teacher reflection.

The Theoretical Metaphors of Chicagoan Human Ecology

The theoretical metaphors of Chicagoan Human Ecology.

The reception of the Chicago sociology in the Russian sociological discourse traditionally was concerned with the “Chicago style” in empirical research. Recent re-evaluation of the Chicago heritage put ahead its theoretical peculiarity, namely – Human ecology of Robert Park as the post-Simmelian sociology of space. The outline of the main metaphors driven from the Human ecology and used to represent the reassessed significance of the Chicago theoretical perspective includes the following ones:

1) The ontological metaphor: Society as a “Process” (VS “System/Structure”) in the post-Chicago sociology. “CCAA” as the structure of the social process. “CCAA” and “AGIL” – the holomous of the contraries. The “Cycle” as a way of functional metaphor for the social process and the recurrent form of the “immortal ordinary society”.

2) The methodological metaphor: “Dynamic disequilibrium” – interactionism, atomism and “sympathetic identification” on the micro-level (spatial dimension) and evolutionism (from biotic to social/moral) on the macro-level (temporal dimension).

3) The epistemological metaphor – “Laboratory” (Racial relations, , or The City). “Empirical bias” rendered as a tutorial problem and as the way of institutionalization rather than a prospective for the discipline development.

4) “Marginalization” and “in-betweenness” as the core of the sociology of Space. Space is not simply the type of “marginal man” as the embodiment of the “intelligent creativity”.

5) “Social order” and “freedom” as heterogeneous multileveled and interweaved phenomena.

The Body in the Brazilian Congress of Sports Science

This text shows partial data of an exploratory bibliographic research, in which the objective is to identify the principal conceptions of body, aesthetics and health into the scientific production of Thematic Work Groups “Memory, Culture and body” And “Body and Culture” in the CONBRACE, from 1997 to 2009. Quantitative data had been collected from the Annals of the Brazilian Congress of Sports Science (CONBRACE). The focus from the survey was the Thematic Work Groups (TWG) “Memory, Culture and body” And “Body and Culture”, and it was considered the production since 1997. Partial results have been shown. Of all the pieces of Work presented in CONBRACE, it had 625 proceedings; 312 in the specific TWG. From the total, 171 were in the TWG Memory, Culture and Body and 141 in body and Culture. It identifies the increase of proceedings from 1997 to 1999. In the TWG “Memory, Culture and Body, there is a decrease from 1999 to 2003. The proceedings also decrease in the TWG “body and Cultures” in 2009. Of the Selected Works, 97.73% has the keyword body, 17.05% aesthetics, and 9.66% health. The FURN (Federal University of Rio Grande do Norte) was the institution that presented most part of Proceedings in the TWG, moving the knowledge production to the center South-Southeast, becoming the most important center of knowledge production in Brazil around this theme. The research is still in its initial phase, but it is possible to understand the ways, dips and focuses on how the education is expressed in body, health and aesthetics conceptions in the TWG’s productions and its implications to physical education teachers’ formation.

Children’s Active Participation in Institutional Interactions

The concept of children’s participation enhances different versions of the relationship between children and society. This paper aims to clarify the meaning of children’s participation in the relationship between children’s individual action and the social treatment and consequences of this action. For this purpose, the paper explores the integration of different theoretical approaches that can shape research on children’s participation, looking at interactions, complex social systems that include interactions, and narratives that are produced in these contexts. The paper develops the understanding of the ways in which children actively participate in communication processes, the ways in which social structures condition children’s active participation, and the ways in which children’s active participation can enhance structural change in social systems, through the implementation of “promotional interactions”. This theoretical perspective is exemplified in the case of the education system, in which different forms of interaction can have different consequences for children’s participation.

The Role of Family Background and Gender Stereotypes in Determining Boys’ and Girls’ Mathematics Achievement

The presentation reports the results of the 2010 empirical research examining the role of family background and stereotypes about mathematics as male domain in boys’ and girls’ mathematics achievement in Croatian compulsory education (N=677, 52.4% female). Individual roles in determining mathematics achievement of both of these variables were widely confirmed (Bourdieu, 1996; Sirin, 2005; Eccles, 1987). This presentation focuses on exploring their possible interaction effects on boys’ and girls’ math achievement.

Family background was operationalized as a composite of indicators of socioeconomic status (parental work status) and status capital (parental education, possession of relevant goods), modelled after Bourdieu (1977). The scale assessing stereotypes was constructed for the study purpose and validated in pilot study. Mathematics achievement was operationalized as a composite of mathematics school grades.

Two-way ANOVAs revealed some gender specificities in the effects of the IVs on DV. Results obtained for girls indicated both main effects and interaction significant. Girls who belonged to higher status families and those who reported lower support for stereotypes achieved better in mathematics. Significant interaction effects (assessed that being from lower status families and supporting stereotypes was connected with girls’ worst mathematics achievement. Conversely, being from the higher family background was associated with higher math achievement, regardless of the level of stereotypes endorsement. Thus, originating from higher status families functioned as a barrier for the stereotype effect. As for the boys’ math achievement, only family background appeared to be relevant. As expected, boys from advantaged family backgrounds attained better math grades. Although below the significance level, the data trend shows that boys’ poor success in mathematics coexisted with the combination of lower family status and
stereotypes rejection, while good math grades related to higher family status and stereotypes endorsement. This analysis uncovers girls from non-advantaged families as most-in-need group for stereotype reduction programs.

Does European Country-Specific Context Alter Motherhood Penalty and Fatherhood Premium?

This paper contributes to the discussion on the effects of childbearing on men's and women's employment in the developed countries. While the literature on motherhood penalty due to childbearing is voluminous, there have been no empirical studies that systematically compare the size of the effect of fatherhood on employment cross-nationally net of selection into fatherhood. Furthermore, previous research for women has usually either compared the effects of childbearing across countries assuming exogeneity of family size to women's employment or examined these effects by using methods which deal with endogeneity of family size and simultaneously focused on single countries. In this paper we overcome these shortcomings. We employ instrumental variable models with instrumental variables based on data on multiple births. Using data from European Survey of Income and Living Conditions (EU-SILC), we examine the cross-country variation in the causal effects of family size on employment of men and women across the groups of European countries with converging welfare state regime and gender norms.

Heterogenous Impacts of Sibship Size on Educational Attainment Across Countries – Results from Meta-Analysis

The literature reports a negative relationship between the number of siblings and educational outcomes in the US and Western Europe but the pattern is less clear in several other countries. Some researchers have argued that the availability of relatives, who share the costs of childrearing by providing care and covering financial costs, can offset the dilution of parental resources. We expect that the same mechanism applies to the role of state: the state policy may provide services and funds that support parents in raising and educating children. As a result, the inverse relationship between sibship size and educational outcomes should be weaker or even not apparent in countries that implement such policies. We test this hypothesis by conducting a meta-analysis of available studies on the relationship between sibship size and education. Our study contributes to the on-going debate on the way the institutional and cultural context shapes individual educational opportunities.

Socio-Economic Contradictions Of Capitalism: The Nature Of Social Stratification and Inequality Today

Sources of contemporary social problems are seen more rarely from the perspective of the direct (or even indirect) causes, because thinking in terms of effects have become a standard analysis of contemporary social reality. By examining current systems of social stratification and forms of inequality especially in developed countries, one can easily fall into the “universalist” pattern of thinking, where divisions and tensions are seen as dysfunctional elements that need to be addressed on the one hand, but not necessarily looking for their sources on the other. Referring to Daniel Bell's The Cultural Contradictions of Capitalism, I want to extend the area of the contradictions of the capitalist economic formation by taking into account social economic factors, which in my opinion are the basis of unequal allocation of opportunities in modern societies in two dimensions (Harman 2009; Harvey 2006, 2010, 2012; Husson 2011; Therborn 2006; Wallerstein 2001). The first one concerns the distinction between developed countries and their peripheral quasi-partners (e.g. Amin 2011), and the other – often overlooked – focused on rich societies. The consequences of capitalist relations of production together with a system of socio-political representation are crucial not only for the situation of the distribution of social opportunities (stratification systems), but also for the social relationships that may in the future develop a more egalitarian forms of production and governance (Sen 2010, 1992).

Trust in Chinese Guanxi?

The paper demonstrates that the concept of trust requires very careful specification if it is to be used properly. It does this by framing sociological treatment of Chinese guanxi, an asymmetrical form of favour exchange based on enduring affective ties in which enhancement of public reputation is the aspirational outcome. English-language assessments by both foreign and Chinese authors emphasize the basis of guanxi in relations of trust between the provider and seeker through a careful examination of the structure of guanxi relations it is shown that not trust but relational obligation, third-party monitoring and fear of loss of face serve to support and enhance guanxi relations. Rather than trust, then, there are other forms of socially cooperative engagements based on different bases of solidarity. The paper shows that the concepts of trust and trustworthiness must be clearly distinguished and that the understanding of trustworthiness in Chinese cultural contexts operates not as a correlative element of trust relations but as an index of personal intimacy and interactive familiarity that are based on interdependent relations of normative obligation or loyalty associated with role expectations. The paper demonstrates, then, that theoreti- cal problems ensue if reference to and understanding of trust in cross-national comparative studies fail to take proper account of the wider social, institutional and cultural contexts in which socially interdependent relationships occur.

The UN Rules for the Treatment of Women Prisoners: Human Rights and Clinical Sociological Practice Implications

In 2010, the United Nations adopted the United Nations Rules for the Treatment of Women Prisoners and Non-custodial Measures for Women Offenders (the “Barbados Rules”). This was a landmark step in adapting the 1955 Standard Minimum Rules for the Treatment of Prisoners to women. As ‘soft law’, they are human rights principles that recognize that female prisoners have different needs from male prisoners. They are also reflective of previous reform efforts on behalf of women in prison around the globe. They take into account the presence of high levels of victimization among women prisoners and their greater propensi- ty for self-harm and suicide; the lower risk of most women prisoners yet higher classification levels; the special status of some women prisoners as mothers of children; the distance of women’s prisons from home communities and the diffi- culties of prison visiting; the particular health and hygiene concerns of women- related stigma and discrimination facing women prisoners; the use of prisons as shel- ters for women’s safety, as well as their use for ‘immoral crimes’; the need for gender-responsive programs and activities for women in prison, yet on a par with the opportunities given to men prisoners; and the particular needs of indigenous women prisoners and those from diverse religious and cultural backgrounds.

They call for gender-responsive and gender-sensitive policies and programs in prison in a wide variety of areas: intake, classification, mental and physical health- care, mothering in prison, searches, women’s safety, and the development of pre- and post-release programs that take into account the stigmatization and discrimi- nation that women face upon release from prison. The history and background of these rules will be examined, as well as their implications for clinical sociological/ criminal interventions related to women in prison around the world.

Countrieside Ghettoes? Immigrants’ Settlement Patterns in Italy Outside Gateway Cities

Italy has been -- and continues to be, notwithstanding the effects of the crisis -- an important destination country for immigration to Europe in the last decades. It is also characterized by plural and diversified settlement patterns, that mirror local and regional differences in competitiveness and position in the global markets. From the tough conditions of seasonal workers in Mezzogiorno agriculture, to the relatively smooth inclusion in Industrial district; from the quite welcomed re-population of shrinking mountain and hill towns doesn’t prevent the risk of territorial segregation, with peculiar forms of micro-ghettoization. Abandoned farmsteads, isolated and declining industrial or residential buildings are reused by migrants, producing also concentrations that -- not so large in general terms -- assume a focal role in setting local agendas on immigration. Here, the right to signify space in small communities is under debate.

Though, it will be shown also that these settlements are constitutive part of the development strategies enacted at local level, particularly consistent with the failures of the “growth machine” strategy enacted at local level.

The Expansion of Higher Education in Brazil: Academic Bias and Social Inefficiencies

This article tries to raise some hypotheses to explain, at least in part, social and economic inefficiencies in the Brazilian system of higher education. Combining two sociological models (meritocratic and credentialist), this article aims to comprehend the role of knowledge, experience and schooling (achievement) and social origin or position (ascription) in the determination of returns to higher ed- ucation. Using the case of technologists we try to understand the social meaning of third level schooling. This level tends to reinforce social origins much more than achievement, even in a context of huge expansion and diversification.

The domination of academic bias in Brazilian education system – especially in higher education – seems to generate some of its inefficiencies. These inefficien- cies are made evident in its inability to adequately qualify students to job market or in the lack of innovations and patent registration. The most outstanding ineffi- ciency would be found in the social dimension: the new groups who manage to gain college degree are excluded from the best positions in society by the devalua- tion of some titles or certificates and by the subordination of certain careers and types of training to the academic model.

Older Adults, Social Capital, and the Internet: The Matthew Effect?

Despite the so-called age-based digital divide, older adults are progressively using the Internet. But older adults are still less likely to use the Internet when compared to other age groups. So, how does this usage (or lack of) affect their social capital? Social capital is defined as the resources that are potentially available in one’s social ties. Social capital has been associated with a variety of positive outcomes from status attainment to well being.

To explore the relationship between Internet usage and social capital, we surveyed a stratified random sample of 417 individuals living in Lisbon, Portugal, of whom 18 are older adults (over 64 years of age). Social capital was measured through three dimensions (bonding, bridging, and resources) and analyzed with Latent Class Modeling (LCM) and logistic regression analyses. We analyzed these dimensions separately and then combined them with LCM to create the variable social capital. Internet usage was measured through frequency of use; grouped into non-users, light users, and heavy users. The quantitative data was complemented by 14 follow-up qualitative interviews.

Our findings show that, on the one hand, the selected dimensions of social capital decrease with age but increase with Internet usage. On the other hand, social capital is lower for older adults than for younger ones. The “Matthew effect” (Merton, 1968) is an adequate concept to describe social capital and its relationship with Internet usage: advantage begets further advantage, and disadvantage begets further disadvantage. Education predicts Internet usage by older adults; simultaneously the Internet seems to be compensating for the age effect related to social capital: those who are older and use the Internet are more likely to have a high level of social capital than those who are older but do not use it. The implications of these results are discussed herein.

BARDHAN ROY, MAITREYEYEE* (Basanti Devi College, maitreyyee25@rediffmail.com)
Health & Nutritional Status of Indian College Girls –Urban and RURAL Conglomeration

Undernourishment of women is a development-related problem in Third World countries. Poor nutritional status of women leading to 1.1 billion days of illness a year (World Bank, 2002) Vitamin A deficiency, susceptibility to respiratory dis- eases and diarrhea (World Bank, 2002), Iron deficiency and anemia, increased death rate, low birth weight, impaired growth and retarded cognitive development, low work capacity and low productivity (ACCN/SCN, 2002) are the outcome of it .

West Bengal (23’s 97+), an Indian state, covers 2.89 percent land area with 8% of India’s population where 32% population (national figur26.5%) live below poverty line (BPL), 72% children of 06-35 months , 66%...
pregnant and married women of 15-49 years suffer from iron deficiency (NFHS-3).

Considering the risk criteria of height less than 145cms & weight less than 38 kg, (Sarama 1989), the present paper tries to reveal the nutritional status, height and weight of 390 adolescent girl students commuting from urban and rural peripheral areas to a college in Kolkata Metropolis. To correlate family status with women's health and to incubate the high obstetric risk associated with it, the respondents from urban and the remote village background (Sunderban delta) are chosen. Food habits (Rice eater 70% rural students and 90% urban students are junk food eaters) and physical structure correlation is observed through weight and the pattern on Sickness: Sudden sickness, indigestion, anemia, headache, getting senseless, irritable stomach ache are common rural women symptoms. Obesity or figure syndrome for urban students. Difference in attention syndrome in the single daughter families and the both sex children families are looked up as an exception.

Indian Fathers in Transition; Visionary Father Vs Father in Reality

The concept Father was totally different in Indian tradition. He had been explained as a figure staying much above the normal family surrounding. He was expected to be a person concerned with food and shelter of the family members and not as a person within the inner circle of a parent child family. Post Globalization, his role made a dramatic change in father image. In the nuclear family, the bread winner parent families, he is expected to be more practical. The role model of a father figure existing in him has been challenged. His outer image to a care taker has been converted into a co-partner and care taker of the children born to a nuclear working mothers families. Considering this significant shift in the role of the father from a father from care taker to Care giver, a role conflict arises in himself. In Indian middle class families, especially to the transitional period (link years of Pre and the Post Globalization era) puts him to a dilemma. In the above study reveals that assured irrigation facility has a definite impact on the production process. It has diversified agricultural economy by encouraging farmers to go for cash crops like, Sugarcane, Soybean, Wheat and other staple food crops because of assured irrigation facilities, where as the ground water irrigated village, cultivators are growing crops like, vegetables, cotton, Turmeric and other staple food crops. The Ground water is costly and not available so easily. In the Canal and Groundwater irrigated villages, cultivators apply more fertilizers, pesticides, and use modern agricultural implements and depend upon hired labourers in the production process. The third, dry village cultivators are cultivating the crops like, Cotton, Soybean and other staple food crops completely depending upon monsoon. The production process in the dry village reveals that the agriculture depends upon monsoon with traditionalpractices.

Migrant Labour and Textile Industries: Who Gains In The Process Of Labour Mobility

Abstract: Globalization process in the Asia and let alone in the Globe opened up frontiers of new employment avenues for labor mobility. The present paper deals with the mobility of Odia laborers migrating to the textile Industries of Surat. This mobility reflects upon the mobility of labor from a rural economy of western part of India to a developed industrial economy of western part of India. Odias were known as good gardeners. Gujarati merchants in the British Colony of Mauritius invited their kith and kins to engage themselves in the different sections of Jobs offered by the textile industries. The data reveals the fact that during seventies hardly a couple of Odia laborers migrated to Surat to work in the textile industries. The recent census figure reveals the fact that around twelve lakhs Odia migrants work in the textile industries of Surat. Majority of them are youth and highly educated. In this process of labor mobility kinship relation play a vital role. These laborers work for twelve hours per day with no paid holiday. Employment condition is purely temporary with no provision of insurance. Majority of them in the slums with a life full of miseries and agony. It is strongly believed in labor mobility theory that migrants used to send money to their home places in turn which brings prosperity and change in the home economy and change in the life style of migrant family. Our observations substantially do not support the dominant theory of socio-economic change.
Drawing on the distinction between four sources of critique and outrage by L. Boltanski and E. Chiapello selected examples of culture jamming from social movement actors as well as professional artists are presented and interpreted. The paper argues that the distinction between culture jamming practices of collective protest actors and individualist authors corresponds with the general distinction between ‘critique artiste’ and ‘critique sociale’ developed by Boltanski and Chiapello. We find marked differences regarding the dominant sources of outrage in the imaginations: While images of professional artists mostly deconstruct branding as source of loss of authenticity and repression of individual freedom, cultural jamming practices of second movement actors mainly criticize commercial branding for its impact on ecological destruction, social inequality or political repression. Apart from that, both types of visual critique differ in their expression of the relation between production and consumption. Finally, the paper analyzes web-based practices of remix and culture jamming by individualized, non-organized actors that transcend the modern differentiation between experts and amateurs.

Which Tradition Shall I Reject? The Dilemma of Second-Generation Members of New Religious Movements

Whilst some young people leave the religion in which they have been raised because it is perceived to represent many of the beliefs and values that they want to reject, other young people prefer to stay within the womb of the traditional religion with the expectation that they themselves will carry forward its, their family’s and their society’s traditions. The situation becomes more complicated, however, when one grows up in a family in which one’s parents have rejected the main society and expect one to follow their new Truths.

Research indicates that the first cohort of second-generation members of new religious movements (NRMs) are likely to reject and leave the movements, while the second and second-generation members are more likely to accept the movement’s beliefs and practices and stay. The paper will examine this phenomenon and discuss some of the possible explanations for its occurrence. It will draw in particular, but not exclusively, on some of the author’s research into the Unification Church, the Children of God/ The Family, the International, the International Society of Krishna Consciousness and other NRMs that became visible in the West around the late 1960s. Comparisons will be made between first-generation converts in the 1970s and ‘80s, and the first and second cohorts of second-generation members. The discussion will focus on what might appear to be pertinent changes in the movements’ beliefs and practices.

Culture and Social Movements: The Case of Disability Protests Cross-Culturally

Perhaps a naïve observer would think that protests relating to disability would be similar cross-culturally, since the phenomenon of disability has certain medical similarities. However, this is not the case. Despite the fact that mobilization around disability issues is increasing, that there is neither one truly trans-national organization nor one international Disability Rights Movement begs explanation. This paper explores data from over 2600 cases of disability protest from around the world, gathered from media reports and analyzed quantitatively. While media reports themselves raise cultural and methodological issues, which the paper will discuss, the analyses also show markedly different patterns in protest issues and tactics. One issue with huge cross cultural variation is that of what constitutes disability rights. In protests in cultures which lack a strong rights tradition, issues which are framed as ‘rights-related’ in one context may be framed in others as being ‘services-related.’ Some types of impairments are more stigmatized in one society than another, which affects mobilization and effectiveness of protestors, as well as, possibly, by the media. Issues related to the likelihood that a protest will be noted at all, as well as the availability and translation of media reports, are also considerable. Unless each variable were coded based upon its own cultural context, biases will occur. However, doing this would add extensively to the time and other resources needed for the research. Thus this paper raises questions about if, and under what circumstances, cross-cultural social movement research would be possible.

Variety and Emergence in Complex Environments: The Role of Innovation in Organizational Competitiveness

Nowadays, the advancement of global society and economy along with the rapid growth of Information Technology and Communication (ICT) have created significant challenges for those companies, who pursued both their permanence and their development in the markets where they compete. Thus, enterprises have responded with the adoption and / or generation of innovation mechanisms to maintain or improving their own competitiveness. Firms have understood that intellec
tual capital is a mechanism to add a value to their processes, products or services that they offer to their clients, therefore to maintain their competitiveness advantages that help them to have a better position before their markets.

The aim of this work is to generate a first approach, essentially theoretical in nature, that when seen from complex systems, help to characterize the complexity of this environment and to understand how companies have developed a variety of known responses to everyday problems. Moreover creating emerging nature mechanisms that have served them to generate responses, which have helped them to successfully face the challenges of innovation that the market required in order to maintain its competitiveness.

How Do Rural Popular Groups Mobilized? Investigation about Local Resistances Against the Closings of Classes in the French Context

The contemporary reform of the State, in France as in other democratic countries, has various implications on the lifestyles of the populations. It induces for example a reduction of the school offer in the rural contexts. For mainly economic reasons, the pupils are concentrated in the same schools – “school poles” – which often strain the families with important daily displacements. In parallel, this school concentration induced the closing of proximity small schools of campaign. Then changes of the public services of education are often the occasion of collective actions protesters who enable to question, in an exemplary way, the relationships of the civil society and the State to the prism of these collective resistances. Socio/spatial investigations were conducted on the dynamics in French rural areas. The ethnographic investigation is based on observations (close to the institutions and social groups), with about forty interviews (with varied elected

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
members, different administrative officers, and parents of various social back-
grounds, militants or not, on archives (administrative and from associations of 
parents). From these materials and by comparing different cases (closing of class 
or not, maintenance of closing or reopening further to local mobilizations, etc), 
this study underlines how particularly marginalized groups as the rural popular 
groups can attempt to resist collectively to the political reforms and the under 
State control power by taking support on the experiences of their daily life. The 
analysis of the release of these mobilizations, dynamics of their progress (rep-
terote of action, etc), and their conditions of success (or failure) shows that the 
most participatory is the rural popular families succeed to be opposed 
collectively to the State only while being combined with other more favored social 
groups (like farmers or teachers) and leaning on political supports (local elected 
members).

What Mean to be “Citizen”? Ethnographic Investigations about the 
Various Modes of Exercise of Citizenship in France

The citizenship was the object of an abundant literature in political science 
since the first steps of this discipline. Beyond the philosophical and conceptual 
controversies, I made the choice to conduct several investigations of field to ob-
serve since 2006 the methods by which the citizens in France, in their diversity, 
exercise their political prerogatives. While having recourse to interviews-in depth 
repeated in time (in ordinary period and in electoral situation from a compared 
point of view), to ethnographic observations within various authorities where the 
citizens are invited to take part (dialogue, devices of the “participative democracy” 
today in full rise, etc) and within the framework of local associations, like that 
questionnaires, I studied the practical relationships to the politics, to the local 
institutions and to the State of citizens from different social and ethnic groups 
in France. These ethnographic investigations underline a plurality of forms of 
citizenship. French citizens appear in various ways integrated into the political 
system according to their social and ethnic membership, their local sociabilities 
and their militant experiences. They are thus very unequal from the point of view 
to their participation in the democratic authorities as the vote, the social move-
ments, the associative commitment, or the contacting. Although the forms of cit-
izenship evolve historically in France, the diversity of the attitudes in front of 
the political system and to the public policies remains a constant. The contemporary 
citizenship lets room to a plurality of manners of being “citizens” which is consub-
stantial from democratic systems.

Access Gap to Technology and Usage of Media Contents: A Study on Tijuana’s Digital Blackout

We will show data related to an investigation-in-process related to the digital 
blackout that was applied in Tijuana, México last year. There is a worldwide tend-
dency to shift TV telecommunication from analog to digital. In 2004 the Mexican 
government adopted the North American Advanced Television Systems Commit-
tee (ADTSC) to start the migration from the current TV analog system to a digital 
one. The city selected to start this process in this country was Tijuana. This deci-
sion was made due to the supposition that a border city such as Tijuana would find 
it easier to migrate from analog to digital. It could adapt them to the proposed shift. This did not happen. The project presented several delays and de-
levering devices to adapt digital transmission to analog TV’s demonstrated that the 
estimations of the number of people with access to analog TV were miscalculated.

After years of delays, the blackout did finally happened on 2013, however there 
are now many doubts about how this could affect social inequalities, as perhaps 
7% of the population in Tijuana has now lost access to TV. Studies on social in-
equalities have recently focused on the problem of access to different forms of 
social capital (cf. Rodríguez Gallardo, 2006). Nevertheless, what does it mean for 
social inequalities to shut down the TV? Particularly, how does access to telecom-
munications and media affect social capital? Does being able to watch TV diminish 
the social consequence of individualizing free-time, or does it increase it 
through a sharing of experience that allows connectivity to society and the world? 
In this paper we present an approach to this phenomenon and to reflect on the possible implications they have on a better 
understanding of the inequality gap on access to communications technology and

When It Rain It Pours: Reality Shows and Charades for Climate 
Change Tragedies

In September 2013, Mexico was quashed by two hurricanes during the same 
week. One came from the pacific and the other form the Gulf of Mexico. The 
consequences were tragic and colossal. The days prior to the storms the Mexi-
can government was warned by the Mexican National Weather Service about 
the magnitude of the catastrophes coming, but they were more focused on ‘cleaning 
off a teacher’s demonstration at Mexico City’s main square. National TV networks 
were barely focused on taking to the teacher’s movement. And only when it was 
too late they started a campaign to help and rescue the victims. One of the ac-
tions that became particularly emblematic was the preparation of a reality show 
screening an infamous TV presenter heroically ‘helping’ the victims. The farce 
was unmasked by a very important Mexican political magazine and one of the 
main journalists questioned the staging, the TV presenter has a very belligerent 
reaction. The scandal is in progress at the moment of submitting this abstract. 
Social networks are been particularly virulent at this point. In this presentation, it 
will be shown how this episode could be explained using sociocybernetics tools 
and following previous presentations of the author, it will be developed how crit- 
ical sociocybernetics model would work to explain media performance and the 
emerging role of cyber-activists in the face of climate change disasters.

Ces Adolescents Venus D’ailleurs : La Prise En Charge Quotidienne 
Entre Politiques De Protection Et Politiques D’Immigration

The figure of the immigrant, figure emblématique de l’âge, apparît au cœur 
des discussions et débats politiques et sociaux. Parmi ce public migratoire, 
un groupe particulier attire notre attention : les enfants et adolescents arrivant 
e France sans responsable légal. Ces jeunes, dits « mineurs isolés étrangers » 
doivent, d’après les conventions internationales, être pris en charge par l’institu-
tion de protection à l’enfance. Ces derniers demeurent donc au carrefour entre 
politiques d’immigration et politiques de protection à l’enfance.

Cette communication se propose d’interroger les tensions produites au sein 
des organisations d’accueil, relatives aux spécificités de chacune de ces politiques 
prises dans leur confrontation - l’une liée au discours institutionnel sur la pro-
tection des enfants et l’autre aux contraintes de la régulation par des politiques 
d’immigration. Comment ces logiques sont-elles vécues au niveau existentiel par 
ses principale parties prenantes dans des organisations de ce type? Eloignés de 
si bien les caractéristiques de vie de ces adolescents constituent la délicatesse 
constitué par les éducateurs, l’équipe technique et d’autres adolescents. Nous 
verrons comment l’organisation, lieu d’exercice effectif de ces politiques, prendre 
dans l’imaginaire des jeunes qui y habitent.

À partir d’une étude ethnographique de recherche théorique, ce travail s’appuie sur les 
observations participantes faites au sein d’un foyer de vie dans la région parisie-
sienne accueillant de jeunes étrangers. Notre communication portera sur la 
supervision de l’organisation d’accueil, mobiliser les théories de la psychosocio-
lie et de la sociologie clinique sur les organisations et les institutions, et s’étayera 
estimation des impacts de la psychanalyse de groupe (Kais, Anne) aussi 
bien que sur des de la clinique transculturelle de l’ethnopsychanalyse (Devreux-
ux, Moro). En nous appuyant sur ces théories, cet article propose de discuter les 
liens tissés dans cet espace et leurs influences sur la construction subjective des 
adolescents.

Comunity Based Tourism: A Dialogic Proposition Via Local-Base Development

In the inequality context, the theories about development turn to local spaces and a increasingly number of researches have been approaching the relevance of culture, and favoring local experiences, knowledge, traditions, aspirations and needs. It is necessary to understand that local must be perceived within its re-lations with the globalization process, its differences, particularities, traditions, and in the continuous processes of change existing in social-cultural processes. The touristic phenomena - intrinsically related to the globalization process- favors multiple possibilities for new social actors, new identities, new references, and new practices. This process of exchange due to the articulation of “local/global” shall foresees the development and innovation, and enhance with the construction and re-construction of place. Besides the globalization process, there is, undoubtedly, the renewal of interest in the local. A conception of development that approaches the local as reference must rely upon the harmonization of en-dogenous and exogenous factors, referring to socio-economic produc-tions adequate to each reality. In such perspective, this research aims to ana-lyze Tourism of Communitarian Base (TCB) as a development proposition, where each city must live its own modernity brought by its own multiple, multif orm and multidimensional innovations achieved by the adoption of its own innovative and diversified ways of development. The TCB constitutes a proposition that has great contributions for the local development, as it has as major objectives the social inclusion and equity for the inbound tourist community, the valorization of the culture and traditional knowledge, the experience exchange, and the respect for natural resources.

Leisure and Participation: A Social and Cultural Issue

In the context of today’s inequalities it is important to consider leisure, as an individual option, and the participation that is produced within the social dynam-ics by this activity that can be understood as a social and cultural issue. By this perspective it is important to respect the social actors in the iden-tification of their own problems, and their ability to develop innovative solutions for themselves. An important issue that arises is how to respond to the commit-ment to participation in face of development processes aiming life quality improve-ments. The major mean and purpose of development is to allow the expansion of individual liberties, so they can be able to achieve better live standards. Within this process of expansion of liberties, the population can reclaim opportunities that in the face of development in such social integration process where all can be more participative. To achieve this development proposition, it is nec-essary to conceive quality of live within social sphere and its different relations, where leisure plays a fundamental role. For Joffre Dumazedier, leisure highlights elements that drive the individual to fulfill their social wellbeing-ness, and to foster a more active participation in the achievement of individual, family and professional, cultural and communitarian or-ders. Leisure enables individuals with conditions to develop themselves as they receive or increase elements that, recklessly, constitute them. Reflecting about the dynamic of the society, leisure is more than a simple complement to work, it is a source of production for new sets of values. It is necessary to conceive social and cultural valorization of leisure as both social circumstance and global cultural feature.

Greening the Global City. City Networks in Environmental Knowledge Production and Policy Transfer

Environmental governance becomes more and more embedded in a set of different scales. Institutions simultaneously in which cities and metropolitan regions play major roles. City governments transpose different scales rather than merely act as subunits within a hierarchical state organization. At the center of this pa-er are two major global city networks that engage with environmental issues on a global scale. C40 Cities Climate Leadership Group and ICLEI - Local Governments for Sustainability. They are working on developing innovative environmental and climate protection programs and policies and cities often serve in this process as the laboratories for pioneering technologies and policy programs. Knowledge production is thereby incorporated into governance practice that shape planning ideas, policy innovations, and “best practices”. This development has led to an institutionalization of knowledge/policy interfaces (Chilvers and Evans 2009) through policy networks at local, national, transnational and global scales.

To understand how policies and planning practices within the metropolises are entangled with global governance and economic development, it is necessary to look at the institutions, ideologies, and actors and the connections and inter-link-agers they establish between different levels. The question is how environmental objectives are framed by institutionalized discourses on a global interurban scale, and how these frames of knowledge are in turn interrelated with local regimes of environmental governance? The study of the two city networks will thereby function as a lens through which to search for a different understanding of urban environments. In tracing the actors, information, ideas and ideologies on different scales in a ‘global ethnography’ (Burawoy 2001) the channels of global flows that shape the landscape of intensified interurban relations become visible and concrete.

School Segregation in Rio De Janeiro Public Schools: A Longitudinal Analysis

The paper presents school-level figures to analyse the impact of the education- al transitions on school segregation for all Municipal Public Schools in Rio de Janeiro, Brazil, from 2006 to 2011. Segregation here refers to an uneven distribution of pupils with similar characteristics across a school system, and this is assessed utilizing the Segregation Index (GS). The methodological approach tracks one spe-cific cohort, that from the 1st to 6th grade (age range 6 - 11) of Fundamental School. Rio de Janeiro presents an education system that combines two distinct app-roaches. On the one hand, parents have purported freedom of choice. There are no restrictions on allocating pupils regarding family place of residence, and the policy of free public transport for pupils in public schools, which, in theory, allows for the free movement of pupils through which “global/local re-scaling” processes relate to the production of urban environments. Within school segregation (also called “school shift effect”), increases in the same period/transition. The in-terpretations suggest that the results observed can be attributed to bureaucratic patrimonialistic practices and loopholes in an unclear regulatory regime.

BARTKIENE, AISTE* (Lithuanian Univ Health Sciences, aiste_bukeviciute@yahoo.com)

The Ethics of Care and the New Habitus: Rethinking Community in the Age of Shale Gas Exploations

The lack of care for the environment has often been deemed to be one of the most important contributing factors leading to the overuse of natural resourc-es. While feminist philosophers and bioethicists have developed analytical tools explicating the ethics of care, scholarly debates in environmental sociology have generally overlooked this body of literature. The purpose of this paper is to bring these two bodies of literature in conversation with each other, particularly by link-ing the ethics of care as articulated by N. O'Donnell, M. Slotte, and J. Torino, and the notion of social practice and habitus developed by Pierre Bourdieu. Staring with Boudieu's theories of habitus and social practice that have been incorporat-ed in the analyses of community-based natural resource management we expose tensions between care as a mode of living that is oriented toward sustaining and preserving the environment and the limiting effects of routines, social rela-tions, and economic logic on such care. We argue that care about the environ-ment as a social practice is dependent not only on social milieu and culturally embedded class identities but also on normative attitudes of a care-giver. As a case study, we focus on the coordination of the Zygociai community in Western Lithuania against the efforts of the international energy giant Chevron, to explore and extract shale gas in the area. Zygociacai community has become the symbol of anti-shale gas development in Lithuania and East Europe more broadly, while also spearheading a public debate about the responsibility of the national and international states vis à vis corporate interests, national security debates, and energy independence. Through the analysis of public discourse, we will highlight the emerging new articulations of care and responsibility and relate it with ethical theory which reveals importance of relationships for developing a caring attitude towards environment.
How Is Demographic Decline Translated to Bureaucracy? Population Numbers As Calculation Devices of Local Government

Max Weber’s “classic” ideal type of bureaucracy has inspired organizational theory and numerous critiques of public administration. Both strands of literature seem to agree that public organizations coming close to Weber’s ideal type are ill prepared to adapt to new problems. As a consequence, prescriptive texts recommend the alignment of public and private organizations—often by marketization. The proposed paper presentation will investigate how local public administrations respond to declining population numbers (in the face of lacking market environments).

Declining population numbers are especially likely to challenge established structures of local government as municipal service provision was established historically during times of growing or at least stable population numbers. Demographically induced changes in demand are regarded as problematic because some of the costs for public service provision will remain largely fixed (e.g., buildings and staff) even if capacities are not used. This diagnosis (from public finance scholars) implies that there are effective organizational devices translating statistically observable demographic changes to demands for public services. The thesis of this paper is that bureaucracy might translate demographic change into relevant administrative problems by its own means. But which are these?

After 1989/90 most countries in the former East Bloc witnessed dropping birth rates and also out-migration. Therefore, the empirical part of the paper draws on 62 expert interviews with decision makers in 21 Municipalities from West Germany, East Germany and Poland (with West Germany providing contrasting cases on rates and also out-migration). Therefore, the empirical part of the paper draws on 62 expert interviews with decision makers in 21 Municipalities from West Germany, East Germany and Poland (with West Germany providing contrasting cases on rates and also out-migration). The results of these interviews also emerge emerging as administrative devices for the calculation in-kind of public services approximating changes in local demand.

Interestingly, the empirical material shows that a seemingly antiquated organizational theory proves to be highly relevant for current adaptation processes. Calculation in-kind makes bureaucracy responsive to demographic change without eliminating political discretion.

Religious Heterogeneity and Civic Participation In Comparative Perspective

The effect of diversity on civic participation is a hot issue in social sciences during the last decade. While some authors point out that diversity erodes social capital and decreases political participation, other researches prove that different type of diversity (namely ethnic or linguistic diversity) have different effects on political and civic participation. The current research focuses on the effect of religious heterogeneity on civic participation, taking into account the effect interaction between the religious heterogeneity and individual belonging to a particular religious denomination. The result of multilevel hierarchical models run on EVS 2008 data shows that religious heterogeneity has a negative effect on civic participation, but the moderate effect depends on the individual religious denomination.

Yet Another Junkie Story? Lived Experiences of Drug Policy in Norway and Why They Matter

Norway is one of those European countries with the highest rates of drug-related deaths. In attempt to improve the situation, Norwegian government chooses a medical approach to substance abuse and removes responsibility for the field from social welfare services. Treatment of abuse became defined as specialized health service, and the abusers’ rights became articulated in a new language—language of health rather than punishment. As a project with moral undertones, the reform created not only new epistemological and organizational framework for treatment, but it also tried to construct new identities. It was designed to “liberate [the abusers] from the established stigmatizing label as a social client”. What is the abusers’ experience of these changes?

We seem to be living in a time of revolutions which do get televised or at least broadcast. For our research, it is possible in no small measure because of sustained visual exposure that helps turn a given local occurrence into a translocal event, or—to use Bruno Latour’s parlance—‘a matter of fact’ into ‘a matter of concern.’ Conversely, if sustained visual exposure and iconic contextualization don’t happen, even genuine rebellion becomes invisible or marginalized, or simply go unnoticed. All kinds of media, old and new, are the usual suspects here. Just about any social occurrence is subject to the constraining influence of visual framing and rhetoric deployment. Thus, visibility and iconography must be thematized, “practices of looking” unravelled and the politics of visual culture scrutinized. Similarly, the importance of the specific spaces at which protests take place must not be underestimated. The present paper explores these themes in the context of the Gezi park civil unrest that shook Istanbul and the international community in 2013.

the cultural and social constructions, and the social transformations perpetuating abuse and addiction. Following the analysis of the “inside stories”, I will discuss how these stories can be used in social, political and therapeutic interventions. At the same time I will discuss the methodological and moral pitfalls related to life story interviewing of vulnerable individuals.

International Migration and Life Satisfaction in Europe

A core finding of research on subjective wellbeing – concluding that an increase in one’s income does not generally bring greater life satisfaction - suggests that economic migration (motivated by hopes of an increased income) would not result in greater life satisfaction. Income affects life satisfaction mainly via the way it signals status. This paper uses survey data from European Social Survey (in the first instance) investigating people moving from eastern to western Europe, and (for the second proposition) on people moving from wealthier countries in northern Europe to Mediterranean countries such as Spain, Portugal and Greece. In general, migrants do not appear to gain life satisfaction as a consequence of migration – and in some instances (particularly for migrants moving to a poorer country) migration appears to reduce life satisfaction. Migrants certainly expect migration to improve their lives, but it is not clear that these expectations are generally met in their experiences.

Welfare, Religion, and Values: An Investigation of Ultra-Orthodox Jews in Israel

Welfare states and welfare policies are commonly understood as mechanisms for addressing material deprivation (and, perhaps, the social exclusion that follows from being poor). In some cases, however, welfare programs as experienced by recipients have more to do with a religious and/or cultural imperative: state support enables people to reproduce a particular way of life, especially by making it possible to survive without engaging in full-time work (paid employment).

This paper explores that proposition via analysis of Ultra-Orthodox Jews in Israel, where many of the men in very religious families prefer to engage in full-time religious study rather than holding regular jobs. These arrangements are controversial, producing resentment among secular Israelis who believe that ultra-Orthodox men impose unfair fiscal burdens on the state and taxpayers. The paper argues that welfare systems should indeed consider religious and cultural differences of this sort, rather than assuming that material sufficiency is only relevant value. The Israeli welfare state helps a distinct group of citizens to resist systemic pressures to become “normal” members of society (e.g. focus on conventional goals such as consumption, leisure, and career advancement); with state support, ultra-Orthodox Jews have more scope for pursuing goals and values of their own choosing. In the Israeli case, however, one must balance the view against concerns about the way ultra-Orthodox elites use welfare programs to exacerbate the dependence of other (regular, non-elite) members of that community.

The New Challenges for Health Care System

Keywords: health care system (HCS), welfare state, trust in healthcare system, ISSP (International Social Survey Program)

The continuous shifts of the modern society are the causes and should account for changes in all the ways society operates. Risk related to socioeconomic changes, economic crisis, demonization of medicine, marketization and etc. are boosting the new challenges for the individuals as well as for society itself, and these social changes have also affected modern healthcare system. Thanks to these technologies that are being developed nowadays, medicine can cure infectious diseases; however, the development of medicine technologies can’t overcome the social and health inequalities in many countries. Using the worldwide data of 27 world states (from The International Social Survey Program about instution of health and various indicators (such as opinion about efficacy of healthcare system, trust in healthcare system, lay knowledge about health preservation, healthy life strategies and etc.), there is possibility to identify the healthcare situation globallly. This presentation aims to showcase this peculiar situation and compare it within various welfare states in the world. East-Central Europe (as post-soviet states) and Mediterranean countries could be distinguished by lack of efficiency, trust and pessimistic beliefs in healthcare system; while survey showed the biggest trust, efficiency in healthcare system are in Scandinavian and Benelux countries. These findings draw attention to much wider sociological discourse, that differences could be explained by differences in welfare regimes in various countries.

Women in Higher Education in India: Patterns of Exclusion

Women taking to higher education have been on the steady rise in India with many institutions of higher education having women in equal number to men if not more. There appears to be something more behind this. Not only is there a quantitative shift that is not matched by the qualitative content. The present review article seeks to probe into gender considerations and their implications for higher education in Indian context. An attempt is made to analyse and substantiate the situation based on information available with various government and developmental agencies. Having analysed social reality pertaining to the state and status of higher education and the major limitations and constraints in achieving the envisaged and aspired levels of expansion, excellence, quality and access for its inclusivity, the article reveals that several gender considerations come to condition the statics and dynamics of higher education, including access, exclusion, distribution and composition and even the governance of institutions of higher education and the centres of excellence. An attempt is made to ascertain how the quantitative growth in women taking to higher education alone could be misleading and a misconception about the status of women's education without a corresponding change in the qualitative aspects such as relative importance and value of the courses in terms of opportunity for employment, importance of the sector that the courses offered can open for women, that is, the extent to which the higher education being accessed by women can empower them in true sense of the term.
and, they showed a reluctant attitude toward gaining applied and clinical skills through participating in an applied and clinical project. For this reason, in the second semester, new group of attendants were 20 people; newly graduated ones were encouraged to apply. The training in the second semester provided for the attendants both, a basic vision about applied sociology and a predisposition in taking responsibility by joining an applied team.

In the third semester, an “applied sociology project development group” was created, by selecting from the second semester successful attendants. During this semester, it was asked from group members to prepare a project by developing the idea of providing advancement for, and through the participation of the sociologists, recently employed in the Ministry of Agriculture. The attendants were taken “European Union Project Cycle Management” training course; and developed a project titled as “Advancement of Applied and Clinical Skills for the Agricultural Sociologists”. In the fourth semester, the project started to be implemented by providing the support of relevant governmental institutions.

In the paper, it was presented as a case study 1. the problems -faced in the stages of training, project development and project implementation of both, the sociology graduates attended the training program through four semester, and the agricultural sociologists participated in the project implementation; and 2. the attempts developed to deal with these problems through all the stages.

Black Immigrant Youth Inequality in Another France

This paper uses in-depth interviews with first- and second-generation immi-
grant youth of African descent in France to understand their integration process. I first examine identity, by addressing the following question: Where do these young immigrant descent individuals see themselves fitting in French society? I use respondents’ voices to identify cultural and structural factors that define their integration experience, and then present initial findings as they fall within three areas: 1) identity formation, 2) religion as a mechanism, and 3) the importance of race and immigrant statuses. Then, I apply the cultural materialist framework to explain an unequal world and integration challenges using two particular cases: Alita, a first-generation young woman’s integration, and the 2005 riots of immi-
grant youth in France’s suburbs.

Interwar Constitutionalism and the Remaking of Social Policy in Latin America

The establishment of the 20th century welfare regimes has often been viewed as an outcome of continuous processes of national policy implementation conditioned by local levels of economic development, democracy, and position in regional influence systems. This paper concentrates on a normative shift that has become a blind spot in the comparative literature of the welfare State. Specifi-
cally, this paper seeks to shed light on the influence of a constitutional reform movement that took place across Europe and Latin America in the Interwar pe-
riod. The Mexican Constitution of 1917, the Soviet Constitution of 1918, and the Weimar Constitution of 1919 established the recognition of social and economic rights, and set out new concepts and principles, such as “linguistic sustain-
ability” and “linguistic subsidiarity”, as a basis for a new organisation of human languages.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
In Indonesia, transnational labor migrations have become a major source of foreign currency over the past twenty years. New migration routes are shaped by various forms of collaborations between official and irregular actors and networks. In this context, migrating becomes a very uncertain journey, and migrants are often subjected to abusive, sometimes violent or even deadly experiences abroad. Yet, the “migration industry” can count on increasing numbers of candidates. How, then, migrant workers relate to this risky adventure?

As it appears, local conceptions of “fate” help to neutralize fear: the opacity of migration routes is not conceived of in terms of uncertainty; as it is rather perceived since destiny lays ultimately in the hands of God, dealing with it is a matter of faith: Only by surrendering sincerely to Allah is one able to insure his future in this dangerous milieu. In this cognitive framework, incidents are lived as cobaan Tuhan – godly trials - , full of meanings, which are meant to test one’s faith in God. And bad experiences, rather than being seen as contingent are perceived as godly signs, which need to be interpreted in order to comply with God’s will.

Laying on ethnographic materials collected during a 12 months fieldwork spread between Java, Kuala Lumpur and Singapore, we will try to show how this ethos tends to reduce the perception of risk and/or uncertainty under the concept of nasib and/or takdir (fate; destiny), and through its connectedness to God and faith.

**An Analysis of Social Indicators in Brazil after the “Real Plan” (1994) until 2012**

Brazil, during the 1990s, went through a period of profound economic and social transformations. Economic openness advocated in the early 1990s, during the government of President Fernando Collor de Mello (1990-1992), marked by a severe economic recession, corroborated by blocking monetary assets generated a serious social and police crisis cooperated to the “empeachment” of the president and demanded a drastic change in relation to economic policy. “The Real Plan”, conceived during the administration of President Itamar Franco (1992-1995) fostered a profound social and economic transformation in the Brazilian economy. Implemented in 1994, “the Real Plan” was crucial for promoting monetary stability and exchange rate of the country. From this plan, considerable improvements in Brazilian economic indicators began to be observed, such as: GDP growth, expansion in inflows of foreign capital in the country, the positive evolution of the trade balance and expansion in employment and domestic income. Based on these positive results, the aim of this paper is study the evolution of the social indicators in Brazil after the “Real Plan” in 1994, until the year 2012. The methodologies used for this study are descriptive statistics and literature review. The results showed that the expansion of the economic indicators echoed directly in the improvement of social indicators in Brazil. There was expansion of HDI, improvement in the Gini index by regions, reducing the infant mortality rate, expansion of life expectancy, expansion of Gross National Income, expanding access to public health, significant reduction of the population in extreme poverty, and increasing access to goods and services by Brazilians.

BATISTA MURTA, MARIA HELENA* (SUPRAM LM, batimaruta@hotmail.com)
The Filipino Istambays and Transition Crises: Locating Spaces of Social Sufferings and Hope

This paper examines the layers of transition crises experienced by a loosely-organized sector of relatively young Filipinos who are “waiting for employment”, generally known as “istambays” (on standbys) in the Philippines. It relates the impact of such crises as these and their poverty to their failure to translate educational capital into employment, which hinder their social mobility into becoming productive adults. It argues how these istambays negotiate their work problems in two-edged realms of protection and disconnection. In times of crises, istambays appear to be protected from discouragement by the cushioning effect of the Filipino “familial-faith dynamic” providing a sense of dependence and resilience among them. On the other hand, istambays disconnection from the state reflects their lack of trust in the government due to its failed attempts to provide them sustainable employment. In the end, this chapter articulates how these transition crises unravel both the istambays’ social sufferings and spaces for hope in reversing their “waiting status” into having sustainable futures that address cycles of intergenerational poverty and inequalities.

Russian Modern Educational System and Its Trends

The article studies the educational system as a two-facet unit. Firstly, as the process of production and transmission of systematized knowledge and skills through studying in specialized institutions. Secondly, as a social institution with the functions of adapting to social and cultural atmosphere, preparing and including young generations into different spheres of social life.

The authors examine the specifics of the educational system in modern Russia, define the tasks, solved under the pre-school, school, and professional education. The article analyses the dynamics in the population educational level according to the census data. The authors single out the main criteria of pre-school, general, and professional education in Russia from 1990s up to 2011. They define the basic trends in the development of the Russian educational system under global and national social processes, determined by system transformations (such as changes in the structure and the demand for education due to the changes in demographic situation; general growth in interest to education; using by the young of the life strategies that actualizes the necessity for supplementary educational services) and by institutional changes (such as introduction of competence approach, diffusion of integrated institutions of continuous education providing three-faceted education – science – business), positioning their peculiarity and competitive advantages in the market of educational services.

They especially examine the changes in the legal regulation of the educational system as the most discussable question of the educational system.

BAUER, ANGELA* (Institute for Employment Research, angela.bauer@iob.de)
Contradictory Ruling Regulations in Practice – Empirical Evidence from an Implementation Study on Tolerated Refugees Access to the Vocational Training System in Germany

In our qualitative implementation study “Vocational Training of Young tolerated Refugees in Germany” we are exploring the pitfalls and challenges in transforming modified ruling regulations into organizational practice. Legal changes that have been introduced on the federal level since 2009 are the background of our research. They are to reduce vocational training boundaries for young refugees who are only timely-limited ‘tolerated’ and aim at opening up new legal avenues to transit to a legal residence status in the aftermath. This marks a sweeping novelty in German migration and integration policy. So far, tolerated refugees have been object to a broad-based institutionalized exclusion.

Evidence from our interdisciplinary (Sociology, Political Science) research reveals the legal inconsistencies and organizational difficulties in the implementation of the new regulations in various institutional subsystems. Empirically it is based on document analysis and long-term, multi-site fieldwork. Since 2010 we have been conducting semi-structured individual and group interviews with a wide range of experts and participated at expert meetings in order to uncover the organisational practice and ruling relations that may transform the vocational participation opportunities of this marginalized group of young non-citizens. Migration authorities’ social practices in the application of the modified legal rulings prove to be of a particular relevance. They may act as institutional gatekeepers either supporting or constraining the vocational inclusion of young tolerated refugees in a specific local context. This results in regionally diverse vocational training boundaries for the target group.

In our presentation we would like to touch upon these questions: How differ are the new regulations being transformed into practice within the relevant organisational units and immigration system? How may we explain these differences? Which lessons do we learn for scientific policy advice? To answer these questions, we outline the legal framework and present central findings of selected regional case studies.

BAUER, ZSOFIA* (Corvinus University of Budapest, bauer.zsofia@tk.mta.hu)
Experiencing Assisted Reproductive Technologies in the Digital Age

As having children is considered an inherent stage in family development, inability to procreate can be considered as a crisis on both a family and an individual level. Infertility treatment is also a life event that may result in significant emotional distress as well as long-term embeddedness into a professional, medical context. Thus it is equally imperative to concentrate not only on how patients experience their own childlessness, but how they perceive their successful or unsuccessful treatments within the medicalized and institutionalized 21st century.

Present paper (funded by OTKA-K108981) investigates everyday life experiences of infertile women who have decided to seek medical treatments which employ assisted reproductive technologies (grounded in a volatile relationship with the health care facilities), based on a systematic and in-depth qualitative analysis of topic related on-line discussion group messages. A central focus is on how the participants make sense of their conditions and treatments, what questions they find worthy of discussing and how they communicate among their own internet community. Theories of individual construction of technologies, concepts of the changing doctor-patient role and theories of rising consumerist attitude guided the research, focusing on the ART treatment within the context of the Hungarian health care system. The research investigated the constructions, tones, themes, portrayed topics and problems of the individual contributors, focusing on the rapidly evolving patient-doctor relationship, whilst not neglecting the dynamics of the online group.

This unique research design permitted studying the discourses of the participants in a natural, non-controlled environment, where the presence of the researcher had no influence on the results. Main findings suggest that while lay expertise and condition based knowledge is rising in the digital age, the supremacy of trust towards medical professionals and institutionalized medicine is fading, a new dynamics in attitudes towards treatments is emerging as we speak.
However, one should not forget that in many businesses, employees and even the shop owner are neither highly educated nor necessarily proficient in any language apart from their own native language nor do they necessarily use the new media in their daily work.

How does this influence nonresponse? How do reasons for nonresponse differ from survey of the general population or organizational surveys in large companies? Which is the appropriate survey mode in order to minimize nonresponse? What other measures can be used in order to maximize response rates.

Using the hairdressing and barbering markets in four European cities (Birmingham, Hamburg and Glasgow in the UK, Dortmund and Frankfurt in Germany) as an example, we discuss these questions.

The aim of the study was to sample the whole population of hairdressing and barbering businesses in each of these cities, and we had mailing addresses and telephone numbers of all businesses and email addresses of part of the cities. Starting from this, we used a mixed-mode design (online, postal and telephone survey), experimenting among others with different questionnaire lengths and interviewer types.

BAUER, SHERRIE* (City College & The Graduate Center-CUNY, SBauer@GC.CUNY.edu)

Mobilizations across Boundaries: Latinos and New York’s Environmental Justice Movement

In this proposal, I argue first, that while the U.S. environmental justice (EJ) movement has been painted mainly as an African-American struggle, there is also an undervalued Latino contribution in New York City. Second, there are transnational dynamics in Latino environmental activism in New York (between the diasporic community and the home country) that may serve as a model for other immigrant activists in New York. Finally, as a political scientist, my focus is on the results of Latino (EJ) activism on particular policies, programs, and projects.

I am interested in the several decades of Latino (especially Puerto Rican) social/environmental justice activism in New York and the transnational processes between mainland and island activists. While Puerto Rican activists are not, technically, transnational given the island’s political status, their behavior is similar to transnational Cuban or Dominican networks (e.g. Duany 2011) or environmental justice networks working on both sides of the U.S.-Mexican border (Carruthers 2007).

I begin my overview with the public health and sanitation campaigns of the Young Lords in the late 1960s early 1970s and how this coincided with a growing environmental consciousness in Puerto Rico over the excesses of industrial development in one of the most densely populated places on earth. I next chronicle how Latinos have been at the forefront of conflicts over urban greenspace—particularly for culturally relevant greenspace with casitas and community gardens—starting in the 1970s. In the late 1980s, I chronicle several “classic” EJ battles over disproportionate siting of noxious infrastructure (e.g. incinerators, waste transfer stations, transportation hubs, and energy plants) in poor neighborhoods. I end with the “victory” of sorts in Vieques, which ended the Navy presence in 2003 but where justice activists still fight to remediate sixty years of military toxic.

BAYAT, ASEF* (University of Illinois, abayat@illinois.edu)

Asef BAYAT: Life as Politics: How Ordinary people Change the Middle East

Prior to 2011, popular imagination perceived the Muslim Middle East as unchanging and unchangeable, frozen in its own traditions and history. In Life as Politics, I argue that such presumptions fail to recognize the routine, yet important, ways in which ordinary people make meaningful change through everyday actions. The book shows how the subaltern groups in the Middle East such as the urban poor, Muslim women, the youth and others strive to enhance their life chances in the everyday life by resorting to discreet and dispersed activities that I call ‘non-movements’. While the non-movements—the collective action of non-collective actors—constitute the salient feature of subaltern politics in normal times, they may assume collective and audible forms when the actors find fitting opportunities. They may even coalesce and merge into much broader political movements and uprisings. Life as Politics navigates from the politics of ordinary people in communities, courts, and on the streets to the eruption of mass uprisings and revolutions in the Middle East. Drawn on over a decade of research and reflections, the book’s geographical scope extends from Iran to the Arab world, in particular Egypt.

Enigmas of Struggle in Neoliberal Times

For many research questions especially in organizational and economic sociology, the unit of analysis is not an individual person but the organization (i.e. the individual analysing organizational behavior). When analysing organizational behavior, one very often thinks of large international companies with a highly educated personnel who are proficient in English and use email and the Internet in their daily work.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
Extreme inequality is a hallmark of neoliberal times. How to fight against it? The paper focuses on the paradoxes of struggles against neoliberal inequality. It proposes that while the ‘market society’ has contributed to waves of spectacular revolutions and protest movements in recent years, the dissent has taken place not just against, but also within and often shaped by the neoliberal logic. Consequently, the narratives and positions have been mostly limited to protestation against what they do not want, failing to articulate a vision of what they actually want and how they can achieve it. It is largely in the marginalized communities, those least influenced by the neoliberal logic, wherein a measure of relative autonomy and somewhat alternative arrangements in working life and day-to-day life-world may be realized. The paper draws largely on the experience of the Middle East in the past few years.

*Othering and the Poverty Discourse. Narratives from the Periphery of Mexico City*

Together with the analysis of the material basis of poverty, it is necessary to understand the symbolic and relational dimensions that contribute to create, maintain, and reproduce deprivation. This paper is based on ethnographic work conducted in an area of concentrated poverty in the periphery of Mexico City. Through in-depth interviews with neighborhood residents exploring perceptions, experiences and life trajectories, the analysis attempts to dismantle the myths, stereotypes and stigmas on the poor and their places that underlie the public discourse of poverty.

From a sociological perspective, the paper seeks to understand how the poor coexist with, resist and adapt to a dominant discourse that stigmatizes and denigrates them, daily and systematically. It explores the processes and social mechanisms through which the poor are constructed as others (othering) and its implications for the experience of poverty, social policies and social coexistence. It examines how the dominant representations of poverty contribute to legitimize, consolidate and reproduce social distances, obscuring the political and economic nature of inequality, wage deterioration, job insecurity and the limited dynamism of the labour market. It is not only a question about the extension of poverty, but about the levels of tolerance for inequality that characterize the Mexican society, in particular, and Latin American societies in general.

*The Impact Of Economic Empowerment On Women's Risk Of Intimate Partner Violence In Turkey*

Violence against women; a major violation of women's human rights; is defined as “any act of gender-based violence that results in, or is likely to result in, physical, sexual or mental harm or suffering to women, including threats of such acts, coercion or arbitrary deprivation of liberty, whether occurring in public or in private life” by the United Nations. Sadly, women are at great risk of facing violence where they should actually be the safest: their homes. Violence against women is a major issue in Turkey. The National Research on Domestic Violence against Women (NRDVAW) carried out in 2008 in Turkey showed an increase in the most extreme form of violence against women in Turkey in the last decade; feminicides where women are killed by partners or close male members of their families. The NRDVAW also shed insights into the other types of domestic violence women experience. According to this nationwide survey, 39% of women aged 15-59 experienced physical violence at least once in their lifetimes. Moreover, 15% of women reported experiencing sexual violence; 44% reported emotional violence; and 27% reported economic violence. This study aims to focus specifically on the linkage between economic empowerment of women and domestic violence. Although there is vast literature on the issue; the conclusions reached are far from being parallel. While some findings suggest a preventive effect of economic empowerment on domestic violence, other studies suggest otherwise. We further aim to see whether economic empowerment, specifically house or land ownership, act as a deterrent for domestic violence, some suggest otherwise.

While some findings suggest a preventive effect of economic empowerment on physical and economic violence in a multivariable setting. Further analysis will provide information on how exit seeking behaviors differ by economic empowerment.

*Professional Bullying - Do Ethics Matter? Ethics In Research As A Way To Cope With Excessive Evaluation Anxiety (XEA) and Bullying*

This paper explores the XEA phenomenon proposed by Donaldson and his colleagues[1], and presents a guide for identifying and managing XEA. XEA can be a distractive factor and have negative consequences such as preventing access to important information and data, causing confidence problems, failure reporting. XEA is always a negative influence as opposed to "normal" evaluation anxiety which can be either negative or positive (i.e., causing positive stimulation, awareness, and a desire to improve performance).

In the course of evaluating a new training program, we encountered difficulties that were manifested by professional bullying and caused by what we discerned as XEA. After reflecting on the evaluation process and these difficulties, we reexamined the evaluation contract. We found that most of the contract’s technical aspects (timetable, methodology, etc.) were addressed, while the ethical aspects were taken for granted and neglected. We assumed that the lack of a detailed contract that addresses ethical aspects (rights, obligations, commitment, etc.) was the trigger for these difficulties including professional bullying. We suggest that formulating an acceptable contract which addresses both ‘ethical’ as well as ‘technical’ aspects and clearly defines these components may enable coping with difficulties emerging in the process of evaluation and reduce XEA and bullying. Furthermore, we have developed a guide that contains: (a) XEA signs, consequences and ethical guidelines for reducing XEA and (b) strategies for XEA management and possible applications and solutions in evaluation contracts that contain ‘technical’ and ‘ethical’ aspects and clearly define these components. This may enable coping with complex situations like professional bullying in research.

going from North to South. The studies indeed show that encounters between migrants and the local Moroccan or French population shape migration paths from South to North and vice-versa.

This paper will also explore how migration choices are related to the collective and familial history of the migrants encountered. Some of the French migrants in Morocco have been motivated and mobilized because of their family past, by the fact that a number of them had ancestors who had lived in Morocco during the colonial period. The Moroccan migrants in Europe on the other side were also motivated in their migration by their complex experience of transnational collective and familial history in the colonial era. Because of these experiences, both familial and national, the encountered migrants had been connected to the “North” and the “South” long before their physical migration.

These cross-cutting perspectives will raise the following questions: how do the interrelations at work between migrants in/from the South and in/from the North affect migration flows? How does the past, here the colonial experience, connect individuals to/from the North or the South even before their physical migration? How is this interaction affected in times of crisis and how is it reflected in an unequal global context?

BECK, ULRICH* (Ludwig Maximilian University, u.beck@lmu.de)

We Are Not Living in an Era of Cosmopolitanism but an Era of Cosmopolitization

Most of the time, discussions are blocked by misunderstandings. ‘Cosmopolitization’ does not reflect the experience of an advantaged minority, and treats that as the new reality of the world; it is not a view from a highly specific somewhere, namely the European Enlightenment; it is not intended to convey the shallow political message that ‘we all are connected’, nor does it normalize imperialism and existing global power relations.

I define the notion of ‘cosmopolitization’ as different modes of simultaneous inclusion and exclusion of the ‘global other’ - the global other’ is in our midst. ‘Cosmopolitization’ is descriptive not prescriptive; it is not about ethics and inclusion and exclusion of ‘the global other’ - ‘the global other’ is in our midst. Existing global power relations.

We elaborate on the consequences of neglecting both measurement and aggregation error in multilevel age, period, and cohort analysis using German Media Analysis (MA) data 1978-2009 as well as German Politbarometer (PB) data. Regarding the MA, we first analyze the association between individuals’ leftist and rightist party preference on the one hand, and usage of leftist and rightist quality papers on the other hand (cognitive consonance effect; cf. Festinger 1957). We use cross-classified random effects models to disentangle age, period and cohort effects (Yang & Land 2006). Next, we use additional PB data to estimate doubly-latent measurement models for political involvement by period and cohort controlling both measurement and aggregation error. We store period- and cohort-specific latent means of these between-level models and merge it to the MA data in order to account for the variance of the cognitive consonance effect over time. Finally, results are compared to more ‘naive’ accounts of contextual-level index building.

Biographical Narrations, Discourses and Collective History of Palestinians in Jerusalem’s Old City and in a Palestinian Refugee Camp

During their initial self-presentations, many Palestinian interlocutors, who granted us biographical-narrative interviews, were barely embarking on ‘individual’ processes of narration and were often only marginally talking about their own life courses. Instead of, they were arguing about historical events and processes referring to a collective history shared by all Palestinians. This is one of the biggest empirical challenges of our trilateral research project which is supervised by Prof. Gabriele Rosenthal (Göttingen).

In this presentation, we want to introduce how we approached these empirical challenges. By looking more closely at two localities – the Old City of Jerusalem and a Palestinian refugee camp in the West Bank – we highlight and compare rules of talking and commemoration in self-presentations. The questions that guide us are: What are the relations between these rules of talking and the inhabitants’ collective history, their current situation and the life courses of the interviewees? How do these relations shape ‘individual remembering’?

Based on our empirical reconstructions, we want to shed light on the similarities and differences of the dominant we-discourses in those two local contexts. On the one hand, inhabitants of both localities negotiate images of the self and the other in relation to the long-term conflict between Palestinians and Israelis. In both localities, we have furthermore identified similarities in who is not following the rules of a hegemonic we-discourse. These inhabitants can be considered as outsiders in the sense of figurational sociology because of their different social position. On the other hand, there are considerable differences of the we-images in the two local contexts. These are related to the history of specific local constellations of belonging to different Palestinian groupings (in these cases we have identified religious, political, generational and economic affiliations).
Discretionary Birth: Assisted Reproductive Technologies and the Rationalization of Decision Making Around the Beginning of Life

This study applies Machado’s (2005) theoretical concept of “discretionary death” in order to generalize the notion of rational discrete decisions from the domain of end-of-life studies to ethical questions concerning the beginning of life. Birth “as deed” (ibid.: 792) reflects a “new in-between class of situations” for medical personnel and (future) parents where natural birth is complemented by a range of prenatal (and postnatal) medical techniques including among other interventions ART (ART and DBT and how birth becomes negotiable) (ibid.). The medical contexts of firms offering IVF and genetic analysis as well as hospitals and birth clinics make up a professional sphere where the beginning of life is partialized in discrete choices and reflects rationalization and optimization of formerly “intimate” matters and “natural” processes. Together with the increased application and knowledge about ART and discretionary birth technologies (DBT) the social sciences gain importance besides medical and bio ethics: While morality politics analyses the processes of gaining influence on public opinion by political leaders and interest groups, sociological and survey research focus on tendencies in attitudes as well as the use of ART/DBT and how birth becomes negotiable. This paper presents empirical evidence from a pilot survey in Germany (2013, n=900) on the semantic framing of the beginning of life and contextualizes these results in the light of a rising biotechnology industry and the implications for the meaning of the beginning of life in the process of discrete subsequent choices that become available.

The Political Economy of Drought Conditions in an Indian State

This paper uses primary agricultural data collected from six villages in the western part of the state of Odisha during the period 2010-2012. Odisha was declared as severely drought affected for two consecutive years during the period. This paper critically analyses the institutional arrangements of the Odisha government and the implications for the meaning of the beginning of life in the process of discrete subsequent choices that become available.

De-Capitalising Women Due To Development Induced Displacement: A Case Of International Fishing Harbour Project In Kerala

Kerala is a well-known state in India for its human development index. As the shortage of land and population density of Kerala are bigger problems in Kerala, displacement due to development project affect the most marginalized people and it multiplies their vulnerability, particularly to women. Women are removed from their productive system, commercial activities and livelihoods due to displacement. Subsequently, they lose both natural and human capital. This study tries to analyse the case of International Fishing Harbour project at Vizhinjam, Thiruvananthapuram. This study tries to analyse the problems faced by the women who lose their employment due to displacement and how it affects stress level of women. The present study could found that it affect their self-esteem and confidence in society and feeling of injustice and it deepened their vulnerability. The present paper also tries to analyse the practices which leads to ill-health of women. Here displaced women do not avail the monetary compensation but also lose of social networking. One side, women project as the social capital of the state but on the other side they are voiceless and oppressed. Development projects tend to ignore women’s needs and aspirations and are making the women from one form of subordination to other form. Loss of livelihood impoverishes them further but even among them women suffer more than men do. Women have received less attention in the developmental process of the country. Moreover, the prevailing cultural practices and socialization process, market situations, etc devaluing women’s critical contributions to the society. There is much effort is required to consider them with their own skills, strength and capacities to improve their condition for an inclusive growth. A gendered approach is needed in the planning, implementation of developmental projects for the conducive development.

Displacement and Protest Movements –the Kerala Experience

Kerala is an Indian state located on the Malabar Coast of South West India. It is far ahead in the Human Development Index than any other state in India. Kerala has a great tradition of protest movements against displacement caused by large projects like Silent Valley power and irrigation project in 1970s. Development projects definitely bring displacement. The geographical constraints of Kerala intensified the magnitude of the problem. This displacement causes impoverishment of the local people and their surroundings. As displacement and protest movements have both sociological implications, this study focuses on, namely, ICTT (International Container Terminal Project) and International Fishing Harbour Project at Vizhinjam (IFHP) in Kerala. These projects had been implemented in the midst of public protests. This study tries (1) to make a comparison of trajectories of mobilisation of these two projects (2) to find out whether the strategies used by agencies were effective in terms of opposition (3) to assess the nature and extent of these protest movements. Finally this paper examine the way in which it is faced by the Government. This study could found that this protest movement of people could really helped them to go ahead with their livelihood and sustenance to some extent. Both of these projects had been evicted a number of people from their land and thousands of people became landless and homeless. In this case, people demand only a fair compensation. They are not even aware of cultural ecocide. Orthodox development theory promises “growth with redistribution”, while development policies have failed in practice to distribute growth benefits equally. The findings of the study reveal the lacunae in the policy in regard to development.

Creating Certainty from Uncertainty. Paternalism, CSR and the Mechanisms of Employee Welfare

What does it need for a successful employment relationship? How socially responsible can a company be towards its employees? Businesses face these questions when they hire and decide the scope of potential in-work benefits. In historical perspective, such activities were subsumed under a paternalist agenda, describing an employer’s authority claims over employment in an obligation to provide stable employment. In contemporary perspective, corporate social responsibility (CSR) programs, management, and employee relations are framing the form of employment and define its scope. However, what is the link between these two perspectives?

The paper’s answer comes from a systemic analysis of the employment related key CSR and historical paternalist activities of British and German companies. It is argued that a company cannot be socially irresponsible in its CSR employment activities and that, while management indeed professionalised from the historical paternalist relationship, the mechanisms of providing in-work benefits remained the same. CSR is a business’ means to communicate with its non-business environment by ordering the complexity of demands and addressing some of them. In outcome, businesses gain legitimacy and present themselves as a good member of society; violating commonly held societal norms would prevent such a status. Moreover, businesses typically operate within prescribed economics and structures. They exist to turn profits and actions are chosen on the basis of their previous and likely future success; CSR is part of these operations. In the past, paternalist employers also used these two mechanisms: they conformed to societal expectations and provided benefits that were commonly held to be acceptable; and they used their own experiences to model employment in their companies.

The paper contributes to critical discussions of CSR by providing a theory informed analysis of options and limitations of employment-related welfare activities. It additionally contributes to comparative research of in-work benefits and shows their historical continuity.

Violence and Dissidence. Political Imprisoned Women In The Former GDR

As Ingrid Miethes (1999) study of the biographical background of former East German oppositional women has shown, there is a strange connection between experienced violence in the family and the genesis of dissident behavior in totali-
tarian systems like the former GDR. It is remarkable that one can find quite similar phenomena in our study of the biographical backgrounds from women who have been imprisoned for political reasons. There seems to be deep connection between violent social relationships mainly to male persons and the development of a dissident action scheme. In the presented paper will be argued that dissidence in totalitarian systems (not only) is based on a specific psychological character-trait, but primarily a reaction based on biographical experiences (such as violence trajectories) and their relation with social frames. These frames are potentially built up by social discourses, like the socialist female stereotypes and are processed through biographical work (Riemann & Schütze 1991), which is influenced of violent experiences. For these women it is neither possible to adopt political indoctrinated worldviews nor to emancipate from cultural stereotypes. This results in “damaged social frames”, which made these women incapable to find neither private niches, nor active actions schemes in the GDR. Violence, this is the central thesis made here, can damage social frames and results thus in a disorientation and passivity. This leads to the strange consequence that a private crisis can lead to political persecution in dictatorships like the GDR.

In the fact, as Mikhail Bakhtin puts it, truth is not to be found inside the head of an individual but to knowledge is by connecting to people that know or know who to contact. But knowledge surfaces through dialog, all knowledge is socially mediated and accessed to knowledge is by connecting to people that know or know who to contact. In the fact, as Mikhail Bakhtin puts it, truth is not to be found inside the head of an individual but should prove its compatibility with Islamic basic first. Social Organization and social process. Adline De Grumer: New York. S.333-358

Ingrid Miethe (1999), Frauen in der DDR-Opposition. Leske + Budrich: Opladen

Obstacles of Clinical Sociology in Iran

In the domination of a single belief, which carries its own worldview system including beliefs about “ultimate reality, epistemology, ethics, purpose, etc.”, and has a solution for social, psycho, economical and even environmental problems, it’s difficult for any external new science to penetrate or sum up against these worldviews which became a denomination or sacred in some realms. Clinical sociology is not immune, but rather, is maybe on the verge of more anathematization.

In Iran, which Islamic law creates a huge shadow over all acts and interacts, and provides basement for any theory with its fixed solution, no new option can find its way, because should prove its compatibility with Islamic basic first. But knowledge is embodied in people gathered in communities and networks. The road to knowledge is via people, conversations, connections and relationships. Knowledge surfaces through dialog, all knowledge is socially mediated and accessed to knowledge is by connecting to people that know or know who to contact. In the fact, as Mikhail Bakhtin puts it, truth is not to be found inside the head of an individual person, it is born between people collectively searching for truth, in the process of their dialogic interaction.

We may obtain information from the ‘sage on the stage’ a book or CBT, but we learn on the playing field, where our identity is forged, opinions are validated, values mediated, beliefs formed and assumptions are tested. Because of that, we find clinical sociology can be useful for improving social behavior in Iran, but should approach its thoughts and solutions with basic Islamic concepts. Based on this fact, we think clinical sociology if wants to find a gateway for improving the views and values in Iran, should correspond its solutions with the values mediated, beliefs formed and assumptions are tested. Because of that, the process of their dialogic interaction. In Iran, which Islamic law creates a huge shadow over all acts and interacts, and provides basement for any theory with its fixed solution, no new option can find its way, because should prove its compatibility with Islamic basic first.

The main goal of this project is to carry out an interdisciplinary analysis of the meaning of violence for the indigenous youth of Reserva de Dourados, Mato Grosso do Sul - Brazil. Violence in this population has different variants of those known in the Western society. This is extremely important for us to act within the cultural dialogue towards public policies proposals based on indigenous and human rights.

The constant traffic of that population between the cities and the border, makes it produce a hybrid discourse in which, often, acts considered normal and usual are appointed as violent, and with ambivalent attitudes.

A great example is the fact that youth, mainly women are beaten by their companions frequently. They know that, in the surrounding society, this is not considered normal, but, at the same time, “it has always been that way, since the times of our mothers.” However, many times they rise against it and go in search of justice outside for help, but, soon, they repent and justify the beating: it occurred because the mate had drunk too much.

This kind of ambiguous attitude represents the disagreement that exists in the negotiation between the Western values and those of the Indigenous People, in our case, the ethnicities Arawak and Guarani Kaiowa and Guarani-Ñandeva.

The methodology of this research was based on action research between the healthworkers, the indigenous teachers who work in the Reserva, me and the Indigenous youth who attend the Youth Indigenous Action of Dourados. We held six workshops about the meaning of the violence and acts of violence and how we can avoid them.

Indigenous Youth: Fighting for Their Rights

The spotlighting of the Israeli-Palestinian conflict by the international media and the relative accessibility of contested areas in the West Bank have turned it into an interesting destination for foreign visitors. In the past decade such tourists have become an integral part of popular demonstrations and other activities in such localities as Bīfīn, Boudrus and Sheik Jarrah. In many of these places, local committees have learned to utilize international visitors as a political asset in their battle against injustice, be it land confiscation or house demolition. These tourists display diverse degrees of political awareness and motives, but regardless of whether they arrive in the West Bank individually or as part of an organized political initiative, they represent a new form of political consumerism in the arena of international tourism. Based on ongoing fieldwork in the West Bank, this paper seeks to address three questions: Does the mobilization of tourists for political ends as seen nowadays in the West Bank constitute a new phenomenon, and if so in what way is it new? Does this mobilization succeed in achieving its aims? Does it always promote just causes?

Political Tourism in the West Bank

The spotlighting of the Israeli-Palestinian conflict by the international media and the relative accessibility of contested areas in the West Bank have turned it into an interesting destination for foreign visitors. In the past decade such tourists have become an integral part of popular demonstrations and other activities in such localities as Bīfīn, Boudrus and Sheik Jarrah. In many of these places, local committees have learned to utilize international visitors as a political asset in their battle against injustice, be it land confiscation or house demolition. These tourists display diverse degrees of political awareness and motives, but regardless of whether they arrive in the West Bank individually or as part of an organized political initiative, they represent a new form of political consumerism in the arena of international tourism. Based on ongoing fieldwork in the West Bank, this paper seeks to address three questions: Does the mobilization of tourists for political ends as seen nowadays in the West Bank constitute a new phenomenon, and if so in what way is it new? Does this mobilization succeed in achieving its aims? Does it always promote just causes?

Self As Avatar

Two opposite ways of regarding the self in a digital world are as a branded object and as an anthropomorphized subject. When Marx condemned tendencies toward the objectification of people and the personification of objects, he was certainly not envisioning either the self-objectification that takes place when we treat ourselves as a brand or the reanimation of self that takes place when we breathe life into computer animations representing us. Rather than being pawns of capitalism, we see ourselves as becoming agents empowered through both of these processes. But just as Marx cautioned, there is still a dark side to objectifying people and personifying objects.

With expanding Internet possibilities, it is not surprising that we are being urged to manage our online “persona” identities. We are urged to attend to our packaging and product, our unique selling proposition, and self-promotions, co-branding, brand positioning, market segmentation, and our social media portfolio. Target audiences include our employers, friends, family, potential dating partners, professional colleagues, and institutions. Self-branding takes place in online networking and marketing, but even our presence in blogs, social media, and our photo and video uploading sites. The problems entailed in these presentations of self in everyday life are detailed and discussed.

Second, the paper examines the anthropomorphization of self that takes place when we create, use, and embrace avatars in online games, virtual worlds, and other venues. The human-avator link is not just a projection from human to avatar. We create our avatars and our avatars create us. Our avatar’s characteristics and behavior online carryover to the “real” world. Like the commodification of relations in self-branding, avatar selves often reduce human relations to prejudicial stereotypes from the real world.

The paper concludes with an appraisal of these new phenomena and reflections on future issues.

Visualising an Interiority: A Self-Reflective Process of Collage

I propose a self-reflective case study of a synthesis of the thinking through making, as an artist exploring her own ageing process and searching for a method of inquiry through creative practice which merges the making and the textual. Collage appears to offer versatility as it allows one to express subjective experience through reflexivity and its intrinsic multiple interpretations of the image. ‘Collage’ is derived from the French word, coller, to stick, a familiar cut and paste process going back 1000 years to when Japanese calligraphers used torn bits of paper to embellish their written texts. More recently, it could be said to have paved the way for Postmodernism, which is itself almost ‘collage-like’ in that it disrupts our sense of reality and the generally understood aesthetic unity of things by reflecting the way we see the world, with objects being given meaning not from something within ourselves, but through the way we perceive how they stand in relationship to one another. It does not preclude conventional ‘artistic skill’ but it does encourage creative exploration; therein reists its inherent attraction for artist/researchers as it offers the gift of multiple voices.

This study investigates the subjective experience of ageing through the gaze of an older woman artist, viewing her own transitioning, relinquishing and becoming, where the self is both subject and object, examining the inter-subjectivity of the micro within the macro. Working within the comparative safety net of generated images rather than articulating through the sometimes unforgiving precision of words, this paper illustrates the advantages and pitfalls of how collage might help untangle the complex and frequently unresolved inherent emotions.
people for a progressive alternative in a non-revolutionary situation, the promises and perils of coalition politics with elite political parties, and the possibilities and problems in linking a progressive international agenda with a local reform agenda. Among the questions my intervention will seek to answer are: Where does the corruption and governance issue fit in a progressive agenda? How does one promote distributist reform in asset and income distribution in a period when people's movements are weak? How does one link a local reform program to a strategic post-capitalist agenda? How does one promote a reformist foreign and global policy agenda that addresses climate change, the crisis of globalization, continuing interventionism on the part of the United States, an increasingly assertive China, and geopolitical rivalry between the United States and China.

Children's Autonomy and Parents Responsibility in Urban Spaces

The aim of the proposed communication is to demonstrate that, despite the increasing attention to children's autonomy and the arising of policies devoted to this principle, a decrease in spaces of responsibility awarded to children is occurring, so that they have limited decisional power, a restricted use of public spaces, fewer "unsupervised" relationships within peer groups, dependency on adults and mandate to adults in their courses of action. The hypothesis of increasing risk of dependence of 9-12 years old children from adults' control is based on a research focused on Turin area, part of a national project on children's autonomy and adult's responsibility.

Analysis pointed at the different ways in which autonomy/independence ratio, referred to the children's space management, is declined by adults, either in domestic or in public spaces. Variations are considered depending on children's gender and age, family social condition and type of neighbourhood of living. Different degrees of autonomy and responsibility are related to different family social condition.

As regards methodology, 46 in-depth interviews were carried out to 9-12 years old children son/daughter's school grade and their parents contacted through two selected school, located in two different neighbourhoods and characterized by a different class composition. Four focus group, involving teachers of the two schools have been realized.

Arts, Popular Culture, and Chinese Migration in Spain. Dialectics of the Incorporation

This paper discusses how the Chinese origin people in Spain it is present and active in the Arts and popular culture of the country. Besides that only very recently the Chinese population volume is significant in Spain, since the very beginning of his presence the art and popular culture have been a way for the Chinese incorporate to the Spanish society: circus, acrobats, painters; and very soon it also developed another phenomenon as some of the Spaniard magicians adopted Chinese names for their presentation into the public. This kind of two ways incorporation is still at work.

In this paper we will analyze how the Spanish arts and popular culture use the “Chinese” and how they are incorporated to the mainstream as well as to the marginal social. At the same time, Chinese in Spain are agents/actors/producers of arts and popular culture that interplay with the rest of the society showing an incorporation dimension where the class level is also at play. This dialectics of the incorporation will be analyzed through different artists and creators' cases studies.

Are 'New Wars' Rational? Symbolic Violence in Israel's Recent Wars

The burgeoning academic literature on new wars is still grounded in the rationalist assumption that wars are a means of achieving material or ideal goals. However, this presentation argues that the new wars of the post-Cold War era of reflexive modernization and globalization are not rational per se. Alternatively, these wars are a realization of significant controlling function. Modern universities limit their objectives only to information transfer and miss the formation of character, moral and civic principles, and also could hinder the development of social qualities of the individual and its behavior, that have socially useful nature.

Few questions, which need its answers, acute before the system of social control in Russia. First, could modern universities be elements of social control? Does it exhaust its correcting, controlling potential?

Higher Education in Russia As Institute of Social Control of Student Deviant Activities

Social control plays for the society a significant regulative function, is a complete mechanism of maintaining of public balance, facilitated with a wide range of tools, forms, methods of impact on undesirable to a society manifestations of human activity, which find first of all expression through social institutes. A social institute of education (higher education in particular) takes on special significance. However many modern scientists say that an institute of education keeps actualized with a realization of significant controlling function. Modern universities limit its objectives only to information transfer and miss the formation of character, moral and civic principles, and also could hinder the development of social qualities of the individual and its behavior, that have socially useful nature.

Few questions, which need its answers, acute before the system of social control in Russia. First, could modern universities be elements of social control? Does it exhaust its correcting, controlling potential?

S. N. Eisenstadt : The Challenge Of Social Change

S.N. Eisenstadt: The challenge of social change

Social change was one of Eisenstadt's major areas of interest. In his view, the possibility of innovation and change is not something external or accidental to any institutional system. It is given in the very nature of the process of institutionalization and systems. He applies this principle of dialectical transformation to his analyses of the dynamics of civilizations and modernity. SNE perceives socio-historical transformations through an emphasis on the multiplicity and variety of forms that civilizations may adopt and how human agency and creativity play a major role. Hence, such developments are made possible by the emergence of new types of elite. It is in this perspective that SNE discusses inter-class and inter-elite struggles, demographic expansion, domestic and international difficulties of states. SNE's analyses favour cultural and ideological premises. SNE sees modernity as the emergence of a social reality where the legitimacy of the social order ceases to be taken for granted and becomes an existential problématique for people, as members of society. This perspective, which developed in Western societies in the context of given civilizational legacies, has not remained these societies' exclusive privilege but has quite rapidly conquered more and more spaces, intermingling everywhere with singular cultures. This is what qualifies for SNE's notion of multiple modernities. SNE, however, does not indicate anything that transcends modernity in the social world. Under this angle, the project of modernity can be seen as a variant of 'the end of history' theme. Modernity is not only 'endless trial', but also 'an endless trial. Obviously, present-day globality, transnationalism and multiculturalism have tremendous influence on individuals - diasporas and non-diasporas - as well as on society. Are we now seeing signs heralding a new sequence of modernity or are they pointing out to a new era?

Dominant Parties In Non-Western Countries

Dominant parties in non-Western democracies

In general, it is assumed that dominant parties are able to maintain themselves in power election after election thanks to their immense power which they manipulate in order to retain their status. The current presentation refers to Kalder's Crisis and compensation and suggests that a major factor that accounts for parties to gain strength in non-Western democracies and remain in power for protracted periods stems from their capability to respond efficiently to ongoing social, political and economic challenges. This capability warrants parties' retention of dominance - or at least dominant influence - over the years. Even if they do not retain an exclusive hold on governmental power, they do imprint their perspectives on the setting's political scene as a whole. This presentation validates this perspective by analyzing the cases of Japan's LDP that has been (and still is) in power for 40 years.

Negotiating National Identity: Inequality and Uprising

In this colloquium, we intend to analyze the question of minorities in the North of Africa, particularly in Algeria and Morocco. Our observation about this question has an aim to understand why the ethnic tensions and Arabic spring took place in almost all the Arab countries except in these two countries. Our study intends to predict bias on analyzing what would happen in the coming years. Our research terrain is both countries as they have several ethnic and political problems. Then, we ask the following question: What would the future hide as events for these two countries basing on the social change factor as a fundamental point. This sample "ethnics in Algeria and Morocco" - as a second factor- are considered as elements influencing in the social cohesion and having as a possible result a real political, social and Cultural revolution. As a matter of fact, we consider that the political borders are not coherent with the geographic borders. To understand this matter, it is necessary to study the internal factors in the two countries in the first place (social, psychological, political and cultural structures) as means of inequality in the society. In the second place, we have to study the external factors related to the French and American interests in this strategic region. We try to understand if the failure of transformative politics is behind the ethnic incochesion and how this could introduce a revolution spirit in the two countries. We think that such failures often force minority groups to devise other means of self-protection. Basing on the Jacob Mundy's book on failure of transformative minority politics in Algeria, we will examine the question on inequality and its impacts on the social and political cohesion.

Non-Standard Professional Workers and the Demand of Representation: Do Knowledge Workers Need Collective Organizations?

Since at least 30 years, the processes of economic and social change in industrialized countries have been weakening the collective dimension of working conditions. This is especially the case for young non-standard workers experiencing a more individualistic relation with work and labour market. Indeed, the decreasing participation to unionism can be partly explained by the individualization of work. Italy is a particularly interesting case at this regard, as several labour market reforms took place since the end of the 90s pushing high-skilled young workers into non-standard contracts and positions.

The aim of the paper, based on a qualitative survey involving 75 young professionals living in Milan (Italy) and 16 organizations, is to understand whether high-skilled non-standard professional workers express a specific demand for representation, and what kind of answer traditional and innovative organizations are likely to offer.

Our leading hypothesis is that, as a consequence of a general disappointment towards politics and unionism and of the change of workers' social identity, young professionals do not refer to unions but pursue individual strategies to solve their conflicts within the labour market. Non-standard workers constantly refer to rhetoric on personal autonomy and freedom against the 'boring standard long life full time job' (not existing any longer in the real life).

Our results in Milan, the Italian metropolis which usually anticipate national changes in the labour market, shows a mismatch between job conditions of these workers that have strongly worsened in the last decades, and the awareness that these conditions are shared by a large part of non-standardworkers, and their (in) capacity of collective representation and action. The lack of sharing a common place of work is one of the elements to understand this mismatch. Given this scenario, the possibility for unions and other associations to organize these workers is very unlikely.

Leisure and Health

Mental or emotional health refers to overall psychological well-being. It includes the way we feel about ourselves, the quality of our relationships, and our ability to manage our feelings and deal with difficulties. Good mental health isn't just the absence of mental health problems. Being mentally or emotionally healthy is much more than being free from depression, anxiety, or other psychological issues. Rather than the absence of mental illness, mental and emotional health refers to the presence of positive characteristics. Similarly, not feeling bad is not the same as feeling good. While some people may not have negative feelings, they still need to do things that make them feel positive in order to achieve mental and emotional health.

The positive characteristics of mental and emotional health allow us to participate in life to the fullest extent possible through productive, meaningful activities and strong relationships. Taking care of our body is a powerful first step towards mental and emotional health. The mind and the body are linked. When we improve our physical health, we automatically experience greater mental and emotional well-being. For example, exercise not only strengthens our heart and lungs, but also releases endorphins, powerful chemicals that energize us and lift our mood. The activities we engage in and the daily choices we make affect the way we feel physically and emotionally. If we maintain a balance between our bodies and our minds, we improve our physical health, we'll automatically experience greater mental and emotional well-being. The mind and the body are linked. When we improve our physical health, we automatically experience greater mental and emotional well-being. For example, exercise not only strengthens our heart and lungs, but also releases endorphins, powerful chemicals that energize us and lift our mood. The activities we engage in and the daily choices we make affect the way we feel physically and emotionally. If we maintain a balance between our bodies and our minds, we improve our physical health, we'll automatically experience greater mental and emotional well-being.

The purpose of this article is to examine the empirical evidence and describe theoretical perspectives that address under what conditions and why leisure acts can be therapeutic and contribute to mental health.
The neighbourhood of Château Rouge in Paris’s 18th arrondissement is home to a large foreign-born population of residents and has been called “Africa in Paris.” However, while the neighbourhood is often labelled as “exotic” it has also earned a reputation for being one of the more dangerous and lawless neighbourhoods in Paris. In 2012, Château Rouge was listed as one of 15 “priority security zones” by the French government, leading to increased police action on unlicensed vendors, prostitution, theft, occupation of public spaces and drug trafficking. While the local government has created political and economic interventions that seek to solve these problems, local residents have taken to online blogs and forums to complain and raise awareness about what they deem to be Château Rouge’s “real” problems: the failure of the police, the municipal destruction of old buildings and classic architecture for redevelopment, and “mono-commercial activity,” or a lack of commercial diversity in the neighbourhood. However, while these online discussions often commence with a statement of support for the neighbourhood’s cultural, religious or national diversity, it is evident that some of the products of Château Rouge’s multiculturalism—halal butchers, African hair salons, “ethnic” grocery stores and a large concentration of African migrants—are a source of discontent for many residents. Based upon ongoing research in Château Rouge, this paper presents evidence of social and political policing efforts and governance deficits that attempt to control a “dangerous” and “stereotyped” neighborhood while concealing growing discomfort with this “ethnic enclave.”

Protest Mobilizations at the Beginning of the 21st Century: J14 as Part of a New Global Cycle of Protest

In the aftermath of Arab Spring, throughout Israel there were massive protests, indeed, on a per capita basis, the “cottage cheese” revolt, or J14 (June 14), can be seen as part of the Global cycle of protest. According to Schechter (2012) three phases of the Israeli J14 can be identified: 1) The public phase, 2, Immediate Post – tent city phase, and 3) Long lasting projects born out of the protests. Like many, if not most of these movements, the mobilizations were responses to neo liberal globalization, which has had adverse impacts on Israeli youth, especially rising costs of living. But like many of these movements, they were not simply workers, or even socialist unions, but a wider range of actors, especially youth, not just seeking a better standard of living, but dignity, recognition of their humanity. But did these movements have any impact? Let us note that to gain the support of many, the occupation of Palestine, a huge drain on the economy was not made an issue. But that said, the “success” of Lapid, limiting the “victory” of Netanyah must be noted. While he remained in power, that power was weakened. More recently, the likelihood of the USA and others to negotiate with Iran, and the growing discontent over the Palestinian issues, seem to have made a weakened Bibi more bellicose and intransigent than ever. Noting parallels with New Dawn in Greece and the Tea Party in the USA, which have been losing actual support, it might be suggested that while the movements of 2011/12 may not have result ed in short term change, or perhaps things even worsened, these movements have just been the opening shot in more long term progressive mobilizations.
The Intersectional Politics of Masculinity: The Case of Hip-Hop in Sweden

Critical research on racialization in contemporary Europe demonstrates the extent to which dominant discourses displace sexism, homophobia, foreignness, and other unwanted characteristics onto non-white men. But how are such attributes negotiated and challenged? Over the last two decades, hip-hop culture has emerged as a central site for the articulation of resistance to racialization, by what Fatima El-Tayeb calls ‘European Others’. While research on hip-hop in Europe has tended to foreground rap artists as street-style postcolonial intellectuals, less scholarly attention has been devoted to how notions of gender and sexuality are implicated in resisting racialization. This paper presents findings from a study of rap lyrics from hip-hop in Sweden over the last twenty years. Drawing on an intersectional perspective, it seeks to challenge mono-categorical analyses of either racialization or masculinities, by focusing on the emmeshed negotiations of race, class, gender and sexuality. The analysis shows how male artists often challenge racialized discourses, but in ways that simultaneously draw on racialized stereotypes as a means for performing heterosexual masculinity. Furthermore, attention to female artists’ critique of the sexism of their male colleagues, and queer analysis of male homosocial desire, reveals how hip-hop is often very radical and conservative at the same time. In this way, I seek to complicate our knowledge of how racialization and masculinity are constructed, negotiated and challenged, by focusing on what I call an ‘intersectional politics of masculinity’.

BERGGREN, KALLE* (Uppsala University, kalle.berggren@soc.uu.se)

Beyond Intersectionality and Masculinity As Proper Objects? the Case of Hip-Hop in Sweden

In the last 25 years, sociological gender research has seen the development of two important research traditions: intersectional scholarship, and the sociology of masculinities. Yet, there has been a lack of mutual engagement between these bodies of research. Intersectional theory and research has primarily focused on differences and power asymmetries between women, in terms of race, class, sexuality, and to some extent age and (dis)ability. The sociology of masculinities, on the other hand, has typically been more concerned with the critique of ‘hégemonik masculinity’ or the ‘hegemony of men’. This paper seeks to contribute to an emerging use of intersectional analyses focusing on men and masculinities. It draws together findings from a study of how the categories of race, class, gender and sexuality are constructed, negotiated and intersecting in the case of hip-hop in Sweden. The study is based on discourse analysis of a broad sample of rap lyrics from the last two decades. Based on this empirical research, the paper presents findings from a study of rap lyrics from hip-hop in Sweden over the last twenty years. Drawing on an intersectional perspective, it seeks to challenge mono-categorical analyses of either racialization or masculinities, by focusing on the emmeshed negotiations of race, class, gender and sexuality. The analysis shows how male artists often challenge racialized discourses, but in ways that simultaneously draw on racialized stereotypes as a means for performing heterosexual masculinity. Furthermore, attention to female artists’ critique of the sexism of their male colleagues, and queer analysis of male homosocial desire, reveals how hip-hop is often very radical and conservative at the same time. In this way, I seek to complicate our knowledge of how racialization and masculinity are constructed, negotiated and challenged, by focusing on what I call an ‘intersectional politics of masculinity’.

Young Researchers in Germany: Different Forms of Examination and Evaluation of Academic Careers

To be under examination is a quite common experience for young researchers. In the German university system, young researchers are confronted with examinations at three different points, the doctoral exam, as well as with examinations in a broader sense (e.g., regular evaluations of teaching, peer review). From our perspective, it is important for a comparative sociology of examinations to look at different forms/formats of examinations and evaluations within specific fields in the Bourdieusian sense. Thus, we intend to compare the various formal and informal processes and instances of examination and evaluation young researchers experience during their careers. In the same vein, we draw on phenomena of trust/mistrust in the academic trajectories.

In our presentation we will (a) differentiate between forms of examination and evaluation which are typical for academic careers in Germany. We will then focus (b) how young researchers cope with different forms of examination and evaluation. The presentation is based on a research project on academic careers in Germany with a special focus on trust funded by the German Federal Ministry of Education and Research (BMBF). At the current stage of our project we mainly use qualitative interviews to analyze the relevance of trust for academic careers.

Differentiated Implementation Of Human Rights: A New Research Agenda

One of the major issues attracting the attention of scholars studying global norm regimes is under what conditions and how transnational regimes impact state behavior. Focusing on the human rights regime, we propose to broaden the research agenda of the literature dealing with the implementation of norms in domestic settings by re-conceptualizing implementation. We show that the research agenda has reached the instrumentalization of human rights norms within the local sphere uses the state as the unit of analysis and therefore implicitly assumes that the processes of implementation are uniform and consistent across the population. We introduce the term “differentiated implementation” to capture variations of implementation across different social groups within a given society (descriptive level), and use perspectives and methods from the sociology of inequality to explain specific patterns of implementation. We present two case studies to illustrate our argument – the right to vote in the US and the right to work of people with disability in Ireland. Our effort to connect the implementation literature with the sociology of inequality can encourage human rights scholars to examine the impact of local structures and processes, and prompt inequality scholars to explore the global human rights context.

marketized social policy without accompanying compensation mechanisms, such as strong civil society participation rates and institutionalized conflict procedures. In this paper, we test this convergence hypothesis by tracing social policy orientations and transitions in the context of larger institutional change. As these countries now face critical junctures, they are important test cases on the impact of external shocks to domestic social policy and the consequences of pushing market mechanisms into welfare provision in the context of unpredictability in political and economic outcomes.

Hesitant Secularists: The Politics of Secularism and Post-Secularism in 21st Century Portugal

How secular is Portugal? Is it a post-catholic polity, transitioning from mono-confessionality to religious pluralism? Is it, in that sense, a post-secular polity? Recent events suggest that post-secularity might underpin a specific mode of governance to a larger and deeper extent than previously thought. Research on the religious field in Portugal has been dominated by Church-centric frameworks, eschewing Bordieuian field theory in its richness; moreover, that research stream has rarely taken steps towards a keener understanding of intersections between religion, culture, traditions and public policy. As a consequence, debates on the categories of secular, secularism and secularity are limited to discussions on crude distinctions between the separation of private and public spheres, without regard for contemporary discussions on varieties of secularism, the emergence of post-secularism as a descriptive term as well as a mode of governance, and the redeployment of religion into a richer societal landscape where, as Charles Taylor states, it is one among many options in the collective knowledge and meaning-making pool. This is quite clear in Portugal, where the religious field has faced significant reconfigurations since the early 1990s. Moreover, corporatist modes of intermedialization bringing secularism to the fore as a relevant conceptual tool to scholars envisioning the emergence of new formations of the secular in politics where the usual tropes of secularization theory were hardly ever applicable. The Portuguese polity is an interesting test-case in this regard, as its regulatory environment regarding religion has evolved largely according to governance procedures that hold to diverse normative visions of what is secular, non-secular and perhaps post-secular. The interplay between these categories in a largely unknown conceptual territory and empirical context is thus the object of this paper.

Financialization in the Backyard: Shrinkage, Welfare State Restructuring and New Housing Investments

The paper discusses the interplay of local planning policies, welfare restructur- ing and global financial markets in the “making” of social segregation. It builds on an empirical study in Halle-Neustadt, a shrinking New Town in East-Germany and uses a mix of survey data, interviews and document analysis as well as fieldwork.

In Halle-Neustadt, the paper argues, different developments come togeth- er: First, Neustadt has experienced dramatic population losses, which stimulated large scale demolition programmes as well as planning policies which aim to transform parts of the neighbourhood to a green space. Second, Neustadt has experienced two waves of privatisation in the last two decades, leading to a complete change of ownership structures. Thereby, municipal and cooperative owners have been largely displaced by national and international financial investors which hold their stock as an asset and aim on short-term gains, rather than long- term development. Third, welfare cuts have put more pressure on welfare-recipi- ents to accommodate in cheapest housing available on the local market which led to a “business-model” profiting on low, but state-subsidized, rents in peripheral estates.

The paper discusses how these developments work together to produce new concentrations of poverty households in a prototypical shrinking city. With this, we expand on the already fairly developed debate on the financialization of urban development and provide new insights on (a) financialization in shrinking, low-de- mand markets, (b) the relationship between planning, state restructuring and fi- nancialization in a German context. We demonstrate that the political economy of housing follows different dynamics here which are owed to both the weak-market situation and the path-specific restructuring of the German planning and welfare system. We conclude that research should put the state more into the centre of explanations and take different paths of state restructuring as well as different socio-economic contexts more seriously.

Ict Infrastructures For Social Public and Political Participation

Diffusion and deployment of high-speed internet and related services are considered a key element for fostering smart, sustainable and inclusive growth and taking advantage of a digital single market for households and businesses and overcome the digital divide.

This contribution is bound to explore the link between ICT diffusion and smart growth, putting in evidence how high-tech information technology is a necessary but not a sufficient condition for a true smart development. By means of first- hand quantitative as well as qualitative data deriving from the research project, conducted in Piedmont region in 2010-12, and also on European and national surveys on ICT diffusion this paper explores to what extent ICT can really induce high intensity knowledge activities and services able to promote social participa- tion and cooperation.

This paper will highlight how a cooperative game between the different social, institutional and economic actors can improve the quantitative and qualitative diffusion of ICT infrastructures and give raise to effective vertical (interaction between regions, provinces, municipalities) and horizontal (interactions between institutions, public companies and non-profit organizations) forms of e –government and e-governance aimed at creating a social and cultural capital. Furthermore on the base of 40 case studies of territorial Wi-Fi facilities it will be put in evidence how the creation of these infrastructures, highly placed in a territorial context, can manage to create a call to action which combines technology and technological capabilities with social relations, giving rise to interesting forms of cooperation among social actors in promoting both the growth of citizens services, new economic innovative activities and interesting forms of participation.

Alienation, Emotions, and Well-Being In a Mexican Indian Society

In a Mexican Indian community in Mexico in the State of Puebla, the recent in- stallation of maquiladoras in the vicinity of the community, has provoked important changes in the socio cultural and economic life of the villagers that is reflected in their patterns of emotions, which role in overcoming alienation and restoring individual's socio psychological and physical health will be analyzed. As it will be seen, alienation through emotion labor and control are not an important part of the economic wealth of the community.

Contrasted Cases: Childcare in France and Germany

Contrasted cases: Childcare in France and Germany

Children under six need adults to take care of them and teach them the ba- sics of social life, which they also learn by themselves in playing – a very serious occupation. Sociologically speaking, childcare organisation is not only about who will take care of a given child, but also through which kind of social relation with whom. Razavi's core diadrom, used by Ochiai to compare childcare organisation in East Asian countries, distinguishes four main types of social relations. In contin- ental Europe also, ways of organising childcare differ widely. In some countries: Portugal, Spain, Italy, Ireland, but also Germany where public childcare for young children is almost non-existent, the traditional 'familialist' pattern remains. Thus women as mothers have no choice but to stay home (or remain childless). By con- trast, in Scandinavian countries but also in France public care of children is highly developed and subsidized; mothers can keep their job and pursue their career (or study). The French école maternelle, local preschools where children from age 2 to 5 are taken care of by well-trained personnel during 'normal' working hours, is a success story. While free of charge and not compulsory, 98 % of children aged 3 to 5 attend it. For the nation's budget the cost is 5.000 euros per child/year, totalling 0.8 % GNP. But as a result French (and Swedish) birth rates are 50 % higher than the German one. Children in France do love their neighbourhood's maternelle; and this is where children from migrant parents, who do not speak French at home, learn it. Of course it helps them when entering elementary school, compared with migrants' children in 'familialist' countries who will only start learning host soci- ety's language at six.

Why Empirical Sociology Needs Life Stories

Why empirical sociology needs life stories

Whatever continent they live in, women and men will act so as to try and make their life better. This universal tropism orients most of their individual courses of
action: the succession of steps an individual actor takes to try and reach one of her/his significant goal(s). Indeed it takes planning, mobilizing information and means, finding support, focusing efforts, anticipating obstacles, (re)defining tactics and strategies to move a project forward through months and years. Examples are: getting a degree; looking for a decent job; moving upward in organization (career); finding a place to live; attaching to oneself a desired partner; buying a flat; raising a child (long and tricky course); divorcing; changing one’s job; setting up one’s own business; fighting an illness; getting rid of some addiction; becoming an activist of some cause; emigrating and settling in another society…. All these courses of action depend ultimately at changing the individual’s social status: from student to graduate, unemployed to employed, bachelor to married, childless to parent, ill to healthy, from passive to active citizen…. In a constructivist perspective, millions of such courses of action contribute together powerfully to shape societies and their history. However none of empirical sociology’ standard methods has been designed to observe a course of action. Indeed it takes narrative interviewing with actors to try and reconstruct, admittedly with imperfections, what they did, with whom, in which context(s), how they did it (and why). For instance, only through series of (focused) life stories – the damned method? – collected in the same social world may one understand sociologically what are its inner workings, how they are re-produced, how they change. Furthermore these informative testimonies will cross-check each other, solving several validity issues.

Social policy by numbers – numerical tools in global social policy making

The paper investigates the role of a special class of tools in the formulation of global social policy: the use of numbers and quantification. We argue that numerical tools, beyond their technical function of supporting decisions, shape or even constitute the ‘social’ in the global sphere, and that they enhance the legitimacy of policies that make use of them. We draw on recent sociological theories of quantification and numbers, on world society theory and on the constructivist theory of social problems. Empirically, the paper flows from an ongoing research project on designing and spreading social protection policies worldwide, a field replete with quantitative tools of policy formulation and implementation. We compare three types of international organisations (IOs) as to the degree and the varieties of numerical tools they use in designing and spreading social protection policies worldwide: lending IOs (World Bank, Asian Development Bank, the latter producing the Social Protection Index for Countries in Poverty Reduction); standard-setting IOs (ILO) and non-governmental advocacy IOs (HelpAge).

We pursue two questions: In which ways are social problems and related social policies constructed by numerical tools as globally comparable and applicable? How do numerical tools create legitimacy for policies advanced by IOs, making up for the lack of electoral legitimacy (e.g. the strong role of quantitative communication in achieving the unlikely global consensus on ‘social protection floors’ by the ILO in 2012)? Overall, we hypothesize that these practices change the meaning of ‘the social’ as compared to conventional national social policies, initiating socio-technocratic ‘policies by numbers’ in both global and national arenas.

Key words: global social policy, world social theory, policy by numbers, international organisations, international non-governmental organisations

Figures of Hope in Supporting Terminally Ill Relatives

The ‘end-of-life’ notion doesn’t really make any sense to relatives who take care of a seriously ill person, even when the latter suffers from a life-threatening disease. The risks of aggravation of the physical or mental condition and the bare possibility of death always go hand in hand with a kind of hope that organizes the horizon of thinking and influences the ways of acting. This term of ‘hope’ does not here refer to afterlife or religious representations. Rather, it refers to an analytical category useful for understanding the ways these close relatives support the ill person as well as the relational balance between all the individuals concerned: as early as a diagnosis of a potentially fatal condition is made, what kind of emotions are suitable to be shared with the ill person? Is it necessary to intensify one’s presence? Is it appropriate to communicate openly with children, friends or coworkers? For how long? And on which grounds is it possible to assess the consequences of actions taken and attitudes adopted during this period of time filled with uncertainties? This presentation will address these questions. It is based on an ongoing empirical research, entitled “Supporting a dying relative: between working and end-of-life care” (September 2012 – August 2015) and financed by the Swiss national science foundation, through its national program on end-of-life (www.nrp67.ch). Drawing from about sixty in-depth interviews with informal carers who consolidate their professional activity and the support of their ill relative, this communication aims at presenting an analysis of how the various components and forms of the ‘hope’ category segment and organize the day-to-day life of this period of temporary vulnerability, a period that can be obviously associated with the ‘end-of-life’ denomination only after the ill person’s death.

BERTINA, LUDOVIC* (Ecole Pratique des Hautes Etudes, ludovic.berting@gmail.com)

French Catholic Environmentalists and the Church: Suspicion, Expectations and Mutual Reliance

The French Catholic environmentalists are in an ambiguous position halfway between political ecology as supported by the Green French Party and a Catholic field largely hostile to any environmental issue. It results from this position an aversion to political commitment, as I could perceive it during my qualitative survey of forty French catholic environmentalists met in Catholic movements concerned by the environment.

Far from leading to a denial of any political commitment, Catholics avoid the obstacle and promote a commitment of the Church on environmental issues. Sometimes seen by activists as a political force able to mobilize a significant part of French population, they also highlight Church skills as international actor capable of producing a meta-political discourse overstepping the borders that can be understood by all Christians in the world.

The Church of France faces these expectations, positioning itself as a concrete objective and neutral actor, ready to restore a democratic dialogue between the government and environmentalists (especially in Bure, future center of nuclear waste disposal, or at Notre-Dame des Landes).

The links developed between environmentalist believers and Catholic Church illustrate, in a specific way, the complexity of relationships between social movements and institutions. Far for being reliant to the institution, (Cf. D. Hervier-Léger, 1979), there is an indivisible bond that connect institution to social movements. In theory, the political commitment demanded by activists should be calculated to the expertise wanted by religious bodies. However, this polarity is not absolute. And inevitably it ends up, at the crossroad, with an interdependence that will result in a form of commitment in the expertise wanted by Catholic institution concerned about the “signs of the times” (Cf. W. Ossipow, 1978) while the discourse of militants called by the institution turns into expertise to remain audible. (Cf. S. Ollitrault, 2008).

Parent-Child Relations in Young Adulthood: Evidence from Switzerland

In times of economic crisis, insecure labour markets and the rising importance of tertiary education, young adulthood is characterized by prolonged dependency from the parental generation, making it necessary to renegotiate the subtle balance between autonomy and attachment. While parental resources like socio-economic status or cultural capital are well known to shape the career opportunities of young adults, research about their influence on ties between adult children and their parents still remains sparse. However, recent relevant additions to the Swiss TREE survey ("Transition from Education to Employment") now offer the opportunity to investigate intergenerational family relationships of young adults.

This study will therefore focus on two concepts of intergenerational solidarity that seem salient and stable across the life course as well as through the layers of society: affective solidarity (emotional closeness) and associational solidarity (contact). How do the crucial transition markers, such as the achievement of financial and residential autonomy, influence parent-child bonds? Will ties loosen, once independence is established? Or does the relief of achieved autonomy actually enhance feelings of attachment? In what way do individual, familial and societal determinants explain different patterns?

The overall hypothesis, basing on need and opportunity structures of individual and parental agents, suggests that financial or residential dependence of young adults strains the intergenerational relationship, whereas a (financially) secured situation leads to higher emotional closeness. Using the TREE panel data, multivariate analyses of the relationship between 26-year-old respondents and their parents have been conducted. The results support the main hypothesis, but also show a remarkable difference between the adults’ intergenerational family relations, both due to life course events and broader familial and societal contexts.
Over the last few decades, family arrangements have become more diverse in France: mono-parental, same-sex, migrant, bicultural and step families. This new context redefines the roles of fathers within the family and outside, in relation to work and social and care institutions.

Within the framework of a research project about parenthood (with the financial support of the French National Family Benefits Fund), we used data from the French longitudinal studies of children (more than 18 000 children born in 2011) and we interviewed 60 families of different types: large, with step-mothers and step-fathers, migrant or bi-cultural and same-sex families. We chose families with a new-born baby because birth situations put at stake family roles and the links between families and institutions are reinforced at children's birth.

According to our first results, the major differences between the family types involve the form of parenthood: more or less reflective, authoritarian or negotiated relationships, more or less linked to gender.

The communication explores different ways of being a father, in relation to family structures, from two perspectives:
- How do fathers contribute (and want to contribute) to children's care and education?
- What do mothers expect from fathers?

Key words: fatherhood; families; institutions; France

BESIO, CRISTINA* (Technical University of Berlin, cristina.besio@tu-berlin.de)

The Research Project and Academic Careers

This contribution analyzes “researchers” as an important type of knowledge workers. We focus on the “research project” as a widespread form of financing and coordinating research activities not only in the natural sciences, but also in the social sciences and even in the humanities. The institutionalization of project work transforms the practice of research which no longer takes place as a “freely roaming” activity guided by the interests of the scientists, but as a sequence of clearly defined tasks delineated by deadlines and milestones.

In this context, one may ask: Do projects change academic careers as well? The hypothesis is that they are relevant in different respects:

1. Projects require new competences. As projects should be carefully planned and monitored, researchers must be able to behave as managers. Moreover, in order to obtain project grants and to communicate results, it is necessary to have the ability of translating complex findings into convincing statements.

2. Projects also influence scientific reputation, which no longer relies exclusively on publications, but also on project funds obtained.

3. At the beginning of academic careers, projects provide more people the chance to engage in research activities and be socialized in science practices in an early phase. Later on, projects also allow more experienced researchers to obtain funds to engage in autonomous research on specific issues.

4. Since project planning and financing require time, the number of academic positions with managerial and administrative tasks increase in both universities and funding organizations.

Under certain circumstances, project work opens up new opportunities and scientists become an autonomous “self-entrepreneurial” workforce. In other cases, researchers experience these new arrangements as a burden. We analyze in particular how projects affect women’s careers.

Two Versions of the Low-Cost-Hypothesis: Theoretical Foundations and Empirical Implications

This paper critically discusses the theoretical foundations and empirical implications of the low-cost-hypothesis (LCH), and extends the hypothesis. The LCH postulates that the action alternatives, the costs at stake in the situation. The effect is deemed to be higher in low-cost-situations, compared to high-cost-situations. We argue that a closer look at the literature reveals two distinct versions of the LCH, which have not been disentangled so far. The first, “simple” version can be derived from a standard expected utility model. In this model, attitudes and tangible behavioral costs exert independent effects on the net utility of the action alternatives. A conditional effect of the attitudes that depend on the behavioral costs only exists with respect to the probability of choosing an action alternative. However, this dependence of marginal effects on the actor’s initial level of utility or probability holds for any independent variable or utility function. A second, “specific” version of the LCH postulates a variable-specific interaction effect between attitudes and costs. We point to the problems of previous approaches to deriving such a specific hypothesis and identify dual-process-theories as an alternative theoretical foundation that allows understanding the limited scope conditions of the specific LCH. The paper carries important conclusions for empirical applications of the LCH in diverse fields of sociological research and, more generally, for the decision-theoretic analysis of social action.
In poverty research, many different approaches of measuring poverty have been developed. The most basic distinction is between indirect and direct approaches. Indirect measurement concentrates on the resources available, while direct measurement tries to capture an actual deficiency. The resource approach based on income is the most popular indirect measure. The standard of living approach provides a direct way of measuring poverty. It refers to goods of the household and the pursuit of activities of household members. The living standard is generated primarily from resources. However, similar resources must not lead to a comparable living standard. There are several reasons responsible for differences in the transmission. In addition to individual preferences, also debts and assets, support networks, education level, household composition and regional differences can affect this process. At the transmission of resources into living standard also the course of time is of central importance. Despite strong fluctuations in income the living standard can stay on a nearly constant level due to foresighted economic activities. Even during periods in which the income falls (e.g. unemployment) the living standard can still be kept at the previous level and decreases only delayed. This paper examines the relationship between available resources and the actual living standard of households over time. This implies the following research questions:

- How does the living standard respond to changes in the resources? Do households fit their living standard at temporary changes in income or do changes in living standard more depend on long-term changes?
- Are there differences between several dimensions of living standard?
- How do debts, savings, networks and education affect the living standard?
- And what is the short-term and long-term impact of changes in employment status?

For empirical analyses the Panel Study ‘Labour Market and Social Security’ (PASS), a longitudinal data set for Germany, is used.

Dynamics of Income and Living Standard

The living standard is generated primarily from resources. However, similar resources must not lead to a comparable living standard. There are several reasons responsible for differences in the transmission. In addition to individual preferences, also debts and assets, support networks, education level, household composition and regional differences can affect this process. At the transmission of resources into living standard also the course of time is of central importance. Despite strong fluctuations in income the living standard can stay on a nearly constant level due to foresighted economic activities. Even during periods in which the income falls (e.g. unemployment) the living standard can still be kept at the previous level and decreases only delayed. This paper examines the relationship between available resources and the actual living standard of households over time. This implies the following research questions:

- How does the living standard respond to changes in the resources? Do households fit their living standard at temporary changes in income or do changes in living standard more depend on long-term changes?
- Are there differences between several dimensions of living standard?
- How do debts, savings, networks and education affect the living standard?
- And what is the short-term and long-term impact of changes in employment status?

For empirical analyses the Panel Study 'Labour Market and Social Security' (PASS), a longitudinal data set for Germany, is used.

achieved and throughput. However, various researchers and opinion leaders still view the quality of education in South Africa as disparaging and deficient as well as characterised by an increasing prevalence of dysfunctional schooling systems. Therefore, this research aimed to design a generic mentoring framework through which transformation within dysfunctional schooling systems can be facilitated and to determine whether this framework can be used to develop a micro-level analysis of schooling systems, using the functionalist perspective, specifically enabled through the contributions of Parsons and Merton was undertaken. In addition, insight gained from a broad range of literature and other secondary resources on mentoring, best practice and quality education was used to develop a number of premises. Based on these premises the generic mentoring framework can be adapted to enable a fit-for-purpose mentoring system within a school to allow facilitation of a process of sustained transformation which gravitates towards whole school development and culture that envisions quality education for all.

Purpose Capital© a Path for Self-Empowerment

This study highlights importance assessment of self-relations as basis for deconstruction and reconstruction of behaviours to enable inner effectiveness. Using the outcome of a self-relations assessment and providing insightful understanding of purpose capital a path toward inner effectiveness can be encouraged within those that attend this module. All respondents indicated growth within their self and no greater effectiveness within their workplace and enhanced relations in family and social life. Respondents also indicated a difference in self-perception and self-esteem and between intra- and interpersonal relations after attending the module. It was concluded that interventions aimed to enhance inner effectiveness should consider opportunity for self-relationship assessment, inner reflection, reflexivity, and deconstruction-construction of self-behaviours.

Socio-Economic Consequences of the Population Aging

A number of able-bodied, young population has a large impact on economic growth factors of a country. In case of equation of demand and supply on labor market young educated population becomes the most important factor of social and economic growth in main spheres. Moreover a number of population of military age is important for bringing up to strength of Armed Forces. And, as the experience of India, the USA, Canada and Australia shows a gender does not play such a big role as before. In order to examine an impact of an age structure on an economic sphere of a country we have looked through the data of research institutes and the Congress of the USA. The results of such examination allow us to draw a conclusion that an optimal age structure of population needed for economic growth and growth of consumption is situated within 35-54 age limit. Expenses of elderly people are considerably lower than those of able-bodied population which allows us to draw a conclusion of long-term geopolitical dividends of countries having young population.

On the contrary, intensive processes of population ageing and reduction of able-bodied population have a reverse effect on economic growth tendencies. Most countries with ageing population face a problem of budgetary shortfall for paying pensions, tax levy reduction, growth of costs in the spheres of social and medical services for elderly people. Thus, ageing population has a very negative effect on geopolitical and economic potentials of a country.

Modernity and Postcolonial Critique

While the social relations of colonialism, imperialism, and slavery are coextensive with the emergence of the modern world, most social theoretical accounts of modernity render them peripheral to understandings of its development. In this presentation I discuss the limitations of standard approaches and argue for a ‘connected historical sociologies’ approach that addresses the postcolonial present of sociology, and its concepts, through recognition, historically, of the ‘colonial global’ and the figure of the subaltern.

Beyond Love: Gender Power and Desire Amongst Young Africans

Africander youth sexualities are often framed within the context of death, danger and disease with little attention to the affective investment young people make in relationship dynamics. In the context of HIV, sexual coercion and gender violence, the continued focus on teenage sexualities within the context of structural inequalities, gender power imbalances and the suffering of young women in particular remain important specific in Africa where sexual violence has become a concern of epidemic proportions. Beyond representations of violence as ‘natural’ and ‘traditional’ within the domain of suffering, this paper seeks to demonstrate the ways in which teenage Africans make claims to love and the social processes through which love is articulated. Drawing on an interview study of teenage Africans in the KwaZulu-Natal province of South Africa, the paper shows how the construction of love creates possibilities in relationship dynamics that alter familiar versions of masculinity and embedded within care, negotiation and agency. Such newer versions of sexuality however are in tension with the continued vulnerability faced by young women in particular emphasizing the importance of attending to gender ideologies, economic dislocation and masculine power. Addressing teenagers as sexual subjects, as agents of love instead of agents of violence alone and constrained by social, gendered and economic processes is important in working with and developing interventions that seek to increase sexual well-being amongst young Africans.

Utilization Of Shamanistic Services For The General Ailments In The Eastern Region Of Nepal

Medicine, to the western mind, is based on the notion that science, with its methodology of research and experimentation, is potentially capable of combating any sickness and curing any disease. (Blustain, Harvey S, 1976) Objective: This study was designed to explore the practices of shamanistic services for the illness in the population and trace the plausible reasons for doing it. Methods: A cross-sectional study was designed where total of 1985 women of reproductive age were interviewed face to face covering 10432 total population. The population surveyed was rural area in the six districts of Eastern Nepal. Results: Substantial families were found to be utilizing the services of faith healers especially for the indigenously defined diseases which are attributed to evil forces or god and goddess. Modern health service utilizers gave the reason of service satisfaction, traditional healers gave the reason of tradition and beliefs and risky service utilizers gave the reason of affordability and accessibility for utilization of the services. Diseases defined indigenously were found to be
cured effectively that disease having somatic origin among the illnesses treated by shamans.

**Conclusion:** Despite of various efforts by government in delivering the basic health care in the community, large proportion of people in the rural area are still utilizing the services of faith healers and believed firmly that some indigenous defined illnesses are cured effectively. A Multidimensional study on these people and their healing practices can explore the rationale behind utilization and relevancies of their services in modern health care which will ultimately help to combat the evil of health life in the Eastern region.

**Gender Discrimination: Female Feticide, Infanticide and Leisurely Attitude Towards P.N.D.T Act**

Gender discrimination: Female feticide, Infanticide and leisurely attitude towards P.N.D.T Act

Women consisting half of the human population have been treated as weaker sex in all the societies of India. They are victims of feudalistic institutional, traditional practices, cultural prejudices and religious extremism. The gender inequality is of grave concern to the issue of human development. According to UNICEF about 30% lack of female feticide are recorded every year. According to available statistics, about 12 million girls are born in India every year but 1.5 million girls die within one year. Another 0.85 million do not live to see their sixth birthday. Every sixth female death is specifically due to gender discrimination. It is alarming to note that India's sex ratio among the children aged 0-6 years declined from 976 females (1000 males) in 1961 to 914 in 2011. It is lower than the overall sex ratio of 940 females for 1000 males in 2011. Many districts have been recorded sex ratio of female child lesser than 850 this is the most disappointing indicator of the census 2011.

This paper aims to identify various factors responsible for feticide and infanticide and the leisurely attitude of educated women towards P.N.D.T Act 1994 and 2003. This study is being conducted in Varanasi city famous for old traditions and religious beliefs. This paper is based on the study of 1000 educated women. I have also included secondary data taken from different reports. Interview Schedule is being used to assess the attitude of educated women selected by random sampling.

The paper concludes with some suggestions which can be utilized for solving the problem of declining sex ratio in not only India but also the countries facing the same problem. To protect the right of girl child is to restore the universal justice.

**Women Empowerment and Reproductive Rights**

Women Empowerment and Reproductive Rights

The historic convention on the elimination of all forms of discrimination against women (CEDAW) was followed by fourth world conference in Beijing in 1995. It was accepted that substantive equality for women is essential. Beijing platform for action (BPFA) was a commitment by nations towards the advancement of the cause of women’s movement and also to eradicate all kinds of gender discrimination. Inspite of the fact that being signatories to various international treaties and conventions little has been done at the grass root level for the empowerment of women.

In Indian context women have been facing many problems of gender discrimination, violence, disempowerment and are not aware of their reproductive rights that includes the right to health care, the right not to be subjected to violence, discriminating the right to determine the number of children and the right to be free from ill-treatment, sexual violence. Reproductive rights are founded on a number of international agreements including human rights documents.

**Objectives –**

1. To study the awareness of reproductive rights among women.
2. To analyze socio, economic, cultural factors influencing reproductive rights.
3. To analyze the attitude of educated women towards reproductive health and its dimensions.
4. To assess the implementation of reproductive rights and women empowerment.

The paper comes up with solutions and awareness programs which should be taken to protect reproductive rights for the equality, dignity and empowerment of women.

The study is being conducted in Varanasi city, one of the oldest cities of the world and full of old traditions and cultural values. I have selected 100 graduate women from different fields. I have also adopted case study method and selected 10 working women. Interview Schedule is used for the study.

**Psycho-Social Experiences of Scheduled Caste Students at Higher Education Level in India**

Education in Indian tradition has not been open to all the downtrodden sections like scheduled castes. Even today, they are the victims of isolation, untouchability, social stigmas, and the trap of the poverty in the society. With the protective discrimination policy in place, few of them are getting education and very few of them do have access to higher education. Most of the scheduled caste students are suffering from the problems, like discrimination, humiliation, deprivation, sub-ordination and domination at different levels of education. On the way of exploring the psycho-social experiences, this study intends to look' looking at the patterns of discrimination relating to humiliation, ill-treatment, stress and mental block experienced by the scheduled caste students at higher education level in the State of Odisha. This study is based on exploratory research; data triangulation is the method for the data collection. Thematic analysis and descriptive statistics are the data analysis procedures for this study. The bitter psycho-social experiences have a devastating effect on the academic achievements and performances of scheduled caste students at higher education level in the state of Odisha (India).

**Gender Inequality and Changing Perceptions about Women in India**

The mandate for equal rights for men and women is embedded in India's Constitution. Gender equality is a constituent of development as well an instrument of development. It is a constituent of development as no country can be deemed developed if half its population is severely disadvantaged in terms of basic needs, livelihood options, knowledge access, and political voice. It is an instrument of development because without gender equality other goals of development like poverty alleviation, economic growth and environmental sustainability will not be achieved.

Gender inequalities hinder development. Ignoring gender disparities comes at great cost to people's well-being and to the country's abilities to grow in a sustainable manner, to govern effectively. Social hierarchies are embedded in social institutions which are designed to perpetuate them through control over the environment and the socio-economic resources. The gender inequality is manifested by the unequal power relations between women and men. Equality of control enables women to gain improved access to resources. Social equity can enhance livelihood security, productivity and sustainability of all members in building their capacity for their own development.

Equality of participation and control are the necessary pre-requisites towards gender equality. There are many special challenges still faced by the women, but progress has been made when gender equality is viewed over the longer term. Much more can be accomplished, however, when women's contributions are valued by society as a whole, when they have a more prominent role in decision-making, and when women and men work in partnership to achieve these aims. In this context, the paper attempts to highlight the gender inequalities and identify the recent trends in women's social and economic development in India. The paper will be based on secondary sources of data.

4 Keywords: Gender inequality, Changing perceptions, Women in India, Women's development.
El principal desafío que se presenta a la Argentina es potenciar las conexiones entre academia y producción, ejecutar proyectos conjuntos de I+D dirigidos a consolidar las pequeñas y medianas empresas nacionales y su inserción en nuevos mercados regionales e internacionales. Un equipo de investigación perteneciente a la Maestra en Seguridad e Higiene Ocupacional de la EST –Escuela Superior Técnica de Ejercicio Ambiental[2] está preparando dicho estudio bajo el método Delphi para ampliar las bases del conocimiento en la materia y ofrecer subsidios para generar un manual de buenas prácticas que acompañen el principio jurídico de precaución en la Argentina.

BIEBER, INA ELISABETH* (Institute of Sociology, bieber@soz.uni-frankfurt.de)

It's the Party, Stupid! Why the Success of Female Politicians Depends on the Intra-Party Democracy

It’s nothing new that women in politics throughout the entire world are underrepresented. In addition to numerous other factors, this phenomenon is often explained by micro-structural factors such as party affiliation. A central theme in regard to the effect of parties on the representation rate of women is that the odds of women in political parties on the left side of the spectrum are particularly high. Furthermore, the effectiveness of the proportion of women in politics is discussed. It is also necessary to realize that, in the studies, particularly female politicians are observed and the nomination perspective is spared. But the nomination perspective is very important: on this level especially, women must overcome the barriers placed within certain parties, which are often higher than in others. That’s why focus on the nomination perspective can explain the underrepresentation of women in various parties. The aim of this paper is therefore to examine this question in an analysis of the nomination processes and electoral successes of women in 15 countries at 18 national elections with data from the Comparative Candidate Survey (CCS). The analysis shows that party affiliation provides a key contribution to explaining the underrepresentation of women in politics. However, it is also clear that the electoral system in particular, or the question whether the candidates compete on a constituency or on a party list, provides another key contribution to this explanation.

Exploitation and Resistance: A Comparative Analysis Of The Chinese Cheap Labour Electronics and High-Value Added IT Sectors

China is frequently considered to be an example of successful developmental catch-up. And yet, the country’s impressive growth rates are to a large extent based on the super-exploitation of its workforce. In recent years, Chinese workers have started to resist these exploitative conditions. The purpose of this paper is to analyse the dynamics of resistance within the wider structural conditions of the global political economy.

Empirically, this paper will provide a comparative analysis of the electronics sector based around Shenzhen with the IT sector in the area of Shanghai. While the former is predominantly based on cheap labour, assembling electronic goods for export – see, for example, Foxconn and the assembling of Apple products – the latter relies on a more skilled workforce manufacturing high-value added goods.

To what extent and in what way condition these rather different locations within the global political economy the form and contents of resistance in these two sectors?

Conceptually, this paper will be based on a historical materialist, neo-Gramscian analysis, which starts through an analysis of the social relations of production and the different ways of how these two sectors are integrated into the global political economy. In turn, this will then allow us to identify key social class forces and provide the structural background within which these forces struggle against exploitation at the work place, the form of state and world order levels of activity.

Selling Places: The Right to the City in an Age of Market Oriented Urban Management and Planning

Since the beginning of the so-called cities financial crisis, market oriented policies have been adopted by local administrations in order to deal with the consequences of this crisis. Moreover, this strategy has been taken in different places as the only way to face the complexity and also the increasing problems linked to the ongoing process of world urbanization. This paper discusses such processes in Brazil, taking as case study Rio de Janeiro metropolitan area, specifically the case of the “Operação Urbana Consorciada” (which can be freely translated as “Urban Consortium Operation”) of Niterói city – former capital of Rio de Janeiro

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
state - a huge urban project that intends to privatize the management of its central business district. The paper gives an overview of how such projects have been presented and discussed with local dwellers, highlighting the strategies and struggles that have emerged from the process. It shows that the adoption of strong market-oriented strategies to face financial crisis has brought huge constraints to those groups who have been struggling to the right of city, spoiling of democratic decision-making processes. The paper has three parts. The first one gives a broad view about the present Brazilian urban process, focusing the discussion on Rio de Janeiro city, mainly in its docklands area seen as a model to the cities located in its metropolitan region. The second part presents the case of the “Operação Urbana Consórciada” of Niterói city. Finally, as preliminary conclusions, it shows how urban democracy has been considerably spoiled, considering the market-oriented urban policies.

Valuing Segregated Observers: Mapping West Bank Settlements From Without and Within

In this paper, I argue that segregation affects the process of collecting empirical data, and therefore shapes the content of scientific and technological knowledge. Through a comparison of the maps of Israeli settlements made by two premier non-governmental organizations (NGOs) in the West Bank, one Palestinian and one Israeli, I demonstrate how segregated landscapes not only separate populations, but they also serve to reproduce disjunct observations among cartographers who map areas, and use technologies, that ostensibly are the same.

Since 1967, Israel has occupied the Palestinian Territories and hundreds of thousands of Israeli settlers have moved into segregated communities in the West Bank. However, it is difficult to produce reliable statistics for the expansion of these settlements, because this requires the ability to make observations on the ground—practice which is often as segregated as the region that cartographers seek to map. Israeli efforts benefit from the infrastructure the state provides, and take place largely within Israeli settlements, thereby depicting Palestinian areas from without. In contrast, Palestinians work within Palestinian communities, but must map Israeli settlements from without, including recording the locations of buildings which they may only be able to view from a distance. In theory, such segregation should not affect the data collected, but in practice it has a profound effect on the resulting maps.

This research contributes to work which analyzes the role of international forms of mapping in the Israeli occupation. In addition, to Science and Technology Studies (STS) and the sociology of science literatures, I provide a conception of the ways that empirical knowledge is geographically produced, as well as socially constructed. Overall, I aim for a better understanding of how the materialities of knowledge interact with imbalances of power, with the goal of enabling landscapes that are more epistemologically diverse.

The Role of Religion in Economy: A Theoretical Analysis

The analysis of the role of religion in welfare, often directs our attention to the study of the relationship between religion and economy, and its various aspects in particular. Sociologists, seeking for more complete analysis, often refer to the models of economic theory and applied economics incorporating the element of religion in their analyses. However, insufficient understanding of the nature and structure of theoretical economic models, frequently leads to the development of an approach that omits or misrepresents many important elements, such as the nature of human action, the implications of the religious adherence for the action, etc. In our work we present some results of our research on the relationship between economic and religious thinking in the context of models of Economics of Religion, and their weaknesses. Based on this study, we can observe the major flaws of the adoption of some theoretical models of religion, mainly due to the differences and reductionism in the anthropological assumptions which support, necessarily, all these models. Hence a sociological study, which adopts, implicitly or explicitly some anthropology, will be conditioned by the statements adopted by other scientific theorists. This paper, in addition to identifying the elements that need to be taken into account in the study of the relationship between the economy and religion, seeks to define the theoretical elements of the underlying anthropology concerning the economic and sociological models to provide a framework necessary for the scientific analysis of the role of religion in the welfare of the people.

MISTRY, JAY (Royal Holloway University of London)
Feeling and Acting ‘Different’: The Role of ‘Affect’ in Indigenous Facilitators’ Film-Making

Participatory video can raise new levels of self-perception and can contribute to forming, transforming and reconstructing the identity of those involved (Blous- tien, 2012; Luttrell, Restler and Fontaine, 2012). What emotions, in particular, are provoked by facilitating a PV project in one’s own community?

This paper draws on empirical materials (videos and photostories, interviews, informal conversations, participant observation, email exchanges) collected within the ongoing Project COBRA (http://projectcobra.org/). Five indigenous facilitators have been hired on a 3 years contract to help their communities in Guyana to identify ‘community owned’ indicators of sustainability through the use of PV. Work with facilitators has repeatedly highlighted emotional issues, including satisfac- tion, strong commitment, but also anxiety, fear of gossip, disapproval, sense of social pressure and fear of community jealousy, suspicion or stigma. These emotional states can be understood in the light of the multiple identities which being part of the PV project can engender, bringing about community participation, being trained in using advanced and unfamiliar technologies, having access to transportation and fancy communication tools, as well as having to engage with a new, abstract, foreign language through the project theoretical frameworks can make facilitators to be perceived (and perceive themselves) as “insiders and yet outsiders” in their own communities. This has the potential to introduce an emotional distance between themselves and their family, friends and neighbors, and can lead them to conceal certain aspects of their emotionality.

The paper analyzes diversity of emotional states of the five COBRA facilitators, and how they are tied into a variety of relations, practices and exchanges, and those related to the micro-dynamics of community life. In so doing we investigate the distinctive ‘emotional terrains’ within which these facilitating experiences are embedded in.

Unisex Toilets for All? the Sexual/Gender Ideology of Public Toilets in Taiwan

The purposes of this paper are to analyze the progression of Taiwan’s gen- der-equal toilet movements, experiences of sexual minorities in using public toi- lets, and attitudes of the general public toward using unisex toilets.

In 1996, some feminist students groups in Taiwan launched the Women’s Toilet Campaign using the slogan and action of “Occupying Men’s Toilets.” They successfully attracted public and media attention, and the government promptly amended the related building codes. Concerns of number and quality of women’s toilets have, however, presupposed that gender equality for public toilets without challenging the dichotomy of sex, the reinforcement of stereotypical gender performance and the inconvenience for transgender people. In 2009, several LGBT groups initiated another toilet campaign advocating for unisex toilets in public space. It has not earned any response from the government yet, but how the general public and transgender people react to unisex toilets is a question worth probing.

The problems brought by sexual segregation of toilets (Brownie called it gende- rism) has been increasingly recognized, but the resistance from the general public is seemingly huge. It is seemingly proposed to introduce a third toilet labeled “other” where people with disability, parents with children, LGBT, or any- one who refuse to use traditional toilets would feel comfortable. Without abolishing women’s and men’s toilets, this alternative may be acceptable for the general public. However, the problem of ghettoization still exists. Sexual minorities might be questioned more severely when using traditional men’s/women’s toilets.

Public toilets are typical spaces segregated by sex. By examining the unisex toi- lets dilemma, this paper will reflect on the legitimacy of sexual-segregated public spaces, social exclusion, and the mutual construction of gender and space.

Designing “Community”: The Significance Of Place and Urban Design In Public Housing Renewal

In the US, UK and Australia public and social housing providers are embark- ing on large-scale estate redevelopment projects. These projects are often pre- sented as an urban panacea - intended to solve a large and multi-faceted urban ‘problem’ – namely the tenant and asset management challenges that have left many estates as ‘homes of last resort’ in recent decades. In Australia, these ‘re- newal’ projects are achieved by using mechanisms within the planning system to increase dwelling density on-site. By changing the tenure profiles to increase the ‘social mix’, the state hopes to attract private investment through the introduction

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
of private market housing into formerly public housing estates. These policy objectives will see public to private housing profile changes, with the introduction of up to 70% private dwellings in some projects (Housing NSW, 2011). The built form of these states is undergoing massive change, with new construction replacing existing dwellings. Previous research has sought to understand the impact of social mixing policies (Anthusr and, 2002; Briggs, 2008; Goetz, 2000; Imbroscio, 2008) or have championed a heavily materialist understanding of urban design and renewal (Jacobs, 1961; Newman, 1972; Dunay and Plater-Zyberk, 1994).

This research seeks to uncover the significance of ‘place’ and ‘urban design’ for residents in both employment professions in estate redevelopment by approaching these concepts from three directions: experience, discourse and spatial form. This ‘trialectic’ (following Lefebvre, 1991) draws on three distinct research traditions: phenomenology; discourse analysis; and spatial analysis. This approach is being taken in an effort to understand the multiplicities of place and present the lived experience of residents through the public housing renewal process.

Welfare State or Participation Society: 40 Years of Monitoring the Social State of the Netherlands

Since 1973 we monitor the life situation and trends in quality of life (QoL) of citizens in the Netherlands. Using and combining a broad set of social indicators, this gives a good overview of the trends in the social state of the country. In this 40 years period the welfare state in the Netherlands has changed continuously and profoundly. The current economic crisis is just one in a row of global crises in this period. It may be argued that not only financial constraints and risks caused by the crisis forced to reconsider the welfare state. Fundamental shifts in societal views on the role of the state in protecting the vulnerable and on citizens’ own responsibilities too were drivers for renovating the welfare state. In 2013 the Dutch government introduced the term ‘participation society’ that should replace the welfare state. Citizens should be more active to take responsibility and to support their fellow citizens when they are in need. In this presentation we analyse major changes in social (in)equality and social policies in the Netherlands since the seventies and we discuss whether the welfare state is at danger.

BILECEN, BASAK* (Bielefeld University, basak.bilecen@uni-bielefeld.de)

The Meaning of Home and Practices of Home-Making: An Example of Turkish Migrants Living in Germany

Drawing on twenty qualitative interviews and five participant observations at home settings with migrants from Turkey in Germany, this paper will illustrate the meanings attributed to the idea of home. For most individuals the idea of home ‘often remains as the un Interrupted anchor’ (Morley, 2000:2) and indicates stability and is attached in location, whereas mobility challenges all these ideas about home. If home is conceptualized as both a physical space as well as a symbolic perception of belonging, it is obvious that international migration experience alters individuals’ ideas of home which this paper discusses.

The preliminary results suggest that respondents perceive home as a shelter, ‘a place where they can be themselves’. In addition, how they decorate the home space will be elaborated. For instance, the living room is considered to be the ‘most important room’ because although it is a private space, it is the ‘public’ space of the home.

Who Cares the Elderly? Migrant Women at the Crossroads Between Family and Welfare State

Drawing on qualitative interviews in ten households in southern Turkey, Antalya with employers of live-in migrants who care the elderly in the family, as well as the migrant caretakers, this paper examines the dynamic relationship between migrant caretakers and the elderly with an intersecional perspective taking into account of age, gender, class, and ethnicity. Given the country’s changing migratory patterns from being an emigration country to an immigration and transit country, Turkey attracts migrants from its neighboring countries at a steady increase rate, which makes it an interesting case.

Elderly care is closely interlinked with a country’s formal welfare provisions and informal protective schemes. Turkey is usually described as having Southern welfare model, characterized by low level state penetration into the social sphere as well as lack of social assistance provisions. However, with the introduction of recent healthcare reforms, this perspective needs further elaboration not only on the formal regulations level but also at the access and use of such regulations of the individuals. Therefore, family and welfare policies in the area of domestic work and care will be elaborated. Despite novel social assistance schemes, the existing cultural system in Turkey still favors caring the elderly at home particularly by women, who are usually daughters, daughter-in-laws and recently migrant women to some extent. Migrant women are usually from former Soviet Union such as Armenia, Georgia, Moldova, the Central Asian Republics and to a lesser extent Russia and Ukraine, who often work undocumented in tourism and household sectors.

Deployments of Intersectionality in Masculinity Studies: A Power/ Knowledge Analysis

Intersectionality is increasingly used as an analytical tool to complexify the categories of men and masculinities, to shed light on the processes producing marginalized, racialized and deviant masculinities. The paper examines the deployments of intersectionality in masculinity studies and its effects to attend to three problems that are encountered in the current state of feminist scholarship on intersectionality: 1. the increasing delegitimizing of intersectionality through its conflation with identity politics and/or the framing of intersectionality as endorsing essentialist identity categories; 2. the whitening of intersectionality in which the critical race analytics becomes optional; 3. the depoliticizing of intersectionality through its disciplinarization and institutionalization. Based on an extensive analysis of the ways in which intersectionality is used in masculinity scholarship, the paper asks whether these problematic tendencies are also observed in this field of knowledge. If so, what are their specific configurations and their specific effects? Does the current engagement of masculinity studies with intersectionality help to consolidate or to confront these problematic tendencies?

Social Mobility and Fertility: Parity Transitions in Sweden

This study explores the relationship between social mobility, both intergenerational and intragenerational, and fertility in Sweden over the last decades. Scholars have developed a rich set of theories and mechanisms through which mobility plausibly influences family size. The original focus was on upward mobility and the relationship was expected to be inverse. After three decades of research in the mid-20th century, literature that focused on trying to disentangle these mechanisms yielded surprisingly few consistent results, which was argued to be due to unaccounted variation in the institutional settings, theoretical ambiguity as well as significant limitations in the methods and data at the time. This project aims to revive the debate using better equipped data and methods as well as expanding the theoretical discussion to include the important work from the last decades on gender, work, and family.

In prior mobility and fertility research, scholars analyzed the total number of children alongside the occupational class of adults and their parents at selected moments in childhood and adulthood. The timing of these measures reflected data availability rather than theoretically relevant moments in the life course, which meant researchers could not observe the order of events. This very important point of past research can be avoided in this project because Swedish data provide information on the timing and order of these childbearing and mobility events.

Specifically, the Swedish Level-of-Living survey (LNU) data (2000, 2010) provide the opportunity to study both inter and intragenerational mobility and fertility, which has scarcely been studied in Sweden. This study will be based on the biographies of the 1950-1985 birth cohorts, which means childbearing will be observed roughly from 1970-2010. Both men and women will be analyzed separately.

The Transition Generation’s Entrance to Parenthood: Patterns Across 27 Post - Socialist Countries

The age at which men and women enter parenthood has increasingly become of interest as we witness the postponement of parenthood across a variety of contexts. Large literature has developed on factors related to the age at first birth, both in terms of variation over time within a population and between subgroups of a population. Fewer studies have tried to explain variation across countries in the average age at entering parenthood, despite large and persistent differences in countries sharing contextual similarities and differences. We aim to fill this gap.
and learn more about how social, cultural and economic forces influence when adults experience one of the most significant life course events.

We use micro-data and contextual indicators to explore differences in the timing of parenthood over a wide range of post-socialist countries. We focus on men and women who entered adulthood during the transition from communism to post-communist countries representing six different geographical regions.
came a hotly debated topic among social philosophers. The philosophical use of the term “intentionality” refers not only to the intention to act, but also to the content of mental acts such as believing, desiring or feeling. Drawing on the recent philosophical debates, I would like to analyze the concept of collective intentionality and discuss its ontological and methodological consequences. Starting from the extreme positions in the discourse on collective intentionality – which can be labeled “reductionism” and “holism” – I will primarily discuss John Searle’s and Margaret Gilbert’s accounts on collective beliefs and actions. Searle offers a strong reading of collective intentionality that claims to be compatible with methodological (and ontological) individualism. Gilbert stresses the importance of mutual commitments for the constitution of “plural subjects” which highlights the inherent normativity of collective intentionality. The arguments of both authors can be brought together in a sociological conception of collective intentionality that has strong similarities to the Durkheimian *homo duplex*. Collective states and actions always entail a normative component. Collective intentions and beliefs are not only shared, but one feels an obligation to share them. Though ontologically anchored in individual bodies, “collective intentionality” turns out to be a fundamental sociological term, underpinning such concepts as cooperation, norm and communication.

Success or Failure?: Competing Concepts of Heritage Value in Lijiang Old Town

It has now been six years since the Old Town of Lijiang, in Yunnan Province, UNESCO World Cultural Heritage Site since 1997, received a negative review from the World Heritage Committee’s reactive monitoring team, citing the overuse of tourism and the exodus of members of the local Naxi ethnic group as having seriously detracted from the value of the Old Town as a World Heritage Site. Since that time, in heritage circles Lijiang has become a case example of World Heritage management gone wrong. However, within China both officially and popularly, Lijiang is considered one of Southwest China’s greatest successes in bringing development to an impoverished minority area in the far reaches of China’s borders. In this paper, I will review the different discourses present in the Old Town of Lijiang regarding the value of cultural heritage to demonstrate why UNESCO’s failure has likewise been Yunnan Province’s success. This includes elaborating the value of cultural heritage from the viewpoints of the World Heritage Committee, the Chinese State, and the tourism industry itself. Finally, I will describe what this has meant for the Naxi people of Lijiang, and how the intersection of these varying values have come to be interpreted by and affect how Lijiang Naxi understand themselves and their relations with others.

“You Mustn’t Regret the Past, You Mustn’t Fear the Future; You Must Rejoice the Present”: Survival at the Margins

Around the world youth are negotiating everyday life under difficult socio-economic and socio-political conditions. The consequence of the aforementioned has been a growing and protracted youth unemployment problem. Drawing on a qualitative case study that investigated male early high school leaving in a township in South Africa, this paper answers the following question: how do unemployed male youth negotiate everyday life? The narratives of the male youth point to desperate conditions within which they negotiate daily survival. Furthermore, their observations of their social world provide anecdotes of what peers in similar circumstances are engaged in. The desperate conditions are captured by coping and survival strategies such as informal trading, cleaning garbage bins, substance abuse, theft and collecting scrap metal. The paper reaches the following conclusions: 1) the male youth are negotiating multiple marginal positions within their social world, 2) the state of “wait-ship” characterising their lives entrenches destructive social practices, and 3) the stalemate in policy direction around youth unemployment is not only perpetuating dependency, it is producing complex social problems that a finally in youth unemployment policy will not contain.

Coping Unpredictability – Hope and Orientation of Burkina Faso University Graduates in Times of Uncertainty

This research examines the self-concepts and strategies of action of university graduates in Burkina Faso who find themselves in uncertain situations due to vast unemployment rates. Motivated by the wish to find well-paid jobs, which will allow them to live the life they want to live and to meet the expectations of their families and of society, they pursued university studies despite the costs and the expenditure of time as well as the unfavorable study conditions. Thus, university studies involve various risks, yet still the aspirations connected to an university degree outbalance the anticipated difficulties. University graduates are hoping for a golden opportunity, be it in the private or the public sector, bearing the possibility to fulfill one’s wishes concerning the future. Given their uncertain situation, university graduates face major difficulties in planning their life, yet they hope that their situation will change in the foreseeable future, be it by the grace of god or by the emergence of new possibilities. The hope for a possible, maybe unforeseeable change is what drives them in evolving various strategies which on the one hand might increase their chances on the labor market, but on the other hand also include certain risks. Based on six months of empirical field research in Ouagadougou, this paper investigates how hope informs the anticipation university graduates have concerning their future life courses as well as the trust on which their navigation through omnipresent uncertainty towards an anticipated brighter future is based, and also on the various risks those strategies might contain.

Collective Memory of Operating Experience

The nuclear power industry has been in existence for over fifty years. Despite the mishap at Three Mile Island, the accident in Chernobyl, and the catastrophe at Fukushima, this industry with its self-regulating model has operated more safely and productively than most fossil fuel industries. The nuclear power industry is aware that its survival depends on its ability to share operating experience to prevent recurrence of past errors. This begged the question *How does the nuclear power industry use operating experience*? Capturing and disseminating operating experience constitutes an organization’s collective memory. Problems at one nuclear plant are documented and stored to be shared with other nuclear power plants. Lessons learned from Three Mile Island, Chernobyl, and Fukushima provide impetus for actions at all nuclear power plants as each plant analyzes its vulnerabilities. Identifying and sharing with the industry, a plant’s potential for mishap and taking action to mitigate disaster becomes part of the nuclear power industry’s collective memory. The nuclear power industry’s collective memory exists in its operating experience database, and becomes a living entity through the training function. Using case study methodology and extensive interviews with training instructors, this study examined how significant industry mishaps are remembered in the training function of one nuclear power station, and how remembering past operating experience informs a current nuclear power industry workforce.

Managing Tolerable Risk: How Are Significant Organizational Mishaps Remembered in the Training Function of the Nuclear Power Industry?

Retaining lessons learned from organizational mishaps is important to organizations that use high risk technologies. High risk technology organizations, such as the nuclear power electricity generation industry, rely on their collective organizational memory of mishaps to prevent future mishaps and protect the safety of the public. The 1979 accident at Three Mile Island (TMI) nuclear power plant was a defining moment in the nuclear power industry in the United States. Since TMI, the nuclear power industry has emphasized using operating experience to remind workers potential mishaps. The 1986 explosion of the Chernobyl nuclear reactor developed an awareness for the need for international collaboration in establishing uniform operating standards for nuclear power plants so as to ensure nuclear safety. The nuclear catastrophe at Fukushima in 2012 reminded the world once again about the risk of nuclear technology. Using the theoretical lens of collective memory and commemoration, this study explored how workers in the training department of the nuclear power industry retain memory of significant organizational mishaps by focusing on what workers pay attention to, what stories they tell about organizational mishaps, as well as how mishaps are categorized and commemorated, and the role management plays in helping to retain operating experience of significant events. This case study combined interviews and document analysis, as well as ethnographic observations of training conducted at a nuclear power plant site to learn how significant industry mishaps were remembered.
Leisure, Tourism-Development and Environment Interface: Uttarakhand Tourism in India- Reflections

Uttarakhand with an area of 53484 Sq. Kms., is the ninth Himalayan state of India. Located on the fringe of two international boundaries, the state of Uttarakhand is known for its innumerable tourism destinations including various hill stations, wild life centuries, national parks, adventurous sports and pilgrimage tourism centers. The mission of the state government is to develop Uttarakhand as a tourist hub and the ‘tourism’ as the core- sector for employment generation. In this very context the main objective of this paper is to analyze, ‘leisure, tourism- development and the environment interface’ and its pervasive environmental, economic and social impacts on the stakeholders, the tourists and the people dwelling in the place of tourist destinations.

The study goes with this hypothetical proposition that, the sustainable tourism strategy can only serve the mission of tourism development along with its triple principles (the environmental, economic and the social) and also satiate the need and purpose of tourist.

The study concludes that; the leisure, tourism-development and environment are interrelated phenomena. It is the leisure that paves the way for tourism, and correspondingly the tourism accentuates development and also accelerates the pace of infrastructural development to cater the need and objectives of the tourists as well as of the man power engaged with tourism practices. The consequential impacts of the whole of the tourism practices are viewed on; (i) the over all environment of the place of tourist destinations (ii) the economy of the stakeholder (iii) the society and culture of the places of tourist destinations and (iv) the tourists. The ground realities exhibit that, despite incommensurate impacts of the whole of the tourism practices are viewed on; (i) the overall environment of the place of tourist destinations (ii) the economy of the stakeholder (iii) the society and culture of the places of tourist destinations and (iv) the tourists.

The prevailing discourse from contemporary health policy, views obesity (and also on smoking) as a public health issue, and assigns responsibility for actions and outcomes to the individuals concerned (the ‘hostile’ anti-obesity discourses).

The study goes with this hypothetical proposition that, the sustainable tourism strategy can only serve the mission of tourism development along with its triple principles (the environmental, economic and the social) and also satiate the need and purpose of tourist.

We suggest that whilst these practices can be understood sometimes visceral but muted accounts of the enjoyment and desire associated with consuming food. We suggest that whilst these practices can be understood sometimes visceral but muted accounts of the enjoyment and desire associated with consuming food.

It's not unusual for Cristiano Ronaldo to hear Messi's spontaneous calling when he goes to play away. But bringing up Messi's name to tease him has indeed happened in his own backyard. Just recently, while preparing to play an international game for Portugal in the northern town of Guimarães, a Portuguese fan annoyed him maliciously again gigging and crying softly for Messi. Cristiano Ronaldo, wisely, just walked away, skipping any kind of confrontation. Why is this so? What, concerning common thoughtfulness, separates both players? Why do fans feast on Ronaldo's celebrity figuration while leaving Messi to enjoy impressive widespread praise and cult?

The reason for this, we shall argue, has to do less with the icons they personify, or, in other words, the theatre of sport by entertainment coding, where “delay of gratification” is unwelcome, that shapes sports social worlds nowadays, or even a frantisch dispute gathering diverse social categories about who's the best football player in the present day, than with a sharp opposition that divides the field of sporting (possible) grandeur. We refer to the antagonism between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice between professionalism and amateurism, measured or assessed both through the sense of competence versus (self-)interest and by the sense of talent and voice.
developing countries, focusing on both profit maximizing, and economic growth and poverty reduction in developing countries. When Nordfund gets involved in land-related issues, such as palm oil production, is done on the basis of close considerations related to economic growth and business opportunities in that area. This paper looks closer at some of the paradoxes that surfaces when large investors are aiming at both ecologic and social responsibility and maximizing profits at the same time. We will also describe and discuss some of the existing mechanisms for influencing investment behavior of these large global players, both domestically through the government controlled bodies, and internationally through conventions such as the OECD ethical guidelines.

BJORN, HVINDEN* (NOVA Norwegian Social Research, bjorn.hvinden@nova.hioa.no)
The Capability Approach and the Agency / Structure Discussion in Sociology How to Understand Efforts to Combat Social Exclusion?

This paper argues that the Capability Approach of the Amartya Sen and Marta Nussbaum can enrich sociology by linking human agency and structure. Finding ways to capture the linkages between agency and structure (or alternatively; between micro and macro) remains a never ending story in sociology, despite efforts by some of the sharpest minds in the discipline. Proposed ways of capturing the linkages often turn out to be biased towards agency or structure, leaving the contours of the other vague and indeterminate. Alternatively, the proposed solutions are in practice blending or fusing structure and agency into one. The Capability Approach is frequently perceived as being individualistic, i.e. only concerned with the individual’s effective freedom to live the life he or she has reasons to value and desiring to live. Sen do, however, emphasise that people’s possibilities to convert given opportunities or resources into desired functionings do not solely depend on individual characteristics (e.g. having a physical or mental impairment) but also on the structures (e.g. of a physical, social or attitudinal nature) that people face or within which they find themselves. The paper clarifies how the Capability Approach can contribute to a better understanding of factors hampering or facilitating human agency – both individual and collective – and the processes reproducing or transforming the structures people face. As case the paper discusses the efforts of persons with disabilities to combat exclusion and achieve full participation in society on an equal basis with others.

BLACK, GRANT* (University of Tsukuba, grant.black@yahoo.com)
Student Self-Concept and the College-to-Work Transition in Japan

Although the youth employment rate for Japan compares favourably with other OECD-member nations, job seeking has been following a trend of increased risk. Changes in the labour market and hiring practices have meant the wearing away of Japan’s traditional life-long employment system. For university graduates the process of securing employment has become more complex and is now fraught with greater uncertainties. The Capability Approach is frequently perceived as being individualistic, i.e. only concerned with the individual’s effective freedom to live the life he or she has reasons to value and desiring to live. Sen do, however, emphasise that people’s possibilities to convert given opportunities or resources into desired functionings do not solely depend on individual characteristics (e.g. having a physical or mental impairment) but also on the structures (e.g. of a physical, social or attitudinal nature) that people face or within which they find themselves. As case the paper discusses the efforts of persons with disabilities to combat exclusion and achieve full participation in society on an equal basis with others.

The Cold-War As a Mode of Subjection: Power / Knowledge Dynamics in the Age of Empire

Hardt and Negri (2000, 2009) argue that modern forms of Empire provoke power struggles among sovereign states for global hegemony as well as resistance from the periphery. Actors who resist Empire are ritually defined as “terrorists” by the agents of the US power elite who are tasked with the management of contemporary Empire (Domhoff 2010). Blain (2009, 2012) argues two modes of power and subjection come into play in these power struggles. The first type is victimization ritual rhetoric designed to motivate masses to support warfare to destroy “the enemies of empire.” The second type of discourse is associated with the social and psychological sciences and the bio-political practices of national security “experts.”

A main finding was the role a small number of “terror” journals in the discursive formation “terrorism.” They published many influential texts prior to the 9/11 attacks and WOT. They continue to exercise disproportionate influence.

Table 1 Percent Influential Journal Articles (> 5) by Type of Journal Pre-9/11 (1960-2001) and WOT (2002-2012) in Sociology Abstracts

<table>
<thead>

</tbody>
</table>

Note: Source Sociology Abstracts, 1960-2011. *Z test for column proportions, p < .05

In conclusion, two dangers are discussed. First, the WOT has reduced the problem of political violence to “terrorism” and the ritual victimization of Islamic subjects. A second danger is the way the dynamics of Empire tends to reduce knowledge to its auxiliary function in the project to produce powerful regimes of governmentality, intensifying surveillance and the detention of the “suspicous.” On the other hand, there are grounds for hope. A huge amount of critical research is going on in response to the WOT.

Racial/Ethnic Variations in Adolescent Aspirations: The Relative Influence of Parental Involvement

Previous research on the occupational and educational aspirations of adolescents has noted that teenagers’ desires in regard to their future statuses are often influenced significantly by family and parental characteristics. In this study, we examine the relative effect of parental involvement upon adolescent aspirations. This involvement comes in a variety of forms, including direct involvement (such as helping their child with their homework) and indirect involvement (such as participating in parent-teacher organizations). Using data from the High School Longitudinal Study, the relationship between parental involvement and adolescents’ aspirations is examined, with particular emphasis upon racial- and gender-differences. The involvement of educational institutions in promoting internationalisation at selected elite Japanese universities. This presentation will report on initial results from a survey investigating identity, individualisation and internationalisation for Japanese students in tertiary education at a large national university in Japan. The study explores student perceptions of internationalisation and global skills for their transition to the workforce. The study is important toward greater transparency for tertiary education in Japan on performance, internationalisation and employment outcomes.

A 40-question survey was developed in part based on questions from the UK Understanding Society study and recent global human resources surveys from Manpower and McKinsey. These were rendered into Japanese and added to a Japanese-language core of established biographical data questions. The principal research themes are: a) Student self-concept of employability skills/future employment; b) The role of the university for future employment; c) Internationalisation; d) Gender and national culture in the Japanese labour market.

The general issue addressed in the present discussion concerns the ways in which interaction within systems can be determined by forces, processes, and media apparently beyond the voluntary control of individuals. The particular focus in this regard is the medium of power. We will ask whether and how the exercise of power, especially subjection to power, can potentiate interaction such that particular types of interaction tend to occur with a significantly higher degree of probability than others. We will argue that the addition of the subjection to power in this respect is power. The specific question to be addressed is: Why do people believe they know objective things with stable natures because they believe they are a potential to interaction can lead to specific types of meaning being constituted in interaction that may facilitate the functioning and propagation of a seemingly alien power over us.

People believe they know objective things with stable natures because they have forgotten that they live in a world of meaning that they have created themselves – and it is the state of existing social relations that causes them to forget this fact. When human relations and human creativity become ossified into products of human activity that appear to exist independently of their creators, people do not attain the awareness that all we perceive and know is transitory precisely because we have created it as it exists for us. Heidegger has written about the forgetfulness of being. We are instead concerned with a type of imposed forgetfulness that has led us to misunderstand our own creative and productive powers as the objective power of an external and seemingly eternal world that is beyond our control.

The Need For Land Tenure Rights For Indigenous Populations In Tropical Rainforests

For centuries tropical rainforests have been inhabited by indigenous and other forest dwellers who have depended on the forest for their home, livelihoods and culture. As a result they are better equipped to manage these areas than other members of the community. The reality however is that regardless of this long standing relationship formal land tenure rights have rarely been granted to these people and ownership mainly vests in the state. As these forests are being destroyed at an unsustainable level it is necessary that developing countries provide indigenous people with land tenure rights so that these forests can be effectively managed and protected.

Against the “People Power Church”? Contemporary Forms of Organized Nonreligion and the Debate on Reproductive Health in the Philippines

After being heavily debated for more than 10 years in- and outside congress, current president of the Philippines, Benigno Aquino III., signed the so-called “Reproductive Health Bill” (RH Bill) in December 2012. However, firmly opposed by the Roman Catholic Church (RCC) and its public organ, the Catholic Bishop’s Conferenc of the Philippines (CBCP), the now called RH Law is still waiting for its implementation. The RCC’s/CBCP’s influence as a “moral compass” (Bautista 2010) or “public religion” (Casanova 1994) in this Christian dominated nation is grounded in its prominent role during crucial historical events and political transformations, e.g. the “People Power Revolution” in 1986. Such events and their interpretations led to a “religio-nationalism”, a discursive “process of co-construction between Catholic identity and national identity” (Natividad 2012), which enables the RCC/ CBCP to shape public and political debates. Such debates like the conflict over reproductive health issues, in which various social actors articulate their own notions of morality, nation, and modernity, provide an ideal framework to analyze church-state relations and the local intersections and complex dynamics of religion and modernity in the Philippines from a social scientific perspective.

In my paper I will focus on nonreligious groups like atheists, humanists, and freethinkers which have emerged in the Philippines within recent years. Although constituting different forms of organized nonreligion with different agendas, they find common ground, for example, in their fight for secularism, LGBT rights, and their engagement in the debate on the RH Bill/RH Law. By looking at their criticism of the RCC/CBCP’s position on reproductive health policies through ethnographic fieldwork and a relational approach to nonreligion (Quack 2014), I show how they try to delegitimize the Church’s strong public role by breaking up the aforementioned “religio-nationalism” and by offering an alternative, modernistic-scientific moral/social framework.

Assembling Urban Riskscapes: Climate Adaptation, Scales Of Change, and The Politics Of Expertise In Surat, India

The risks of climate change become tangible and urgent in cities – and accordingly, climate adaptation has risen on urban political agendas worldwide, including in vulnerable coastal cities of East and South Asia. Drawing on ethnographic fieldwork and involving debates on ‘assemblage urbanism’ (Fariaus, McFarlane), this paper analyses the contested politics of expertise by way of which Surat, in the Indian state of Gujarat, has been reshaped over the past few years into a regional model of climate change ‘resilience’, within local-global networks of urban design, planning, and power. Mediated through unequally structured transnational policy mobilities, the work of resilience-building is shown to revolve around local economic-political elites, who deploy consultancy knowledges to render particular urban riskscapes (in-)visibible, in ways conducive to specific forms and scales of middle-class ‘development’ in the city. In turn, the paper shows how this local elite-driven climate politics is contested by two alternative socio-technical coalitions and assemblages: on the one hand, groups of globalized engineering professionals look to embed Surat as a ‘test-case’ of low-carbon transition in the global South; on the other, groups of city-based activists and critical professionals seek recognition and redress of more ‘proximate’ hazards (pollution, poverty, lack of infrastructure). In analyzing how competing urban riskscapes come to be assembled through heterogeneous knowledge practices, the paper highlights the different visions and commitments to ‘scales of change’ (jiménez) thereby enabled and furthered. By thus allowing us to grasp the situated tools and knowledges through which ‘large-scale’ processes of socio-political change – development, low-carbon transition, justice – are shaped and contested around specific urban places and spaces, the paper suggests that assemblage urbanism contributes valuably to new critical explorations of technical politics and sustainability in the city.

The Politics of Urban Climate Risks: Theoretical and Empirical Lessons from Methodological Cosmopolitanism?

In the face of global climate risks, world cities are increasingly being positioned, in academic and policy discourse, as strategic spaces for orchestrating the expertise and governance capacity needed to steer societies towards more sustainable, low-carbon futures. This paper reviews and rethinks theoretical and methodological approaches to the study of urban climate politics, by way of asking what contribution Ulrich Beck’s theory of world risk society – and principles of methodological cosmopolitanism – make to such epocho conversations? Three existing analytical frameworks are singled out for their importance: low-carbon transitions literature highlight generic socio-technical dynamics of ‘greening’ urban infrastructures; urban policy mobility approaches document growing inter-city networks around climate and sustainability; and actor-network theory (ANT) work on architectural controversies engage the localized politics of specific urban riskscapes. While each framework point to local-global interdependencies manifest in urban climate risk politics, this paper suggests that all of them remain under-theorized from the point of view of their specific dynamics of ‘cosmopolitisation’. To counter this deficiency, the paper draws on Beck in outlining the contours of new ‘cosmopolitan urban risk communities’, seeking to define their main analytical constituents and point to emerging empirical realities. To this effect, the paper points to the need for reworking methods of multi-sited ethnography and comparison as central parts of a ‘cosmopolitan’ approach to urban climate risks.
cer Plans, since 2003. In order to reach the entire population, innovative campaigns were not only broadcast on television through advertisements but also on the packaging of food, tobacco and alcoholic products. Perception of these new health messages were positive, however, risk behaviors have not decreased. Regrettably it has been shown that this type of campaign approach has been ineffective since the tobacco usage has increased from 2005 to 2010.

According to the results of many investigations, members of the lower social classes and the elderly are more affected by cancer, yet these people have been found to be less concerned with these prevention campaigns. Impression may be they “choose” not to follow the guidelines proposed by public authorities. That shows the importance of social classes, age and sexes determinism (Bourdieu 1979, Bihr and Pfefferkorn 2008). The few changes in risk behaviors are less the product of individual choice, but rather the result of constraints such as health problems, obesity, etc.

One might then think of new types of “prevention campaigns” with egalitarian goals, which would not be limited only to simple quotes such as “stop smoking” or “eat fruit and vegetables”, but whose purpose could be to promote “self-care” and to develop agency of people. This means to act on both economic and cultural dimensions of the concerned groups.

New Values, New Moral Attitudes, and New Dilemmas? the Metamorphoses of Professional Ethics Among French General Practitioners in a Renewed Primary Care Governance Context
French private GPs’ values have been historically structured by the ideological frame of the so-called “médecine libérale”. Although they have consented to collective conventions and regulatory fees, their individual consciousness is supposed to support professional ethics in the service of the patient. Public regulation has been suspected in damaging their professional commitment. This traditional settlement has been destabilized by new governance principles introduced to regulate (more from above than from inside) the professional autonomy through new professionalism criteria. We would like to examine how different types of reforms raise different ethical issues.

Some reforms have sought to give more content and opposability to classical professional ethics (moral autonomy, continuous training, accountability, independence from the firms, respect for patients’ rights, fee moderation or acceptance of poor patients). Other ones have been presented in the name of rationalization or public health, but have equivocal moral implications on the way GPs treat their patients. For instance patient lists have been introduced for each doctor, and more prevention is required, both should lead GPs to develop a more collective perspective on the population they are in charge of and use systematic procedures: does it affect their consideration of patients’ personal complaints? does it make them aware of social inequalities in the care they dispense? A third kind of reform has introduced financial incentives and may strengthen altruist motivations by treating GPs as common self-interested economic agents.

How do GPs deal with the moral implications of these inflections of their mandate, which intersect with concomitant changes in their own inclinations? Do they reaffirm classical professional ethics or adapt it? Does it lead to coherent changes in their practices, or lead to new individual dilemmas, or to “moral fragmentation” between different medical sub-cultures? Our analysis will be empirically based on 100 interviews focused on preventive care.

BLUMBERG, RAEL* (University of Virginia, rblumberg@virginia.edu)
The Tortoise or the Hare? Long-Term Continuity vs. Rapid Shifts in Gender Equality

Undoubtedly, women’s relative position has been improving almost globally in recent decades. But how can we predict fast vs. slow shifts in most places or the possibility of a dizzying descent into inequality in a few others? Examining recent changes in historical patterns through the lens of my theories of gender stratification and gender and development, I suggest that we examine structural variables, the bedrock of gender stratification: women’s relative economic power (defined as control of income/other assets – my theories’ key variable) and the patriarchal system. Historically, women have done best where their control over the kinship system is bilateral or matri-oriented (so that women inherit and marital residence often is with/near the bride’s female kin). This pattern prevails in most of Southeast Asia – and largely so even in Indonesia despite ~700 years of Islam. Regionally, women’s economic autonomy and overall position long have outshone most of Europe and proved better than in almost all world areas where inheritance goes wholly/disproportionately to men and the bridal couple lives with/near the groom’s male relatives. This includes 75% of sub-Saharan ethnic groups, almost all the Middle East/North Africa, and most of South Asia (Kerala State, India is the strongest exception). A common phenomenon in these patri-oriented countries is that women lack effective land rights, even if laws have been passed giving them theoretical rights (e.g., India). A sudden burst to full gender equality seems unlikely even in Scandinavia but a steep ideologically-propelled slide could happen in conflict countries where women lack economic power and the kin-property system is highly unfavorable, e.g., a repeat of what happened in Afghanistan under the Taliban. Overall, however, women’s rising economic power should prove more consequential in driving gender equality than changing social norms and growing proportions of females in parliaments and schools.

BOATCA, MANUELA* (Freie Universitaet Berlin, mboatca@zedat.fu-berlin.de)
Title: Commodification of Citizenship and Racialization Processes

The widening of the worldwide inequality gap is paralleled by an increase in the commodification of citizenship. The emergence of official economic citizenship programmes (aka “citizenship by investment”) as well as the illegal trade in EU passports (“buy a EU citizenship” schemes) are similar strategies of eluding the ascription of citizenship through recourse to the market. As the – real or perceived risk – of more people gaining access to citizenship of wealthy countries increases, so does the racial criminalization of migrants to core regions -- most prominently, the European Union and the United States, regardless of the citizenship regime of the country of arrival. Thus, the ethnic profiling of Moldovans in the European Union is directed against immigrants suspected of having abused the right of blood in order to acquire citizenship, by trying to prove Romanian ancestry in order to acquire a EU passport. On the other hand, the ethnic and racial profiling of immigrants who come to the US to give birth targets pregnant women accused of having abused the right of soil to the same purpose. The scandalization of “forged descent” in one case and of what could analogously be called “cultural descent” in the other is simultaneously a statement about the immutability of the ascription of citizenship through both bloodline and birthplace for the wider population, and ultimately a denial of equal opportunities for upward social mobility at the global level.

The Proliferation of Composite Indexes

This paper aims to reflect on the impact of the hipper-proliferation of composite indexes in society. First, although methodological problems have been amply identified decades ago (MacRae 1985; Porter 1995), most composite indexes are increasingly being constructed to support decision making without caveats. The impacts of their use are largely unknown, although by now they are expected to be found all across society (Boavida et al. 2013a; Boavida et al. 2013b). Second, a fast and steady creation of new indexes in the last decades also presents significant risks because they can lead to erroneous interpretations of the results (Benot Godin 2008; Grupp & Mogee 2004a; Grupp & Mogee 2004b; Grupp & Schubert 2010a; Freudenberg 2003; Jesinghaus 1999; Nardo et al. 2008; Munda & Nardo 2005; Nardo et al. 2005a; Munda & Nardo 2009; Saltelli 2007; Katz 2006). Interestingly, more expertise is needed to interpret the composite indexes, not just at the macro and sectoral level, but also at the individual level (Boavida 2011). One of the main problems with the composite indexes is their launching without proper guidelines for their use. This is particularly visible in the public sphere, where debates abound with abusive citations of indexes and ranking positions of countries, regions, sectors and even politicians’ acceptance rates. Although less visible, there appears to be a underlying attitude to compare personal decisions with existing rankings uncritically of the measures being involved (Boossen 2002; Feller-länzlinger et al. 2010; Dahler-Larsen 2013). Therefore, we will understand the amount of expertise present at the time of the comparison, to be able to understand the extent of their misuse.

This paper is part of a research project, and will elaborate on the way different groups use and are aware of limitations of composite indicators. Several methodologies will be used, such as literature review, interviews and surveys.

-forest, we learn more about the normal way of living and we can learn a lot about the routines if we disturb them. The irritations

Migration and Home As Absence, Feeling and (Re)Construction: A Conceptual Overview

My paper aims to take critically stock of the literature on migration and home(s). International migration is a promising topic for inquiring "where home is", and why this matters. The constructions of home and of its absence – as a place, a relational configuration or a way of feeling – are central to the migrant life experience. Extended physical detachment from what used to be home, and the search for new home, are both constitutive of it. Unsurprisingly, the notion of home resonates widely, and with mixed emotional tones, in migrants' biographic accounts. However, the ways in which home is re-constructed, (re)placed or projected into the future are extremely diverse and case-specific. While some literature has increasingly highlighted the immaterial bases of mi-
grants' feeling-at-home, most studies point to their persisting need to emplace
home in distinctive geographical locations and material (domestic) arrangements.

Generally speaking, the housing solutions encountered by migrants abroad may be little conducive to a sense of domesticity. The critical point, though, is now their sense of home is reconstructed and turned into real social practices over time. How this happens, and how this "homeing" interacts with their relational conditions, class

The Non-Contractual Side of Care, Unpacked. Emotional Work and Shifting Care Boundaries in the Narratives of Immigrant Caretakers in Italy

My paper aims to theoretically revisit the everyday negotiation of profession-
al, emotional and ethnic boundaries between dependent elderly and immigrant care workers. It builds on my research on home care in Italy – a country marked by increasing concentration of feminized and ethnicized labour in this labour market niche. As part of distinct case studies, I have collected about 300

in-depth interviews to immigrant caretakers, most of them Eastern European and live-in, over the last decade. A striking commonality across their narratives lies in the divergence between their formally defined brief and the emotional work they do display and enact. In order to make sense of this variable gap, I will elabor-
ate on the concepts of boundary-making and emotional work. As a result of differences in ethnicity, social class, age and generation (and often gender), a va-

riety of boundaries are negotiated in everyday interactions between immigrant caretakers and clients. The process whereby their views, needs and habits are mutually accommodated, despite being strongly asymmetrically loaded, has important

cultural and emotional implications. How the emerging emotional configurations are amenable to mutual manipulation, and what control caregivers exert on them, are issues in need of deeper and more sophisticated understandings. To be sure, the facetted configurations of emotional labour and boundary-making – as quintessential to this extra-contractual dimension of care – are reluctant to any ready-for-use clas-

ification. However, a better understanding of their influence on the quality of care, and on the rights, interest and needs of those involved, is necessary at many

levels – including the need to move the debate on immigrant care beyond pitiec-
tic, victimizing or merely "technocratic" accounts. The consequences of emotional

(over)involveement on immigrants' conditions and life trajectories are also to be revisited along these lines, as I will do in my paper.

BODE, INGO* (University of Kassel, ibode@uni-kassel.de)
Organized Heterogeneity in Disorganized Fields: The Case of Child Protection Services in Germany

Much of what has been developed in organizational field theory has long been applied to well-organized sector obeying to a clear-cut set of logics that cohabit peacefully after all (e.g. bureaucracy and professionalism). Many of these fields have a public service background. For a while now, however, multiplicity has given way to a new breed of field here in the sense that logics inhabiting such fields come to sit uneasy with one another as they trigger decisions or policies pointing to opposite directions (ensuring revenue or giving priority to observed needs, for instance).

What is more, new institutional logics encapsulated in quasi-market regulation tend to ‘disorganize’ establish fielded structures and seem to leave permanently the players of a given field with either-or constellations. Drawing on a research project conducted between 2010 and 2013 that has investigated developments in the sector of child protection services in Germany, this paper presents patterns of what has been referred to recently as institutional work, with an eye on two sorts of organizations: public hub agencies with an administrative remit and nonprof-
its entrusted with service provision. The material consists of an interview-based, in-depth investigation of selected settings, embracing the entire set of agencies relevant to child protection in a given area, with a hermeneutic approach inform-
-ing the analysis. The analysis suggests that there are various responses to this “organized” heterogeneity of references (e.g. managerial standards or templates channeling decisions) throughout the field under study; however, most are about processing ambiguity by provisional and peace-meal action through which these references and the underlying institutional logics become fuzzy themselves. Hence the disorganization of organizational fields goes alongside the blurring of those cognitive foundations on which they are built.

BOEDIONO, KUSHARIYANINGSIH C.* (University of Indonesia, kboedio1@binghamton.edu)
Forest Resources and Local People Livelihood

The decision of the Indonesian government to implement Law No. 22/1999 on Regional Governance in 2001 has resulted in the delegation of authority to the regional governments and a more decentralized political power as well as more localized decision making on natural resources’ utilization, including in the forestry sector. However, a number of studies on the implementation of decentralization in the forestry sector show that impacts of the transfer of authority to the regional governments have been mostly negative on the environment. The efforts to protect the environment, i.e. forest resources, are also facing serious threats from “the oil palm trend” which is replacing “the log trend”. After more than 10 years of the implementation of decentralization policies, the current conditions at the local level have shown that not only the share of the region’s natural resource revenues has increased but the pressure to utilize these revenues to alleviate poverty and social inequalities has also become greater.

As environment and society shape one another, the first part of the paper explains the political economy approach, the causes of widespread environmental destructions after the implementation of Law No. 22 in January 2001. In the second part, this paper will analyze, based on Buttel's (2003) argument, the role of activism/ movements and state environmental regulation, particularly in the forestry sector; as two basic mechanisms in supporting the process of environmental reform. In the last part, this paper proposes a mechanism defined by Martel (1994) as “decentralized community with institutionalized co-ordination” as well as explores, as suggested by Frickel and Davidson (2004), linkages between the state (particularly governments at the provincial and district level) and specific civil society actors (involved in environmental justice movements or act as environmental knowledge professionals) in enhancing state interest in sustainability and improving the local people livelihood.

BOEHME, JULIANE* (WZB Berlin Social Science Center, boehme@wzb.eu)
From Unknown to Known Objects- Cultural Knowledge in Action

We know how to use objects in our everyday-life. Normally it’s not problematic because we just do it. But if someone ask us why (we know that) it is getting more complicated because it’s hard to reflect about our own routines of practice. In line with Garfinkel (1967) I assume that everyday activities aren’t arbitrarily but organ-
izationally structured – that the routines are formed by an interactive process. The limitations of the routines offer insights in the ways people try to fix the crisis situation and to come back to “normality”. It’s curious but we learn more about the normal way of doing things if we disturb them as if we just try to observe the normal way of acting.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
To provoke an irritation of the routines of meaning construction of objects I gave unknown objects to small groups of students and asked them to find out the use of these things. I used video analysis methods to keep the details and to be able to recognize situational procedures of handling the uncertainty in the material world. The results show that the meaning of the unknown objects emerged in a communicative construction which strongly bases on different forms of cultural knowledge in action. Interesting examples are the search for contexts of use which are in a pragmatic manner connected with imagined or real experiences and body knowledge as a way to test and create ideas for the "right" use.

How to Measure Quality of Life? an Integrated Approach in the Netherlands

How to measure quality of life? An integrated approach in the Netherlands

The Netherlands Institute for Social Research uses a composite index to describe and monitor developments in the quality of life of the Dutch population. The SCP Life-situation Index (SLI) is used to measure objective aspects of individual quality of life. In constructing the index, we depart from the view that quality of life is a multi-dimensional concept. SLI is composed of indicators from eight domains: health, housing, social participation, cultural leisure activity, consumer durables, sports activity, vacation, and mobility. Education, income, paid employment and safety/sufficiency are considered as "resources". They can be used by citizens to improve their life situation.

We use non linear canonical correlation analysis to combine the indicators into the index. SLI is based on micro-data, stemming from survey research. With these survey data we are able to give a summarizing insight in the different domains of the life situation at the individual level. We can also break down the life situation for different social groups (enabling us to compare income groups, educational levels and household types). In our view quality of life has an objective and a subjective part. Using micro-data also provides the opportunity to explore the relationship between objective wellbeing (as measured by the index) and subjective wellbeing (happiness and satisfactions).

The paper focuses on two of the major issues we come across: 1. How to measure quality of life? Why did we choose not to include subjective indicators? Does it change the results if we did? 2. How to combine the indicators? The life situation index is constructed statistically, using nonlinear canonical correlation analysis to get the weights. But there are other ways to do so. Does using alternatives lead to different results?

Measuring Wellbeing Across Countries – Can It be Done?

There are no widely adopted definitions for the concepts of wellbeing and quality of life. First, I discuss the correspondences and differences between measures of wellbeing and quality of life, like the Gross National Happiness of Bhutan, the Happy Planet Index of the New Economics Foundation, the Better Life Index of the OECD and the Human Development Index of the UNDP. I also compare these measures with the SCP Life-situation Index which is used in the Netherlands. When describing the quality of life of the Dutch with this index, a conceptual model is used, which is centered around the index. In this conceptual model the view is taken that quality of life has an objective and a subjective part.

The conceptual model of the SCP Life-situation Index can be used to describe how objective and subjective wellbeing are related. In this model a causal relation is proposed between capabilities (or resources, like education, income and paid work) and objective quality of life (as measured by the SCP Life-situation Index, which combines indicators on health, housing, social participation, etc). Next, a causal relation is proposed between this objective wellbeing and subjective wellbeing (happiness).

This model is tested for the Netherlands and the results show that the model works.

In the paper I will use the European Social Survey to look at whether the model can also be used for other European countries. Though the model can be used, there are differences between countries, for example in the weights of the indicators.

Boersma, Sanne* (Erasmus University Rotterdam, boersma@fsw.eur.nl)

Vis-à-vis a homogenous 'native' population in national societies. As such, the contested (future) condition of society is stabilized. This paper seeks insight in how future projections of 'non-western' presence in West-European societies come about and how the field of immigrant integration expertise can be perceived as what Timothy Mitchell has called a "sphere of calculability" i.e. framing, drawing limits, measuring and visualizing (Mitchell, 2002). By doing ethnographic research at the "centres of calculation" (Latour, 1987) in combination with document analysis this paper aims to show how immigrant integration is made into a field of challenges, strategies, demand and importance, subsequently effectuating particular logics of visualizing national societies.

Bogner, Artur* (University of Bayreuth, artur.bogner@web.de)

Analysing Real Conflict Scenarios Empirically – Experiences from Ghana and Uganda

Armed conflicts are phases or processes of armed escalation within much longer (and often large-scale) social processes, parts of much wider synchronic and diachronic contexts that may be conceptualized as "dynamic systems", "figurations" or "self-organizing" processes – including long-term as well as shorter-term processes. Their analysis is essentially identical to the investigation of socio-cultural structures under specific perspectives, especially regarding the chances of armed conflict and fluid and multipolar balances of power (between diverse centres of social power and various makers and executors of conflict management or violence management respectively). This paper by a figurational sociologist will discuss the methodology of investigating and forecasting real conflict scenarios empirically with a focus on practical research practice and with regard to the relations and combination between empirical conflict analysis and the study of real conflict scenarios. The paper will argue that in order to exploit these opportunities numerous preconceptions and dichotomies in the social and cultural sciences need to be overcome – e.g. the divide between macro- and micro-sociological concepts, and between sociological, historical, political-scientific and ethnographic methods of data collection and analysis.

Eisenstadt and Elias: Static and Dynamic, Competing and Complementary Accounts of the Social World in the Modern Age

The complicated interrelationships between particularity and generality, the abstract and the concrete, or atomistic and holistic conceptions of causation, history and society continue to afflict the socio-cultural sciences. This also applies to the relations between modern culture and its diverse actualizations as well as relations between competing conceptions of the social world without and within history. Elias's and Eisenstadt's work belong to the sustained and coherent efforts among sociologists to explain the defining qualities of the world in the modern age and their genesis. Some understand their theories as retreats of the post-WWII modernization discourse. Although there is some truth in this perspective, it should not deflect from the fact that Eisenstadt's and Elias's perhaps most elaborated attempt at revising the essential constituents of this discourse,

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
whereas Elias's theory represents a radical alternative (of pre-Parsonian and pre-war provenance) to it, in terms of basic terminology and basic vision of the social world as well as its methodology - in a manner reminiscent of the polarity between Kantian and Hegelian epistemologies or concepts respectively. Whereas Eisenstadt refined and differentiated the concept of modernity, Elias generally abstained from using this term and suggesting a total break between the modern and the preceding periods and emphasized long-term continuities and patterns in European and human history, while anticipating some central ideas of the recent discourse on globalization. Whereas Eisenstadt focused on the implementation of "cultural and political programmes", Elias emphasized the unexpected consequences of actions and the unplanned nature of collective processes and phenomena. The paper will analyse how far insights and concepts of two eminent scholars of historical sociology are mutually compatible or complementary as well as explicate their methodological, conceptual and material differences.

**Effects of the Visual Presentation of Don’t Know Options in Rating Scales on Responses. Comparing Results of a Paper and an Online Panel Experiment**

Several studies show that in self-administered settings respondents use both, verbal information as well as nonverbal, visual features of rating scales within the question response process. Nonverbal, visual scale features (VSF) are for example font, size, color, or graphical display of the rating scale. However, the findings of the existing studies are not consistent and thus, there is still much to learn about the specifics of personal and situational settings that make respondents susceptible for VSF. This research examines attitude strength and demographical characteristics as potential moderators of the effects of VSF. Two randomized experiments were conducted varying the visual layout of a five-point agreement-disagreement rating scale. Three different visual layouts were tested in each experiment: a. the don’t know option is separated from the other scale categories by a clearly visible vertical divider line, b. the don’t know option is simply added to the right hand side of the scale, and c. no don’t know option is offered. The first experiment included 307 German students using PAPI mode; the second experiment included 450 respondents and the ETS online assessment. The assumption is that respondents are influenced in their selection of the middle, extreme and don’t know response category by the VSF. By means of multilevel analysis, the likelihood of selecting these categories are estimated for both middle, extreme and don’t know response category by the VSF. By means of multiple moderation effects of the existing studies are not consistent and thus, there is still much to learn about the specifics of personal and situational settings that make respondents susceptible for VSF.

**The Cuisine Culture from a Polish Perspective. How Popular TV Programmes Use Cooking to Create a Modern Lifestyle and Present the New Middle Class**

In the aftermath of the events of 1989, Polish society faced many changes. One of them was an invasion of global cuisine culture. I would like to research how did the typical Polish city change under the influence of the culinary culture and TV cooking programmes? I am interested in how the culinary culture is currently used to promote the values of the consumerist society, such as competition, rivalry, pleasure, and entertainment. I would like to present the examples of the popular TV series "The Cooked" and "The Kitchen Revolutions". Both of them play a very important role in changing Polish attitudes to cuisine and its meaning in social life. The programme "The Cooked" presents young representatives of the new middle class from big and global cities which are the beneficiaries of the Polish transformation in 1989. They treat the cuisine culture as a very instrumental way to present their social status and proof of their place in the global community.

The second example is a TV series called "The Kitchen Revolutions". The main character is a famous Polish chef who visits different restaurants in Poland and helps the owners change not only material aspects of their restaurants, but also the owners' general attitude towards the cuisine culture. The process of changing the material and aesthetic vision of restaurants also creates opportunities to compare global imagination about cuisine culture with the local tradition of nutrition. Both popular TV programmes create possibilities to define attitudes towards inequality and the differences between the global cities and other parts of the country. The cuisine culture and its popularity can be treated as an instrument to understand the process of changing the rules of lifestyles and construction of the new middle class in the new democracies.

**Violence Against Women and Femicide: Sociocybernetic Approach**

In spite of the existence of significant regional differences, gender and domestic violence data (including psychological abuse, physical assaults and femicide) are so regular and stable that the phenomenon can be considered ‘structural’ and “systematic”. First of all, we should admit that conflicts of interests, a frequent ‘cero-sum game situation frame, structural conditions of stress and imbalance of physical, economic, and/or symbolic power, inadequate emotional and cultural references between conflict and appropriate scripts’ for communication and other forms of face-to-face interaction make intimate partnership a context prone to conflict breeding ‘accidental’ violence.

This paper presents, we present the first steps of our research program is the design of sociocytbernetic model. It gathers all relevant variables at all three structural levels, weighted by their predictive power according to path-analyses. Conflicts are frequent in intimate partner life, but it is only a precondition of violence. Violence and femicide are the result of personal, micro-social and socio-structural and cultural variables that, in some triggering circumstances, get aligned and form a ‘trajectory of accident’ from aggressor to victim.

This vision shows that true severe violence results from a continuous story of abusive ritual interaction oriented to establish and preserve a position of domination and control. More research at micro-sociological level is needed to identify really predictive variables. Path-analysis to weight them a sociocybernetic model to help to design better preventive public policies. This research could also help to move farther away from former ‘pathological culture’ and present ‘bureaucrat culture’ on intimate-partner gender violence towards a ‘generative culture’ able to foster a social ‘cycle of learning’ among all participants, from couple members through lawyers, psychologists and public officers, to all members of society.

**Has the Globalized Sperm Banking Industry Committed the Baudrillardian ‘perfect Crime’?**

Assisted reproductive technologies constitute a fruitful soil for cultural Sociological theorization. In particular, the sperm donation industry is a unique arena in which personal emotions and dreams encounter the constraints of technologi- cal and medical reality as mediated through economic transactions. The article proposes some sociological insights into the sperm donation industry, derived from a qualitative study of sperm donor profiles in nine sperm banks from Eu- rope and US. We started our analysis acknowledging our a priori assumption of semen commodification. We content analyzed extended profiles and conducted a visual analysis of baby photos of 135 randomly selected donors who appear in the sperm donor catalogues. Browsing for the ideal donor while reading the ‘perfectionized’ profiles is a technology which aptly illustrates Baudrillard’s concept of ‘hyper-re- ality’. Borrowing Baudrillard’s terminology we argue that extended donor profiles are not ‘real’, rather they are hyperreal. These profiles are an “authentic fake” of the fathers families desired by women in today’s postmodern era. We examine the way the sperm industry uses personification practices as a tool to add an emotional context, resulting in a re-enchantment of the postmodern spirit. In- spired by Jean Baudrillard’s and Eva Illuz’s writings as well as Zygmunt Bauman’s insights on ‘liquid modernity’, we show how sperm banks de-commodify sperm, personify donations, and add an emotional context to the economic transaction. Sperm donor profiles are a meaningful and important postmodern text, as such they deserve to be interpreted by means of sociological theorization. As products of socially constructed mechanisms, analyses of the ways these profiles are displayed and produced certainly communicate much about the contemporary sense of ‘liquid modernity’. This creates a powerful re-enchantment mechanism counterbalancing the alienation and disenchantment characteristic of donor insemination technology and the postmodern spirit in general.

**Diasporas In Times Of Multiculturalism and Transnationalism**

The magnitude and scope of contemporary processes of social, political and cultural change and their related, multidimensional and contradictory nature are challenging to sociological theory. Current processes of change transcend national frontiers and relate and interconnect societies. Globalization and transnationalism refer indeed to the new conditions derived from radical changes in the way time and space have ceased having the same influence on the
way in which social relations, identities and institutions are structured. The role of countries and borders between States become diffuse, porous and permeable and global connections are intensified by virtue of the fact that they are shared with great velocity in multiple places.

Amid these trends, migration became a source of social transformation. Contemporary migration emerges steadily as well as repeated and circular, bi-local and multi-local movements. Expanded mobility, multiple relocations, sustained interactions enhance exchanges of economic and social resources, cultural narratives, practices and symbols between communities and societies. Migration has widened the spectrum of encounters from between individuals and groups carrying distinct communal organizing principles, historical trajectories, models and logics of the collective. It thus poses equally new challenges to Multiculturals.

Aiming to account for singularity (as differing from exceptionalism) we claim the need to focus on the collective dimension and on the institutional underpinnings of neo-liberalism and its structural effects in order to account for past and present cases of re-diasporization and explore the transition from ethno-national diasporas to ethno-transnational ones.

Ethnic Inequality in the Labour Market: The Transferability of Skills and Degrees

Migrants are less successful in the labor market than natives, relative disadvantages that are often referred to as “ethnic penalties.” Previous research estimated these penalties using education as a proxy for skills. However, highly educated individuals are not only rewarded by employers for their skill levels, but also for the signaling value of their degree. Although most studies that estimate ethnic penalties usually acknowledge the existence of these two mechanisms, empirical work that incorporates this is extremely scarce. In this study, we include a measure of both cognitive (numercy, literacy) and non-cognitive (motivation) skills, which allows us to separate mechanisms that explain the educational payoff of migrants. This increases our knowledge of how the transferability of skills and degrees affects ethnic inequality in the labor market. We analyze both unemployment risk and income.

The paper furthermore contributes to the literature on ethnic inequality in the labor market by explaining variation in ethnic penalties across countries with varying institutional contexts. Studies that structurally analyze variation in penalties across countries are scarce, and there is no comparative work that analyses the role of skills in reducing ethnic penalties across countries. We identify three institutional conditions that are especially important in explaining cross-national variation: the educational system, labor market flexibility, and immigration policies.

Empirical analyses are based on the PIAAC 2013 data (Programme for the International Assessment of Adult Competencies). The data include detailed measures of cognitive and non-cognitive skills. Furthermore, the PIAAC allows for a cross-national analysis.

BOLDT, THEA D.* (Guest Professor, thea.boldt@kwi-nrw.de)

Meditation and the Art of Hermeneutics. Approaching the Notion of Subject and Object in Research on Non Subject-Object Phenomena

Even though in the last 20 years an increasing interest of academics in the spread of Buddhism in ‘the West’ can be observed and enough has been said about this process to establish Western Buddhist Studies as a new academic discipline, there is still a limited knowledge about the meaning of Tibetan Tibetan Buddhist meditation practices, especially as performed by the ‘Western’ buddhist disciplines.

Leaving the common misunderstanding of Tantra as ‘esoteric teachings blotted with Simon’ behind us (Suggested by Herbert V. Guenther 1974: 12), the paper is aiming to relate to the practice of the Tantric Tibetan Buddhist meditation, in particular to the so called Meditation on the Nature of Mind (Mahamudra and Mahā Ati), and comprehend it as an advanced scientific and synaesthetic (cf. Helmut Plessner 1923) performance leading the buddhist practitioner to the dissolution of subject-object duality in perception of the phenomenal world.

The paper will work toward a methodological repertoire in order to approach the field of studies on meditation practice(s) from the viewpoint of a participative social scientist. It'll explore the possibilities of synchronising the methodology of meditation and the phenomenological practice of social science. It'll search for further ethnographic means of ‘not speaking about’ (cf. Trinh T. Minh-ha) as well as for videography as a tool of hermeneutic knowledge production in the tension between on-this-side-of and beyond the subject-object division.

Result-Based Public Governance. Challenges in Developing and Using Daily Performance Measures

Within the public sector, many institutions are either steered by governance by targets or result-based governance. The former sets up quantitative internal production targets, while the latter advocates that production is planned according to output as well as to the right, whose members use the argument of ‘necessity’ to justify their conservatism. On the other side, the critical stance has had only very limited support from the social movements and, particularly, the labor Unions, whose energies are absorbed by their efforts to survive. In the vacuum created by the West and beyond the subject-object division.

Towards an European Neo-Conservatism? From the Formation of an Economy of Authenticity to the Renewal of Nationalist Ideologies

The implementation of neo-liberal policies in Europe, and their devastating results, have triggered, during the last ten years, numerous critical reactions, particularly in the intellectual and political fields. But this renewal of social critique has not yet had any concrete effect on the actions of the power elite, belonging to both sides as well as to the right, whose members use the argument of ‘necessity’ to justify their conservatism. On the other side, the critical stance has had only very limited support from the social movements and, particularly, the labor Unions, whose energies are absorbed by their efforts to survive. In the vacuum created by the West and beyond the subject-object division.

Older Immigrants Living in Switzerland and Forms of Ambivalence Around the Retirement Period

The sociologist Abdelmalek Sayad (1991; 1999) has defined ambivalence as part of the immigrant condition. According to him, since most of international migrants are not considered as full citizens in host States neither in home States, their situation tend to be ambivalent on many dimensions. For instance, they expect to come back once to their home country, but they also know that their economic, social and familial conditions make this option highly improbable. Thus, they tend to postpone this issue for a later period of their lives. When they retire however, the question of return can arise again. Thus, it can be argued, retirement may represent for immigrants not only a social transition, from work to retirement, but also a possible spatial transition, from living in one country to settlement in another country. In that sense, it can be considered as a double change in life course that can generate new dilemmas and ambivalences in couples and families. This paper explores how older immigrants from different origins (Italy, Spain, Portugal, Latin America, Africa, Kosovo) and living in Switzerland perceive
this ambivalence and how do they deal with it. Analysis is based in data from a quantitative survey carried in 2011 (immigrants from the 3 EU countries) and from qualitative interviews (immigrants from all origins) carried in 2012 and 2013. Main trends and differences between older immigrants groups are presented and discussed.

Framing a Moral Protest in a Secular Country, the Civil Society Mobilization Against Homosexual Marriages in France

The introduction of same-sex marriages has recently occupied the political agenda of many countries. The public debate on the question has illustrated the enduring impact of religious values in the political sphere and the greater mobilization of religious civil society groups in contrasting the legalization of homosexual unions. This paper will investigate the socio-political discourse of civil society actors involved in the protests against the introduction of homosexual marriages in France. The activism of groups with a religious background was one of the most salient political phenomenon in the French political life in the latest few years. The broadness of the protest was so vast to be described as a fundamental experience for an entire generation. The study of the French mobilization offers the opportunity to come across some intriguing sociological issues. Why the social protests in defence of a family model upheld by the Catholic Church were so strong in one of the most secularized countries in the world? Why Catholic values had a prominent role in a public policy debate in a country where the separation between politics and morality is a paradigm of the political life? Why the traditionally weak French civil society demonstrated such a strong activism?

This paper will investigate the framing process of the discourse of the social actors involved in the French protests against homosexual marriages. Then it will discuss the intellectual and political reasons that contributed to give an ample resonance to their ethical and religious values. Finally it will compare the discourse of the French mobilization with other social protests against the legalization of same-sex unions in other Western countries.

The Financialization of Welfare States. the Case of Complementary Social Insurances

The process of financialization of capitalist economies has recently interested many welfare states. The reforms of the social protection introduced in the last two decades have given greater importance to the role of the financial sector as a welfare policy maker. An increasing number of families rely on the revenues of their financial investments to get those social services previously provided by state authorities. A paradigmatic example is given by the several complementary insurance schemes increasingly diffused in several Western and developing countries. Their introduction was generally supported by governments and labour unions that believe the financial sector may provide workers those economic resources that current welfare states find difficult to guarantee. However the process of financialization of welfare states could enlarge the already existing income inequalities, strengthen the increasing social stratification, and intensify the process of dualization of the social protection that is interesting many welfare states.

This paper will present a comparative investigation of the diffusion of private complementary social insurance schemes in France, Sweden, and the UK after the onset of the latest economic crisis. It will discuss the political debate about their introduction. Then it will evaluate their likely impact on the process of segmentation of the social protection. Finally it will broaden the conclusions drawn from the case studies previously considered to other developed and developing countries.

From Art to Urban Politics – and the Other Way Round. the Art Festival “Paratissima” and Its Complex Relationship with Processes of Urban Regeneration in Turin, Italy

Art can be a mean of claim, empowerment, participation, protest. But what happens if such forms of art are then adopted as tools of urban regeneration? This paper focuses on the relationship between art, civic participation and urban regeneration processes analysing the social impacts and political appropriation of an alternative, non-institutional yearly art event in the city of Turin, Italy.

In order to move away from its fordist past, the city of Turin has betted on culture, creativity and entertainment as core elements of a new path of development. In this frame the City launched a contemporary art fair for international galleries, “Artissima”, taking place every year in the first week of November. Against its institutional, elitist approach, a group of young artists founded in 2005 “Paratissima”, an alternative, parallel open art exhibition, affirming the freedom and the social value of art. In 2008 Paratissima moved to San Salvario, a multicultural, mixed neighbourhood looking forward to emancipating from its problematic past. The event took place into empty stores, shops, internal yards and streets, making Art and everyday-life in unconventional spaces, tackling local social issues and involving inhabitants, shopkeepers and social associations. Occurring there ever since, it has contributed to re-shape the neighbourhood and to attract new flows of people and investments in the area.

Relying on interviews and ethnographic fieldwork, the paper analyzes the ambivalent relationships between Paratissima, other forms of civic participation and the neighbourhood social and cultural fabric, highlighting benefits and criticisms of short and mid-term influences over the neighbourhood’s transformation. Moreover, it examines the processes that have brought both the local authorities and the organizers to consider this format as a successful and replicable model of urban re-development, and it problematizes the path towards institutionalization that this event, born as critical and alternative, seems to have taken.

Whose Street Is This? Commercial Gentrification, Symbolic Ownership and Legitimate Uses of Public Spaces in a Changing Neighbourhood of Turin, Italy

This paper aims at investigating the interactions between commercial landscape, symbolic ownership and everyday practices in upgrading neighbourhoods. Focusing on the neighbourhood of San Salvario (Turin, Italy), it argues that commercial transformations have a major role in challenging established uses and representations, and in framing claims, visions and actions of different sets of actors over the same urban space.

Despite a long tradition of studies on gentrification and neighbourhood’s transformations, only in recent times the role and the socio-cultural impacts of changes of commercial and recreational landscape have been taken under careful examination. Processes of commercial upgrading should not be read only as markers but as active agents of change. New stores, cafés, clubs and night spots embody a powerful discourse that legitimizes some uses, images and users while excluding others. In this frame, the street becomes a crucial space of friction, contestation and negotiation where broader dynamics constantly interact with everyday practices.

Right next to the city centre and the central railway station, San Salvario’s neighbourhood has recently turned from a multicultural, mixed, problematic area into the new core of leisure and consumption of Turin. The opening of new cafés, clubs and night spots has challenged the identity of the neighbourhood and the established uses of public spaces. In this setting, relying on almost two years of ethnographic research, the observation of via Berthollet allows us to examine dynamics and everyday practices of contestation, claims and negotiation over the legitimate uses and representations of public spaces. The analysis highlights the relevance of both space and time dimensions and it unveils the constant interactions between complex sets of actors, such as the established users of the street (mainly foreigners), the new users (mainly university students and young urban middle class), the residents, the commercial entrepreneurs and the local authorities.

The despachantes were in charge of collecting taxes, and forwarding the documents that this event, born as critical and alternative, seems to have taken.
The impact of the global neoliberal agenda on the local occupation of despachantes has reduced the size of the group in three times during the last twenty years. In the new context of north-south professional relations, despachantes are being replaced by paralegals, a global occupation that has been introduced in Brazil, providing work to a large group of law bachelors without the credentials to practice. The research fieldwork is based on document analysis; data collected at the Regional Council of Sao Paulo Despachantes on their 3.429 members; qualitative interviews with leaderships of two competitive professional associations and a survey with 100 despachantes in the state of Sao Paulo.

Transnational Lives of Pinays on the Canadian Prairies

Filipino women or Pinays are, undeniably, the most visible mobile group of temporary foreign workers in Canada and elsewhere today. They are also the most highly socially integrated group of women from Asia due to intermarriages and a western colonial legacy. Over three hundred years of Spanish rule and fifty years of American tutelage have made the Filipinos the “little brown Americans” whose use of the English language, practice of liberal-democratic politics, and adherence to Catholicism shape their trajectories as “citizens of the world”. Filipinos have become one of the most desired group of non-white workers and immigrants for their distinct ability to integrate in western societies, to be “at home in the world”. The plight of Filipino women has indeed attracted much attention from scholars, practitioners, and policymakers. But a nuanced approach to how racialized Filipino women negotiate the limiting social structures of inclusion facilitates a broader appreciation of the meaning of migration in their lives. This paper extends and explores the migration, identity, and community of Pinay in the prairie provinces of Alberta, Manitoba, and Saskatchewan. While Filipino women have become the mainstay group for case studies on the live-in Caregiver Program (LCP) in Canada and its consequent phenotypical constructs of the “nanny,” “caregiver” and “domestic worker”, I extend the prevailing dominant experiences of community participation, activism, volunteerism, and negotiating multiple identities in making meanings of their quotidian transnational lives.

Les Transformations Du Travail Professoral : Origines, Fondements Et Enjeux

Les universités font l’objet depuis au moins deux bonnes décennies d’une transformation majeure de leur mission, dans la foulée de la mise en place de ce que plusieurs ont considéré comme étant une société néolibérale (Freitag, 1995). On parle de plus en plus de performance, d’efficacité, de compétitivité, de productivité, etc., pour spécifier les valeurs autour desquelles on voudrait réorganiser le travail universitaire. Or ces valeurs, qui prévalent dans le secteur privé, amènent avec elles de nouvelles contraintes qui ont des impacts directs sur le sens même du travail des professeurs d’université (entre autres chez les jeunes professeurs). Comme l’indique Lebus, « les nouvelles professeurs et les nouveaux professeurs sont projetés dans une culture organisationnelle et dans des pratiques gestionnaires qui ne sont pas celles qu’ont connues leurs collègues à leur entrée à l’université, que celle-ci remonte à plus de trente ans ou même à seulement une dizaine d’années (2006, 57). On en demande beaucoup et de plus en plus aux professeurs d’université. Ainsi observe-t-on une tendance à l’augmentation des problèmes liés au stress et à l’anxiété en milieu de travail. Dans son dernier rapport, l’Association canadienne des professeurs et professeures d’université (ACPPU) en arrive aux conclusions que le niveau de stress et d’anxiété chez les professeurs d’université est très élevé et tend à augmenter de manière croissante. Dans le cadre de cette conférence, nous allons présenter les témoignages que nous avons recueillis à la suite d’une collecte de données conduite auprès de professeurs d’université en 2012. Nous avons effectué 17 entrevues auprès des membres du corps professoral d’une université ontarienne (Canada). Nous allons mettre en lumière, à la lumière des témoignages recueillis, la nature des contraintes et des pressions qui pèsent sur les professeurs dans leur quotidien en mettant au cœur de l’analyse les transformations globales de l’université.

Globalising Patterns of Professionalisation and New Groups in South Africa

Transformations at the level of societies, cultures and economies affect professions in different parts of the world in different ways. In some senses these transformations reflect the interactions between the macro (global developments) and the micro (country developments). Key to the transformations witnessed in the South is the process of professionalisation of new groups (for example, security guards) and as a strategy for limiting certain rights. And, fourthly the strategies developed by the state, professional bodies and educational/training institutions to effect racial transformation in the composition of traditional professions.

BONOLI, GIULIANO* (University of Lausanne, giuliano.bonoli@idheap.unil.ch)

Social Investment Policies in Times of Permanent Austerity

The objective of this paper is to identify the political conditions that are most likely to be conducive to the development of social investment policies. It starts from the view that the state's response to welfare retrenchment that in the current context of permanent austerity, policy is likely to be dominated by retrenchment and implemented in a way that allows governments to minimise the risk of electoral punishment (blame avoidance). It is argued that this view is consistent with developments observed in several European countries, were some welfare state expansion has taken place mostly in the fields of childcare and active labour market policy. An alternative model is put forward, that emphasises the notion of "affordable credit claiming". It is argued that even under strong budgetary pressures, governments maintain a preference for policies that allow them to claim credit for their actions and that the traditional redistributive policies tend to be off the menu for cost reasons, governments have tended to favour investments in childcare and active labour market policy as credit claiming tools. Policies developed in this way while they have a social investment flavour, tend to be more limited in the extent to which they genuinely improve prospects of disadvantaged people by investing in their human capital. A more ambitious strategy of social investment seems unlikely to develop on the basis of affordable credit claiming.

The paper starts by presenting the theoretical argument, which is then illustrated with examples taken from European countries both in the pre-crisis and in the post-crisis years.

BONVIN, JEAN-MICHEL* (Haute école travail social et santé, jmbonvin@eessp.ch)

The Potential of the Capability Approach for Developing a Sociology of Democracy

The capability approach emphasizes the tight connection between democratization and social justice, thus providing an essential clue in the "agency vs. structure" debate. In Development as Freedom (1999), Sen insists on the constructive value of democracy that, ideally, should allow all people to effectively take part in collective decision-making processes, i.e., to express their viewpoints, wishes, expectations, etc. but also the information and knowledge they have about the issue under scrutiny, and to make them count. In other words, democratization should permit all people (agency) to be part of the construction of the social fabric (structure), thus contributing to a more reflexive relationship between agency and structure. The paper focuses on the potential of such a perspective for developing a sociology of democracy; it both discusses its normative foundations, and suggests analytical tools for its implementation in the empirical enquiry. At normative level, Sen's fascination for democracy has raised sharp criticisms: real democracy does not match Sen's ideal at all; only active deliberators are allowed to enjoy the full benefits of democracy (cf. Cohen's objection of athleteism, etc.). In The Idea of Justice (2009), Sen strives to answer these criticisms: he develops a notion of democracy as public reasoning, emphasizes the relevance of issues such as the informational role of democracy, the inescapable plurality of principles and the needed focus on tolerant values. The paper assesses to what extent these developments take up the normative challenges raised by the critics. At empirical level, the concept of "capability for voice" as a basis for the sociological use of the capability approach is presented, and the factors facilitating (or impeding) its effective implementation are identified, thus providing an analytical grid for the sociological enquiry of democracy and participation.

BOOI, HESTER* (Bureau for Research and Statistics, h.booi@os.amsterdam.nl)

Amsterdam: How Just Is the Social Housing Sector?

The role of the social housing sector in the Netherlands is changing, it becomes smaller and more exclusively targeted to lower income groups. In Amsterdam, where half of the housing stock is owned by housing associations, the effect of these changes will have a great impact on the city. Susan Fainstein argues in 'The Just City' that the social housing system is a key element that makes Amsterdam a just city. But how just is the social housing sector in Amsterdam? And what impact will all these changes have on the chances to move in the city and the spatial division of the city?

The distribution system of social housing in Amsterdam is based on waiting time. The longer the waiting time, the higher chances are to find a new dwelling. The waiting list is long, the mean waiting time is 15 years.

Previous research indicate that in general younger households, households with a higher income and non-immigrant groups tend to have higher chances to move. Our first findings indicate that is also the case within the social housing sector. Although waiting time is the basis of the distribution system, our findings show that waiting time is not a relevant factor in explaining the chances for households to move.

In Amsterdam the segregation levels are rising. The social housing sector does not seem to contribute directly to the income-segregation, but our first findings indicate that it does influence the ethnic segregation in the city.

The analyses are based on the biennial survey 'living in Amsterdam' (17,000 respondents) combined with the actual moving behavior of the respondents. To reflect on the outcomes of these analyses we look at the actual spatial distribution of housing and households based on register data.

Imagination of Nation in Multi-Ethnic Situation: Understanding Ideological Conflicts and Ethnic Exclusions in the Imagination of 'bharat Mata'

Imagination of Nation in Multi-Ethnic Situation: Understanding Ideological Conflicts and Ethnic Exclusions in the Imagination of 'bharat Mata'

The idea of nation has traversed a long path of contradictory conceptualization based on the perspective adopted and the context where it is done. Debate on the precedence of nation and state is continued along the basic question of the idea of nation itself. Historical specificity lead to precedence of nation before state in Europe, but state formation followed by attempt to create a corresponding nation is more visible in the case of post colonial countries of Asia and Africa, although exceptions are also visible. The post colonial state formed mainly with the formulation of the colonial masters, which are many times not suits the ground realities thereby opens the scope for ethnic assertions among multiple groups. This lead to two important questions: the validity of state formation in the multi-ethnic situation and what leads to the formation of the nation? Although both questions need special attentions but addressing the second question can also lead to some clues to the first question.

We see that the imagination of bharat mata in the Indian context as separate nation is totally different from the western idea of imagination of a nation. Rather than simple imagination, it is more to do with darshan which has more to do with seeing beyond the eternal reality. Such philosophical underpinnings of the imagination of the Indian nation lead to emergence of distinct nature of Indian imagination which has more to do with dominant Hindu ideology, and thus excluding all others who don't come in its fold. This inherent exclusion that takes place in the imagination of bharat mata is manifested as routine part of life thereby became tragic.

A great number of chemicals are used along the complex supply chains of textiles. Since many of these substances are hazardous to human health and the environment, dealing with knowledge-related challenges plays a central role for achieving a responsible governance of textile supply chains. Although previous research enables identification of general organisational commitments and capabilities facilitating the transition towards responsible supply chain management (RSCM), the challenges in various contextual settings need more detailed scrutiny. In this study, we investigate which knowledge requirements and knowledge strategies textile procuring organisations experience and apply when striving to satisfy expectations from external stakeholders as well as from internal pressure. We describe these challenges regarding chemical risks in the supply chain and analyse how the efforts potentially relate to expressed commitments as well as perceived capabilities for responsible supply chain management (RSCM). We lean on literature on Supply Chain Management and Sustainable Supply Chain Management in order to analyse the knowledge process. Empirically, the paper builds on a qualitative study of medium-sized Swedish textile procuring organizations. Participatory observations and a series of semi-structured interviews were conducted with staff responsible for environment, procurement, and CSR, as well as with other actors that in various ways engage in developing policies, instruments, and knowledge of relevance for RSCM. The empirical results show that several textile procuring organisations express serious commitments towards achieving RSCM. However, most organisations feel they lack capabilities in rising to the challenge. There seems to be a poor state of knowledge on many substances and inherent difficulties in both gaining knowledge on chemical risks as well as facilitating a responsible management upstream complex supply chains.

**Differential Subalterns in a New Social Movement to Prevent Bauxite Extraction on the Niyamgiri Mountain in Eastern India**

The Niyamgiri movement in Eastern India witnessed the participation of several kinds of actors, ranging from indigenous villagers to European governments. This paper will examine how these threatened by environmental risks, such as inhabitants of the region around the mining project against which the movement was launched, responded through symbolic action, legal mobilization, ‘pure politics’, media activism and contingent alliances with political parties. Across these strategies, the trope of indigeneity as symbiosis with Nature can be traced as a theme countering the philosophy of industrialized development of which the proposed mining project at Niyamgiri was to be an example, as well as a tool encouraging/facilitating state and trans-national sympathy for the protest movement. The operationalization of this theme by non-indigenous inhabitants of the region around Niyamgiri, the legacy of the presence of this theme in Indian culture, and official state reception of it in legal, legislative and discursive terms, will constitute the paper’s first layer of analysis. The second layer of analysis will focus on why non-indigenous actors who had valid reasons of their own for opposing the mining project, chose to rally around this theme, and project the cause of the indigenous villagers who were threatened with the loss of their land, to the forefront of the movement. This analysis will be undertaken with the help of subaltern theory and new social movement theory. The non-indigenous villagers will be analysed as differential subalterns and the Niyamgiri movement as a new social movement. Indigeneity as living in the space of tension between exclusion and freedom, will be explored as a potentially useful concept for the provocation of public debate on the validity of mainstream industrialized development – the paper will analyse whether indigeneity then remains a legal/strategic instrumentalization or goes beyond to become a call to broad-based cultural critique/renewal?

**European Environmental Cosmopolitanism As a Call to Indian Gandhian-Style Democracy: The New Environmental Nation-State As Soft Power?**

Zygmun Bauman offers a persuasive argument of the importance of Europe’s post-imperial cosmopolitan role in world politics. Part of a legacy that traces itself to Immanuel Kant, this stance can be argued to be a form a soft power – a way to consolidate legitimacy in the global moral economy. This paper will argue that in the Indian context, and with pertinence to a particular case, it has been received as a call to a similar response. The case concerns the struggle of what was highlighted as an indigenous community protesting against the acquisition of their sacred mountain by a UK-based mining company. The Norwegian government and the Church of England among others, disinvested in the company and also tried to apply diplomatic pressure on the Indian government to ban the company’s mining project – to which the Indian government responded amenable and with an official acknowledgement of the role of the Norwegian government in influencing its decision. However, in further developments related to the case, the Indian Supreme Court issued a landmark judgment that was perhaps as much diplomacy as it was jurisprudence – it asked for an environmental referendum at the level of the village councils of the indigenous community, which would decide the fate of the mining project. In data collected in relation to this case, many informants emphasized that the government’s stance was more influenced by the management of its image in the international public sphere than it was by domestic imperatives. The paper will argue that the government’s actions were in fact a way in which to go beyond the European cosmopolitanism to which it responded, and showcase efforts towards a Gandhian-style grassroots-level environmental democracy – thereby enhancing its own stock of diplomatic soft power.

**CAN Cultural Festivals Create Sustainable Tourism ? A Study Based on Festivals in North East India**

Festivals are integral to culture. Culture formats festivals, reflecting traditions, belief and faith of the communities in its celebration. Festivals brand communities, display culture in all forms, preserve ethnicity and identity that create potential for tourism markets. Tourism is gaining momentum across the globe owing to growing assets of tourism. Festivals, events and cultural tourism is a marketing mix and economic phenomenon, that creates innovative tourist avenues for developing nations. In India, Assam tourism policy banks upon the festivals and cultural heritage of the state as tourism product promotion. The deviation is from simple celebration to commercialization. In this context, the study is a research on festivals that showcase culture in art, dance forms, traditional handicrafts, jewellery, etc that is hypothesized to impact on creation of tourism. Method: The centre of the study is the touristic and commercial hub of Guwahati city, a major destination for all North East States in India and gateway to several South East Asian countries that forms India’s Look East Policy. Guwahati holds the major destination for all North East States in India and gateway to several South East Asian countries that forms India’s Look East Policy. Guwahati holds Guwahati holds Guwahati holds Guwahati holds

**“Maternity Capital Program” in Russia and Its Outcomes: Gender Perspective**

This paper (based on the collective project) examines the implementation of the Maternal Capital Program (MCP) in Russia (2006 - 2016). MCP - the most prominent feature of Russian family policy in recent years - is the monetary benefit aimed at support of the family with two and more children. It is targeted basically on mothers and has to be spent on purposes predefined by the policy-makers. MCP is gendered and has gender consequences. We show that instead of promoting work-family balance for working mothers and gender equality, MCP is primarily aimed at encouraging the traditional role of the woman as the mother...
and the main subject of care. Interestingly enough such policy takes place in the context of economic growth in Russia. The empirical data are the documents of MCP and 36 interviews with mothers who are eligible for MCP. The questions are: how the social policies are perceived by families, how MCP is used. The researchers control biographic situations as household structure, material conditions, housing situation, health status of children and parents, education and employment of parents, support from the older generation, availability of childcare institutions.

The analysis is based on the feminist approach aiming to investigate if the political measures empower women and help to achieve gender equality. The structure of the paper is as following: The first part presents the discourse analysis of MCP. The second part focuses on the practices of implementation of MCP. In the third part, a broader perspective is reconstructed on the basis of interview data which represents the citizens’ attitude towards the conducted social policy and its gender consequences.

*Building a-Where-Ness: Housing Access Strategies of Internationally Protected Individuals* 

*Building a-where-ness: housing access strategies of internationally protected individuals*

Alongside citizenship there is an increasing number of legal statuses that are temporarily limited among which refugees, asylum seekers and internationally protected individuals. These categories share the same territoriality with citizens, although they have limited rights. Most importantly, they have different access possibilities to such rights. Despite the creation of a common European asylum system, issues regarding reception and integration of refugees and internationally protected people are still heavily relying on nation state decisions and their policies. This happens within the context of restructuring of welfare and decentralization of competences from the central level to regional and local levels that addresses not only the territorial dimension of policies but also the actors involved in their implementation, leading to a subsidiarization of social policies (Kazepov, 2010).

Temporary protected individuals are caught in a mechanism of bureaucratic and juridical obstacles that displays itself as multi-layered according to different territorial levels: interestingly the fact that the rights of these categories are anchored at the national and even the supra-national level (EU Regulations, Conventions) does not necessarily imply a correspondence at the local level. Through the findings of a multi-sited research in two local societies in Europe, Turin (Italy) and Berlin (Germany), this contribution means to offer an insight on how boundaries are produced within both cities, and what practices are enacted by internationally protected people in the process of access to housing policies. It is going to point out how the interplay of normative settings on different scales hinders the access of internationally protected people to public services at the local level.

*“Vanz” Phenomenon*

Vanz behavior or behavior of male teenagers who like to increase speed of their illegally modified motorcycles in order to make a loud noise “Vanz” and illegally race on public roads at night is a social phenomenon in Thailand. This phenomenon is an infringement of human rights, social order and laws because it interrupts and harms to other people and property. This problem is seriously being solved by law enforcement; however, it cannot be solved by law enforcement only because it is social pathology which needs an understanding of problem system, cause and social impact. The research result suggests that Vanz is a social combination of teenagers to form their social identity and social space. This behavior can reflect myth or false consciousness of teenagers by creating social recognition and identity, for example, trying to be outstanding person in order to get female teenagers’ attention, without paying attention to other people’s death and life.

While the above problem is continuing, Vanz gangs have their own self concept that their behavior is not a problem or an inflection. Moreover, there are several kinds of Vanz behavior, such as showing illegally modified motorcycles, riding for social combination, illegally racing for attention and racing for betting. Therefore, an overall understanding of this phenomenon is needed in order to know and categorize teenagers into problem group and risk group. Also, the problem is multi-facet which cannot be solved by only one solution.

Therefore, the problem should be clearly understood and target groups of problem solving should be clearly categorized. Guidelines to solve the problem should be various strategies which are designed by participation of concerned organizations and their awareness. Traffic regulations must be strict and be the same standard. The concerned organizations should collaborate to prevent, support, enhance and suppress the problem.

**Scale, The Silo Effect and Intergovernmental Cooperation:** Institutional Analysis Of Global-City Development and Ecological Sustainability

American global cities include only 25 percent of the U.S. urban population, but are at the nexus of U.S. and world economies and culture. While recognized as compelling world stages and mighty seats of power, they also contain the ingredients of a “full-spectrum problem” for public policymaking. They exist in huge scale, overwhelming complexity, and in paradox regarding globalization’s forces behind urban development and the limits of ecological carrying capacity. Furthermore, their urban governmental jurisdictions are often mismatched with the problem’s central elements, and policy outcomes frequently reflect difficulty achieving cooperative intergovernmental behavior. This paper examines the ability of multinucleated urban government in dealing effectively with issues of scale, complexity and paradox, and to identify criteria necessary to improve policymaking for global cities.

As previous research suggests (Boschken, 2013, 2008), global cities are a special case in the American urban experience. Due to the skewed configuration and momentum imparted by contemporary globalization, they have evolved along a different path than America’s other metropolitan areas. This path is characterized by their centrality in a corporate global economy and by the enrichment of other conditions regarding political culture, lifestyle and consumption. But, most importantly, American global cities have enormous footprints extending beyond their regional confines, enabling globalization’s developmental requisites to influence a nation’s entire socioeconomic and ecological condition. Although atypical in these respects, global cities are similar to other cities in their polycentric governmental structure, consisting of general-function city and county governments, special districts, and regional planning, development and regulatory agencies. Although superior to a unitary bureaucracy in dealing with complexity and systemic interdependencies, multinucleated government nevertheless raises concerns about collaborative, integrated, evidence-based policymaking. This paper examines intergovernmental impediments to collective policymaking and poses structural-design reforms that could improve policy response to the problems of scale, complexity and the sustainability paradox.

**Mapping the Categories and Overlapping Roles of Publics/ Stakeholders in University Research in Nigeria and South Africa**

University researchers are increasingly faced with the challenge of multiple demands from both the publics and stakeholders of their research, and often these two groupings overlap. Publics are abstract entities that have a direct stake in the research message, i.e. the target audience or intended beneficiaries. Publics are also stakeholders to the extent that they may have a direct stake in the creation, dissemination or uptake of the message, and/or in the creation of the research behind the message. The aim of the current study is to map the different categories of publics/stakeholders in Nigerian and South African research published between 2010 and 2012, and to demonstrate their overlapping roles. The first focus of the paper is a bibliometric analysis of research articles by universities in the two countries, extracted from the Web of Science, and highlighting the role of funders and collaborators in the research. The second focus is more specific, as it investigates the co-occurrences of publics/stakeholders at different stages of research (creation, transmission and uptake) and how these relate to other factors of research production, such as research field and the nature of the research (curiosity-driven research; research addressing grand challenges; and research contributing to economic growth, job creation and innovation). The methodology for the second focus involves an electronic survey of the corresponding authors of the published research articles.

**Participation of Women and Girls in the National Science, Technology and Innovation System in South Africa**

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
The importance of documenting data on the inclusion and participation of women and girls in a society's science, technology and innovation (STI) system cannot be underestimated. The paper presents results from the Gender Equality and the Knowledge Society Framework indicators: an enabling policy environment, opportunity and capability, and women in Science and Technology and innovation systems to understand the status of women and girls in different spheres of South Africa’s reality as well as their participation in the knowledge society. It is argued that the policy environment in South Africa has ensured that a gender machinery has been put into place and operates in all the realms of government. A lack of funding, human resources’ constraints and insufficient co-ordination mechanisms have hampered the effective implementation of some of the policies. Statistics around access to quality education for girls and boys are provided and a discussion around some specific projects and mechanisms that have been put in place to encourage the uptake by girls of science and mathematics at school levels are presented as case studies of the opportunities available to ensure gender parity in STI education. Lastly data is presented on women’s participation in the STI system in South Africa. South Africa has an aging, predominantly white male, scientific and engineering workforce. In this regard, there is a need to focus on both tertiary level education as well as women in science leadership in the country.

**Different, Marginal or Discriminated? Representation of the Family and Practices of Parental Responsibility in the Opinion of Same-Sex Parents and Their Children**

In the variety of family configurations that characterizes contemporary pluralistic societies, homo-parental families stand out as a “social laboratory”, as they are confronted with new, complex psychological and social problems. Moreover, in Italy they construct parenting in a condition of anomie, owing to the lack of social and legal institutionalization.

In the paper, after giving an overview on the orientations expressed by sociological and legal culture on the concept of parental responsibility, we present some findings from a pilot study conducted with Italian same-sex parents and children born or grown up in homoparental families. The aim was to investigate parents’ and children’s social representations of their family and practices of parental responsibility. Adults and children were in depth interviewed and involved in focus groups. More specifically, we interviewed 4 couples of gay fathers and 6 couples of lesbian mothers, we involved 7 children – aged 9-12 – in two focus groups and finally we individually interviewed 2 girls over 18.

Adults and children were asked to talk about their daily life in order to identify the practices of parenting and the representations with regard to the dynamics governing the roles and practices of different parental figures. We detected norms, values, upbringing style, child care, and disciplinary practices, and their experience with respect to agencies of socialization, especially school.

**Opinions and Representations of Rights in Children with Visual Impairment. Findings from a Research Conducted in Italy**

Young disabled people are subjected to a dual risk of social marginalization because of their age and disability. This risk is closely related to the conception we have of children and of disability. Current approach in childhood and disability studies considers children and disabled people as active members of society, subjects with rights, capable to express their opinions, identify their needs and claim rights. This tenor is stated – among others – in two international legal documents: the 1989 UN CRC and the 2008 UN CRPD.

But which representations do disabled children have of themselves, their agency and rights? We can assume that such representations are related on how they/ we define childhood (an age characterized by incompleteness and vulnerability rather than an age whose components are competent social beings) and disability (an internal condition of individual rather than an external condition determined by structural and organizational circumstances).

To answer these questions we planned a research with Italian visually impaired 12-18 years old children that integrates quantitative and qualitative methods. First, we will carry on a web-survey with a national sample of visually impaired children. We will ask questions on their knowledge, representations and respect of their rights at home, school and in their spare time. Second, we will conduct 12 focus groups and 30 in depth interviews to identify, analyse and look for solutions to issues concerning their rights. Some children will be involved in the research-planning in order to implement a web-platform accessible to them, and to identify the topics to be addressed. For all these respects, the research contributes to the field of study related to the sociology of children’s rights (aiming to investigate the “common sense of law” developed by children in their everyday normative and legal experiences), and the field of participatory and emancipatory research.

**BOSSENDAL, INGRID** (Lund University, ingrid.bossendal@gmail.com)

**On Justification of Child Treatment**

On justification of child treatment

Since a government decision in 2009 Sweden has a national policy for parental support, attended by the Swedish Institute of Public Health and strongly oriented to parental interventions that are evidence based (which is defined by the author as “interventions that have been checked by high-quality research and have proven to give results”). Furthermore the Swedish Institute of Public Health states that “support of good parenthood” is one of the main targets for the public health interventions.

In this paper I analyse the definitions of child and childhood in the national policy for parental support and in three of the proposed, so called “evidence based” parental educations (whereof two are directly imported from USA, with none adaption to a Swedish context).

My research aims to investigate how different definitions of a child – and “good parenthood” - is used by the authorities to legitimise a certain - and preferred - kind of parental treatment of the child. When is the child’s behaviour seen as a problem? How, and from which professional perspectives and national contexts, are the parents taught to act in these situations? And why are they taught to act like this (how are the insisted actions justified)?

Theoretical as well as analytical I am influenced by Michael Foucaults archeological discourse analyses (highly applicable in a field so composed by investments in scientific findings) and Luc Boltanskis and Laurent Thèvenots six orders of worth.

**Developing Capacities for Sustained Transnational Environmental Activism**

Most environmental problems are extremely long term and have cross-border implications. For environmental non-governmental organizations (ENGOs) to achieve significant impact on environmental governance cross-border and sustained activities are required. The purpose of the paper is to identify key barriers and possible pathways to develop sustained and transnational environmental activism among ENGOs operating in strikingly different political contexts.

Our analysis is based on qualitative methodology and empirical analyses of ENGOs in six countries (Sweden, Germany, Poland, Italy, Slovenia and Croatia) and two regional contexts, the Baltic Sea and the Adriatic Sea regions. The study is based on document analyses and semi-structured interviews with representatives from 4-6 key ENGOs in each country. The theoretical framework departs partially from social movement theory.

The paper reveals intriguing similarities and differences between the countries regarding ENGOs’ abilities to develop sustained and cross-border activism. We pay particular attention to differences in opportunity structures for resource mobilization. The last decades, the European Union (EU) has emerged as a key opportunity structure that in various ways facilitate cross-border collaboration and capacity building among ENGOs, particularly in Central and Eastern European (CEE) Countries. However, the EU also considerably shapes the conditions for ENGOs to set independent long-term agendas. With the exception of Germany and Sweden, ENGOs “relly heavily on their ability to develop a legitimacy, which in turn requires fund-raising skills and procedures. Also ENGOs in Germany and Sweden make use of public grants. However, the fact that they historically have been able to mobilize huge number of members/supporters –which is still extremely difficult in particular in post-communist countries - have profound implications for abilities to develop transnational and sustained environmental activism. We discuss the role of (dis)trust (institutional vs. family-based trust), political culture and historical legacies to analyze these remarkably different conditions for resource mobilization.

The Impact of Motherhood on Women's Retirement Income: Six EU Countries

Concern with equity and adequacy in retirement income for men and women is a serious issue, especially due to the longer life expectancy of women in Europe and North America. Women not only face a higher risk of widowhood, but also the incidence of divorce has become greater. Older women, especially, are at risk of living in a single person household, a household that does not have the economies of scale of a two-person household.

Important factors in retirement economic security and equity are linked to the work life of women in comparison with men. Under current conditions women are likely to have not only a less stable work life but also more limited access to better pensions linked to a stable work life. The most important factor impacting a women's work life is motherhood in contrast to fathers who typically have a more stable work-life than non-fathers.

Initial results indicate that where there is greater protection for mothers to sustain their work-force activity to contribute to pensions systems during maternity leave or leave to caregiving their pensions will be more similar to those of men. This is the case of Sweden where gender equity and gender mainstreaming have been a long established as policy goal. In Germany, however, mothers typically drop out of the workforce and have very limited access to pensions based on their own workforces history. In Spain and Italy where mothers of this generation typically did not work, widows will be more at risk although these widows may benefit, from living arrangements with adult children which can protect them from poverty. The situation in France and Belgium will also be analyzed.

The data for this paper come from SHARE (Survey of Health, Aging and Retirement in Europe) which allows a detailed analysis of the six countries.

These people, bound by their common use of the Internet, are known to be at the fore of the online petition asking for José Bové’s ‘come-back’. On a second time, this paper examines the day-to-day practices of these migrants to show how a more traditional repertoire of actions remain and shape, complete or interfere with their online practices.

[3] The analysis based on a 3 year long field work carried out among some José Bové’s campaign activists included semi-structured interviews and participants’ observations.

There are only few, if any, studies of inequality in the long run even though it is widely acknowledged that intergenerational mobility fluctuates a lot. At the same time, several studies observe the way different kinds of capital are transmitted between generations. We take advantage of a large genealogical sample (we have detailed data on wealth at death, education, occupation, and mortality for fathers and their children over a century and half) to study the transmission of different forms of assets in France in the long run. The period under study is characterized by major changes: industrialization, urbanization, expansion of wage labor, self-growing professional women—as well as by economic and political shocks. All these changes have deep and lasting effects on wealth structure, on the return of various kinds of wealth and portfolios, and on the relative importance of different types of capital.

We will address the question of the effect on individuals of a given generation of receiving capital from the previous generation. First, we will consider the transmission of material wealth, studying those who get any wealth versus those who get nothing before looking at the amount of inherited wealth. Second, we will take into account the composition of the inherited wealth (real estate, financial assets or working material for instance). In particular, we aim at differentiating the effect of transmission as a whole—or transmission of any type of wealth—from the transmission of particular goods (for instance any kind of land versus the one the individual has worked on with his father since his youth). Third, we will consider non-material inheritance—mainly education and occupation—and its interactions with wealth. We will investigate if other types of capital compensate the absence, or the scarcity, of wealth or if, conversely, inequalities are cumulative.

BOURQUI, MIKAEL* (University of Oxford, mikael.bourqui@sociology.ox.ac.uk)
Conceptualizing the Globalization of Local and National Class Structures from the Case of Tokyo and Japan

The internationalisation of markets and the acceleration of the circulation of people (both, of course, within controlled regimes) has quite naturally led observers to speculate on the emergence of a global class structure, in addition to the increasingly studied impacts on national class structures of the spatial reorganization of world economic activity. In this way systems of social stratification, too, are concerned by globalization defined as a general process by which the world scale becomes relevant. The proposition that underlies the question of globalization and class is the assumption that the identity of a class is tied to the place of its members in the world economic system.

Specifically, the paper discusses the experiences of an international student who participated in the mobilization of Collective Actors Around the Stake of Environmental Health

Various sanitary crises (such as asbestos, contaminated blood, madcow disease BSE, etc., industrial accidents (Tchernobyl, Seveso, Bhopal, etc) and the rapid development of new technologies (biotechnologies, nanotechnologies, electromagnetics fields...) induced a growing public concern on the links between environment and health. Several participatory initiatives of upstream engagement of these NGOs have been conducted such as public debates, dialogue committees, etc. to try to regain trust in the institutions and in the process of health risk assessment. This communication will present and analyze the processes set up within the French Agency for Food, Environmental and Occupational Health & Safety to foster dialogue with civil society in this field.

RC47-777.2
BOURQUI, MIKAEL* (University of Oxford, mikael.bourqui@sociology.ox.ac.uk)
The Mobilization of Collective Actors Around the Stake of Environmental Health

The rapid development of technologies, such as biotechnologies, nanotechnologies and radioactive frequencies (namely mobile phones, Wi-fi, relay masts, etc.) available on the market is expected to contribute to the insufficient risk assessment of their potential negative impacts on health resulting in a growing public concern and distrust in the general benefits of science and technology. Uncertainties and scientific controversies related to the consequences on human health and biodiversity of these emerging environmental and bio-physical hazards (such as the presence of GMOs and nanomaterials in food or manufactured products or the increase in electromagnetic fields) are rising. They question scientific “technocratic” expertise and more largely the gap between science and society. Various groups (NGOs) contest the use of these technologies and traditional risk governance. They demand a better transparency in the decision-making process as to technological choices and a more democratic governance of public policies in the field of environmental health. Several participatory initiatives of upstream engagement of these NGOs have been conducted such as public debates, dialogues committees, etc. to try to regain trust in the institutions and in the process of health risk assessment. This communication will present and analyze the processes set up within the French Agency for Food, Environmental and Occupational Health & Safety to foster dialogue with civil society in this field.

Redevelopment and Reinvention in ‘Low City’ Tokyo

The term ‘gentrification’ in the case of Tokyo has been applied to a process, begun in the 1960s-1970s, of construction of high-rise residential or mixed-use complexes in formerly industrial areas (especially along the Sumida river and Tokyo Bay waterfronts). The developers behind these projects are among the largest corporations in the country. While some of the most prominent ones involve typical brownfield sites such as freight yards, most are built by consolidating many small plots, and they replace a vernacular landscape of factories, shops, and low-rise wooden housing. This landscape, emblematic of Tokyo’s traditional ‘low city’ areas, now exists in the gaps between towers of apartments marketed to white-collar commuters, alongside new parks and shopping facilities created as part of these developments to fulfill ‘public space’ commitments. While the ‘low city’ landscape is pushed to the margins, there is interest in promoting a nostalgic image of it to drive local tourism as a way to compensate for the decline in manufacturing employment. This may be encouraged by developers and local authorities, as with the promotion of the ‘Tokyo Skytree’, a combined television transmission and observation deck opened in a formerly run-down area by a consortium of rail and TV companies, as part of a ‘low city’ travel experience. There are also community-led initiatives to market local culinary and other culture to visitors. Using photography, maps, and visual media including advertising, this paper documents these three contrasting visual aspects of the ‘new low city’; the urbanized rear of the city, the industrial landscape of traditional ‘low city’ areas, and the materialisation of revived local character (sometimes as simulacrum or museum). It aims to throw light on the local transformations brought about by this model of urbanism and critically evaluate its contribution to community life and maintaining or promoting social diversity.

Statistical Representations and Stereotypes of Youth Labour Market Participation. Insights from Australia

Statistical data can have important explanatory power, and with the rise of ‘evidence-based’ policy such forms of knowledge have become more influential. As Boehm and her co-authors (2012:236) observe: ‘Knowledge generation is not neutral, but it is influenced by social and political relationships that enact and generate knowledge’. Using youth labour market data as a case study, this paper will explore how statistical categories create and reinforce normative understandings of life stages, in this case, the period between 15-24 years of age. For example, the Australian Bureau of Statistics uses the category ‘fully engaged’ to describe those who are in full-time employment, full time education or training at or above Certificat III, both part-time employment and part-time education/training, or both full-time employment and full time/training. The number of people in this group is subtracted from the population of young people within certain age groupings – such as 15-24 or 18-24 – to calculate those who are ‘not fully engaged’. In government and other reports, this group is often referred to as ‘disengaged’ or ‘inactive’. In everyday usage, these terms have negative connotations. This paper will examine how the use of statistical categories such as ‘fully engaged’, ‘disengaged’ and ‘inactive’ in policy discourse in Australia – and elsewhere – reinforces negative stereotypes about young people and obscures the processes that shape young people’s lives.

The New Organising Model in Political Advocacy; Australia’s Experience

This paper considers some initial findings from a qualitative study examining the ways in which the new, techno-social organising model in progressive advocacy groups has changed the nature of political participation in Australia. Specifically, the paper draws on the findings of an ongoing participatory case study of GetUp – a campaigning organisation which describes itself as ‘... an independent, grass-roots community advocacy organisation which unites and builds a more progressive Australia by giving everyday Australians the opportunity to get involved and hold politicians accountable on important issues’ (GetUp, 2013). Established in 2005-2006, GetUp is a prime example of new member-driven, internet-mediated campaigning organisations that continue to challenge traditional notions of democratic participation with novel membership engagement practices. This paper discusses early findings pertaining to one of the study’s key research questions – How do GetUp members understand their own activism and their relationship to the organisation? Data collection methods employed have thus far included participant observation, document analysis, in-depth, semi-structured interviews with GetUp members and with elite professional campaigners, and thematic analysis of membership survey responses. Early findings suggest that members are drawn to GetUp because they do not feel that their voices are ‘heard’ by their political representatives or by mainstream political processes. GetUp appears to be for its members a voice and to foster a sense of community and shared values. Furthermore, GetUp can be viewed as one of an archetypal category of political advocacy groups which have emerged primarily in modern western societies human’s health.

BOYLE, KAITLIN* (The University of Georgia, kmboyle@uga.edu)

“Victims” and “Survivors” of Crime: The Effects of Labeling Unwanted Sexual Experiences on Mental Health

Despite a high level of general interest in stigmatized identities, sociologists have given little attention to victimization as a stigmatized identity. How adoption of this identity influences one’s self-sentiments, behaviors, and mental health has been largely unexplored. This is important because criminologists document that women who acknowledge as “rape victims” have different post-assault outcomes from those who do not acknowledge. This study applies affect control theory, a formalized theory of symbolic interaction, to examine the relationship between labels and sentiments, post-assault behaviors, and mental health in a survey of undergraduate college women. While previous studies generally use dichotomous measures of rape acknowledgment, neglecting other labels of the event, this study measures multiple event labels and links these labels to shame, anger, PTSD, and relationship termination. Results show that calling the event “sexual assault” or “rape” is associated with heightened PTSD, yet only “rape” is associated with increased shame. This suggests that the label “sexual assault,” which is also associated with relationship termination, is more benign and helpful than “rape.” Being a “victim” and calling the perpetrator a “rapist” are also associated with shame and PTSD, most likely because these are stigmatized labels that cause identity disruption and anxiety. Finally, “survivors” do not have increased shame or PTSD. Instead, this more powerful and active identity is associated with anger and relationship termination. This study generally supports rape workers’ and activists’ move towards calling women “survivors” instead of “victims.” However, the two labels are correlated and share similar predictors, revealing the complex nature of rape acknowledgment. General social psychological processes explained by affect control theory increase understanding of this process. Implications for the effects of labeling traumatic experiences on emotion, mental health, and identity are discussed.
Cosmopolitanism has been mooted as a possible transcendence to the sup-
posed demise of multicultural theorizing by some authors (Beck, 2007; Held, 
2010). Others have argued that its Western origins and bias limits its usefulness 
as universalizing theory to promote global solidarity (Pensky, 2007), while in con-
trast some have suggested that it is best complemented by a creation of solidarity 
“from below” (Kurasawa, 2004) or by focus on “everyday” forms of non-elite cos-
mopolitanism (Nava, 2002).

In this paper, I focus on criticisms of a free-floating cosmopolitanism, empha-
sizing an anthropology of the everyday worldliness viewed as a political project.
In other words, the elite form of cosmopolitanism’s chief weakness can be traced 
to its lack of a rootedness in the political struggles of working people in the face 
of economic and social injustice. These cannot be remediated simply by foci of 
liberal multiculturalism’s tolerance and recognition but potentially only in a more 
radical projection of conviviality with otherwise that recognizes the other in one-
self (Hage, 2012). “This involves a conundrum that the newcomer “other” is al-
ready part of the community, not separate. Therefore the question is not one of 
creating identities that surpass nations or borders, but ones which facilitate 
understandings of the self in communities replete with multicultural differences 
of post-national immigrant societies.

How to generalize such understanding across contexts is a key problem. One 
avenue suggested is that the construction of identities compatible with global and 
transnational phenomena (as opposed to substantive and more national-orient-
ed identities) promotes the type of relationality conducive to acceptance of global 
humanism (Pries, 2013).

However, another problem ensues as transnational imagined communities 
can also harbor anti-humanist attitudes and tendencies as illustrated both by 
exclusive conclaves (the super rich international elite, typified by Davos) or reac-
tory anti-immigrant populists, unified as political parties or in online groups.

Japanese Higher Education’s Fragility: Bureaucracy and Risk’s Dialectic

The scope of risks facing Japanese higher education institutions stems from 
both local conditions and global developments. Among the local factors are the 
steady pace of the 18-year-old population, difficulties in establishing norm-
tionalized programs to attract more foreign students, government disinclination 
to increase funding due to high deficits, strong linkages with vocational orienta-
tions and post-graduate employment guarantees, and underdeveloped graduate 
school education. Other more global risks include the growth in online education, 
for example MOOCs, administrative overload as a result of expanding academic 
and non-academic functions of universities, and challenges resulting from the 
trilemma (Kariya, 2011) of costs, equality of opportunity, and quality assurance.

Strong central bureaucratic management by the Ministry of Education (MEXT) 
is a notable feature of Japanese education in the form of shido (guidance), 
so that, for example, universities must follow stringent guidelines to implement 
new programs and create new departments. In addition to this layer of admin-
istrative control from outside and above, many universities rotate management 
positions within the organization. Insiders who have worked for long periods in 
the same university often become presidents, vice presidents, deans and heads 
of centers, and top administrators. The emphasis on strong administrative sta-

Assessing the Impact of Social Network Sites’ Usage on Bridging and Bonding Social Capital

When a computer network connects people, it can be referred to as a social network. Close relationships and social support are defined as social capital (SC) and are of prime interest for many sociology scholars. The recent widespread use of Social Network Sites (SNSS) may have SC implications. The concept of ‘virtual social capital’ suggests that there are off-line advantages that virtual community members can gain from their online affiliations. However, findings also indicated that male participants tended to benefit the most from using SC networks. Close relationships and social support are defined as SC (47 men and 80 women; ages 22-61) found that those who reported frequent use have an effect on the quality and quantity of offline bridging and bonding SC. Analysis of a web-based survey completed by a diverse group of 127 adults (47 men and 80 women; ages 22-61) found that those who reported frequent use of several SNSS benefited the most in terms of bridging and bonding SC quantity. However, findings also indicated that male participants tended to benefit the most from using SNSS, due to the fact that a large portion of their online contacts involved people with whom they also had face to face relationships, which thus contributed to bonding SC. Limitations and implications of the study are discussed.

Developing a Risk Inventory for the German K.I.D. 0-3 National Prevalence Study of Psychosocial Burdens in Early Childhood

Early exposure to psychosocial burdens in families with young children has been identified in the psychological child development literature as an important predictor of development deficiencies and a potential risk factor for child neglect. Its relevance, however, goes beyond the bounds of any particular social and policy context. A federal action plan of ‘early intervention’ aimed at children from birth to 36 months of age has been in place since 2009 and the National Prevalence Study of Psychosocial Burdens in Early Childhood has been initiated to evaluate the effectiveness of the action plan. The study was designed to provide a comprehensive picture of the range and extent of psychosocial burdens in early childhood, the factors associated with these burdens and the consequences for the children's development. The study was based on a national representative sample of 1,000 families with children aged 0-3 years and included interviews with parents, observations of the children, and questionnaires for the parents. The results indicated that psychosocial burdens were common in early childhood and were associated with a range of factors, including social and economic disadvantage, parental stress and mental health problems, and child characteristics. The study provided important insights into the needs of children and families and highlighted the importance of early intervention and support.
most the same demographics trends regarding their total population and Muslim population, it is very interesting to focus on how national policies on diversity, and especially Islam, influence extremist group discourses. Whether it focuses on the veil/burka or construction of mosque, both states deal differently and undermine the way extremism reject multiculturalism.

BRAULT, JEAN-FRANÇOIS* (Paris 8 University, jfbrault@live.fr)

Feminist Disagreements: The Post-Colonial Contention Between Femen and Muslim Women

Founded in 2008, Femen is a feminist Ukrainian protest group based in Kiev and in Paris, whose main political enemy is patriarchy. In their struggle for gender equality, Femen activism sees religious institutions as a substantial tool of oppression against women; hence the current anticiplerical position of the group. In Femen’s approach, nudity is the best means to break free from male dominance, and they deeply believe that being topless can be empowering. Femen’s mobilizations are always carried out in a spectacular way, in which they scream and shout provocative slogans that are also written on their naked bodies.

In my paper, I will mainly focus on Femen slogans that are addressed to muslim – especially veiled – women, encouraging liberation from both religion and male domination: “muslim women, let’s get naked”, “nudity is freedom”, “bare breast against islamism”, “topless jihad”. Muslim women have answered Femen’s injunction to liberate through nudity by creating a series of networks, accompanied by virtual and physical mobilizations, in which muslim women from all over the world post photos on facebook featuring reactive slogans such as “Islam is my choice”, “nudity is not freedom”, “Femen stole our voice”, “there is more than one way to be free”.

Indeed, one can clearly see how Femen’s mobilization has entailed a counter-mobilization led by muslim women, and under what circumstances the latter are questioning a hegemonic western idea of what a free body looks like. Far from being an event of the current struggle between Femen and muslim woman to define what “feminism” is and, by extension, what a free woman is, is not new. Rather, it alludes to a more deeply rooted antagonism that dates back to the colonial period.

Contrasting a Market-Led Tendency Towards Social and Functional Separation. Outcomes of a Comparative Research in Milan, Copenhagen and Hamburg

The redevelopment of inner city urban areas has been a main concern for European cities dealing with post-industrial restructuring in the last decades and large scale urban projects have been extensively and investigated by urban research. The raise of a complex interplay among different public and private actors as well as issues of social (in)justice have been analysed and discussed by critical research work with reference to the phases in which the projects and the master-plans have been conceived (see for example: Salet and Gualini, 2007; Fainstein, 2010).

While these large scale urban projects are now mostly implemented, it is worth investigating how spatial and social organization processes are developing in these new urban areas which tend to display a significant role in hosting a consistent number of those inhabitants who “return to the city” in the phase of re-urbanisation. In this respect, driving research questions may be: under which conditions, tent number of those inhabitants who “return to the city” in a phase of re-urbanisation these new urban areas which tend to display a significant role in hosting a consistent number of those inhabitants who “return to the city” in a phase of re-urbanisation.

Twenty years later after this landmark in scholarly discussions of experiences of migration and multilingualism, Eva Hoffman wrote the novel “Appassionata” (2009). A passionate and dramatic love affair between an American pianist and a Chechen partisan forms the story of this book, which is at the same time centred around extended reflections on music. Even though the autobiographical background of this novel is not at all obvious like in “Lost in Translation”, there is a strong connection between these two books.

In my paper I will reconstruct the intersections of cultures and nationalities, and more specifically of language and music in the biography of Eva Hoffman as particular ways to form and express fundamental experiences of an intellectual woman in turbulent historical times and circumstances.

Family Photo Albums on the Web

The use of photographs, especially their distribution and arrangement in photo albums, seems to undergo deep changes brought about by the technological developments of computer, internet, and specifically so-called social media (Pauwels 2002, 2008). Even though the traditional way to create family photo albums, especially for the following generation(s) (Hirsch 2002), is still an usual and for the respective families important social practice (Rose 2010), the question is at stake whether the shift to so-called new media is changing the biographical meaning and relevance of these practices.

What is different in form and content in processes of creating a family photo album in the semi-public realm of the internet with exclusively digital or digitalized photos, compared to the haptic way of choosing, arranging and gluing photos into an album-booklet? How is the former biographical significance of these practices transferred or ‘translated’ to the new media? My paper will explore these questions with an in-depth case study from a social network site using a combination of visual and text-based methodologies and methods.

The Place and Role of the Sociology of Law in the System of Science

The century has passed since the publication of the monumental work by Eugen Ehrlich – Grundlegung der Soziologie des Rechts – which marked the foundation of the discipline, but methodological problems and disciplinary belonging of the legal sociology are still disputed. After the century it is still not clear where does legal sociology belong to – is it a sub-discipline of sociology, is it a part of juristic science using interdisciplinary methods, or has it already been established as an autonomous discipline beyond both sociology and legal science, thus representing an independent discourse with its own identity, subject matter and internal logics? As argued by neutral observers of the discipline, the majority of socio-legal scholars doing either empirical or theoretical work, are mostly legally trained, having major in law but also additional training in sociology. The majority of influential manuals and textbooks in sociology of law are produced by legally trained scholars, who use interdisciplinary perspectives. Also sociology of law as an academic discipline is mostly taught at the law departments. Nevertheless sociology of law is conventionally conceived as sub-discipline of sociology, what really neglects increasing and almost exclusive role of legal scientists for the establishment of the discipline.

It will be argued in the paper that conventional thinking about disciplinary boundaries of legal sociology has to be reconsidered under its current academic status, role and institutional autonomy. Both emergence of independent socio-legal science course and its institutional autonomy legitimate this challenge.

The alternative definition of legal sociology will be proposed in the paper, stating that sociology of law represents an independent academic discipline beyond sociology and legal science, based on the observation of legal practices in social reality, having as its aim to criticize the positive law and propose alternatives for improving the modes of normative regulation in society.
The Marketization of Employment Services: Evidence from the UK, Germany, and Denmark

One trend across OECD countries since the late 1990s has been the marketization of employment services. Intense price-based competition is increasingly used to govern these services. Based on an in-depth three-country comparative project, this paper examines the extent and trajectory of marketization in Denmark, Germany, and the UK since the early 2000s. ART using fresh eggs are unable to compensate for this natural fertility decline and egg freezing is therefore thought as fertility declines with increasing female age; ART using fresh eggs are unable to preserve fertility. The 2011 bioethics law opened a door for the specific case of oocyte preservation, the technique is also used for cancer patients, prior to infertility-inducing treatments. In December 2012, the French College of OB/GYN stated that this technique should be made available to all women, arguing that the law is discriminatory. The underlying rationale is medical: this rising age average at which women have their first child is an important reproductive health problem, as fertility declines with increasing female age; ART using fresh eggs are unable to compensate for this natural fertility decline and egg freezing is therefore thought to be a timely reproductive insurance which should be an option for all women.

To transform public health messages into health-inducing acts, and relying on state-sponsored healthcare priorities specifically linked to gender (perinatal care, breast cancer screening). The women interviewed strongly relied on themselves to create global health trajectories, and not simply healthcare trajectories, encompassing past family habits when they considered them useful to their health, but also discarding family histories of ill-treatment to save themselves through the consolidation of their health. Health trajectories thus appear as a vector of self-discovery and subjectivity. However, health is also a relationship to healthcare professionals and healthcare structures. This is the second key aspect of this study: women demand a personalized relationship with physicians, which goes beyond protocolized treatment schemes. As Pilnick and Dingwall (2011) have shown, though, women don’t challenge the asymmetrical nature of patient-physician interaction. The physician’s expert knowledge is sought and valued as such, but women concurrently ask that their profane, personal, body-anchored, knowledge of their health or ill-health be taken into account by their physicians.

We will thus show that women are forceful actors in the determination of their health patterns, relying on their own resources, while tapping into a highly sophisticated biomedical system into which they strive – on an individual level – to promote a more personalized patient-physician relationship attuned to the experiences of their own, singular, bodies.

Stability and Change in Language Use during the Transition from Primary to Secondary Education in a Catalan Sociolinguistic Environment

One of the current challenges confronting bilingual education has to do with pupils’ reluctance to transfer their school-based L2 linguistic knowledge into their wider social domain. Whilst it is clear that bilingual education, in its multiple forms, can and does lead to successful outcomes (Baker 2006), the definition of success is often limited to the sociopolitical climate of the school, area or community and to the patterns of dominance relations between the two languages (Thomas and Roberts 2011). Nowadays, the successful bilingual education in Catalonia is complex. On one hand, knowledge of Catalan among young people has increased significantly. However, knowledge is not seen translated into an effective growth in the use of Catalan inside and outside the school. Some authors have attempted to explain part of this process by examining the transition from childhood to youth.

This paper investigates the change in language practices that take place during the transition from primary to secondary school. It focuses especially on: identifying the most relevant changes that are produced in the linguistic uses in three domains: home, school and peer-to-peer, and examining the influence of sociodemographic and sociolinguistic environment in the transition and its sociolinguistic impact. The methodology for the study was based on a survey on language competence and use in Catalan and Castilian. The universe of the study is formed by 888 pupils aged between 11 and 13. The basis of the analysis is a panel comparison of indicators. Results show that in the transition from primary to secondary school, there is an increase in the use of Castilian in all domains from home to school. However, the use of Catalan is explained by the characteristics of the individual, the nature of the linguistic interaction and the availability of the language inside and outside the school.

Local Alliances and Metropolitan Planning Issues. How Do Local Elected Officials Negotiate Their Position?

This paper addresses what it means to be a mayor in a metropolitan planning context. Specifically, by looking at the implementation of a metropolitan urban plan concentrating on transit-oriented developments, we wish to highlight the interactions at play between local mayors. While pursuing goals related to sustainable development such as increased residential densities, mixed-use development, greater use of public transport, and the preservation of rural land and natural areas, mayors in the North American context also seek growth in the municipalities they represent. Given the contradictions at work, how do local elected officials collaborate to take part in the development of a metropolitan scene including issues of environmental protection? By trying to differentiate their cities, mayors endorse planning innovations. Our goal here is to highlight the alliances and oppositions between local elected officials in order to better understand the sociopolitical processes at work at the metropolitan level by looking at the Mon-
treal Metropolitan Community, an entity that has adopted a metropolitan development plan in 2012. We also aim at providing a portrait of mayor’s specific role in a context where major institutional reforms and increased citizen participation have forced new strategies of regional collaboration.

BREWER, ROSE* (University of Minnesota-Twin Cities, brewe001@umn.edu)

Decolonizing Knowledge(s) in 21st Century Political Struggles

The paper is a call for a deeper interrogation of how knowledge is produced and whose theory and practice are guide-posts for 21st century revolutionary change. In international knowledge production spaces such as the ISA, we need to put the issue of decolonizing on the table. Regarding political change, too often the same colonial assumptions are folded into social movements as the very knowledge systems that originally colonized. It is a call for traditionally marginalized voices to be heard, but also a call for interrogating the hierarchies reproduced in social movement spaces. What is clear regarding knowledge for whom, we must think more intersectionally, decentering the traditional ways of articulating social change. We must interrogate continued practices of heteropatriarchy, colonialisms: neo, settler and internal, in the context of neoliberal global capitalism.

BREWER, ROSE* (University of Minnesota-Twin Cities, brewe001@umn.edu)

Interrogating Racism and Class in the Capitalist World System: Historical Formations and Contemporary Realities

Racism and other ‘isms’ are deeply embroiled in a global, technologically-driven capitalist world order where the wealth and resources of the globe are held by a small elite of multinational firms and their comprador allies. These are historical formations with tentacles into the contemporary period. Moreover, there is an ideological structure of racial formations intertwined with global capital. At the core of this analysis is an articulation of economic systems of how Western capitalism has engendered underdevelopment in peripheries of the world consistently since 1789 through core-dominated techniques of enrolling the periphery in the world capitalist system according to the interests of the core (Wallerstein 1974). This is a historic process. Extending this analysis contemporarily, the dispossessed in advanced Western capitalist societies such as the United States, the dismantling of the social wage through destruction of social welfare, attacks on public education, the increasing incarceration and imprisonment of Black men (and women), and the structural consequences of wealth concentration in the hands of a tiny elite are part and parcel of the global politics of accumulation. Through austerity and uneven development the process unfolds internally within the U.S. Most recently this entails the bankruptcy and dismantling of an American city. A brief analysis of Detroit, Michigan is illustrative and examined in this paper.

BRICHE, HENRI* (University of Saint Etienne, henri.briche@hotmail.fr)

Sélectionner, Attirer, Sacrifier : La Gestion Du Logement Et De L'espace Urbain à Detroit (Etats-Unis) Et Saint-Etienn (France)

Cette communication a pour objectif d’étudier l’impact des défis posés par les villes en déclin urbain sur le logement en tant que tel ainsi que le territoire urbain dans son ensemble dans deux shrinking cities (Detroit, États-Unis et Saint-Etienne, France). Cette comparaison permet de révéler des tendances et des stratégies différentes quant à la question du logement et la gestion du territoire municipal en crise.

À Detroit, le rétrécissement urbain (rightsizing) est devenu l’une des priorités sous le mandat de Dave Bing à travers le plan à long terme baptisé Detroit Works Project. La crise sans précédent qui frappe la ville (le taux de vacance a bondi de 120% en 10 ans) l’oblige à déployer un plan massif de démolition et de requalification de l’espace urbain. La ville étant composée à 85% de maisons et la très faible densité urbaine ont conduit le pouvoir local à cibler des « enclaves durables » autant que nécessaire. La ville étant composée à 85% de maisons et la très faible densité urbaine a conduit le pouvoir local à cibler des « enclaves durables » autant que nécessaire. La ville ayant le potentiel pour retrouver une dynamique de croissance. Ville assez dense et à la concentration d’investissements dans de rares quartiers. Ce qui engendre une forme de gentrification le long du Woodward Corridor (lofts) attirant une âme de cette culture créative, blanche et à la concentration d’investissements dans de rares quartiers. Ce qui engendre une forme de gentrification le long du Woodward Corridor (lofts) attirant une âme de cette culture créative, blanche et à la concentration d’investissements dans de rares quartiers. Ce qui engendre une forme de gentrification le long du Woodward Corridor (lofts) attirant une âme de cette culture créative, blanche et à la concentration d’investissements dans de rares quartiers.

À Saint-Etienne, le territoire urbain est composé de quartiers de classe moyenne, mais délaissé le reste de la ville à majorité noire. À contrario, la ville de Saint-Etienne refuse à ce jour de reconnaître un quelconque rightsizing de la ville : la démolition n’est pas à l’ordre du jour, le pouvoir local restant persuadé que la ville a le potentiel pour retrouver une dynamique de croissance. Ville assez dense et en majorité composée d’immeubles, Saint-Etienne planifie de remanier le territoire urbain autour de la valorisation de quartiers ‘créatifs’ situés au cœur de la ville et axés autour d’une offre de logements et d’équipements culturels de haut standing. Néanmoins, l’inadaptation de l’offre avec les caractéristiques socioéconomiques des habitants conduit aujourd’hui à un échec de la revitalisation urbaine.

BRICKNER, RACHEL* (Acadia University, rachel.brickner@acadiau.ca)

The Shifting Terrain of Grassroots Mobilization and the Future of Education Reform in the United States

Public education has been a pillar of American society since the 19th century, but since the 1990s an education reform movement has promoted school competition and accountability metrics for students and teachers as critical to turning around the so-called "failing” American public school system. In practice, this education reform agenda has resulted in the proliferation of non-uniformed charter schools, shuffling of urban public schools, and the narrowing of curricula in response to increased use of standardized tests. This paper is part of a broader project exploring grassroots resistance to this reform agenda.

To date, the education reform agenda has been driven by well-financed foundations that are displacing the political influence of traditional education actors (e.g., elected school boards, teachers’ unions, and parent-teacher associations). As the results of the reform efforts become more concrete, however, a grassroots resistance effort of educators, parents, students, bloggers, and some elected officials has emerged that well resourced, democratically governed schools remain a pillar of every American community. The future of education policy in the US will largely depend on how the balance of political influence shifts between the “reformers” and the growing grassroots resistance.

Drawing data from fieldwork in Michigan, Illinois, and Wisconsin, where the grassroots resistance to the reform agenda has taken different forms and had different levels of success, this paper explores the factors that allow these grassroots efforts to successfully promote their vision of democratic public education. Specifically, the paper argues that four factors are critical: 1) shifting the "failing schools" discourse; 2) strengthening the relationships between union leadership, rank-and-file teachers, and the broader community; 3) finding a common frame that unifies the diverse demands of actors within the grassroots movement; and 4) building on the current social media presence while working to influence mainstream media.

BRIENZA, CASEY* (City University London, casey.brienza.1@city.ac.uk)

Born in Japan, Raised in America: Yuri and the Transnational Formation of a Genre of Lesbian Comics

In 2007, Wired magazine published an article by Jason Thompson about how Japanese comics called manga had “conquered America.” In 2012, Takashi Murakami, in an interview for the Asahi Shimbun, disagreed with this assessment, arguing that manga is “only being accepted by a small group of fanatics” outside of Japan. Whether conceived of as a torrent or a trickle, however, both Murakami and Thompson assume that the movement of contemporary Japanese popular culture is unidirectional, something produced in Japan which then arrives, already fully constituted, onto a distant shore. My research complicates this model of transnational flow. In this paper, I show how the current usage in Japan of the genre term yuri, for lesbian manga, originates from a history of transnational cultural flows and cooperatively produced knowledge that developed the genre. Although lesbians had been drawing autobiographically-inspired manga in Japan for years, they did not call it yuri until they made contact with Western fans of lesbian content in the early 2000s. These fans had been calling the Japanese artists’ work yuri, and the once-isolated Japanese artists quickly began to self-identify as yuri creators. Soon afterwards, Japanese manga publishers began soliciting input from this international group in the development of new magazine anthologies like Sun Magazine’s Yuri Shimai, thereby conferring legitimacy to the genre as well as providing a platform for content which was eventually licensed for re-publication outside Japan. In short, in the words of one informant, yuri was “born in Japan and raised in America” and would not exist at all in its current form were it not for a network of international exchange between Asians and American lesbians.
participant-observation and seventy in-depth, semi-structured interviews from informants in and around the American manga publishing industry, I discuss in detail what is actually involved in publishing Japanese comic books in the United States post-2007. Arguing that what they do is first and foremost to make manga American, I conclude by discussing the implications of these findings for the likely fortunes of “Cool Japan” and any other cultural policy premised upon exporting popular culture.

*The Ambiguous Multiplicities. Crowds over, Across and within Individuals*

 Crowds are not mere collections of people but a veritable ‘state of the social’. But, how precisely to theorize crowd states? To tackle this question, I begin by reconstructing various ways in which, particularly at the end of the 19th century, crowds have been investigated, appraised and, ça va sans dire, feared. I seek to highlight which were the major political and ideological stakes of such attempts at apprehending crowds as social multiplicities. In particular, the Italian Positivistic School (Lombroso, Sergi, Ferri, Sighele) and the French School of Criminal Anthropology (Lacassagne, Fourrial, Berthin) are examined.

 However, a similar exploration cannot content itself with cultural history, as it inherently triggers a deeper examination of some fundamental puzzles in social epistemology. In a sense, I propose to reverse the question about crowds and other social multiplicities into the question of that is an individual and how can the boundaries of the individual be drawn. Association, I argue, can regarded as process of territorialization which institutes the individual by drawing boundaries which are made of a wide array of counter-balancing forces. The very difference between objects and environments depends upon such territorial acts. Notably, such transversal vectors which determine the stand-off point between the individual and the crowd can never be found in a state of equilibrium. Rather, they show a kind of meta-stability; in other words, they form a fluctuating threshold of visibility. The constitution of social collectives, I submit as a provisional conclusion, can be best appreciated through a layered model whereby the individual is integrally reconstructed as a region located somewhere inside these thriving states.

*Latin American Social Movements: Research Agendas and Regional Constructions*

Unlike the debate in United States and Europe, the study of social movements in Latin America has never had a well-defined field of study in the social sciences to enable systematic discussion on notions, categories and controversies. However, social movements have been treated in a transversal way within a wide range of topics, approaches, discussions and disciplines, which, in turn, allowed a rather comprehensive and plural perspective. This paper seeks, firstly, to contextualize the sociological production on social movements in Latin America within the regional social theory. Secondly, we would like to identify and examine some analytical axis that has great potential for advancing the agenda of sociology of social movements in Latin America. In particular, we focus on the particularities of Latin American societies; the social and political regional thought; the diversity of contexts of action and the spatial and historical orientations; the socio-political and ideological matrices; and, finally, the practices, imaginaries and transnational networks that allow the establishment of a common collective action and the generation of a transnational frame. In doing so, we discuss some research possibilities for the study of social movements in the Global South who are looking to construct regional research agendas that go beyond Western theories of social movements.

**BRINK-DANAN, MARCY** (Hebrew University, marcy.bd@mail.huji.ac.il)

*If You’re Not Religious, for God’s sake SAY so! Agonism in Secularist Activism*

When secularists talk about God, how does it sound? What do they hope to achieve? Grounded in fieldwork among British and American activists, this paper suggests that Anglo-American secularists talk to the pious to “constitute adversariness worthy of agonistic respect” (Connolly 2008) and not in search of consensus. I offer key ethnographic examples of agonistic interactions between secularists and their pious audiences, examining how ideas about language and communication - rather than ideas about God – drive discussions about faith, doubt and social cooperation.

New Atheism increasingly demands public recognition: The British Humanist Association’s 2011 census campaign cheekily encouraged Britons to tick “no religion: “If you’re not religious, for God’s sake say so!” Another campaign responded to Christian adverts threatening sinners with eternal damnation by posting a counter-message on UK busses: “There’s probably no God. Now stop worrying and live like we do.” Protesters in Jesus costumes at the 2012 Reason Rally in Washington D.C. carried placards reading “Atheists do it better!” Comparing secularism in the UK and the US, Richard Dawkins opened the rally by critiquing the way we talk, not what we believe: “Don’t fail for the convention that we’re all too polite to talk about religion. Religion makes specific claims about the universe which need to be substantiated and need to be challenged and, if necessary, need to be ridiculed with contempt.”

Following Connell’s call for more evidence-based studies of secularist practices (2010), my sociolinguistic and ethnographic analysis chronicles the polysemy (Taylor 2009) of the term “secularist,” recording its use and meaning among Anglo-American activists [atheists, humanists, brights, skeptics and universalists]. Focusing on one small part of the project’s overall findings about communication across faith and non-faith groups, this paper presents ethnographic evidence pointing to the heavy value secularists place on agonism in public discussions about religion.

*To Market We Go, but Where Are We Going? Investigating the Negotiation of Social Impact and Market Forces in Food Hubs*

Food hubs, a new form of values based food aggregation enterprise, are often positioned by their advocates as a solution to the concurrent problems of the loss of family farms, an urgent need to develop a sustainable food system, and the perplexing problem of persisting food insecurity in the global north. Noting a “skyrocketing consumer demand” for local food, United States Secretary of Agriculture Tom Vilsack has identified food hubs as offering “critical” services to farmers, and stated that the success of food hubs “comes from … sound business sense and social impact” (May 2013). However, goals of sound business sense and social impact are not known for their easy affinity. With this in mind, this paper asks: How do the goals of promoting environmental sustainability, and enhancing food security support or detract from the goal of supporting family sized farms within both the philosophy and praxis of food hubs? This paper also provides preliminary investigation into the variable role of market forces, and the necessity of developing a financially viable enterprise, in shaping the institutional goals, policies, and practices of food hubs. Towards this end I will present preliminary research that draws from interviews with national food hub experts and leadership, and case study research with leadership and participating farmers of two food hubs. Findings will highlight the specific ways in which goals of social impacts (environmental, economic, social) are both achieved and inhibited when implemented in a market based programmatic context. I will conclude by suggesting needed next steps in food hub (e.g. values based supply chain) research.

*Circulation of Social Sciences Between the West and Asia: A Contemporary Assessment*

The paper aims to introduce some of the findings of the Interc-SSH survey on the international circulation of Social and Human Sciences (a European Union project under the supervision of Giselle Sapir - EHESS Paris). Albeit this survey
has primarily dealt with intra-European knowledge exchanges, an additional grant has allowed to broaden the focus and to take Asian-European relations into account (mostly from Japanese, Chinese and Korean case-studies). Two sets of empirical/theoretical questions will be tackled. The first one deals with the patterns of intellectual and scholarly exchanges: taking an historical approach, the paper analyses both what authors, theories, books or concepts have been circulating between Asia and Europe, as well as what kind of students/scholars migrations have taken place. Given the asymmetrical nature of the scientific relations between the West and Asia in the recent decades, the paper’s primary focus is on the European authors and texts that have been translated in Asia and have impinged on the various scientific fields. Yet, in a second moment, the paper also deals with the consequences of the contemporary political and economic rise of Asia in terms of scientific shifts. This new balance of power has already resulted in the growing influence of Asian universities as well as in significant changes in terms of academic migration, Funding for new theories and notions to emerge? What credit, in other words, should be given to counter-hegemonic attempts at creating social sciences in Asia that bypass their European origins? Due to the broadness of the scope, both in terms of historical approach and inter-national comparisons, the paper will engage with only a limited number of case studies, which accurately illustrates the main theoretical problems at stake.

Water Governance and Climate Change: Perspectives for Reduction of Urban Water Supply and Sanitation Vulnerability in Rio De Janeiro Metropolitan Area

This paper presents part of a collaborative research, which integrates Brazilian and French universities, in sustainable water management in urban areas. Our study is located within the interface of the so-called water resources management, that refers to the activities of use, conservation, protection and recuperation of crude waters, in quantity and quality, and water and sanitation services management (water supply, wastewater sewage, rainwater sewage). Thus, we start from the hypothesis that water governance in Rio de Janeiro metropolitan area faces two impasses: the preservation of water resources and the universalization of access to water and sanitation for all urban dwellers. Climate change adds a new challenge: adaptation and adaptive process in relation to water governance.

Even if there are still doubts about the incorporation of climate change scenarios into engineering projects for future water supply and sewage systems, due to uncertainties, this issue is becoming more and more important for planners. Different studies discuss the impacts of climate change in water supply system and in sanitation systems shows that Rio de Janeiro Metropolitan Area systems present a series of social, environmental and institutional characteristics that renders them particularly vulnerable to the impacts of climate variability and change. On this basis, this paper first aims to investigate policies that are being introduced, by River Basin’s Committees and by state and municipal agencies that are responsible for water resources and water services planning and governance, questioning if they are able to tackle climate change and to make urban water management more sustainable. This research is still in progress, utilizing, above all, resources of a qualitative nature: bibliographic reviews, elaboration of specific studies, conducting interviews and questionnaires among the key actors.

BRITTON, DERE* (State University of New York, Dee.Britton@esc.edu)

Picturing Dark Tourism: Mostar

The words tourism and disaster seem to be intrinsically paradoxical, yet visits to sites of disaster and death have grown exponentially during the past four decades. Lennon and Foley note that “dark tourism” packages disaster into an economic product that provides interpretation of the event as well as potential economic opportunities for communities. The community of Mostar, Herzegovina is a postmodern disaster tourism site. Once a symbol of Yugoslavian multiculturalism, Mostar became a battleground in the Bosnian wars of the 1990s. Stari Most, a sixteenth-century bridge that was the largest single span masonry arch bridge in the world, crashed into the Neretva River on November 9, 1993 after being shelled by local Croatian forces. A collaboration of nations, NGOs, and transnational groups rebuilt the bridge; the Stari Most is again an iconic image of the city. Twenty years later, ‘Old Town’ is surrounded by former business districts that are filled with bombed buildings and signs warning of unexploded ordinance. These buildings are another element of the photographic Mostar tourist experience. This paper examines the construction and use of photographic image in the dark tourist experience.
rates. The concept emerged out of progressive think tanks and has since been taken up by a range of political actors including Republican state governors and leading figures in the Christian right in the USA.

Its origins lie in an attempt to combat the extreme racial disparity in imprisonment rates, captured in the notion of ‘mass imprisonment’, where imprisonment is so widespread that it disproportionately affects whole (usually racial) communities. Recent critiques from some of its leading proponents suggest that this aim of Justice Reinvestment to redress the effects of mass imprisonment has been lost in the emphasis on recidivism and post sentence supervision.

Using the example of over representation of Aboriginals in Australian prisons, this paper will explore the extent to which Justice Reinvestment as a concept and as a practice and program, is capable of redressing historical and contemporary inequalities and discrimination in criminal justice outcomes.

BROWN, PATRICK* (University of Amsterdam, P.R.Brown@uva.nl)

**Exploring Chains of Trust and Mistrust Across Mental Health Services: Towards an Understanding of Virtuous and Vicious Circles of Trust within Organisations**

Levels of trust bear decisively upon the nature of healthcare practice. Trust relations between professionals and patients, as well amongst professionals and managers, create certain dynamics which can be supportive or obstructive for ethical care provision. Existing research denotes the mutual influence of different trust relationships across healthcare organisations, although the interdependencies between these different relations have not been explored in significant depth. This paper begins to fill this gap through analysis of trust relations in the context of mental health care provision within the English National Health Service. Developing from an initial conceptual framework, qualitative data from interviews with service-users, professionals and managers involved with three services providing care for people experiencing psychosis are analysed. The analysis points to interwoven chains of trust-building or trust-eroding dynamics across the different relations: managerial-professional relations, inter-professional relations, and professional-user relations. Overarching policy frameworks were especially active in shaping experiences of management vulnerability and corresponding working demands at the local-organisational level, in turn influencing professional relations with other professionals and moreover with service-users. Changing dynamics within one form of relationship often relieved or intensified experiences of vulnerability and uncertainty amongst involved actors. These shifting vulnerabilities and uncertainties resulted in modified practices which impacted upon other relationships in terms of trust. Considerations of time and communication, as both necessary for, and products of, trust, were also vital to virtuous or vicious circular dynamics within trust relations within the organisations. The erosion of time, communication and therefore trust has important implications for ethical practice within mental healthcare contexts.

RC36-627.2

BROWN, CRAIG* (University of Sydney, craig.browne@sydney.edu.au)

**Contemporary Reification and Second Order Abstractions**

My paper proposes that contemporary forms of reification are increasingly conditioned by second order abstractions. The distinction between first and second order abstractions is initially analytical; because many of the same mechanisms are involved in the latter’s constitution. However, second order abstractions involve a peculiar kind of reflexivity or doubling. The mechanisms of abstraction are increasingly becoming the objects as well as the means of abstraction; for example, global trade in currencies objectifies monetary exchange. Yet, this objectifying alters aspects of the experience of reification, since the first order processes of abstraction come to operate with reference to these second order developments. Further, second order abstractions do not just affect the relationships that subjects have to their own practices and those of other subjects, they generate new modes of reification in mediating institutions, like that of the state. One result of second order abstractions is greater distortion of the value system of first order commodity exchange. This distortion conditions the contemporary belief that action in relation to major effects of capitalism, like the ecological crisis and the pandemic, is likely to have unpredictable outcomes and cascading consequences, which may contradict the intentions of agency. My analysis suggests that the implications of the major contemporary conflicts of capitalist society should be understood in terms of second order abstractions and this will be demonstrated in relation to recent instances of contestation, like anti-austerity protests and riots. Although my conception of second order abstraction has significant continuities with the major theories of reification, the sense in which it is necessary to revise other conceptions of reification, like those of Lukacs, Habermas and Honneth, will be explored.

RC16-279.2

BROWNE, CRAIG* (University of Sydney, craig.browne@sydney.edu.au)

**Modernist Visions and Contemporary Modernities**

My paper argues that the nexus between history and the subject is central to modernity. I suggest that this modernity is one of the autonomous constituting of society and that this social imaginary forms modern oppositions to heteronomous social relations. It is with reference to this social imaginary that sociological theory has, in my opinion, sought to comprehend processes of social reflexivity and the possibilities for society to act upon itself. In particular, the modernist vision involves an extension of the idea of autonomy beyond the institutional domain of the political order and an appreciation of its social grounding. Significantly, modern perceptions of the limits to autonomy are based on the assumption that society derives from the action of subjects and that social relations of domination are amenable to change. However, as Castoriadis contends, modernity has been shaped by another imaginary, that of the rational domination and control of nature and society. The presumption that these two modern social imaginaries are interrelated and reinforcing has tended to be undermined by processes of social modernization. Jürgen Habermas once described comparable processes as resulting in modernity being ‘at variance with itself’. I suggest that modernity remains a critical diagnostic category concerned with disclosing the immanent potentials of the present development of society and the distortion of these potentials. My analysis seeks to demonstrate this through an analysis of the changes in theoretical conceptions of the tensions and contradictions that pervade modernity and its dominant institutions, focusing especially on depictions of contemporary conflicts and dynamics of transformation. It concludes that influential perspectives, like those of multiple modernities and successive modernities, can be demarcated in terms of their interpretations of notions of collective self-determination and that this reveals differences in their conceptions of the relationship between history and the subject.

**The ‘10-Excess’ Phenomenon In Responses To Survey Questions On Happiness**

Happiness in nations is typically measured in surveys using a single question. A common question is ‘All things considered, how satisfied or dissatisfied are you with your life as-a-whole these days?’ on a scale from 0 to 10. The distribution of responses typically follows a uni-modal distribution with highest frequencies typically between 5 and 8. Yet in some nations, and especially in Latin America, the percentage of 10 responses stands out and is higher than the percentage of 9 responses. This paper explores the prevalence of this ‘10-excess’ pattern and checks some possible explanations.

**The Invisibility Indians In Rio Grande Do Sul, Brazil: An Ethnography Of Roundness Narratives Between Myth, Law and Education**

The issue of indigenous invisibility in Rio Grande do Sul is based on a set of elements that permeate the story of the Guarani, and kaingang Plow different ways. Among these stand out narratives produced by non-indians and have recurring visions and idealized whose elements relating gauchó folklore. One example is the set of representations produced on the Indian missionary Tiaraju Sepe, from the late eighteenth century to the present. Throughout this text we wish to reflect on the interplay between myth, law and education through an analysis of the impact caused by the presence of indigenous students in Higher Education Institutions (made possible by the policies of racial quotas since 2007 UFSC), a context stretched by the relationships established between the invisibility of indigenous narrated in different ways, the plurality of cultural dynamics of the groups mentioned above and individual memories of some Indian students involved in this process forward to the new scenario we consider also invisibilizador Federal Law No. 12,711, 29/08 / 2012 and Decree No. 7,824, of October 11, 2012, governing the policy of social and racial quotas in Brazil.

Local Environment, Innovation and SMEs in the Spanish Vocational Training System

This paper presents the results from the FPInnova project, ‘Vocational training and innovation system: the role of intermediate workers in industrial SMEs’ innovation processes’ (CSO2011-29410-C03-01), funded by the Spanish Ministry of Science and Innovation. The aim of this research is to analyze the relationship between the training system and the regional innovation system of six Spanish industrialized regions. In the current context of economic crisis the study of the processes about the institutional and social construction of the economic model becomes necessary. Education and innovation are part of the answer to the current challenges. This research wonders how are the relationships between the training system and the regional innovation system, and what aspects could be improved.

Particularly, we want to study the relationship between the vocational training system and industrial enterprises of intermediate and high technology sectors in Spain, with special attention to its influence on innovation processes companies. Methodologically, we have studied six Spanish regions with the combined use of qualitative and quantitative techniques. We have put the focus on VET centres and their relations with local SMEs. This approach, linked to the Regional Innovation System perspective, allow us to study the relationships between these actors and how these relationships shape the local environment. Here is an analysis of these relationships for two of these regions studied.

Movilización Social y Populismo En América Latina. Una Aproximación Tipológica a Traves De Casos Paradigmáticos: Chile, Argentina, Bolivia y Venezuela

La comunicación explora el tipo de relación que se viene estableciendo en los países de América Latina en la última década entre los tipos de reconstitución del poder político/mercado que en la región se han formado, y la movilización popular. De acuerdo a la literatura especializada, existen tres modelos típicos de vinculación entre Estado/sociedad que son dominantes en diferentes países de la región: el neoliberal, el neo-desarrollista y una variante más radicalizada, con diversas denominaciones y que asume un discurso ligado a la reactualización latinoamericana del socialismo. ¿Qué vínculos existen entre dichas variantes y las movilización populares, teniendo en cuenta las redes sociales y los avances TIC, desarrolladas en los diferentes países? Para explorar esta relación, en base a la bibliografía especializada, analizamos casos nacionales representativos de las mismas: Chile, en la variante neoliberal, Argentina, en la variante neo-desarrollista, y Bolivia y Venezuela en la variante radical.

Financial Oppression in the Context of Parental Separation

Financial oppression in the context of parental separation is a well-known phenomenon among professionals who work in the violence against women domain and among women’s shelter organizations. In research, however, the issue is to a large extent unexplored. Concepts such as ‘financial abuse’, ‘economic violence’ and ‘economics that are abusive towards partner and children’. These actions are nevertheless seldom in forefront of the analysis. How do victimized mothers and children cope with financially (and often in other ways) abusive fathers? Which parts of the separation process seems to open up for financial oppression from one parent towards the other and children? Further, how is this kind of abuse interpreted and handled by the court in disputed family law cases? In this paper, I present and comment on empirical examples from my ongoing dissertation project. The dissertation deals with professional and ideological discourses and practices around children who are exposed and/or subjected to violence in the context of parental separation and family law proceedings in the Swedish welfare state. The empirical base for the preliminary analysis consists of interviews with ten mothers who have experienced financial oppression in the context of separation and of a review of all court orders in disputes on contact, custody, residence and maintenance, from three districts courts in Sweden during 2010 and 2011. Theoretically, I draw foremost from feminist and intersectional perspectives on domestic violence and from childhood studies.

Kinship in Intersectional Analysis

Kinship is an established and extensively used concept in anthropology. In sociology including intersectional analysis, however, the term is nearly absent, despite its obvious connection to various dimensions of inequality. Previous sociological research on adoptions and on implementation of family law in disputed custody, contact and resident cases suggests that two disparate discourses on kinship compete; one that emphasizes biological kinship and another that draw from a constructionist perspective (Andersson 2010, Eriksson 2003, Otto 2006). Using the same data set, this dissertation aims at distinguishing these discourses and possible implications of using kinship in intersectional analysis together with age, class, gender, ethnicity and sexuality. Empirical examples from my ongoing dissertation project are used as illustrations of how such an analysis could look like. The dissertation deals with professional and ideological discourses and practices around children who are exposed and/or subjected to violence in the context of parental separation and family law proceedings in the Swedish welfare state. A central issue is how these discourses and practices are shaped by intersections of some of the abovementioned axes of privilege and oppression. The present paper draws from a review of all court orders in disputes on contact, custody, residence and maintenance, from three districts courts in Sweden during 2010 and 2011. A sample of in total 224 children who were present in cases with information on violence or some form of abuse was selected and further analyzed.

Skill and the Capability Approach at Work

This paper briefly surveys how the capability approach originally conceived by Sen has been adapted and applied by different disciplinary perspectives for a range of purposes. Then, using data from the workplace, we explore the potential of skill, and the paper explores how a sociological viewpoint might contribute to the operationalisation of the capability approach.

Skill, in and for the workplace, is a significant plank in the economic growth strategies of many governments. Political economy views tend to dominate skill debates focusing on quantifying and comparing the outcomes of different policy regimes. Sociology, along with economics and political science, is a key contributor to political economy analyses. The paper outlines how using the capability approach to analyse high skills policy prescriptions highlights flaws in these visions. By drawing on a holistic view facilitated by the capability approach, this paper may better accommodate overlapping policy agendas and thus overcome issues of policy fragmentation. The paper then argues that sociology can augment and improve such discussions with a return to its core concerns for social processes and norm construction. Flowing from this it proposes that illuminating conversion processes may be the most important contribution of sociology to the practical and theoretical development of the capability approach. The paper then draws on workplace research to illustrate the importance of understanding and addressing conversion factors in order to enable opportunity freedoms (capabilities) for individuals, groups, communities and societies. Conclusions are drawn on the questions that sociology asks, the research methods that sociology employs, and the potential contribution to the development of the capability approach as an analytical tool and as a process of engagement with others.

Widening Access to Higher Education – Social Inequality and Routes to Universities

German education policy aims to widen the access to higher education by raising the permeability of the German educational system. Yet the quota of so-called non-traditional students, which do not have a general qualification for university entrance, is still very low, pending at about 2 percent. Despite some research on non-traditional students in the 1980s there is neither a decent knowledge about their study practice, nor about barriers in their studies or their way to universities.

Our presentation focuses the routes of non-traditional students to universities. Inspired by the work of Bourdieu we analyze effects of social, cultural and economic capital on the duration from school-leaving until start of studies by comparing non-traditional students with those holding a general qualification for university entrance. Using event history analyses we show how social inequality influences individuals’ routes to universities and approach reasons for underrepresentation of working-class students.

Our study “Passages from Employment to Studies – PETS” is a solid basis for analyzing this question as it focuses passages of students at the Department of Socioeconomics of the University of Hamburg. By comparing traditional and non-traditional students, data allow to analyze effects of different types of capital on routes to universities. Findings indicate that for traditional students higher social capital accelerates the process of entering university, while higher cultural
Definitions of what it means to be a ‘good’ father are changing. In the mid-twentieth century fatherhood was defined in economic terms and emphasised men’s responsibilities as ‘providers’. More recently, greater weight is placed on men’s involvement in day-to-day family matters and their hands-on roles in mentoring and providing physical and emotional care to their children. Despite this, evidence still shows that romantic partners take the primary responsibility for childcare, in particular when children are young. Previous research has found that key life-course events, such as the birth of a child, a marriage or divorce or completing education, may change an individual’s gender-role attitudes. Understanding how attitudes towards the role of a father change with life course transitions, in particular the birth of a first child, is integral to gaining better insights into what motivates fathers to increase their participation in childcare, as well as understanding the stability of attitudes within individuals over the life course. We examine how the birth of a first child influences attitudes towards fatherhood amongst men and women using panel data from the Household Income and Labour Dynamics in Australia (HILDA) survey. Our results indicate that gender-role attitudes are not fixed over individuals’ life courses and thus provide support to intra-cohort theories of attitudinal change. In particular, we find that after experiencing a first birth women become less likely to agree that a father should be as heavily involved as in the care of his children as the mother, and men become more likely to question the capacity of a working father to have a good relationship with his children. We argue that these changes reflect the primary identities of men and women as ‘providers’ and ‘carers’ following a first birth.

BUCHLER, SANDRA* (Otto-Friedrich-Universität Bamberg, buchler@soz.uni-frankfurt.de)

The Influence of Gender on Pathways out of Secondary School: Evidence from Australia

The motivation for this research is twofold. Women’s increased education, economic participation, relative to that of men, is expected to give women greater access to favourable and good quality positions on the labour market. Second, the growth of the service sector (and the reduced importance of the production sector) in post-industrial societies have been predicted to increase women’s employment opportunities (and decrease those of men). Despite these changes women’s disadvantage in the labour market is persistent. A common explanation given for these gender differences is women’s greater responsibility for child care and unpaid household labour. However, differences in family responsibilities between men and women at the age when young people leave education and transition into work are largely negligible. This suggests that the gender phase where gender differences can be examined when young people are already in the labour market, but before the gendered division of familial roles is expected to restrict women’s participation in paid employment. Using data from the Longitudinal Surveys of Australian Youth (LSAY) collected from 1995 to 2006 this study examines gender in the school-work transition in two stages. First we examine the most common educational pathways and the distribution of men and women in these pathways. Second, we explore the characteristics of an individual’s first significant job and how this is influenced by gender, education and a range of background variables (such as socio-economic background, language spoken at home, educational achievements and school characteristics) that may play a substantial role in shaping the educational pathways and first significant job outcomes of young people in Australia. This research comprises the Australian country study for the second phase of the Education as a Lifelong Process – Comparing Educational Trajectories in Modern Societies (eduLIFE) project.

Fragmented Translation: Case Study of Max Weber’s Reception in Poland

Fragmented Translation: Case Study of Max Weber’s Reception in Poland

Fragmented translation is what happens when there the unity of the original is not preserved in the work of the translator. In fragmented translation, a body of ideas is misinterpreted as just a text. A text, unlike a body of ideas, can be cut, safeguarded, abridged, but most importantly it can be read as it was in the company of other texts.

I want to discuss the conditions and effects of fragmented translation on the reception of classics. I know the translator’s work of my own experience: I have translated Max Weber, Norbert Elias, Charles Wright Mills, Mary Douglas and many others. In this talk, I will use the case of Max Weber.

Terminological, conceptual and stylistic decisions of the translator working on a text are circulated and create an illusion of completeness, even if the text itself is just a fragment. Such was the case with Weber’s *Gemeinschaft und Gesellschaft* and *Wirtschaft und Gesellschaft*. The phrase *Unternehmungsführung* is translated as ‘Management’ or ‘Entrepreneurship’ by many translators, but it has the same meaning as the English word ‘company’ which is not translated. Incidentally, this made original works look uneconomically verbose, once they finally appeared in Polish several years ago. Another case is *Die protestantische Ethik* itself: it is currently

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
available in three different Polish translations, only one of which is full. Differences between them show that translator's decisions largely go uncontested as far as meaning is concerned. Double responsibility for meaning and for readability is universally accepted, but it is rarely mentioned that meaning is seldom controllable beyond a circle of most fastidious readers. Finally, where some parts are chosen, some are omitted and sometimes hardly read at all. This was the case of Weber's Rechtssoziologie.

Fragmented translation creates an area of shadow in which the body of ideas is lost, leaving behind just a loose collection of texts.

BUCHOLC, MARTA* (University of Warsaw, bucholcm@is.uw.edu.pl)
The Protestant Ethic In Poland: A Book That Failed To Make Sociology

There is hardly any debate as to Max Weber's status as a classic of sociology anywhere in the world, and the Protestant Ethic is probably his best-known work. Nevertheless, there are contexts in which the best known and the most referenced book may not play a role adequate to its apparent significance in the making of sociology. Weber's reception in Poland provided one of such contexts. The failure of Weberian inspiration may be succinctly summarized as follows: instead of providing historical, comparative and interdisciplinary insight for explaining the subtle link between culture and social action, it was used as a prop in scientific quest after a good footing for capitalist economic practices in a post-communist society.

In my presentation, I will substantiate my contention that Weber's book did not make sociology in Poland despite its popularity as a reference source. Among the most important factors which determined the state of reception of The Protestant Ethic I will address the following: (1) presentism of reading, (2) narrow interpretation lacking the background of Weber's greater sociological project, and (3) overestimating religious factor in Weberian model. I will discuss the development of sociology in Poland, including its historical, social and cultural aspects, in order to provide a tentative explanation why The Protestant Ethic failed to make sociology in Poland not only in the early 20th century or under communist rule until 1989, but also after the passage to democracy and free-market economy. In each of this periods, Weberian sociological imagery marked by a combination of a sense for history and culture failed and was replaced by a day-to-day reactive research, which did not make sociology, despite giving work to a large number of sociologists.

Household Wellbeing and Health in Two Types of Welfare Regimes: A Comparison of (Lower-) Middle Income Households Chile and Costa Rica

The aim of this paper is to elaborate to what extent the logics of the opportunities as shaped by welfare regimes (the interplay of markets, the state, communities and households) play out for wellbeing. Health is crucial for wellbeing. Different welfare regimes provide different opportunities to deal with health issues. Chile and Costa Rica's organization of health care reflects the logics of their welfare regimes: liberal and social-democratic. We look at how households deal with health issues and what repercussions this has on their other life domains and wellbeing. We focus on households belonging to (lower) middle-income households. These are heterogeneous, as they belong to those having been heaved out of poverty over the past decades due to economic growth or to formerly middle-income households having experienced an increase in insecurity and downward mobility due to the changes in the model of Social Security linked to the change in economic model (abolishment of the Import Substitution Industrialization model).

Such households struggle to maintain or improve their level of wellbeing and to avoid slipping downwards into even more precarious positions; they do not have sufficient financial means to cushion unforeseen events and are generally not target of social policies. Recent research has highlighted the socio-economic volatility of these households, yet little is known what this means for their wellbeing. Our research looks into the everyday life of (lower) middle-income households by means of qualitative interviews with the same households in 2008/09 and 2013 in Temuco and San José. Results suggest that the households in Chile were constantly preoccupied with how to deal with health issues and the consequences. This furthered anxieties and worries in other life domains. In Costa Rica, the basic security provided by the national heath system of sufficient quality limited the spillover of worries into other life domains.
young adults to fit into parental expectations. They are supported in this endeavor by the national educational system and its representatives. While doing so, adults refer to legitimizations which they take to be given by "religion" or "ethnic tradition".

Based on children's and young people's view of the demands of these generational orders, we can identify positive and negative implications of the generational asymmetry for children and young people. What is taken positive or negative is thereby depending on children's age, but not necessarily on gender although the burdens of the generational order normally weigh heavier on girls than boys.

We operate with a notion of "self"/"good life" in the interpretation of our results. While it may easily be objected that such notion is culturally and historically contingent, we can clearly show that children and young people themselves refer astonishingly enough to such notion while judging about the various qualities of the generational demands and the opportunities they offer to them or while trying to organize their lines of actions. We conclude that the really "other" perspective is the one of the child and the young people. It is a methodological challenge to grasp this perspective and to make this "otherness" available for theorizing and practice. The paper will give empirical evidence for both countries supporting such conclusion.

Where Is The Child In Child Protection? Professional Proceedings Beyond Victims

The paper is based on the results of a project on professional interventions in cases of child maltreatment. More than hundred interviews with professionals (social workers, physicians, midwives) were carried out in five communities in Germany. In this way a data set consisting of 93 cases of suspected child maltreatment was collected.

Our results show that children are generally excluded from child protection proceedings and their voices are ignored. Therefore the rules and ways of this exclusion are analysed:

1. The exclusion of the child works via two main principles: (a) Child protection law addresses the restitution of parental competences and the conservation of the family. (b) The different professional programmes involved in child protection will eliminate children's point of view while focusing other perspectives. Social work is concerned with the relationship between professionals and parents. Physicians and midwives do only partially include the child, as they either take notice of the child's body as a 'corpus delicti' (as a bearer of traces for the physician's gaze) or as an object of parental care.

2. Against such background, traces of the children can only occasionally be found, as some social workers show empathy for the child's position. Institutions like kindergarten or day care serve as amplifiers of the child's need.

3. The information disclosed by children shows that they have a sense for the harm and disrespect as a person they are exposed to. All in all, the children articulate claims for a personal self being respected by others.

4. Furthermore, specific cases show how occasional appearances of the child's agency are silenced by the professionals in the further proceedings. Children's agency were only not reproducible in cases, when they were able to raise their voice at places/institutions outside their homes or when their behaviour continuously disturbed.

BUFFEL, TINE* (The University of Manchester, tine.buffel@manchester.ac.uk)
Experiences Of Neighbourhood Exclusion and Inclusion Among Older Residents In Manchester, UK: Developing Age-Friendly Neighbourhoods

Developing environments responsive to the aspirations and needs of older people has become a major concern for social and public policy. This paper explores conceptual and empirical aspects of the age-friendly cities debate, with a particular focus on issues of place and space in urban settings. Exploratory find- ings are reported from an empirical study in a neighbourhood in Manchester, which sought to examine experiences of social exclusion and inclusion among people aged over 60. Drawing on a mixed-method approach consisting of questionnaires, focus groups and interviews, the paper identifies four issues in relation to the neighbourhood dimension of social exclusion/inclusion in later life: experiences of community change; feelings of security and safety; the manage- ment of urban space; and strategies of control. The article concludes by discuss- ing conceptual and policy issues raised by the research, particularly in relation to the issue of developing age-friendly communities.

Experiences Of Place and Community Among First Generation Turkish Immigrants Living In Brussels, Belgium

This paper aims to explore experiences of everyday life among first generation Turkish immigrants who are ageing in place. The data for the present research are derived from a qualitative study in inner-city neighbourhoods characterized by intense deprivation. Drawing on semi-structured interviews with 23 Turkish people aged 60 and over, the paper addresses experiences of ageing and quality of life in their neighbourhoods; the variety of ways in which a sense of place is constructed; the constraints and environmental pressures which may pre- vent people from developing a sense of home; and the meaning of transnational ties for the experience of place. The results suggest that neighbourhoods, and the attachments older Turkish immigrants maintain with (multiple) place(s), have a significant influence on shaping the experience of exclusion and inclusion in later life. The article concludes with a discussion of three key themes: first, the importance of place for the quality of older Turkish immigrants' daily life; second, the idea of inclusiveness in everyday life among ageing immigrants living in disadvantaged communities; and third, the need for developing social policies that address the transnational interactions, the social needs and health care demands of a growing and increasingly diverse ageing population.

The Association Between Work Type/Status and Mental Health Care Use, before and during the Economic Recession in Europe

Studies have examined the relationship between socioeconomic determinants and mental health care use. However, to date, little research has investigated whether these relations have changed over time and vary across socioeconomic structures and gender. Between 2005 and 2010, a global economic crisis changed Europe's economic situation, with economic instability and rising unemployment rates as a result. Recent research has found that in several countries, the recession has increased the frequency of mental health problems particularly among families experiencing unemployment. The fear generated by this Based chance of unemployment, which may depend on type of job, is also associated with poor mental health. Despite the greater demand for mental health care, there is a risk that austerity may impact adversely on health care provision.

We have investigated the relation between unemployment, type of job and mental health and medical mental health care use in 2005 and 2010. By using the repeated cross-sectional data of the Eurobarometer 248 (2005-2006) and 345 (2009-2010), we have performed gender differentiated multilevel logistic regression analyses.

Preliminary results suggest that compared to 2005, the average mental health status in Europe is worse in 2010 and the percentage that contacted a GP is higher, while in contrast, specialized care use is lower. Only unemployed women in 2005 have a higher general care use, irrespective of mental health. Contrastingly, in 2010 the unemployed men and women are more likely to contact a psychiatrist, also when we control for need for care. For men, this relation is stronger in countries with a lower unemployment rate. In addition, we found that male manual workers are in 2010 more likely to contact a psychiatrist than white collar and that the male self-employed have a lower general care use than the manual workers and white collars, both irrespective of mental health.

Faith-based Organisations and Welfare Provision for Asylum Seekers in Australia

Religion operates in multiple ways as it shapes the experiences of forced migrants. It is often a causal factor in migration, and may either facilitate or impede integration in the country of settlement. Religious identity also plays a significant role in responses to asylum-seeking, with faith-based organisations, or FBOs, providing significant support to asylum-seekers in Western countries. FBOs are ideal service providers because of their strong local contacts, their public legitimacy, theological motivations for service and material resources. In Australia, the state has developed significant contractual relationships with FBOs to deliver welfare services, particularly to refugees and asylum seekers.

This paper examines the role of FBOs in welfare provision to asylum seekers using fieldwork conducted in Sydney, Melbourne and Brisbane. Within each city, interviews and participant observation were conducted with practitioners at FBOs.
who provide services to asylum seekers. The study sought to understand the way that religion shapes the organisational structure, ethos and motivations of the FBO and its practitioners. It also explored the way in which FBOs use religious resources in the construction of settlement programs, how they addressed the cultural specificity of asylum-seekers in program delivery, and how they negotiated their role as ‘neutral’ state-contracted service-providers while maintaining religious identity. The results of the study find that religion is often an important and explicit motivator for practitioner action. Results indicate tensions between practitioners who understand the work in a “human rights” frame and those who may narrate or understand their work theologically. The study also revealed multiple understandings by practitioners of the importance of religious practice to asylum seekers. Finally, the results of this study point to tensions that increased government contractualisation poses for FBOs who deliver government services to asylum seekers, as FBOs have traditionally been strong critics of government policy on asylum seekers.

The Quest for Global Environmental Justice, Healthy Communities and Human Rights

This paper utilizes an environmental justice lens to critically analyze the socio-historical connection between the global exploitation of land and the exploitation of people. The environmental justice movement has expanded beyond its initial challenges to environmental racism and advancing civil rights in the United States to become a global movement advancing human rights, sustainability, health equity, food sovereignty, equitable development, clean energy, and climate justice. Climate change is viewed as one of the single most important environmental issues of our time. The idea of the human right to a healthy environment is gaining momentum worldwide. In recognition of this, the United Nations has created the Global Human Rights Council to oversee a new global protocol that seeks to integrate the human right to a healthy environment into all relevant human rights frameworks.

 Increased globalization of the world’s economy has placed special strains on the eco-systems in many marginalized communities in the global North and South. Globalization makes it easier for transnational corporations and capital to flee to areas with the least environmental regulations, best tax incentives, cheapest labor, and highest profit. Despite significant improvements in environmental protection over the past several decades, millions of people largely in developing countries still suffer from the “Big Three” environmental problems: contaminated drinking water, untreated human excrement, and air pollution.

Loopholes in international conventions and treaties still allow transboundary shipment, export, and trading of banned pesticides, hazardous wastes, questionable toxic products, and “ risky ” technologies. Economic extortion extends to the exploitative work environment of migrant farm workers, garment districts sweatshops, building construction trade, dirty low-paying industrial jobs, and the micro-electronics industry. Workers who suffer under substandard occupational and safety conditions have few rights protected by government. Globalization has complicated the movement of people in and out of countries still suffering from “ the Big Three ” environmental problems: contaminated drinking water, untreated human excrement, and air pollution.

Parallel/Alternative Orthodoxy in Russia: Inside Church, out of Doctrine

Current Russian Orthodox Church situation is unprecedented: during soviet period church was constrained by the regime; at pre-soviet time official Church status did not conduce a free contention of theological ideas. Post-soviet time gives us unique situation: ultra-liberal and ultra-conservative frictions took shape and play out but serious official (both church and state) pressure inside the Church. Both ultra-liberals and ultra-conservatives found formation andodoxy allowable in orthodoxology theological latitude. Ultra-liberal fraction is not large, but ultra-conservatives are really numerous. So, authors focus concentrates on them.

There is no ideological unity in this fraction, but we can notice a few common features. First, hierarchy neglecting patriarch and bishops has no respect in this community, withal mind of “ ancient ” considered as an ultimate truth. Really, we has a situation of forming another Holy Tradition. Second, widespread of apocalyptic moods, expectation of alarming “ properties ” (some of this “ properties ” did not come true yet). Third, monarchy minds, often linked with “ tsar-God ” heresies, where the Christ place occupies the last Russian emperor, whom they call “ redeemer ” of Russia. And last, but not the least, new technologies, especially in information sphere, phobias. Objects of these phobias are bar codes, internet, mobile phones, credit cards and gadgets at all, electronic passports, individual tax number etc. Special sort of phobias – phobia of total state electronic invasion state regulation of religious sphere.

BUNESCU, IOANA* (Malmö University, i.o.bunescu@mah.se)

The paradox of Roma people’s identifications varying from strong assertions of Roma identity to complete negations of it triggers this paper’s inquiry into the reasons why Roma identifications are so heterogeneous. The argument unfolding through the analysis of multi-sided ethnographic data is that the heterogeneity of Roma identifications is not random, but that it follows certain context-specific patterns. For example, at local level in a multi-ethnic locality in Transylvania, one could observe that within the same hetero-identified Roma group there is a tendency for differentiated and fragmented self-identifications; while at state level (e.g. in Romania) and at international level there is a tendency that blurs differentiations and that emphasizes a more homogenous collective identity of the Roma. This paper attempts to uncover the reasons for the large array of Roma identifications through the combined method of “thick description” (Geertz, 1973) and “multi-sided ethnography” (Marcus, 1995). The conjunction of these methods offers a contextual understanding of the complex dynamics of Roma collective identity formation at three analytical levels: the local, the state and the international.

The findings indicate that Roma identifications are contextual and more often than not they represent means in the struggle for resources available within different structural contexts. In such instances, Roma identifications become forms of agency in negotiating a better standing vis a vis other (often more powerful) actors encountered in the process of social interaction. The instrumentality of identifications and identification discourses of the Roma does not entirely dismiss the possibility of a genuine feeling of belonging to certain categories of self-ascription in the moment of identification. Such feelings could suggest an internalization or solidification of some self-identification practices as habitus (Bourdieu, 1992) or structural content.

Goverance of Ethnobotanical Resources in Siquijor, Philippines

The study focused on mobilizing the tambalans and mangangolaps (faith healers and herbal collectors respectively) to take the lead in formulating a Community Based Ethnobotany Resources Conservation Framework Plan, hence, leading the conservation of medicinal trees and shrubs they have been utilizing. The methods included an organizational meeting, personal interviews, participatory field survey and identification, focus group discussion (FGD), and integrated consultation workshop with the tambalans, mangangolap and other local stakeholders. The Siquijor Herbalists Association (SHA) was organized. Most of the tambalans and mangangolaps in the two barangays thought that ethnobotany resources are important source of income. However, since there has been no conservation effort, they realized that the resources are getting scarce.

The project initiated the creation of a Community Based Ethnobotany Resources Management Committee that formulated and developed a conservation framework plan. As an initial intervention to conserve the subject resources as embodied in the said plan, they established a Barangay Ethnobotany Resources Nursery through a collaborative effort by the local DENR, SHA, and concerned LGUs. Additionally, a database of ethnobotany resources was established comprising a total of 63 species showing photographs, local and official common name, family name, scientific name, parts utilized, intended cure, and method of preparation to serve as source of information on ethnomedical practices in the island. Overall, the conservation framework plan formulation was a participative approach ensuring that needs, aspirations and culture of local communities, the concern of the LGUs and national government’s policy and technical framework are duly considered.

Preferences in Leisure Activity As Affected By Gendered Choice

A review of the 10 year enrolment to both martial arts and dance classes was done to establish a trend. The study sought: 1) to determine if gender gap exists, 2) evaluate students’ motivation in their leisure preferences, and 3) to establish whether gender orientation is salient in students’ choice. A questionnaire was distributed to a total of 250 students currently enrolled in martial arts and dance classes. An in-depth interview was also conducted to randomly selected students. With regard to motive in their preferences, result showed that ‘challenge of their body’ and ‘self protection’ ranked first for the male and female enrollos in martial arts respectively. On the other hand, the dance enrollos noted that ‘self expression’ for the female and ‘trying a different field’ by the male students were reasons in their leisure choice. In addition, the interview notes revealed that the idea of femininity and masculinity were almost identical such as soft and gentle meant feminine while masculine were rough and persistent. Now that students enrol a leisure course because they want to, would pave the way to better learning that would actually benefit the physical body and lead to wellness and quality life.

Multiple Secularities and Cultural Memories in Québec

Contemporary contestations over secularity in Western liberal democracies frequently take shape as politics of memory in which accounts of the past are mobilized to legitimate privileges of Christian Churches in the public domain. Such mobilizations meet with legal challenges as there are increasing pressures to bring such privileges into harmony with fundamental rights (equality, freedom, non-discrimination).

This paper addresses the politics around cultural memory and laïcité in Québec and specifies three distinct accounts, carried by civil society protagonists, that feed into institutional responses to religious diversity (heritage secularism, sceptical secularism, ‘open secularism’). Using exemplary cases, it shows how these three accounts are brought to bear on judicial dynamics and civil society activism. The paper is based on archival research and qualitative interviews carried out in 2012 and 2013.

Invisibility As a Barrier to Collectivity: Argentinian and Indian Homeworkers

Two, key and probably interlinked characteristics of homework are gender and the invisibility of homeworkers. However, invisibility in homework has received scant attention from scholars. This paper explores invisibility in relation to women homeworkers: its links to their work experience and recognition as workers, and its interface with unions, NGOs, corporations and government. At the same time, it documents and compares relatively unknown instances of homework in Argentina and India to make a contribution to knowledge about homework, which is still an under-researched area.

Homeworkers are often portrayed as unorganised, and have been labelled ‘unorganisable’. We argue that homeworker invisibility is linked to a lack of representation and agency at the grassroots, which presents a particular obstacle for homeworkers. Corporate responses to reports of poor labour conditions, such as child labour, focus on risks to the firm rather than the work conditions of homeworkers. Rendering homeworkers as invisible allows firms to make sub-
Collective Practices and Appropriation of Knowledge By Three Figures of Knowledge Workers

We propose to analyse three figures of knowledge workers: art and entertainment workers, and salaried-entrepreneurs and makers, of three points of view.

Firstly, we present the institutional framework. All of these workers are out of regular rules of employment. But their activity is framed by different institutional architectures. Art and entertainment workers are formally salaried but really quasi-independent. Salaried-entrepreneurs are formally salaried but really quasi-entrepreneurs. Makers make autonomous spaces out of employment relationships.

Secondly, we analyse these figures not as professional groups, but through their practices of appropriation of knowledge. For art and entertainment workers, the discontinuous employment relationships constitute a precarious condition but at the same time, it is the condition for autonomous artistic and cultural production. For salaried-entrepreneurs the singular enterprise, Business Employment Cooperative is the space for production of common knowledge. Finally, for makers, free knowledge and co-production are the “core business”.

In all of these experiences we can show how collective practices invent singular forms of resistance to the neoliberal model of “self entrepreneurship”.

Social Policy for Improvement of Standard of Living in Thailand

Social Policy entails the study of the social relations necessary for human well-being and the systems by which well-being may be promoted. It’s about the many and various things that affect the kinds of life that people can live. This paper presents the results from Citizen Survey on social quality in Thailand by using the ACSQ (Asian Consortium for Social Quality) standard questionnaire conducted by King Prajadhipok’s Institute during the end of 2012 to explain the important factors affecting the public satisfaction on standard of living in Thailand and what kind of social policy should be formulated to enhance the wellbeing of Thai people. Since Thai present government concentrate mostly on so called “populist” policy which is considered to be different from welfare policy and there are a lot of controversies in Thai society. A lot of money has been spent to support the wellbeing of the people in rural area and the group of the poor. The results show that accommodation, employment, financial status and family life have positive impact on satisfaction on standard of living, whereas political participation shows negative impact. Therefore, the social policies that are appropriate for Thailand should be the strengthening the socio economic security that is related to those mentioned factors.

Historical Perspectives On Risk and Morality

Anthony Giddens argued that the 'risk society' presupposes the 'evaporation of morality'. But like other aspects of the sociology of risk, this proposition has never been empirically substantiated. This paper will historically explore the inverse relationship between risk and morality, focusing on the language of policy debates in the UK on contentious social issues. The balance between arguments grounded in more straightforward ‘right’ and ‘wrong’ and those based in risk and harm reduction will be analysed, focusing on four particular periods: the late Victorian, the liberalising legislation of the 1960s, the Thatcher-Major years, and current Coalition policy language – in view of Cameron's intent to 'remoralise' discourse. The intention is to cast new light on contemporary debates such as around drugs policy and 'policy-led evidence', where the tension between probabilistic calculation and moral judgement is marked, and to direct new theoretical attention to the useful contrast of risk to morality.

Rational for Widening the Research Paradigms in Defence Environment

To date, a large amount of the research conducted within defence organisations has been restricted both in terms of the research paradigms employed and the content areas covered. The paradigms have been predominately positivist and the content has tended to privilege investigations of actions carried out by uniformed military. This paper will argue that the imposition of the neoliberal agenda on most defence organisations has resulted in a civilisation and privatised agenda on most defence organisations has resulted in a civilisation and privatisation of defence. The consequences of this imposition have been so profound as to have altered the very way in which the military can conduct war. As will be demonstrated in the paper these changes in turn also warrant a change in the nature and frequency of the research paradigms used. The present reality is that the pace of reforms has outstripped the ability of researchers to stay abreast of these developments let alone to engage in sound, explanatory, theoretical development. Researchers have been further hampered by the predominance of research paradigms and methodological approaches ill-suited to investigating the complexity of these developments and in particular the social systems involved.

Examples drawn from Iraq and Afghanistan will be used to demonstrate the limitations of existing research approaches to meet the current and future challenges associated with the ongoing nature of defence reforms and transformations. Emerging topics which are explored to justify a change in research approaches include the blurring of boundaries between military and its suppliers; the increased dependence on contractors to generate military capability in the battlespace; and the raft of unresolved moral and ethical dilemmas as well as the jurisdictional nightmare that has followed as a result. The overall aim of the paper is to demonstrate why different topics require different research approaches.

Supporting Family Farmers, Small Traders and Micro Entrepreneurs: Brazilian Local Experiences of Income Redistribution

The inequality in Brazil remains huge. In 2012, the richest 10% concentrated 41.9% of total national income. Although improvements were made in recent years, the country’s Gini coefficient in 2012 was 0.498, which still situates the country as one of the most unequal in the world. Social policies of the federal government such as the Programa Bolsa Familia, the minimum wage increase and the reduction of unemployment have been able to reduce poverty and extreme poverty in the country. However, to reduce inequality is necessary that local governments also formulate and implement public policies aiming to reduce inequalities. This article discusses and analyzes four municipal experiences which are facing these issues. The field research was carried out between 2012 and 2013 and in methodological terms, there was documentary analysis of the legal instruments that have created programs, analysis of quantitative indicators and interviews with government experts, representatives of the legislative power, members of opposition parties, small businessmen, traders, family farmers and the general population. Two of them, in Dracena (State of São Paulo) and São João deイラis (Piauí), are related to family farmers and deal directly with the issue of poverty in small rural municipalities. The third, Cubatão (São Paulo), deals with the stimulation to local trade, through a new kind of social currency. And finally, the fourth case is Cariacica (Espírito Santos), an experience to stimulate local entrepreneurship, accompanied by a public procurement program directed to micro and small entrepreneurs. The effects of the four experiments on inequality are heterogeneous, but the results show that, at different levels, these policies have succeeded in stimulating local economic development and reduce inequalities in cities. They can therefore serve as interesting examples to reflect on the role of local governments in building a fairer society.

The Brazilian Challenges for Effective a Sport Public Policy

The Brazilian Challenges for Effective a Sport Public Policy

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
With the upcoming of the two biggest sporting events in the world - the FIFA World Cup 2014 and the Rio de janeiro Olympic Games in 2016 - Brazil is experiencing a unique moment and fomenting the discussion of sporting infrastructure in the country and the necessity to build a national sport public policy committed not only in winning another world championship in football or guarantee a better classification in the medals table in the next Olympics, but also a policy that ensures the practice of sports to all citizens. This article presents the determination of sport public policies by the federal government in recent years that aims to contribute to the further development of the sport nationwide. The issue consists in the analysis of programs that encourage physical activity and sports, the payment of stipend for athletes (Bolsa-Aleatla), tax relief to companies that support sports initiatives (Sports Incentive Law), improvement in national sports infrastructure and the science support for this area.

The results show that the federal government has been increasing the incentive for high performance sport and ensuring better training and participation of Brazilian athletes in international competitions. Nevertheless, the sport practice is still a result of isolated initiatives. The challenge is to harness the moment that sport has in Brazil to foster discussion and seek to consolidate a national public policy for sport in the coming years.

'Big Brother For People With Degrees': Interpassivity In Contemporary Activism

Since 2011, there has been a resurgence of activism across the globe in an attempt to resist what has come to be seen as an unjust and unfair approach to the global financial crisis. One of the largest movements being managed to spread across 951 cities and 81 countries in a matter of months following the initial call to camp at Zucotti Park, New York (near Wall Street). This paper is based on interviews that took place with Occupy: London in May 2012 (just before they were evicted).

Mark Fisher has suggested that, interpassivity – when "the object itself takes from me, deprives me of, my own passivity" (Žižek 2006:24) – can be seen in examples of resistive culture (such as the film ‘Wall-e’ which "performs our anti-capitalism for us" (Fishier 2009:12). In this way, the current paper suggests that we could apply this to some forms of activism to explain why some people feel like they are part of such movements without ‘properly’ joining them on the ground. Analysing some of the interview data, we find evidence that some people might be allowing the other to ‘relieve them of their passivity’ towards resistance and turning it into a kind of privatised rebellion rather than any real action against the system.

Transnational Grandparenting By Minority Ethnic Groups Living in England and Wales

BACKGROUND: This paper examines the transnational grandparenting activities of middle aged (40-54) and older people (55+) from six ethnic minority groups living in England and Wales (Black Caribbean, Black African, Indian, Pakistani, Bangladeshi and Chinese). Within the sample of 1206 people, there were 1408 transnational relationships (dyads) with relatives overseas. Of the 1408 transnational relationships with relatives only 88 were between grandparents and grandchildren.

METHOD: Frequency and methods of contact (letter writing, telephone calls, ICT, visiting and receiving visitors, sending and receiving gifts, sending and receiving one of gifts of money, sending and receiving regular remittances) were used in exploratory latent profile analysis to identify transnational relationships for all relative dyads. A four-class model was selected as the best fit to the data. The types of transnational relationships were characterised as: Infrequent Digital Communicators; Infrequent Telephone Communicators; Highly Connected Regular Benefactors and Occasional Bilateral-Bounteous-Visitors. Thereafter, our analyses focus on the 88 grandparental transnational relationships. We explore differences between ethnic groups and the gender of the grandparental dyad (e.g. grandmother-grandson, grandmother-granddaughter, grandfather-granddaughter, grandfather-grandson).

RESULTS: Although the numbers are small, trends are observed with regard to differences in grandparental transnational relationships between ethnic groups. A majority of transnational relationships between Black African grandparents and grandchildren were characterised as Infrequent Telephone Communicators (85%); whereas a majority of relationships between Indian grandparents and grandchildren were characterised as Highly Connected Regular Benefactors. Pakistani and Bangladeshi grandparents were more likely than grandparents in other ethnic groups to be Occasional Bilateral-Bounteous-Visitors. With regard to gender dyads, all transnational relationships were with grandsons and there were no significant differences in relationship types between grandmothers and grandfathers.

IMPLICATIONS: The implications of the findings for intergenerational transmission of cultural values between grandparents and grandchildren are discussed, taking into account the location of the grandchild.

Cross-Border Social Security Coordination, Mobility Of Labour

This paper analyses the mobility of labour forces between two European welfare states and its impact on earnings of residents-pensioners and mobile-pensioners. It examines the case of frontier workers in Luxembourg and Belgium. The results of the analysis show that structural differences in pension systems (e.g. retirement age, waiting period, benefit levels) affect mobile pensioners. The case of frontier workers in Luxembourg and Belgium illustrate that current legislation produces uneven effects on the earnings of former mobile workers. Labour mobility plays an increasing role in welfare policies and demands a new approach in national welfare states.

Mobility Of Labour and Pension Outcomes: An Analysis Of The European Cross-Border Social Security Coordination

Pension systems were designed in a time characterized by stable labour markets and limited cross-border mobility. As the labour market becomes increasingly flexible, upcoming generations will be faced with challenges of differences in income taxation and social security systems, as these generate discrepancies in income. We argue that changes in life-cycle due to mobility of work to another country are happening and welfare state objectives need to address these changes.

Labour mobility plays an increasing role in welfare policies and demands a new approach in national welfare states. This paper analyses the impact of mobility of labour between the states, in the European context and questions whether the welfare state attains equally achieves its objectives on domestic and frontier workers. Despite accessibility of pension from different countries, due to differences in welfare objectives, the welfare of mobile pensioners can vary a lot. The results of the analysis show that structural differences in pension systems (e.g. retirement age, waiting period, benefit levels) affect the welfare of mobile pensioners. The case of frontier workers in Luxembourg and Belgium illustrate that despite legislation on coordinating the pension outcomes is in place, this produces uneven effects on the earnings of mobile pensioners and will in the future lead to more obstacles for the welfare of the upcoming mobile generation.

Lean Production : An Erroneous Conception of Work ?

In the 1990s, Lean production concerned automobile factories. Since it has spread to service facilities, hospitals and public services. French government has gone further by promoting and partially financing its implementation, especially in smaller firms in order to develop their competitiveness. However, it has progressively become a topic of public debate. Various experts and trade unions criticize its effects on working conditions, showing that the health of workers is sometimes more affected in context of Lean production than in traditional scientific organizations.

On the basis of about ten case studies, we point out a big diversity in firms that have resorted to Lean production. Its relevance depends on their own issues, the way changes were conducted or the characteristics of the initial organizational context. In consequence, it’s difficult to provide a very strong opinion. However, we put forward that, on the one hand, Lean production has ability to introduce two fundamental aspects which clearly go over Taylorism: the value-added of the ground as a key factor of success in performance's firms and the necessity to pay attention to workers by getting them involved in a continuous improvement of customer satisfaction. But, on the other hand, Lean production doesn’t work into account seriously enough. Work is always standardized and the participation of workers is limited to find a solution to problems in a

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
binding framework. Finally, working conditions remain at the service of productive requirements and are not considered at the strategic level. Lean production doesn't truly question the scientific division of labor, which would suppose to completely redefine the conception of performance including social issues.

Sport As a Thread in the Life of the Destitute

A critical lens on the value and meaning of sport in the lives of what has become known as “high risk” populations. Boasting together to justice to a thoughtful understanding of the value of sport in the lived realities of people. In a study conducted over a five year period (2007-2011), tracing the impact of the G2YZF sport-for-development programme in nine different African countries, 101 comprehensive case studies were compiled. Of these, 45 were selected based on the extensiveness of material available per case. The thematic analysis of life-integrated experiences three main themes was identified. These themes projected differential degrees of integration of sport-related experiences in the lives of participants and implementers (e.g. managers of NGOs, coaches, peer-educator and volunteers). The first theme relates to sports-related experiences as “encounters” which could be interpreted as an initial phase in the socialisation process, where it stayed at a relatively superficial level of engagement. A second theme demonstrates an increased entanglement underpinned by experiences of relative success, acceptance and recognition. This type of engagement proliferated into a myriad of associations and various degrees of sport-role integration. The third theme shows a deepening of commitment which happened by choice and/or socio-economic realities profiling the process as a viable option for survival. The differential depth and role-assignments are analysed to identify the mechanisms in sport and society.

Career and Profession As Subversive Concepts at Mid-20th Century

Mid-twentieth century sociologists showed great ingenuity applying the hegemonic concepts of career and profession to subvert commonplace ideas of success and progress. These concepts of career and profession in overlapping but different ways formed part of a cluster of modernising narratives distinguishing ‘advanced’ western nations from underdeveloped nations; they also distinguishing middle-upper sections of modern technological societies from uneducated parts of the labour market. These ostensibly descriptive uses of the concepts of career and profession were highly normative in two senses. First, they embedded a prescriptive idea about what individuals should do or what constituted a worthy occupational focus. Second, such aspirations embraced by middle-class individuals was naturalised as the desirable modern route to success and fulfilment. Pioneering work by scholars such as Goffman and Becker re-purposed the notion of career as a tool to subvert everyday hegemonic assumptions, delineating instead trajectories of inequality. Similarly, Freidson and Johnson’s re-framed profession-trajectories in particular. This approach suggests that through the accumulation of formal or socio-economic realities profiling the process as a viable option for survival.

Risk Knowledge Versus Uncertainty: Insights from Research on Health Issues

Today dominant forms of risk management illustrate the central role of scientific knowledge in the organization of society in general and in public health activities in particular. This approach suggests that through the accumulation of formal knowledge, greater control over health can be gained. However, the ambivalent consequences of relying on abstract knowledge are more and more apparent. The increasing dependence of – lay and professional – individuals on mediated knowledge (for example screening or epidemiological results) discredits first-hand, experiential knowledge. Furthermore, the definition of health on abstract knowledge (for example screening or epidemiological results) discredits first-hand, experiential knowledge. Furthermore, the definition of health on abstract knowledge (for example screening or epidemiological results) discredits first-hand, experiential knowledge.

Stories of My America: Race and Nation in the Contemporary US

This paper will explore findings from research done to understand contemporary perspectives on belonging and nationalism in the United States. It will explore the meaning of “America,” what is unique about its character and possibilities, and its claims to being special in the history of nations on this planet. These intertwined issues are widely conceptualized in both lay and scholarly discourse as the spirit of American exceptionalism. Just more than one century after its creation, the nation-state expanded to become a global power, including a pattern of territorial expansion deemed by many to be imperial. By mid-twentieth century, the United States was the number one world power.

As the hegemonic power within the world-system, the U.S. was forced to reckon with contradictions within its own borders and how they reflected on its position as the world leader. Anti-colonial struggles that occurred throughout the globe were frequently viewed as aligned with movements for social change among marginalized populations within its borders. The nation struggled with the question of how they would be positioned and perceived in this new era of imperialism. How could the rhetoric of democracy be rationalized as interventions around the globe intensified? The Reagan era provided narratives of benevolence and leadership that justified these actions in the eyes of many people in the U.S. By George W. Bush’s Presidency, nationalism and patriotism were generally assumed virtues that trumped all else. Participant reflections are thoughtful, though often contradicting their words providing their realms of deep internal struggles about how the ideological narratives that people ascribe to sometimes explain but more often disregard the challenges they face in everyday life. These “Stories of My America” provide insight into the everyday struggles engaged to reconcile the rhetoric, revers and realities embodied in the notion of an American Dream.

BUSSCHER, NIENKE* (PhD Researcher, n.a.busscher@rug.nl)

Land Governance and Its Influence on Institutional Development in Santiago Del Estero, Argentina

Over the last decades the rural landscape worldwide has been undergoing major changes. Vast tracks of land are appropriated by different (global) actors for diverse purposes. In Argentina, this ranges from investments for soybean cultivation, cattle farming, nature preservation and ecotourism. The impact of this phenomenon on the livelihood of rural communities in this area is enormous. These populations, who have been living on the land for many generations, often do not possess legal titles to the land and are threatened to continue to live as they did before. Although by law their rights are acknowledged when living on the land for over 20 years, these rights are often not respected. Land appropriation and land grabbing lead to marginalization of rural communities and create inequality. By means of combining literature on governance, socio-ecological systems, and social sustainability, this paper looks at how rural communities in the province of Santiago del Estero, Argentina cope with the challenges arising from increasing land use and acquisition and how they advance their mobilization. The focus of this paper lies on multi-level governance processes within this socio-political conflict of rural communities. The challenges the communities face in terms of new boundaries, land management and use, cooperation and participation and ecological restrictions are central for evaluating the sustainability of the system. Major findings presented in this paper are that negotiations over land take place between actors with an unequal distribution of power, meaning that the rural communities are further neglected and political measures overrule local inhabitants rights. This conclusion calls for more recognition of the conflict by the national and provincial governments but furthermore, improved access to information for the rural communities to advance justice and equity in the governance of the commons.

XVIII ISA World Congress of Sociology
to achieve their project of migrating to Brazil to find job. We draw on fieldwork conducted in Peru where we followed Haitians going through to cross the Brazilian border—where Haitians are granted refugee status since 2012. We combine it with the analysis of the state policies, and the programs international organizations have set up to serve (or control) Haitian migration. In particular, we pay attention to the frames used by international organizations and states (e.g. “victims,” “refugees”) and how migrants themselves draw on them to achieve their migratory project. We want to highlight the mismatch (or decoupling) between how migrants are framed at the international level, and how their see their own migration. Focusing on the latter, we highlight that rather than passive actors, migrants navigate the frames to accomplish their goal that is finding a job in a new country.

The Legal-Illegal Nexus: Haitian Citizens in Their Transit Migration through Peru

The nexus legal-illegal is more fluid than migration literature indicates. Thus far, research on legality/illegality (Carling, Menjivar and Schmalzbauer 2012; Golsen-Boza 2012) has focused on the experiences of families with members with different migratory statuses and/or how migrants from the same country enjoy different migratory statuses depending on the country of destination (e.g. Somalia). There is little on how migrants of the same nationality experience moving back and forth between these categorizations in their trajectory to a destination. We analyze the case of Haitian migration to Brazil to shed light on migrants’ agency and the colonial constraints they face. We argue that migrants themselves do navigate successfully (mostly) the fluidity of the nexus legal-illegal due to their “migration capital.”

After the 2010 earthquake in Haiti, Haitian migrants to Brazil through Peru have called the attention of media, local populations, authorities and security forces. Ever since, changing approaches and ad hoc stipulations in the migration policies of Brazil, Peru and Ecuador regarding “administering” the flow, have created “illegal-legal” scenarios for Haitians. Concurrently, Peru requires visa for Haitians, and Brazil grants refugee status (1/12/2012). In this context, Haitians are both treated as migrant bodies (Chavez 2009) assuming almost passively the events caused by actors who take advantage, abuse them or profit on their needs (Peruvian Police, coyotes, others). Simultaneously, they “master the local legal logic” in order to avoid “restrictions to their projects” (Fonseca and Jardim 2010). We draw on a multi-method and multisite research conducted in 2013 to illustrate this case.

Rethinking Lowrider Artistic Representations: An Aesthetic Response to Social Exclusion

This paper examines ethnographically the construct of the lowrider vehicle as part of the barrio aesthetic. The central argument is that the display of lowriders can be better understood as an artistic response to institutional exclusion – an identity mechanism of resistance used to contest institutional oppression. The principles of the Borderlands theory provide exceptional insights into the analyses of aesthetic manifestions and social exclusion. We use this approach to theoretically frame lowriders’ artistic representations as mechanisms of resistance to social exclusion. This study employs a qualitative triangulation method that includes participant observations, photo documentation, and ten semi-structured interviews. Between winter 2006 and summer 2007 data were collected from two lowrider car shows in the state of Michigan. One site was in the city of Lansing and the other was in South Haven. This study found that lowrider art works as a source of stability and structure for Chicanas/o young adults who live on the margins of society. Isolated by the racial/ethnic larger order from mainstream space, the lowrider aesthetic represents an identity-building component introduced through family and friends – consciously or unconsciously – to question institutional exclusion.

Creative Disturbances in Urban Space

A role for politics in urban space is to make seen that which is invisible in the relationships and structures of the city; to offer alternative thoughts on the use of space as well as question topographies of power that underpin it. Creative disturbances in urban space have held a place in the forms of politics yet recent debates on political and urban geographies has demarcated differences between political and cultural uses of public space, questioning claims of the utility of ‘small’ everyday creative interventions as opposed to Big P political acts.

This paper will argue that the efficacy of cultural politics can be theorised in terms of: In contrast to a politics of presence, imagination and transformation. A politics of presence incorporates into creative interventions that which is not seen in the official discourse of the global city including ethnicity, age and gender. A politics of imagination centres on generative processes, that is, the instantiation of alternative conceptions and uses of urban space. This aspect of creative interventions is working within established fields of what is resistance and ‘who has the right to the city’. Finally a politics of transformation is embedded in narratives of scale. A criticism of the effectiveness of creative interventions is that they are often unable to rise above the locality in which they are centred. This paper will argue through case studies of creative acts from Sydney (car culture among young men), Delhi (multi-media labs in marginalised communities) and London (graffiti knitting), that creative interventions can in fact generate a process of public pedagogy and reconfigure urban engagement that emphasises ‘community’, temporal alternatives, bodily engagement in production, and the aesthetics of public place-making.

Migration As the Process of Care Exclusion

In Poland, alike in other eastern and central European countries, caring functions are played by families and particularly by women. Women who work abroad exclude themselves from direct care of their children and elderly parents. Then their children and elderly parents are left on their own and tent to be excluded by the State as a result of such a situation. In this way they must look for strangers’ help. Cultural norms make both parties (migrants and their families) notice the discrepancy between the obligations and execution of care duties. The presentation quotes the results of quantitative research (N=400) in Polish women migrating to Norway. It shows examples of care deficits and attempts to solve the problem.

“Becoming Expatriate” Foreign Assignments and the Role of Accompanying Spouses in Kampala

Foreign assignments and expatriate lifestyles drew the attention mostly through publications coming from the field of Human Resources. Here the focus lies largely on the risks and costs of premature returns. It is claimed that expatriate assignments often fail and are in most cases caused by marital problems or family issues rather than work environment or poor performance of the employee. Therefore the foreign assignment apparatus of professionals and their families is not only tailor-made to support families but also creates perceptions about how to “live abroad” as expatriates. Spouses are seen as a crucial factor to guarantee the stability of family life and work performance abroad. Scholars have pointed to the influence and constructivist nature of preparation training and the importance of the ‘deploying organization’ in shaping expatriate identities (Hindman, 2007; Mense-Petermann 2012). Until today the aspired stability through support of expatriate spouses rests on a heteronormative perception of family and marriage. Furthermore, transnational companies through global assignment policies, especially through high wages and incentives create differences between expatriates and their colleagues and between expatriates and the local population (Mense-Petermann, 2013). By the same token, Fechter (2007) highlights the notion of privilege and detachment of the expatriate communities from the ‘host society’ and draws a link between colonial and contemporary expatriate lifestyles in non-western countries. This paper examines the role of accompanying spouses in the foreign assignment process and poses questions about how the relationship between the ‘deploying organisation’ and spouse is conceptualized. In addition I will draw attention to the relationships that derives from (economic) privileges on the one hand, and on the other marital dependency created by the “single breadwinner” who is the contract holder. For this purpose I will utilise the findings of my PhD research on the European expat community in Kampala, Uganda.
BYFIELD, NATALIE* (St. John's University, byfieldnm@stjohns.edu)
Targets: The Existential Crisis of Black Male Youth in the U.S

This article uses intersectional analysis and critical race theory to investigate how race, age, and gender intersect in black, male youth in urban areas in the United States to create life outcomes that likely represent an existential challenge for people in this social location. The prosecution of the federal-based War on Drugs in the 1980s led to a moral panic that categorized black, male youth in urban areas as the new “folk devils.” The continuation of the War on Drugs has prolonged the “folk devil” status of black male youth over the course of the last two decades. This contributed to the tendency in this society for dominant forces to construct young black males as criminals. Their status as criminals has shaped their interactions with representatives of the state as well as with other individuals. It has made them targets, at a disproportionate rate, of laws intended to curb criminal behavior such as the New York State Stop and Frisk law being enforced by the New York Police Department (NYPD). This status also contributes to the racial profiling they experience from individuals, who deem them dangerous, particularly in non-black spaces and react to their presence with deadly force as in the case of Trayvon Martin. This paper examines significance of marginalization in these contexts to their future as members of that society.

BYRNE, ELLIE* (Cardiff University, byrnee@cardiff.ac.uk)
Analysing and Interpreting Participants’ Photographs of a Mental Health Hospital

In this paper I reflect upon the analysis and interpretation of 377 photographs taken by research participants in my PhD study. Service users and staff in a mental health hospital were asked to use disposable cameras to show what they thought of their surroundings. The aim of the study was to explore the contribution of photography to understandings of the mental health hospital environment, in terms of both the research process and as visual data. I began with a detailed methodological review of studies where research participants took photographs as part of the research process. This informed the iterative cycles of data collection which followed. Some participants took photographs on their own and did not take part in any form of interview (6). Others took part in follow up interviews where we talked about the photographs they had taken (7). Some participants took part in mobile photo-interviews where I accompanied them as they took their photographs, collecting interview data concurrently (4). In addition, two focus groups took place with people not connected to the hospital. The focus groups produced individual and group responses to a sample of images.

The focus of this paper is on the techniques of data analysis and the interpretation of visual images from different standpoints (e.g. researcher, photographer, third party) I found that certain images produced stronger reactions than others and I will use Roland Barthes’ concepts of ‘studium’ and ‘punctum’ in order to theorise this. I will also discuss the possibility that, by unpicking of the content of a large number of photographs, ‘thin’ yet ‘rich’ descriptions of the hospital environment can be produced.

Patterns of Trust and Distrust in Energy System Transformation

Energy systems around the world are in transition. The need for renewable energy sources and – in some cases – devastating experiences with dangerous technologies has triggered public debate in favor of changing the dominant sociotechnical regimes of energy supply. In question are existing technological, organizational and governmental paradigms. We can observe a lack of trust in technology (nuclear power), in organization (technocracy of experts), and in processes of liberalization, as well as in non-transparent relations between governmental actors and private stakeholders. All of this influences the overall confidence attributed towards the energy domain.

However, we cannot assume that the result of this transformational process yields trust and confidence in the “new” system. In case of the German “Energiewende”, a growing discomfort already leads to a lack of confidence in reliability and security and, partly, to doomsday scenarios of expected major breakdowns. People start to prepare for the worst case.

With reference to the visions and goals of system transformation we have to expect a qualitative change of the relationship between the general public and the energy system. Particularly in vogue are ideas of “smart” technologies (smart grid, smart markets, demand-side-management) in order to implement multiple alternative energy sources and to increase distribution efficiency. The transformation into smart grid energy systems is now likely to cause a shift of modes from confidence to (system) trust among consumers who are supposed to take a more active role as “prosumers” despite intransparent technologies and markets.

Therefore, the sociological problem arises in a probable shift of disappointment attribution from external references (e.g. politics) to self-reference (own decision), making smart grids primarily a problem of increased choice between decision alternatives. This future outlook might entail the paradox experience with technology: A situation of empowered but distrustful users faced with uncertainty and decisional risk.

Cultural Capital and Academic Achievement in Hong Kong

Participation in high-brow culture (e.g., visits at museums or art gallery, attendance at an opera or classical symphony concert) has been of particular interests to sociologists of education in many Western countries as it has been widely used as a measure of cultural capital. In recent years, this high-brow cultural participation increasingly draws the attention of sociologists of education in other parts of the world: East Asia. Unlike evidence showing the positive effect in most Western countries, however, evidence in some East Asian countries suggests that excessive cultural participation may have negative consequences for academic performance. Yet more research is needed to establish the relationship between high-brow cultural activities and academic achievement in East Asian educational systems. In this study, we address this issue by studying the role of cultural capital in Hong Kong. Hong Kong provides a very unique setting of studying cultural capital because of its Chinese history and British colonial experience, which is often referred to as “a meeting place of East and West.” In other words, Hong Kong’s educational system has many similarities with those of other East Asian societies, for example, in terms of a highly competitive school setting and a heavy reliance on shadow education due to the high-stakes exams, while having many Western cultural characteristics influenced by the British Empire. Indeed, our analyses of 2000 Programme for International Student Assessment (PISA) suggest that cultural capital defined as high-brow cultural participation has a diminishing return for math achievement. We discuss a broader theoretical and empirical implication of this result beyond and above the context of Hong Kong.

CABALLERO, HILDA*(Universidad Nacional Autónoma de México, hildac@unam.mx)

Results On Public Policies Against Poverty In Mexico: 1990 - 2012

Results on public policies against poverty have not been successful to diminish it. In 1990, 21.4% of people in Mexico didn’t have enough money to eat, 29.7% of people didn’t have enough money to improve their capacities, and 53% of people didn’t have enough money to have better conditions of life. Twenty years later, in 2010, 18.6% of people didn’t have enough money to eat, 26.7% of people didn’t have enough money to improve their capacities, and 51.3% of people didn’t have enough money to have better conditions of life. Therefore, it is concluded that the public policies against poverty haven’t been able to attack the causes of it, that’s why it is necessary to review the design, conception and implementation of them. This situation is the result of changes in the relationship between state and society and of course in the design of public policies against poverty.

In order to understand what happened with the public policies against poverty it is necessary to take into account the historical context in which they are designed and implemented. Nowadays, public policies do not fight against the process of pauperization, with changes in the economic model since the late seventies; all the countries have been involved in a competition to offer the best conditions to the investors, but not for population. Therefore, implementation of structural reforms has had a huge social cost. The challenge is abandon the assistance policies and design policies that give more alternatives to people to achieve better life conditions.

E-Inclusive Active Aging: Citizens and Senior Volunteers in Telematic Society

ENGLISH

This paper analyze the roles that represent the elderly in our society as citizens who participate actively in social and political processes. Similarly, it intends to dignify the elderly, and thus demystify negative stereotypes and prejudices of this life stage, what they symbolize elderly people not only as social achievement of our time by medical advances, nutrition or friendly policies general welfare, but social capital also usable for their knowledge and life experiences to the generations who share the same context.

To achieve these objectives, it examines the social participation through associations and senior volunteer, as phenomena of social empowerment, digital inclusion and intergenerational solidarity in aging societies by demographic changes, and telematics by technological advances that affect progress, growth and modernity.

The fieldwork was made in a Spanish region with demographic ageing where public and private institutions develop actions to achieve e-inclusion of citizens +65 years (17% of the population); so that reducing the digital gap and promoting the use of ICT to improve quality of life, social participation and cohesion.

SPANISH

La comunicación analiza los distintos papeles de los adultos mayores en la sociedad actual, como ciudadanos que participan activamente en los procesos sociales y políticos, desmitificando visiones negativas y estereotipos sobre esta etapa vital. Para ello se analiza su participación a través del asociacionismo y el voluntariado sénior, como fenómenos de empoderamiento social, inclusión digital y solidaridad intergeneracional en sociedades senescentes y telemáticas.

El trabajo de campo se ha centrado en una región española fuertemente envejecida en la que instituciones públicas y privadas desarrollan acciones para lograr la e-inclusión de la ciudadanía de 65 y más años; reduciendo así la fractura digital y promoviendo el uso de las TIC para superar la exclusión y mejorar la calidad de vida, la participación social y la cohesión.

Who Learns from Whom? Environmental Intergenerational Relations

The communication is a contribution to knowledge of social and environmental intergenerational relationships, specifically the role of grandparents and grandchildren in the acquisition and transmission of values, habits and environmental attitudes.

In advanced Western societies older people have regained some influence on the learning of their grandchildren. The lengthening of life expectancy, medical and health improvements and economic security guarantees due to the performance of the (increasingly reduced) welfare state, allow these groups to reach old age in good physical, economic and emotional. This allows them to devote their time to training activities, leisure and sports, but also help your children in all aspects, especially in raising their grandchildren, going with them a large number of hours per day due to long working double shifts and parents.

This common time they share grandparents and grandchildren can be used to transfer knowledge and new learning from each other. Much of today's grandparents have lived through times of scarcity and have learned to conserve and effectively manage scarce resources available, having generated habits generally keep still. Meanwhile Grandchildren were born in times of plenty and much of their education is based on consumption, comfort and opulence, but also have been influenced by their teachers and media in exercising habits that could called sustainable.

Our work, based on surveys and focus groups, aims to contribute to knowledge of how interact grandparents and grandchildren in the mutual transfer of environmental attitudes and habits; what kind of sustainable habits between generations reproduce. In short, try to know who learns from whom.

Para Qué Estudiar Un Posgrado? El Valor De La Educación Ante La Falta De Oportunidades

A los 25 años de edad las personas que han seguido una trayectoria escolar regular pueden inscribirse a estudios de posgrado, sin embargo esta posibilidad aumenta o disminuye de acuerdo con las condiciones socioeconómicas presentes y los valores atribuidos a la educación se corresponden con estas condiciones.

De acuerdo con indicadores de la OCDE (2011) México presenta una falla estructural en la educación pues en la primera década del siglo XXI, 29.5% de jóvenes que se encuentra en el rango de 25 a 29 años de edad no estudian ni trabajan y el porcentaje aumenta a 47.3% si se considera sólo el caso de las mujeres. Esto significa que casi la mitad de las mujeres que se encuentran en este rango de edad no participan en procesos de formación ni cuenta con un trabajo digno.

En la ponencia se analiza por qué los estudiantes optan por inscribirse en alguno de los posgrados de la Universidad Autónoma de Chiapas. Se parte del supuesto que la decisión para estudiar en estos posgrados está mediada por la imposibilidad de encontrar trabajo o acceder a otro programa que, aunque les resulte de mayor interés, no pueden solventar económicamente.

CADA, KAREL* (Charles University, kcada@centrum.cz)

Public and Private in Transition: Debating Choices in Health Care Reforms in the Post-Communist Czech Republic

The paper examines a public discussion on health policy reforms in the Czech Republic between 2006 and 2008. After the fall of communism, the first period of transformation focused mostly on basic market oriented reforms such as setting up a pluralistic insurance model, decentralizing through privatization and setting up a public/private mix for the provision of health care. Although health care changed significantly in the two following decades, the biggest reform plan was proposed after the parliamentary elections in 2006 when the right-wing government prepared several new proposals aiming both at the privatization of large hospitals and health insurance funds and the cost containment of health care provision.

The reform was presented both as a way to save public funds and as an important step toward a health care system based on diversity and choices. The plan corresponded with a general shift towards a neoliberal paradigm in healthcare...
focusing on consumer-oriented services accessed via the market and patients as self-responsible and rational actors in Central and Eastern Europe. While similar processes have attracted some sociological attention in the context of Anglo-Saxon world and Western Europe, little has been said about the post-communist countries. Using a discourse analysis of parliamentary speeches, TV debates, and media articles the paper examines how health consumers and boundaries between private and public in health care provision were constructed and negotiated. The paper describes the contradictory rhetorics of both enhancing choices and steering choices in the proposed policy programme. In 2006 the Czech public perceived those rhetorics. Health care is strongly considered by the Czech public to be a public good, which should be covered by the state. According to public opinion surveys, the public does not sympathize with market liberalism in the area of health care, even though it has accepted these principles on housing and employment.

CAHYADI, ANTONIUS* (University of Indonesia, ombo_2000@yahoo.com)
Religions In Indonesian Public Sphere: Its Role and Relation With The State

Indonesian public sphere has not ever been secular. It becomes a space of religion for actualizing itself. The debates among Indonesian founding fathers and mothers during State Constitution drafting had established such account. The Islamic faction supported Syariah law for the new independent state; on the other hand the secular or the nationalist groups preferred secular law. The compromise was achieved in the constitution. Indonesia was neither secular nor Islamic state. Under Suharto’s dictatorship, Islamic state supporters and also pro-democratic exponents were all suppressed. The 1998 Reformulation opened a space for all groups and movements that had been silenced before, to sound their voices. Since then Islamic groups seems to have louder voices than secularists and non-Muslim groups. However it was quite surprising, in 2006 the Government in Indonesia officially recognized Confucianism as official religions of the State together with Islam, Protestant, Catholic, Buddhism and Hinduism. Furthermore, in the same year, the Government and the House of Representative stipulated the Law that acknowledged local belief adherents in state administrative system. It shows that religion plays significant role in Indonesian public sphere. It influences legal and political deliberation. The paper will discuss the existence and the role of religion in Indonesian public sphere. The politics of legal identity, in which religion has been used as identifying category of individual in public sphere, will be elaborated in expounding this account. Because of such politics, public sphere has been a contestation arena between official religions and other religions such local religions. In such space, religion has been constructed by dominant power, defining the existing power relations.

Sex According To Law: Socio Legal Study On Local Regulation Proscribing Prostitution In Indonesia

In Indonesia, prostitution is explicitly only proscribed in Local Regulation (Peraturan Daerah) level. It is prohibited in local level. In national level it is implicitly regulated. The Local Regulation proscribing prostitution is only post-Reformation 1998 phenomenon. It appears together with the fever of Syariah Local Regulation stipulation by the local Government that obtains its autonomy after the Reformulation. Motivation for proposing such Regulation is blurred with political interest, financial motive and popularity gaining endeavor. Syariah Law becomes promising project gathering people’s sympathy and money. In National level there are Penal Code and Law on the Eradication of Human Trafficking. However the Laws are implicitly proscribed the prostitution. Hence it is only several local regions and not all regions have regulations that make prostitution illegal. This paper offers qualitative description about the prohibition of prostitution in Indonesia. The Politics of legal identity, in which religion has been used as identifying category of individual in public sphere, will be elaborated in expounding this account. Because of such politics, public sphere has been a contestation arena between official religions and other religions such local religions. In such space, religion has been constructed by dominant power, defining the existing power relations.

A Modeler’s Choices for Missing Not at Random Scenario

Missing data are a common problem in longitudinal studies. For example, respondents may refuse to participate after the first wave of data collection was completed. It is well known that restricting analysis to complete cases may produce biased and less efficient estimates. Generally, there are three main approaches for accounting missing data in longitudinal studies which include, weighting, imputation, and likelihood. As a modeler, the key concern is whether the estimated parameters using any of the three approaches are different from their true values. If the missing cases do not have strong effect on the estimation, then it can be ignored. If the missing cases are not at random; however, modeling the missing and the responses as a joint distribution must be considered. However, testing the ignobility of missing data is difficult and complex. Therefore, the choice between using a missing-at-random (MAR) model and a missing-not-at-random (MNAR) model should be based on results of sensitivity analysis. Although over the last decade a variety of joint models and methods to test sensitivity have been proposed, applications of such models in sociological research are still uncommon, partly due to the computational complexity and technical difficulties of implementation in regular commercial packages such as SAS, and STATA.

In this study, taking advantage of newly updated procedure PROC MCMC in SAS, we implement two MNAR models-- the selection model and the shared-parameter model with various indicators for sensitivity analysis. In addition, we also extend the two above models to nonlinear outcomes, such as Binary, Poisson, and zero-inflated Poisson. To evaluate the performance of our model, simulation studies are conducted with various setups. We also reanalyze the result published by Guo et al. on delinquency. The example provides a comprehensive modeling strategy for dealing with missing in longitudinal studies.

Mortality Differentials Among Asians and Native Hawaiians/Pacific Islanders (NHPI) in the U.S

Vital statistics provide opportunity to examine the health of diverse racial/ethnic groups within the U.S. Previous analysis using 1992 data demonstrated the importance of separating the Asian/Pacific Islander (API) category into component subgroups. Subgroup analysis found age-adjusted death rates ranging from 298.8 per 100,000 population for Japanese to 907.7 for Samoans. When examining smaller ethnic subgroups in the U.S., data from a single year can result in questions regarding the reliability of the estimates, as occurred in the 1992 analysis. Preliminary analysis of pooled mortality data from 2004, 2005, and 2006 from states collecting detailed race/ethnicity data found a significant difference between the age-adjusted death rates for Asians and NHPI.

Age-Adjusted Death Rates per 100,000 by Race, Selected States 2004-2006

<td>650.0</td>
<td></td>
</tr>
</tbody>
</table>

Age-specific death rates of Asians compared with NHPI show higher rates for NHPI at each age except for those 85 years and older.

This analysis of the death rates confirms the need to separate the Asian and NHPI groups when studying their health. Since the number of the NHPI in the U.S. is relatively small compared to Asians, the substantially higher death rates for NHPI are not reflected in data when combined with Asian populations.

These preliminary results include only deaths where a single race is reported on the death certificate. The present study extends and updates the analysis to include the mortality of people for whom multiple races are reported. While multiple race was reported for only 5 percent of the population, significant differences exist by racial group with NHPI most likely to have been reported as multiracial (49.2 percent).

This paper also discusses a national survey underway that will greatly expand the social and behavioral factors associated with health outcomes for the NHPI in the U.S.

Parceirização Trabalhista: La Cooperación En El Sistema Judicial

Las sociedades complejas producen alto grado de litigiosidad. El aumento significativo de la contingencia y del riesgo genera situaciones no normatizadas, para las cuales el intérprete necesita de parámetros innovadores para toma de decisiones. En este contexto, se analiza el proceso de acercamiento entre los jueces y procuradores que trabajan en lo que Enoque Ribeiro dos Santos llama percepción jurisdiccional de acercamiento. En este sentido, la comunicación entre dos sistemas (Poder Judicial y Ministerio Público) tiene el potencial de reducir la complejidad y formular juicios socialmente comprometidos. La reconstrucción de la manera de observar y reducir la complejidad del sistema de trabajo sigue la tendencia mundial en la búsqueda de soluciones jurídicas innovadoras. El juez y el procurador trabajan en nivel horizontal con un fuerte apoyo institucional. Dotados de un gran poder de acción, pueden contribuir para creación de fórmulas jurídicas innovadoras en sintonía con el movimiento de producción de reglas jurídicas transnacionales, ya que las normas de protección de la persona humana están fundamentadas en el sistema de protección internacional (ONU, OEA, Comunidad Europea, etc.). Considerando que el sistema de protección de los derechos humanos y fundamentales posee fundamentación transnacional, podemos intuir que la aproximación entre jueces y procuradores puede marcar el comienzo de una nueva fase de interpretación y aplicación de la norma jurídica, basada en una hermenéutica abierta a la orden jurídica transnacional. Con estas reflexiones, descendentres de nuestro proyecto de doctorado, pretendemos contribuir al debate sobre las acciones de cooperación institucional en conformidad con el derecho internacional centrado en la protección de la persona humana como un bien cosmolopolita.

Long-Term Trends in Life Satisfaction in Europe Explained (1973-2012)

In our earlier research based on Eurobarometer micro-data (1973-2012) for eight European countries/regions we have found that in Flanders net time trends are more important than life cycle or generation effects. The results for Flanders also seem to indicate (1) u-shaped life satisfaction levels in the long run and (2) short-term life satisfaction fluctuations being dependent on economic booms and busts. But these results are not representative for other regions/countries considered.

With each of the three temporal dimensions considered (trend, birth cohort and life cycle), one can associate different economical and/or sociological explanations. In this paper we focus on the explanation of long-term life satisfaction trends (Easterlin-paradox, absolute income hypothesis, social trust, ... across Europe.

We do so by enriching Eurobarometer micro-data (1973-2012) with appropriate macro-level time series such as unemployment rates, GDP, changes in survey methods, ... and applying Multilevel Hierarchical Age Period Cohort analysis techniques to explain the variances associated with the clustering of survey respondents by survey year and by region or country.

Homo Sacer: The American Indian Experience in the United States of America

This research aims to study the relationship between indigenous peoples and the State. By using the concept of homo sacer/ homines sacri (Giorgio Agamben 1998), the study interprets the relationship of the American Indians with the United States of America. Based on a revision of the literature on the American Indians, the study aims at highlighting how the struggles of indigenous peoples over territory and natural resources relate to rights recognized by the international human rights frameworks: the Inter-American Human Rights System and the United Nations Declaration on the Rights of Indigenous Peoples (UNDRIP). In this way, the argument of this study is that international human rights law upholds the rights of the American Indians. This argument is tested against three cases: the recognition and protection of indigenous land rights on the basis of traditional tenure (The Dann Sisters’ case before the Inter-American Commission on Human Rights), human rights violations (the case of Leonard Peltier, activist of the American Indian Movement) and the issue of indigenous nationalism (the case of the Hawaiian sovereignty movement).

Managing Conflict in Indigenous Lands and Protected Areas in Mexico

This study analyses indigenous land tenure disputes within protected natural areas (Montes Azules Biosphere Reserve and others). It does so by analysing the case of the Comunidad Zona Lacandona (Lacandon Community, Chiapas, Mexico) and the land tenure disputes in which it has been involved during the period 1972-2012. The study argues that the Lacandon Community (LC) has a micro-corporatist relationship with the state and that its creation has brought its beneficiaries ( comuneros) into an ongoing dynamic of conflict and cooperation with the state, fellow indigenous landed communities, social and non-governmental organisations and guerrillas. By analysing its relationship with the state and the forty-year long conflict, the study presents the way in which the LC has defended its land rights within institutional channels as well as by means of contentious action. The study also shows how conflict has been dealt with within a political process and contributes to the theoretical understanding of the categories of micro-corporatism and political process as they are employed in those cases where indigenous peoples enter into conflict over land. Data for this study comes from interviews, agrarian archives, public information requests, newspaper articles, and ethnographies on the case study and its wider region.

Managing Uncertainty in Public Health Service Regulation: The Case of Nice Technological Appraisals

This paper examines the 'technological appraisals' carried out by NICE (National Institute for Health and Care Excellence) as it regulates the provision of new drugs within the English NHS on cost effectiveness grounds. Regulators must assess and manage risk in order to ensure the effective functioning of the transactions which occur under their jurisdiction. Recent studies have argued that this role is more one of managing uncertainty than managing risk, but few investigations have explored how uncertainty is dealt with at the micro-level. In the context of our study, probabilistic data is derived from existing studies into the effects of a drug and modelled into quality adjusted life years (QALYs) as a means of comparising the cost per QALY of the particular drug for specific patient groups. Oftentimes this is a highly rational process by which the regulatory process absorbs uncertainty. In practice, and as found in a scoping study, things are far more complex and uncertain. This paper draws on ethnographic data – interviews with a range of stakeholders (including clinical and patient experts and representatives of the drug manufacturers) and decision-makers (n=40), observations of public and closed regulator meetings, and documentary analysis – of the decision-making process around three very different pharmaceutical products. The study explores the various ways in which different forms of uncertainty – epistemic, procedural, relational and others – are perceived, considered, presented and tackled within these drug appraisals. Special attention is paid to various techniques through which uncertainty and complexity are reduced and/or bracketed-off and how these techniques manifest themselves at the micro-interactional level. We also explore how broader organisational pressures and relations are translated into features of decision-making and how actors co-construct and cope with uncertainty.

Are There Bandits at Serra Do Mar State Park? Conflicts, Strategies and Multiple Uses of Natural Resources in the Atlantic Forest, São Paulo, Brazil

The history of the relationship between inhabitants and managers of the Picungua Administrative Nucleus in the Serra do Mar State Park (SMSP) is characterized by conflicts related to the rights to permanence and to the use of natural resources. The SMPS is located in the northern coast of São Paulo State, the richest and more developed state of Brazil. Created in 1977, the park remained on paper until the beginning of the 1980s decade. At this moment, these inhabitants, rural workers and fishermen, were delegitimized and lost their rights to work and to continue their cultural and productive activities. Since then, the inhabitants were considered illegal or, on their own words, “bandits”, due to the Brazilian law prohibiting the presence of inhabitants inside the Protected Areas with strictly...
Swedish Retirement Migrants To Spain and Migrant Workers: Interlinked Migration Chains and Their Consequences To Work and Care In Ageing Europe

In Swedish public discourse, retirees born in the 1940s are considered a growing cohort of relatively wealthy consumers, with more cosmopolitan preferences and habits, and different demands compared to previous generations. Swedish retirees are part of a growing stream of Northern Europeans who migrate to Southern Europe to retire in the sun. This paper presents the preliminary results of an ongoing research project on the conditions of Swedish retiree migrants in Spain and of the workers who provide care and services for them.

We found that social networks, intermediaries and subcontractors are crucial to the organization of migration as well as for the provision of work and services in IRM destinations. In the private sector there are Swedish migrant workers, entrepreneurs and service providers offering the “trust” and “security” of a shared culture. In addition, there are Spanish workers hired by Swedish businesses as well as migrant workers from third countries. At the public and non-profit side, there are Spanish National Services, Town Council “foreign resident offices”, voluntary interpreters, NGOs and charities surrounding the Swedish IRMs. Thus, Swedish IRMs, with little knowledge of Spanish language and institutions, are strongly dependent on intermediaries.

Spaniards and third-country migrants that provide work and services for Swedish IRMs have little direct contact with Swedish IRMs, partly due to language issues, and partly due to not being hired directly by them. They normally occupy low skilled jobs that are not considered acceptable by Swedish workers and entrepreneurs in the area.

Exploring the relations between streams of migrants who meet in Spain, and their intermediaries, this project explores issues of mobility and the globalization of care/service, of crucial importance to welfare states and the future of work, elderly care and retirement conditions in Europe.

quenía habilitadora, social y material transformation the country has experienced.

The goal of this paper is to analyze and compare the patterns and dynamics of residential habitation of three cohorts of young people around of time they start their marital and/or reproductive life. The central questions are: Have these patterns changed in recent decades? If so, in what sense? Other topics of interest are: to what extent young married (or in consensual union) have residential independence? How much remain in the parental home or in-laws or other relatives? How many cohabit with their conjugal partner? With their children? How much do they return to the parental home after an early marriage/unión dissolution?

To answer these and other questions we analyze life history data of a nationally representative sample of three cohorts of men and women born in 1936-1938, 1951-1953 and 1966-1968. The longitudinal and retrospective data come from the Mexican Retrospective Demographic Survey carried out in 2001.

The analysis will be conducted from the perspective of the life course and cohort analysis, with a focus on young people up to thirty years of age.

*How Do Mexican Young Perceive Their Well-Being?*

The purpose of this proposal is to approach the well-being conditions of Mexican youth from the perspective of their own point of view, that is, taking into account how they see themselves to report to feel, perceive and evaluate all the different aspects of their lives, mainly in the areas of education, family and work. We look to answer questions like: Which is the evaluation that young with different socioeconomic characteristics and life backgrounds make about educational opportunities they have had and the level of education they have achieved? How much are they satisfied with their job and labor activity? How do they feel about their family life? What about making their own decisions? and, more generally, How do they perceive their present and future life chances and life conditions?

The contribution is conceptually and methodologically guided by the notion of subjective well-being, which assumes that well-being depends not only on objective and material elements, but also on the assessment of them made by individuals over the base of their personal circumstances and experience. Accordingly, the interest topics will be analyzed and compared taking into account issues such as sex, age group, education, occupation, marital status and urban/rural residence.

Data comes from a survey applied in 2012 by the Mexican National Statistical Institute (INEGI) to a representative sample of individuals 18 years and over. In that survey, called Self-reported Welfare Module (BIARE) respondents were asked to evaluate by themselves different aspects of their own lives. For the purposes of this paper we focus on young aged 18-29 years.

*Reassembling The Cancer Clinic: Genomics, 'Actionability' and Emerging Diagnostic Configurations*

In social studies of diagnosis, genomic approaches have often been conflated with risk-based genetic testing and discussed in the context of expectations about how they will transform healthy individuals into at-risk patients. The development of high-throughput technologies in oncology, in particular of clinical sequencing programs, highlights a different side of genomic diagnosis in action, one that is focused on creating new plans of clinical action for cancer patients, rather than computing statistical risks for asymptomatic patients. The paper will analyze how genetic results in cancer diagnosis are made ‘actionable’, and in particular how the sequencing of genomic approaches has led to new systems of classification and new venues for deliberating on diagnostic actionability. The implementation of the new genomic diagnostic platforms mobilizes clinical research consortia, regulatory agencies, biotech companies and patient advocacy groups, and requires more than the mobilization of existing structures and arrangements. The data collected by high-throughput technologies necessitates the development of new statistical tools, the establishment of standardized registries and databases to ensure their reliability, and a redefinition of the biomedical division of labor as manifested by the emergence of new lines of work and shifts in the traditional interfaces between clinicians, biologists, pathologists and patients. They have also led to the establishment of a public genetic diagnostic infrastructure as exemplified by the Stratified Medicine Initiative in the UK or the Molecular Testing Platforms in France. In this paper we examine recent developments in this rapidly changing field, focusing on the tension between clinical research and routine services, and between qualitative and quantitative diagnostic judgments, which in turn refer to different modalities of regulation and objectification of clinical practices.

*Labour Regulation and Casual Work in Australia*

This paper examines the history of ‘casual’ work in Australia from the nineteenth century to the present. It explores the way in which the consolidation of protective labour regulation in the twentieth century, structured around a norm of full-time ongoing work (FOW), still preserved space for a category of casual work. This space has been enthusiastically colonised by employers in several industries, initially small employers in the low-wage service sector, but then more widely throughout the economy. This in turn functioned as a lever for broader demands for labour deregulation and increased labour flexibility. The result has been an expansion of precarious work in a diverse range of forms, within the framework of a markedly fragmented employment structure and a porous regulatory regime. The paper looks in particular at the implications of the expansion of casualised part-time work, based predominantly on the labour of students and married women, in the retail sector. It examines employer labour-use practices and trade union responses, focusing on the period from the 1980s.

*Two Temporary Foreign Worker Programs in Australia: An Intra-National Comparison*

Australia is conventionally regarded as a land of permanent settlement, but temporary migration has become more important in migration flows in recent years. Two main temporary foreign worker programs (TFWPs), structured in different ways both based on restricted rights to residence and social benefits, are currently in operation. The first is nominally aimed at skilled workers, but it extends to less skilled groups in industries such as restaurants and construction, while the second is a smaller, newer program designed for semi-skilled workers, predominantly in horticulture. This paper draws on a current research project on temporary migrant work and precariousness to describe the two TF-
Selective universities.

The paper focuses on the everyday construction of domesticity 'away from home' in a large and isolated condominium, called Hotel House, primarily inhabited by migrants (95% of the residents) and situated in a small Italian city (Porto Recanati, Mac).

It firstly analyzes home-making practices as forms of spatial appropriation strongly related to emotion and nostalgia, as well as to pragmatic needs and material resources. Migrants living in Hotel House re-territorialize themselves inside the condominium, breathing new life into their own memory, flavors and smells. They create new domestic spaces imbued by personal and collective identities looking for a sense of continuity and 'comfort'. As comfort we intend a back-ground mood of well-being, trust and confidence and the 'fit' we experience in relation to the space we inhabit and the practices we perform' (Noble 2005: 114).

The paper secondly outlines "at-home"ness practices (Seamon 1979) of people coming from different countries and related to different patterns of house ownership and analyzes "home" not as an essence but as a process of production, reproduction and construction of space, bearing in mind the importance of the socio-spatial dialectic (Soja 1980).

It thirdly highlights how these practices often break the boundaries between private and public spaces creating new "parochial spaces" and how these uses of spaces are frequently perceived by autochthonous people as unfamiliar, strange and disturbing.

In conclusion the paper intends to outline how people's relationships to their own domestic places are an ever-changing, dynamic phenomenon and how these re-territorialization dynamics are a central part of the human being-in-the-world.

Class Differences in Graduation Rates in Selective and Non-Selective Universities in the UK

Rational choice scholars widely use Boudon's (1974) distinction between primary and secondary effects to explain social class differences in educational attainment. Boudon (1998) posits that 'secondary effects' refer to the effect of social class on educational decisions, net of academic ability. On the other hand, scholars who study the impact of institutions on educational outcomes point out that institutional selectivity has a differential impact on students from different social-economic backgrounds. However, there is no clear consensus regarding the direction of these effects. Whereas some scholars predict lower (1) graduation rates for students from lower class backgrounds who attend highly selective institutions (Arkes 1999; Amo and Neathery 1999; Pell 2003; Deer 2005; Kieffer and Reimer 2008), others predict that the likelihood of graduating increases as the selectivity of the institution attended rises (Alon and Tienda 2005; Bowen and Box 1998).

Using student-longitudinal data from the Higher Education Statistic Agency in the UK, I assess in this paper through multilevel and matching techniques, whether the likelihood of completing a degree for students from different social-economic backgrounds increases as the selectivity of the institution rises. The findings reveal that students from lower class backgrounds who attend highly selective universities have higher chances of graduating than their counterparts who attend less selective universities. In addition, the results show the existence of class disparities among students of comparable academic ability at the most selective institutions.

Among this group, we find those who support the mismatch hypothesis. These scholars claim that there is a mismatch between minority students' academic preparation and the scholastic requirements of their institutions. Due to their lower academic credentials, students from minority groups have lower graduation rates than their counterparts with similar characteristics who attend less selective institutions.
Divine Love in Roma) and in Japan (the pilgrimage to Ise) which have been studied through comparative analysis.

The empirical data will be analysed and the two examples (Japanese and Italian), each totally different from the other, will be compared. The distance between them, geographically, is enormous - as are the social conditions: historical, cultural, religious, etc. However, notwithstanding these differences, the motivations, the states of mind and the spirituality (the religious capital), which drive the pilgrims to set out on their journey, are essentially the same. Faith in itself is already reason enough to undertake this journey and to try to approach and to remain a sacred place.

Key words: pilgrimage, inequality, religiosity, religion, capital

CANTA, CARMELINA* (University Roma Tre Italy, canta@uniroma3.it)

Religion In Public Space: Laity and Religious Pluralism In Italy

The role of religion in the public sphere is growing in the last years (J. Habermas, J. Casanova, etc.). The face of religion in the public sphere (laity) in Italy is very complex. This paper wishes to analyse the conclusions of the research, carried out by C. Canta, which explored the various forms of Italian laity.

Laity in Italy is declined in different forms in relation to the migratory process, to the phenomenon of ‘de-secularisation’ and ‘post-secularisation’, the emergence of a new consciousness of citizenship, the phenomenon of democracy, the growth of cultural and religious pluralism and the construction of new ‘scenarios’ of cultural and religious pluralism in the social institutions.

The arguments about this theme in Italy are very lively and are connected to questions which are becoming ever more important in the public debate: every day there is a dialectic between believers and non-believers, between different churches and religious denominations and between science and faith. It continues between those who assign to the politician a role limited to dialogue and mediation and those who would want, instead, its presence in the ‘political sphere’, between those who are the spokesmen of the relational instance and those who, instead, propose a separatist and ‘ideological’ prospective.

The subjects of the research were the accredited representatives and protagonists of society: intellectual, politicians in the Italian Parliament, leaders of the religious communities in Italy and young people belonging to religious associations. Thus there are four social and different worlds which influence each other (not always directly and consciously) and which bring with them various instruments to form the common images of laity in its different concepts and in its many narrations.

CANTILLON, BEA* (university of antwerp, bea.cantillon@ua.ac.be)

Minimum Income Protection, Poverty Reduction and Social Security: Cracks in a Policy Paradigm

Poverty reduction rests on the mechanisms of horizontal and vertical solidarity and on prevention and repair of social risks... In this contribution, we argue that in contemporary welfare systems perceives inherent limitations. Focusing on Belgium, we present and discuss empirical indications of a persistent (over a period of at least 30 years) decline in poverty reduction through social transfers, particularly among households who are highly dependent on such transfers... (Hobsbawm, 1983), this paper will shed light on the new ways disenfranchised individuals... "competed" for identity for and were assigned their new identities; (iv) and a final prayer, bringing up issues of language reconstruction and the blending in of Christian tradition. Drawing from literature on the creation of performance as a political act of resistance (De Bord, 1959) and the invention of tradition (Hobsbawm, 1983), this paper will shed light on the new ways disenfranchised members of society attempt to contest and create new identities.

Performance As Resistance: The Taino Show

This presentation will show footage and analyze a ceremony organized to report on the results of mitochondrial DNA analysis to determine Taino (original inhabitants of Puerto Rico) ancestry on the population of Vieques, Puerto Rico in June 2012. Using a set of different techniques, the organizers, participants and the public performed the ‘Taino Show’: a game-show-like ceremony that served to resist imposed notions of identity, to re-imagine and invent traditions (Hobsbawm, 1983) and to assign a new racial hierarchy. The ‘Taino Show’ consisted of four different sections which will be analyzed and coded: (i) the selling of Taino artifacts; (ii) a lecture on Taino history; (iii) a game-show-like performance, with the use of suspense, audience interaction where contestants ‘competed’ for identity for and were assigned their new identities; (iv) and a final prayer, bringing up issues of language reconstruction and the blending in of Christian tradition. Drawing from literature on the creation of performance as an act of political resistance (De Bord, 1959) and the invention of tradition (Hobsbawm, 1983), this paper will shed light on the new ways disenfranchised members of society attempt to contest and create new identities.

The Future Of Leviathan: Value Change and Attitudes Towards The Role Of The State

Several studies have observed a syndrome of value change among different cultures during the last decades. This project investigated whether these changes
It is true that the internet age and Web 2.0 technology has enabled the shift from one-to-many to many-to-many communication, which provides support for the heterogeneity of communicational content and activities. It brings the advent of more multidirectional forms of participation as well, which is very important for democratic societies. But, what happens when technology is used for digital activism which final goal is not democratic, when it violates human rights, when it promotes national or ethnic exclusiveness? What happens when digital platforms like Wikipedia.org or Metapedia.org are used to spread propaganda?

We define digital activism as the practice of using digital technology for political and social change, for promotion of different ideologies, for social mobilization towards promotion of democracy and tolerance, or exclusiveness and hate.

This presentation focuses on how political groups in Croatia are taking the opportunities offered by new media for digital (civil and political) activism, to promote ideology of Croatian nationalism.

Health Care Access Inequalities Among Pregnant HIV Positive Women

The aim of this paper is to analyse the production of some health care inequalities and the capacity of the health system to mitigate them.

In order to do so, it focuses upon the unequal social relations that decrease the adherence of some pregnant HIV women to antiretroviral medication.

It is based upon a study that was led in French Guyana (South America) in 2009: semi-directive interviews were conducted with 10 HIV positive women and 33 health care and social workers following them.

The study reveals that, although the French social system allows all pregnant HIV positive women to get free antiretroviral medication, the adherence of many of these women is far from optimal, leading to a relatively high rate of infection among their new-borns. These women suffer indeed from a diversity of unequal relations that make it difficult for them to achieve an optimal adherence to medication.

Most of these women are altogether:
- Immigrants without a residence permit: they are afraid of attending institutional health care centers because of the risk of permit control
- Struggling with harsh living conditions that make medication not a priority
- Concerned with the stigmatisation of their disease: they must hide infection, pills and hospital follow-up from sexual partners (from who they are economically dependent) and people around (to avoid social isolation)
- Not familiar with biomedical conceptions of HIV infection and treatment: some misunderstand the principles of biomedical treatment

The paper presents health care professionals’ tips to help women with each of these difficulties and then improve their adherence. It suggests finally that professionals also enhance the self-dignity of the women when they offer them the possibility to give life and to actively preserve their child from prenatal infection (thanks to their adherence to medication).

CARDENAS, JULIAN* (Freie Universität Berlin, julian.cardenas@onlinebschool.com)

How They Rule Latin America? Comparative Analysis of Corporate Interlock Networks in Several Latin American Countries

Research on corporate interlock networks around the world has revealed different network configurations across nations: cohesive networks in e.g., Italy and France, and dispersed networks in e.g., United Kingdom and Japan. Studies carried out showed that cohesive and dispersed networks are produced by different institutional contexts, which correspond to varieties of capitalism (Windolf 2002; van Veen and Kratzer 2011; Cárdenas 2012). However, this hypothesis seems not to fit in Latin America since institutional context (or capitalism) is similar (Phillips, 2004; Schneider, 2009), but corporate interlock networks differ between countries.

This communication will test the possibility of different network configurations across nations: cohesive networks in e.g., Argentina (Paredes 2011; Salva) and Brazil (Almeida and Uchic 2012). The present research analyze, compare and explain the corporate interlock networks across Latin American economies in order to comprehend why corporate elites are interconnected by cohesive networks in some countries, and by dispersed networks in others. Research on corporate networks in Latin America has studied national economies, a systematic cross-national analysis is lacking in Latin America. Results obtained are also compared to previous research on corporate networks in developed countries. This paper contributes to methodological debates on: corporate elite cohesion and economic organization (or variety of capitalism) in Latin America. At the methodological level, comparative social network analysis to examine network configuration, and fuzzy set qualitative comparative analysis, QAP regression and structural equation models to analyze the factors that influence network configuration. Findings reveal the impact of family ownership, protectionist laws, revolving doors and business group structures on corporate networks.

On the Theoretical and Social Conditions of Critique in Contemporary Society

On the Theoretical and Social Conditions of Critique in Contemporary Society

Mikael Carleheden
Department of sociology
University of Copenhagen
mc@soc.ku.dk

It is often claimed that critique is in a crisis. But, what kind of critique would be possible in contemporary society? The point of departure of the paper is that the theoretical conditions of critique must be internally related to the social conditions of contemporary society. Thus, conceptions of critique must be related to the epochal transformation of modern society. In order to grasp social change, I will use Boltanski’s and his co-authors’ distinction between critical sociology and sociology of critique, on the one hand, and their theory about the transformation of the spirit of capitalism (inspired by Peter Wagner), on the other. On the basis of this theory of social change I will discuss two of the most influential schools of critique; the Frankfurt school of critical theory (Horkheimer & Adorno, Habermas and Honneth) and the Foucault version of critical theory (Foucault, the governmentality school and Judith Butler). These schools of critical theory have their different weaknesses and strengths, but my overall claim will be that the former lacks a developed theory of social change, while the latter’s conception of critique is undertheorized. Boltanski’s own concept of critique is also still rather sketchy and lacks a strong tradition. In order to work out a conception of critique for today I use the best parts of these three theoretical traditions - the Frankfurt school, Foucauldian critical theory and Boltanski’s French pragmatism - and work out a consistent suggestion.

CARLEHEDEN, MIKAEL* (University of Copenhagen, mc@soc.ku.dk)

On Theorizing: C.S. Peirce and Contemporary Social Science

Social theory is generally seen as a necessary part of social science. It is institutionalized as a specialized area of research competence (e.g. conferences, working groups and networks, journals and positions) and plays an important role in the education of students (compare the amount of textbooks in social theory). However, the issue about how to theorize is only rarely explicitly addressed in the academic community. Social scientists discuss the content of theories, on the one hand, and empirical research methods, on the other. They only seldom discuss theory construction, that is, the logic or the methods of theoretical research. This paper aims to answer questions like: What do social scientists actually do when they theorize? How do they proceed when they construct theories? What does theoretical research involve? What makes theorizing scientific? Do we need methods in theoretical work? Is there a specific logic of theorizing on which such methods could be based? In the first part of the paper, Peirce’s theory of scientific inquiry - in which he distinguishes retrodiction from both induction and deduction - will be used as a point of departure. The conception of retroduction will be seen as especially relevant for understanding the logic of theorizing. In the second part, some influential schools of social theory – Critical Theory, Critical Realism, Poststructuralism, Cultural pragmatics, French Pragmatism and the Social Mechanism Approach – will be investigated and discussed from the Peircean point of departure in order to answer the above mentioned questions.

Diplomats of Ideas and Networks of Norms: How European Think Tanks and European Foundations Are Shaping the Policy-Making

The Paper aims to examine the production and circulation of ideas (as norms and values) across networks of non-state organizations (Think Tanks, NGOs, Foundations) spanning the Brussels policy-making areas and all European countries. The main idea, here, is to present studies and researches presented at several conferences (IPSA, ISA, ECPRT) through Panels I have been organised and also through seminars specifically designed to gather academic informations on european think tanks. As such, it could be at first a kind of mile-stone regarding europaean think tanks als tools for observing the circulations of ideas/elites/norms and how a global governance is possibility emerging.

Democracy, Social Justice and Education

There is general agreement that democracy is, or should be, an important component to the educational project. However, it is difficult to ascertain what democracy is, and how it should be understood, developed, cultivated and implemented. The research in the paper takes the posture that how educators experience democracy themselves, especially in and through education, may have a significant impact on how they actually do democracy in schools. Based on studies of teacher-education students in Canada (English- and French-language samples), the USA and Australia, the presenters highlight the potential for transformative, critical, democratic educational change. We argue that extending critical engagement toward thicker democracy is still a possibility, despite the strictures of neoliberalism, globalization and colonization, which are formidable obstacles. This paper: a) discusses the meaning of democracy in and through education; b) examines how teacher-education students experience democracy in education; c) interrogates the potential for democracy in and through education; d) develops models and analysis to highlight thicker forms of democracy that are informed by critically-engaged and epistemologically diverse concerns. The same instrument and methodology were employed by the researchers, seeking to understand how participants experienced democracy during their own educational experiences, how they understand democracy at present, and how they feel that democratic education should be cultivated within students and schools. The instrument includes open- and closed-ended questions, with the analysis having qualitative/narrative and quantitative components. The findings include an often extremely thin democratic educational experience for teacher-education students, and a relatively narrow definition of democracy as well as serious concerns related to social justice, addressing controversial issues, and the ability to align democratic educational work with educational reforms that seem to favour neoliberal objectives. The paper engages with sociological theory and concepts to further tease out the potential for education for (thicker and more critical) democracy.

Du Problème Social De La Violence à L’école à L’expérience Enfantine

L’expression des violences apparaît par ailleurs fortement différenciée selon les écoles, les inégalités sociales et scolaires pesant sur l’expérience de violence des élèves. Elle varie également en fonction des pratiques professionnelles. On est bien loin des explications mondialisées de la violence à l’école. Loin d’une violence générée par le seul individu, qu’elle relève d’un défi de socialisation, ou d’une pathologie, le contexte socio-scolaire et les pratiques professionnelles sont à interroger.

Aborder la violence à l’école en s’inscrivant dans une sociologie de l’enfance conduit ainsi à une redéfinition des catégories dominantes (et adulte-centrées) et des problématiques.

Implementing a vignette treatment within an online survey of dual-earner couples and judgments and behaviours. Therefore we adopted an experimental approach implicitly interconnected. Further, there is also a problem of reverse causality between

“Du Bois’ the Souls of Black Folk: A Retrospective Classic?”

Nowadays a sociological classic, W.E.B. Du Bois’ 1903 The Souls of Black Folk, was virtually absent from sociology reading lists, let alone theoretical debates, until very late into the twentieth century. By that time, however, cultural studies on race and ethnicity had already become a well-established domain, with its own theoretical approaches, and a wealth of empirical research.

Yet this situation was soon to suffer a dramatic change. Between 1990 and early 2000, The Souls earns its place in the canon, virtually all major race and ethnicity textbooks identifying it as one its founding texts. This paper is a first attempt at tackling this puzzle. Against prevailing theories of disciplinary canonization, which suggest books to inspire practitioners in a certain direction of research, the dissemination and subsequent canonization of The Souls occurs decades after the emergence and consolidation of cultural studies on race and ethnicity. Specifically, we ask: What does the history of this book tell us about the legitimizing role classical books perform in disciplines like sociology, even if retrospectively only? What do we gain from analyzing The Souls not only as a text with certain intrinsic qualities, but also as a book whose materiality includes the circumstances of its production and commercial edition in the turn of the century America, the geography of its circulation (namely, its translations and re-editions) and its material forms? Who were the social agents involved in this process – from commercial editors and professional translators to academic committees that marketed them? How is the reading of Du Bois by major contemporary race theorists, such as Patricia Collins or H. Winant, shaped by the history of this particular book? More generally, what are the implications of this genealogical exercise for the ways in which teaching and research are undertaken in the social sciences today?

Negotiating Gender in the Military and in International Peacekeeping Operations

This paper addresses the process of women’s gender negotiation in military contexts, comparing the garrison environment to multinational peacekeeping missions. It builds on knowledge about the military as a gendered organization, military women’s integration strategies and the gendered negotiations of their presence in complex, multifunctional and multinational peacekeeping missions. It draws on empirical information from two decades of research on gender integration and identities in western military forces as well as on data from a field research with a mixed battalion in Kosovo.

Gendered Division of Labour and Perceived Fairness

Perceived fairness and the gendered division of labour

Research on perceived fairness about the gendered division of labour often showed that equity does not coincide with equality for most couples. Evaluations of justice depend indeed on various factors. According to social exchange theorists, perceived fairness arises when partners’ relative contributions to paid and unpaid labour balance each other, regardless who does what and how the balance is achieved. According to the social-psychological framework elaborated by Thompson and Major, the sense of fairness depends, among other factors, on comparison referents, i.e. the standards against which the division of labour is evaluated. Finally, gender ideology perspective emphasizes the role of gendered social norms in shaping ideas about what is to be considered as just in the division of labour.

In this communication we investigate three aspects of the relationship between perceived fairness and the gendered division of labour: 1) how paid work, unpaid work and money can be exchanged in order to have a just division of domestic labour; 2) who and at what conditions is entitled to ask for a re-negotiation of the division of domestic labour; 3) the effect of interpersonal comparisons in changing a division of domestic labour that is considered unjust by one of the partners.

Studying these topics with standard survey data is problematic because it is difficult to disentangle the effects of various factors that are usually strongly interconnected. Further, there is also a problem of reverse causality between judgments and behaviours. Therefore we adopted an experimental approach implementing a vignette treatment within an online survey of dual-earner couples with children. In depth interviews were conducted as well, in order to verify the adducted arguments.

Municipals Government and Participation in Cuba: A Critical Review

Ante la necesidad de movilizar dinámicas gradualmente participativas en los gobiernos municipales cubanos, sobre la base de una construcción permanente del Socialismo, este material tiene el objetivo de analizar cómo estos gobiernos se configuran de manera participativa, desde una perspectiva estructural, subjetiva y política.

De manera general, ofrecemos elementos que ayudan a comprender las lógicas que en materia de participación hacen parte de este estrato gubernamental en el país, contribuyendo a repensarlas con vistas a una transformación, por lo menos legislativa, que impulse las dinámicas antes mencionadas.

Este análisis está basado en la aplicación de métodos cualitativos (estudio de caso único, análisis de contenido y entrevista en profundidad y observación no participante), mediante los cuales se pudo concluir que, estructuralmente, los gobiernos de los municipios cubanos se configuran a partir de un enfoque de participación esencialmente pasivo; lo cual, en el caso estudiado, coincide con la dimensión práctica de las formas de gestión gubernamental a nivel local, así como con los componentes subjetivos construidos por un gran número de actores en torno al funcionamiento de estas entidades.

South-South Cooperation Under Analysis: Toward a New Pattern of International Relations?

If till the mid 1990s, the North-South International Cooperation (NSIC) model, based on an idealized notion of progress and legitimized by the incontestable technical superiority of Central countries, remained hegemonic, after the end of the Cold War it would change. The increasing financial pressures over the traditional donors, their failure to assure the development of the underdeveloped countries associated to the consolidation of the New Economically Emerging Countries (NEEC), such as Brazil, India, Russia, China and South Africa, were factors that contributed to the consolidation of a South-South International Cooperation (SSIC) model. Characterized by: noninterference in internal affairs; respect for national sovereignty; absence of externally imposed conditionality on the country for receiving aid, as well as respect for its historical and cultural singularities.

The present article examines to which extent the implementation of a Technical Cooperation Agreement established between Brazil, an emerging economic power, and Cape Verde, deemed as a peripheral country, in order to set up a Masters Program of Public Administration, in this latter country, has met the theoretical guidelines assigned to the South-South modality of International Cooperation.
more comprehensive perspective on the processes and mechanisms demanded for successful aid policies and, also, with the difficulties presented by the Least Developed Countries (LDC) to meet the Millennium Goals, have led traditional forms of North-South Cooperation (NSC) modality (Carrión, 2012).

2. Assess how varying roles and regulatory regimes for private health insurance (PHI) potentially affect health inequalities.

Methods
Policy data on the financing and provision of diagnostic services in Australia, Canada, England, Finland, France, Germany, Italy, and Portugal were extracted from the Health Insurance Access Database (HIAD), a dataset of policy indicators characterizing the relationship between public health insurance coverage and private expenditure regulations since 1990. The HIAD data were collected through focused literature reviews of legislative and academic sources. Data quality was verified using a multi-stage content review procedure. Key policy indicators of the legality and regulation of private service delivery between 1990 and 2010 were extracted and analyzed in a spreadsheet to facilitate interpretation.

Results
Private provision of diagnostic services was legal in all 8 OECD countries between 1990 and 2010. A ban on purchasing PHI was only found in Australia where private services are financed out of the patient’s pocket. Among the remaining 8 countries, notable heterogeneity was found in the extent of private market regulation affecting access to care via: levels of coverage, types of PHI plans, regulatory regimes for alternative modes of private service delivery between 1990 and 2010. In addition, several forms of such expressions of ignorance, including: the intentional bracketing out of unknowns (e.g. as an ‘ignorance is bliss’ strategy for avoiding anxiety); awareness of lack of information that was considered unimportant (e.g. as a strategy for distributing attention to other concerns); and dynamic mindfulness that further knowledge may be dangerous (e.g. both because ‘knowledge’ may make daily decision making impossible and as a strategy for living with the perceived inevitability of new, emergent dangers).

Conclusion
Greater PHI regulation to counter inequitable financing and access to services, exists in health systems where it is widely used and an established means of covering the cost of care. Conversely, where PHI exists but plays a limited role, regulation is minimal. Our findings suggest the function and regulation of PHI over time are appropriate indicators to examine inequalities in health systems.
portance of gender identities and their intersection with social class and country of origin.

To do this, I adopt a three-fold approach, linking the materialist feminism to the life course perspective by using an intersectional approach. My hypothesis is that the configuration of social class and country of origin systems modifies pupils’ attachment to gender identities, and creates a new set of rules. These in turn define which teenagers may target gender-atypical professions.

I use data from a survey carried out in Switzerland among a sample of more than 3300 pupils between the ages of 13 and 15.

DEL OLMO VICÉN, NURIA (universidad de zaragoza)

Justice Ecosocial and Buen Vivir: New Enfoque De Desarrollo Social Comunitario Integral e Integrador

En vistas a explorar modelos y actuaciones de desarrollo comunitario ligados al territorio y de expansión, el congreso acuñó el nuevo enfoque que incorpora la dimensión ambiental, sociocultural, comunitaria y el contexto ecológico, se trabajará, desde una perspectiva micro y macrosociológica, tendiendo puentes hacia nuevas nociones de justicia ecosocial y “buen vivir” como vías de reflexión, prestando atención al universo de riesgos globales y la dependencia del ser humano y su cultura con el entorno físico-natural, y reflexionando acerca del sentido comunitario de la vida en relación con la naturaleza, proyectado desde el paradigma de “buen vivir”. Tomando como referencia el centro de desarrollo a escala humana de Manfred Max Neef (1986, 2010, 2011) y las aportaciones de diversas escuelas Latinoamericanas, con la finalidad de encontrar elementos que configurén enfoques vinculados a dicho paradigma, que hagan converger principios de austeridad, justicia socioambiental, y su proyección al ámbito urbano. Nuevos modelos de prosperidad vinculados al concepto “buen vivir” inspirados en culturas ancestrales, pues cada vez más estudios nos muestran que formas de vida mayoria no pueden resistir, ni sobre vivir a gos que emergen de una sociedad sin límites, egoista, consumista y medioambientalmente empobrecida.

Se profundizará sobre dicho concepto, en contraste con el de desarrollo sostenible de la Unión Europea, centrado exclusivamente en la dimensión medioambiental y su afectación a la economía, intentando en ocasiones justificar y manipular la dimensión ecosocial aquí aportada. Un contraste, con especial atención al sentido comunitario de la vida y en relación con la naturaleza proyectado desde el concepto de “buen vivir” en América Latina, reflexionando sobre otras formas de vida que lleven a reconstruir el modelo de prosperidad, tras el fracaso del modelo consumista imperante, e indagar acerca de qué podemos aprender de esas tradiciones comunitarias y cómo se están teorizando estos conceptos.

Social Positions, Inequality and the Relation with the Future in Lisbon (Portugal)

Social positions, inequality and the relation with the future in Lisbon (Portugal)

Despite the spread of the belief that man can control nature and its own life, and the development of rational action, man continues to be a victim whose collective future was minimal for long time. Ecological movements and institutions, and the social and cultural struggle for sustainability changed this picture. Nevertheless, these trends remain fragile, lacking connection to the population in general – after all, the necessary condition for its maintenance. It’s, then, relevant to ask: are people worried and working towards to control their collective future? Which factors explain differences in the relation with the future among persons? Do inequalities of condition or opportunities matter for these differences? Which social positions and dispositions display a stronger orientation to the future?

These questions were introduced in sociology by authors like W. Bell, P. Bourdieu, A. Giddens and B. Armoogam. In general, they sustain that the cultural relation people develop with the future goes along their social characteristics, reflects on their behavior, and after on social structure. The counterfactual nature of the orientation to the future constitutes, then, an essential aspect of reflexivity and modernity. But this work lacks a developed empirical test.

This is the framework for a recent survey on a representative sample of Lisbon. The main goal is to observe people’s relation with the future through its values, social representations and practices, according to social composition. This includes analyzing practices of future planning, saving, ecologically guided consumption, and support for sustainability movements, among other aspects. What do we know about who masters the future, personal concern about the future of life on earth and climate change, and attitudes towards the next generations?

In this paper we will present the first results of this survey.

Exploring the Construction of Moroccan Emigrants’ Cultural Identity through Their Social Interaction with LOCAL People in Spain

Moroccan emigrants in Spain can be considered as a stigmatized institutional category. From a social constructionist perspective, we assume that all social categories are constructed and negotiated in interaction. In this social context, the purpose of this study consists of exploring the cultural identity of Moroccan emigrants living in Spain. In particular, it aims to examine the content of their cultural identity as expressed by them in their interactions with local people of Spain, and also to analyse the social processes underlying the construction of their cultural identities.

To fulfil these aims we use the Social Identity Approach (Haslam, 2004), which has been traditionally applied to a broad array of topics that explore social categories and associated phenomena such as prejudice, stereotyping, negotiation and language use.

We in-depth interviewed 20 Moroccan emigrants living in Spain using purposeful sampling and trying to diversify at most our sample by gender, age, education and socio-economic status. Our qualitative analysis highlights a strong cultural identity in Moroccan emigrants and sense of belonging to their country and culture of origin. However, the characteristics that they most emphasise as main attributes of the social category “being Moroccan” are very heterogeneous. This heterogeneity is explained by their social interactions, in particular by their perceptions of “the other” Spanish local people that provoke the salience of certain attributes of their cultural identity rather than others. Some important theoretical and practical implications arise from these findings.

More Decent Work: Radical Participation In Organizational Life

he challenges facing workers in the world include new forms of uncertainty, heightened competitiveness, and spectres of austerity. These global challenges stimulate new analytical approaches, re-theorizations, and a search for innovative socio-cultural visions, and practices, for work and workers. The International Labour Organisation’s (ILO) promotion since the turn of the 20th century of a core agenda of “Decent Work” gives international voice to aspirations for just economies and fair standards of work for all workers. Its pursuit of “decent and productive work, in conditions of freedom, equity, security and human dignity” have enduring relevance to virtually all dimensions of human productive endeavour and in diverse economic and national contexts. Yet advances toward the accomplishment of decent work continue to be slow, erratic and, moreover, frequently coercively opposed.

Amid readily visible economic concerns there arise further questions in regard to quality of work life and employment relations. Research reports deterioration of cultural qualities – of non-wage aspects – of work in many sectors including professional occupations in developed countries. In response, many call for a renewal of business and organizational ethics and a revitalization of employee participation in organizational life and in substantive decision-making. This paper particularly adds to discussions of substantive worker participation and organizational democracy. Crucially, it proposes that deep obstructions to the development of decent work and substantive, collaborative participation may lie in more than economic injustice and material inequalities. Drawing on Aristotelian, phenomenological and feminist philosophies it sketches a radical, extra-materialist, inter-subjective conception of quality of work and participation. That conception poses a substantive challenge to policy development and responsibilities for the qualitative organization and practices of work and workplace life.

Trade Union Interests In Corporate Governance In Anglo-American Firms

Abstract

The participation of labour in corporate governance is institutionalized in a small number of countries, especially in European Union states, and variably constrained or systematically precluded everywhere else. Notably, the dominant model of corporate governance in Anglo-American contexts in recent decades exhibits a high prioritization of shareholder interest maximization. Much anglophone business, economics, corporate and labour law literatures typically as-

Book of AbstractsXVIII ISA World Congress of Sociology

sume that workers do not have, or warrant, a voice in governance. Workers’ voice, where acknowledged, is expected to be expressed at the level of workplace decisions and employment relations, or through their shareholding interests. That assumed normative exclusion of workers’ representation from high levels of firm decision-making has powerfully subordinated the valuation of workers’ interests and their political expression. In Anglo-American contexts, financialization has prevailed in corporate governance decision-making. However, since the financial crisis of 2008 and its aftermath the centrality of finance and shareholder sovereignty is now called into new question. Corporate governance is being brought into a political economics agenda of interest and regulation.

This paper addresses critical questions in regard to workers’ and trade unions’ interest in, and voice aspirations toward, corporate governance and high-order decision making in Anglophone contexts. The paper is part of a larger comparative empirical study of corporate governance in four Anglophone countries (United Kingdom, United States of America, Australia and New Zealand) conducted 2012 – 2014. The paper specifically addresses Anglophone trade unions’ interest in corporate governance. It discusses findings that indicate significant and various interests among national trade union bodies. It finds that lack of salience or lack of effectiveness of labour interest expression in corporate governance cannot be assumed as lack of interest in participation across Anglophone countries.

Strategic Models and the Response of Government Agencies to Extreme Emergencies

Government agencies that are tasked with responding to extreme emergencies are constantly battling with the tensions and trade-offs of centralized control versus decentralized decision-making. Many of today’s emergency management organizations are a product of World War II and as such they have a military legacy which continues to shape their day-to-day operations well after their migration to the civil sphere has been effected. Since the post-War years, these organizations have grown in size and adopted models which were developed in the business schools for the needs of private industry. Driven by the growth of managerialism, these models attend to very different organizational realities from those of the military and of public service. This is overlaid and absorbed by the reduction of specificity within management and organizational theories that already characterizes them.

In this paper, we focus on strategy and address how military and strategic management models organize the response of government agencies to extreme emergencies whilst also failing to address their core organizational problems. We are interested in the relatively recent creation of centralized organizations like the US Federal Emergency Management Agency (FEMA) as well as the practical life of strategic organization in front-line emergency management. To address how strategic models lacking specificity take on specificity in a practical domain of organization other than the one for which they were developed, we look at changes made to emergency management in the Australian State of Victoria after the catastrophic 2009 ‘Black Saturday’ bushfires. In the public inquiry into the disaster, centralization became an important antidote for previous shortcomings in ‘command, control and coordination’, eventually leading to the creation of a State Control Centre (SCC) which gives specificity of organizing during extreme emergencies to continue to demand decentralized decision-making.

Sociological Studies of Language When Language Escapes: Some Challenges?

This paper deals with inequalities regarding from whom discourses are considered and analysed. Notably, the aim of this paper is to critically discuss to which extent these inequalities might be methodological and theoretical challenges for sociological studies of language. The overall context is a research on sustainable housing, more specifically about how people define “sustainable housing”, and to put the collected meanings into perspective regarding the established institutional language. Regarding the challenges that came across, I moved the interviews forward to focus on those challenges themselves.

This paper is based on two specific contexts, where the challenges emerged. The first is related to adults who suffer from heavy epilepsy and mental disorders, with an extended minority status. Discourses exist about them but less from them. I wonder how to collect their discourses, and then analyse them as a sociological material. I also wonder how to consider the boundary line between sociology of language, psychology, and speech therapy. The second context consists of an organization that combats poverty, including homeless situations and inadequate housing. On one hand, the participants directly challenged the sociologist regarding the use of their discourse as a sociological material. On the other hand, the participants clearly underlined that they want the sociologist to focus on the smallest common denominator they choose for their communication, i.e. without taking into account the individual variability of their discourses. I wonder how to deal with this mise en abyme of language under a sociological perspective.

CASTAÑEDA SABIDO, FERNANDO* (UNAM, sabido@unam.mx)
Is It Possible to Have a NON Modern Sociology?

Is IT POSSIBLE TO HAVE A NON MODERN SOCIOLOGY?
From its origin sociology has been well aware that it has a constitutive paradox. Its main object is modern society, but at the same time sociology is the product of modern society. There has been given many solutions to this problem, as many as sociological theories have been developed.

This paradox goes by side by side with another paradox, modern rationality always implies its counterpart, irrationality. This idea is also and old argument as well, from romantism to system theory.

Both paradoxes had have solutions in the way they interpret modern society. Although they are not very successful.

The developments of sociology in postcolonial societies, have made their interpretation of this paradox trying to reinterpret this history. But I dont think they have a solution. The paper is aim to reconstruct some of the arguments of these paradox and to analye how is reinterpreted by poscolonal sociology.
CASTAÑOS, FERNANDO* (Universidad Nacional Autónoma de México, zuno@унam.mx)

(De)Coupled Identities: Some Theoretical Reflections and a Few Empirical Observations on Exclusion and Inclusion Discourses

Upholding (or opposing) power relationships implied by event models used in a discourse means accepting (or rejecting) social categorizations employed in referential expressions therein are two potentially linked language games. Validating (or overcoming) the communicative roles presupposed by the discourse is a third one.

Although, in each game, player and move definitions can be set in the game’s own terms, and thus form an autonomous system, they can also be construed as mappings of the other games’ players and moves, and they are often so conceived. That is the art of the games, to reframe their own domains and to project their own range of action. For such reasons, coupled player dichotomies often function as subjection or exclusion mechanisms, and decoupling them can contribute to equalize conditions.

Analyses of moves that have coupled or decoupled gender or ethnic ident- ity dichotomies with other categorizations in Mexico’s recent history support the view outlined above, which draws upon findings from various fields, mainly cultural sociology and discourse science. The main corpus consists of public interventions by and about actors of cases that have made the country face contradictions between different laws, between law and tradition or between law and aspiration (such as the revoked and the effective elections of Eufrosina Cruz).

The moves include subsuming one of the coupled dichotomies (as a whole) under a new superordinate or subdividing one of its poles into new hyponyms, which make the dichotomy less relevant. They also comprise ironically denounc ing the consequences of the opposition or simply deconstructing it by introducing co-hyponyms or clines.

Comments on the argumentative and rhetorical resources used to effect the moves lead to identification of key problems in current conceptions of discourse and context interaction.

CASTAÑOS, FERNANDO* (Universidad Nacional Autónoma de México, zuno@unam.mx)

(De)Dicthomatizing Speech Situations, Semantic Fields and Power Relations: Some Theoretical Reflections and a Few Empirical Observations

Given that a discourse presents a configuration of the possible, the valid and the desirable, accepting or questioning the communicative roles it presupposes often becomes a terrain of dispute. Subscribing production and reception condi- tions is one preliminary move in the game of approving the discourse. The same is true of the semantic relations implied in labels of social agents the discourse refers to. Who is seen to do what is modeled and how they are categorized entail the desirable, accepting or questioning the communicative roles it presupposes.

Furthermore, since communicative roles and social categories tend to be cou- pled at the onset of a discursive exchange, their association is itself a matter the discourse has to deal with. If inconvenient, power relations assumed by the use of social categories will have to be contested once the social categories are upheld by the very occurrence of speech. That is why discussing a discussion’s setting is often as important as, and sometimes more important than, the dis- cussion itself.

Hence, opening up a dyadic situation (constituted by an addressee and an addressee) by allowing witnesses, mediators or judges, or reducing a polyadic one by excluding third parties, are potential challenges to given social semantics and to established power arrangements. Conversely, (de)dicthomatizing meaning or power are latent questionings to conventional communicative engagements.

Such view draws upon findings from various fields, mainly cultural sociology and discourse science; I claim it overcomes ontological and epistemological prob-

Transition Town Initiatives. Possible Pathways Towards Urban Sustainability?

Topic of this contribution is Transition Towns movement as an example of a possible top-down and bottom-up integration in creating sustainable development at the urban level.

Transition Towns initiatives are experiments in the re-location of resources on a micro scale. The goal of Transition Towns is to build resilient communities putting in place local practices aimed at environmental, food and energy sustain- ability, i.e. growing vegetables in urban context, self-production of energy and the use of complementary local currency. At the same time, the movement promotes a moral and cultural renewal of society, unfettered by promises of continued growth. Following the theories of Beck and Giddens, Transition Town movement sets up as a new sub-political actor (it was born between 2005 and 2007 in the UK and now has more than thousands of initiatives around the world), a risk society’s offset that build its own identity and goals from two global alarms: climate change and peak oil. In this sense, the Transition Towns can be taken as the exception. Yet, since the 2000s, this practice has been gradually spreading in some newsrooms.

The gradual use of the signature pertains to a context of progressive transfor- mation of the profession. The Japanese journalism experiences a transition from an organizational pattern symbolised by affiliation of journalists to a newspaper company with long career and authoritarian interm mobility, for instance, to a professional pattern symbolised with careers that are not limited to one company.

By giving the journalists visibility beyond their organization, the practice of signing articles symbolizes the latter of these patterns. The main hypothesis of this chapter is that a sociological approach focusing on the signature can high-

Enclaves Of Foreigners and Multiculturalism In Japan

This paper analyses the relevance of the construct of 'celebration of diversity' to understanding the creation of enclaves of foreigners in Japan. Official policies that have permitted the geographical distribution of foreigners in the country have been largely underpinned by an understanding of multiculturalism that tends to celebrate diversity. Such policy-making acknowledges the existence of a full range of differences between locals and outsiders that results in the 'colonization of diversity' (Blackmore and Sachs 2007: 227) and leaves aside issues of equality and citizenship of non-Japanese people living in the country.

The paper contends that celebration of diversity entails a veiled form of colonization. Enclaves of internal others result in an efficient method to manage diversity by ignoring differences within the borders of a particular geographical location. Assimilating into Japanese society appears to be a matter of 'personal choice' because foreigners do not have to take on any Japanese cultural characteristics and can enjoy and preserve their language, religion and habits within the margins of an enclave.

However, enclaves of foreigners become a real teaching device that permits Japanese citizens observe a display of the rich tapestry of human ethnic differences and fully appreciate the uniqueness and 'ascendency' embedded in their Japanese identity. Expressions such as ‘coexistence’ (kyōsei) and ‘multicultural co-existence’ (tabunka kyōsei) help justify the existence of territorial divisions where different cultures can express their cultural and ethnic differences. As Kibe (2011) contends, the Japanese understanding of multiculturalism tends to present locals and foreigners ‘harmoniously’ sharing the same country.

In conclusion, the paper highlights that multiculturalism à la japonaise presents an intriguing parallelism with the multicultural approach mirrored in Disney films. This form of multiculturalism conveys a 'conflict free image of society' (Kellers 2001) that sanctions historical memory and minimises and simplifies class, race as well as gender differences.

CAVAGHAN, ROSALIND* (Radboud University, R.Cavaghan@fm.ru.nl)
EU Responses to the Financial Crisis: Marginalizing Gender Equality?

The European Union boasts a history of championing gender equality and a developed suite of policy commitments to gender mainstreaming (GM), embedded in multiple recent Treaties. These commitments to gender equality coexist awkwardly however with the economic and market-making imperatives which have formed the EU’s raison d’être - the EU has a long track record of subordinating or co-opting gender equality aspirations into the service of economic ones (Pollack and Hafner-Burton 2000, Rubery 2003), particularly in the ‘technocratic’ areas of economic policy, such as competition, de-regulation and Broad Economic Policy Guidelines (Hoskyns 2008, Pollack and Hafner-Burton 2000). Research has documented how policy makers often use economic imperatives to argue either the irrelevance of gender (Caglar 2008, Cavaghan 2013) or to justify their ignorance of how gender might be relevant (Schmidt 2005).

Given the EU’s central importance as a champion of gender equality and the increased salience of economic policies after the financial crisis, this paper argues that feminist researchers must develop a fuller understanding of how the EU’s policies cohere to the financial do, or do not, respond to the EU’s normative gender equality/GM imperatives. Using methods which drawn on the sociology of knowledge and interpretative policy analysis, this paper presents analysis of policy documents and processes with the EU Commission to explore normative commitment to gender equality, or the lack thereof, embedded within the EU’s policy responses to the financial crisis, focusing on the methods of thinking and the gendered normative values and assumptions or ‘gender knowledge’ (Cavaghan 2012) which dominate amongst policy makers in these fields.

This kind of investigation enables an examination of the particular challenges which the increased dominance of economic and/or neo-liberal or logic pres- ent to gender inequality and the resulting reconfiguration of normative priorities within the EU.

Non-Standard Professional Workers and the Demand of Representation: Do Knowledge Workers Need Collective Organizations?

Since at least 30 years, the processes of economic and social change in industrialized countries have been weakening the collective dimension of working conditions. This is especially the case for young non-standard workers experiencing a more individualistic relation with work and labour market. Indeed, the decreasing participation to unionism can be partly explained by the individualization of work. Italy is a particularly interesting case at this regard, as several labour market reforms took place since the end of the 90s pushing high-skilled young workers into non-standard contracts and positions.

The aim of the paper, based on a qualitative survey involving 75 young professionals living in Milan (Italy) and 16 organizations, is to understand whether high-skilled non-standard professional workers express a specific demand for representation, and what kind of answer traditional and innovative organizations are likely to offer.

Our leading hypothesis is that, as a consequence of a general disappointment towards politics and unionism and of the change of workers' social identity, young professionals do not refer to unions but pursue individual strategies to solve their conflicts within the labour market. Non-standard workers constantly refer to rhetoric on personal autonomy and freedom against the 'boring standard long life full time job' (not existing any longer in the real life).

Our results in Milan, the Italian metropolis which usually anticipate national changes in the labour market, shows a mismatch between job conditions of these workers that have strongly worsened in the last decades, and the awareness that these conditions are shared by a large part of non-standardworkers, and their (in)capacity of collective representation and action. The lack of sharing a common place of work is one of the elements to understand this mismatch. Given this scenario, the possibility for unions and other associations to organize these workers is very unlikely.

Risk, Trust and Aspirations of UK Bankers at the Onset of the Global Financial Crisis: A Case of Extremes?

Debates over the causes of the global financial crisis of 2008 have pointed at institutional and individual-behavioural causes; a methodological and conceptual dichotomy that is profoundly affecting risk research. Responsibility and also often blame for the Global Financial Crisis have been placed on banking institutions that failed to apply due diligence against a backdrop of inadequate regulation, or on individualised 'greed' facilitated by banks that incentivised excessive risk-taking.

But were bankers unique and possibly uniquely extreme in their risk attitudes and, thus, were perhaps recruited into the banking system for this reason? Or did the banking system facilitate or enhance a (latent) propensity for those entering the banking system to be or become extreme, perhaps 'money-hungry' risk-takers?

Using the British Household Panel Survey, this paper compares risk perceptions, trust and aspirations expressed by retail and investment bankers in the UK with those of the general working population at the brink of the Global Financial Crisis in 2008. In addition, using the data in longitudinal analysis, it explores whether bankers' attitudes towards risk changed as they spent more time in banking, asking whether institutions and exposure to their cultures shaped and possibly accentuated attitudes to risk taking.

The paper concludes with a discussion of the findings' implications for the study of risk and risk attitudes.

Inequalities and the Material Civilization's Epistemology

Due to the growing gap of inequalities caused by the current material civilization and the ecological catastrophe that tends to prevent a long permanence of life on the planet, people all over the world have started thinking about a new kind of material civilization. To think -and to build- a non-competitive but complementary economy and to radically change our relationship with nature, not considering it an object but a subject, are the main axes of this transformation that implies, first of all, an epistemic dislocation.

I propose to examine from this perspective some of the real experiences and their horizons and world visions, posing them the question of inequality and focusing the different kinds of inequalities they could be reproducing or solving.

Dual Futures: Double Integration? a Comparative Study of Filipino Mothers and Japanese-Filipino Children's Patterns of Transmigration and Social Integration

Keywords: Filipino mothers, Japanese-Filipino children, transnationalism, social integration, life projects

The presence of transnational and intercultural families is a globalized phenomenon that ethnically diversifies societies and raises profound questions on social integration and belonging of immigrants. Over time, the first generation of migrants has redefined their socio-economic positions through acquired and enacted social capital (Bourdieu 1986), which consequently generates a range of influence on the second generation's life projects.

Filipino women represent one of the four largest groups of migrants in Japan whose intermarriage to Japanese men have produced children of both Japanese and Filipino dual ethn-cultural heritage called Japanese-Filipino children (JFC). Over the years, Filipino mothers have been reforming their image and widening their socio-economic participation in the mainstream society, although their minority status still curtails their visibility and political voice. JFC, on the other hand, are rather diverse groups of second-generation immigrant children in terms of socialization and economic experiences.

This exploratory study aims to compare and contrast Filipino mothers and their Japanese-Filipino children's pursuit of social integration by examining the linkage between their patterns of transnational migration and current and future socio-economic life trajectories. Using life vignettes obtained from in-depth interviews with (30) Filipino mothers and (30) JFC, this research analyzes the linkages between migration and parents and children's formulation of life goals and aspirations, considerations of the social, economic, and educational roles of Japan and the Philippines in their individual and family life, and levels of socio-economic participation in both societies.

The case of Filipino migrant mothers and JFC striving to build socio-economic futures both in Japan and the Philippines provides a micro-level context for examining how first generation and second-generation immigrants utilize transnationalism as a tool for (re)constructing life projects while dealing with uneven, ambivalent degree of social integration in both locations.

Circulation of 'Social Movement Unionism' Concept As a Case of Intellectual South-South and North-South Dialogue

The Euro-America centric and hegemonic development of social sciences has been widely debated in various disciplines, but not significantly in labor sociology. Hence, there is a need for studies developing recognition of the experiences of labor movements in the global South, their relevance in the global North, and their scholarly interpretations in both the global North and South. This includes a focus on how the concepts in social sciences, particularly in labor sociology circulates, the plan of any process takes account of both ‘learning from the periphery’ and a ‘mutual learning on a world scale’. The ‘social movement unionism’ (SMU) concept, which has been developed to describe labor movements in the global South in the 1980s and 1990s, and then later used as a model of union revitalization in both the North and South, sets a good example of such consideration. The paper reviews the labor movements in various countries i.e. South America, Brazil, Philippines, South Korea, the U.S.A., analyzes the scholarly use of the SMU concept, and attempts to apply the main arguments of the critiques of Eurocentrism to this case. Consequently, this paper argues that SMU can be regarded as an appropriate example of a non-hegemonic circulation of concepts in social sciences on a world scale, since it refers to an alternative trade unionism; represents cases of learning from the south; is based on local engagements and experiences; and develops through and acknowledges multiple cases.
All the Things You Are. How to Investigate Sociologically Human Dependence on Familiar Things and Places

In the last two decades, the “pragmatic turn” in French sociology brought to a radical change in the triad subject/object/representation to understanding action and knowledge. Bruno Latour’s contribution, by stressing the key-role played by materiality in accounting for individual and collective agency, was crucial to this move. In parallel, Pierre Bourdieu started to explore the relevance in social life of an infra-representational relation human beings develop with their material world. He reduces the practical sense to the non-reflexive reproduction of pre-existing social structures through embodiment. In our contribution we discuss how the concept of familiar engagement with the environment as theorized by Laurent Thevenot provides a frame to investigate practice in terms of a kind of reflexive human agency based on a specific dependency from the non-human environment, which is ensuring the human being with a fundamental sense of ontological stability. This enduring consistence assured by familiar engagement is necessary to the exercise of further capacities to engage with the world requiring to perform the separation of a subject vis à vis her environment. That is why in our opinion both analytic state and to investigate this specific dependency is a crucial task for a new-materialist approach to the study of social life. The specific human-non human entanglement of the familiar engagement gives rise to a human agent as endowed by a personality to which things and places, personally appropriated through repeated use and frequentation, are consubstantial. It accounts for human experiences such as that of being at ease, but as well of longing and belonging of becoming in terms of flourishing. However to investigate sociologically the experience of being familiarly engaged with the world raises a number of methodological challenges that we will discuss relying on our own fieldworks on political participation and environmental mobilizations.

Insurance is a core institution of modern society. Yet a sociology of insurance is still underdeveloped. Starting from the basic assumption that insurance is a way of trading uncertainty, the main hypothesis arises that the evolutionary advantage of insurance industry lies in increasing the self-produced uncertainty which can be absorbed in social systems through decisions. This implies the use of knowledge, statistics and probability theory – in order to sell insurance. Such a paradox is made operative through the premium quantification. How can future uncertainty be reduced to a certain price? Premium itself is a double-side risk: for insurers the matter is to be written or not to be written; for policy holders the matter is to be or not to be insured. And both have to combine the uncertainty of expectations towards a determinate event with the uncertainty of events towards a determinate expectation. The only solution seems to be that of getting ready to cope with surprises. Some financial instruments such as weather derivatives and catastrophe options can be seen as empirical evidence of this complex form of risk institutionalization.

In this paper I look only at one specific aspect of the movements’ failures: the movements’ internal characteristics. The movements brought together leaders and activists that came from far different social milieus. This led to considerable tensions within the camps in a very short time and to the movements’ very rapid demise. Limited by the small number of the occupiers that had relevant organizational experience and knowledge, and by the very severe internal tensions that led to ill-advised strategic choices, the movements never truly managed to widen their appeal. The empirical investigation is based official documents, on newspaper coverage, diaries as Le Progrès in France, and in The Irish Times (Ireland), and on in-depth interviews with French and Irish occupiers, organizers, civil society and alter-globalization activists, trade unionists, and political advisers.

The Arctic region is climatically one of the fastest changing regions worldwide, as exemplified by the decreasing extent and volume of Arctic sea ice. These changes are attributed mostly to cumulative effects of consumption and production patterns in industrialized countries beyond the Arctic’s southern borders - specifically the increasing emission of greenhouse gases and Short Lived Climate-forcing Pollutants (SLCPs). Warming in the Arctic may feed back on mid-latitude weather and climate by impacting storm tracks, which in turn can increase the frequency of feedback loops between climatic and socio-ecological changes in Arctic and non-Arctic regions. The warming climate also enables a number of economic and societal transformations in the Arctic, driven by the extraction of oil and gas resources on Arctic continental shelves, Arctic shipping mostly along northern-eastern routes, and Arctic air routes.

These changes affect regions beyond the Arctic, such as Europe, North America and Asia, creating new challenges for governance. Proactive and anticipatory capabilities are required to deal with these changes, which include adapting to altered weather patterns in mid-latitude and related effects on crop production, trade and limiting air pollution from greenhouse gases, monitoring air quality, and coping with potential rising sea level resulting from a melting Greenland ice sheet.

In this paper we present an original approach taken by the Sustainable Modes of Arctic Resource-driven Transformation and Interdependence (SMART) project at the Institute for Advanced Sustainability Studies (IASS) as a strongly transdisciplinary attempt to deal with these complex issues in an holistic way. A wide range of stakeholders are being engaged in this process using a highly integrative approach across multiple disciplines. Our focus lies on the coupled social, political, and environmental dimensions that include the governance processes and institutional needs for a more sustainable future in the mutually affected Arctic and non-Arctic regions.

In the autumn of 2011, attempts were made to set up Occupy movements in Ireland and in France. Aside from some initial displays of solidarity initially, the general public in the two countries paid little attention to initiatives and Occupiers enjoyed very limited success in mobilizing even a modest number of people. This paper argues that the reasons for the weak level of mobilization and of public support in France and in Ireland are related to movements’ internal characteristics – their focus on non-hierarchical structures, the sociological make-up of their members, their tenuous and confrontational relations with potentially key allies, etc. This led to a situation whereby despite widespread feelings of anger and frustration regarding the state of the countries’ social and economic affairs, activist failed to mobilize participation. For these reasons, they did not succeed in transforming their narrow interests into symbols that concerned society as a whole, and that they were never hailed as champions of the public good.

In this paper I look only at one specific aspect of the movements’ failures: the movements’ internal characteristics. The movements brought together leaders and activists that came from different social milieus. **Social Mobility Springboard: Occupational Prestige of Thai Labour Brokers**

International labour migration is one of the major issues of our time. Nowa-
days around 200 million people work outside their country of birth. This rapidly
increasing phenomenon is examined in a large number of studies on migration.
However, most of these studies focus on experiences and practicalities of mi-
grants at the place of destination. In this study, we provide insight into the other
issue of the migration study by present occupational prestige for indicated social
mobility of Thai labour brokers who were return migrant from overseas working.
The data were collected via structural interview with 321 samples by systematic
sampling from all provinces in the Northeast of Thailand during year 2010 - 2011.
Data analysis for social mobility was made by occupational prestige. The result
indicated that occupational prestige of labour brokers was 0.1934. It was higher
than their old occupational prestige both agricultural occupation and industri-
al-service occupation. Moreover, we found that social mobility of labour brokers
was upper vertical mobility type and it was "Occupational Mobility"

**Images of Activism and Protest in Modern Art: Towards a Visual
Criminology of Risk?**

This paper examples images of protest in the work of graffiti street artists, such as
Banksy and Os Gemeos, as well as more traditionally documentary techniques of
photography, in relation to examples of political activism and public pro-
test in different countries worldwide.

Against the background of consideration of the criminological study of neo-
liberal forms of governance, social indicators and professional and media-driven
definitions of crime and risk, the paper examines the value of visual and ar-
tistic documents for exploring the representation of everyday life and promot-
ing an ethnographic form of narrative criminology focused on the life stories of
the socially marginalized, excluded and disposed.

The paper explores how criminology as an academic discipline has yet to em-
brace methodological pluralism. While it is arguable that the study of crime and
risk brings to the foreground the need to recognize the importance of answering
the perennial question of "whose side are we one?". In concludes how in these
high/post-modern times of globalized risks - such as the financial crisis, terrorism,
health scares and global warming - focusing on "the visual" through the median
of modern and contemporary art reinforces the need to develop a criminology
of risk and uncertainty which is both politically engaged and methodological
nuanced and robust.

**CHAMBERLAIN, JOHN MARTIN** (Loughborough University, j.m.chamberlain@lboro.ac.uk)

**Medical Regulation in the United Kingdom: Challenging Old and New Orthodoxies**

This paper explores recent developments in the governance of the medical
profession in the United Kingdom. In particular, it focuses on the introduction of
the performance and appraisal tool revalidation to monitor medical practitioners’
clinical practice, as well as made changes to the hearing of fitness
practice cases by the GMC when a doctor is accused of medical malpractice.

The paper outlines how these changes have challenged several orthodoxies
surrounding medical governance pertaining to, firstly, the role of the public and
other health and social professions in the regulation of doctors, and second-
d, how social scientists have traditionally conceptualised contemporary trends in
the relationship between the medical profession, the public and the state.

The paper argues that it is important for social scientists interested in the study
of medical regulation to remember that current developments in the governance
of doctors must be analysed within the broader socio-economic-political context.
For recent reforms in medical governance are to no small measure bound up with
a broader shift in how 'good governance' is conceptualised and operationalized
under neo-liberal mentalities of rule as the state seeks to promote 'at a distance'
a certain type of citizen-subject congruent with the enterprise form within the risk
saturated conditions associated with high modernity.

The paper concludes by arguing that we currently sit at the apex of far-reaching
changes in medical regulation, the full affects of which will not be known for
at least another generation, and it is therefore vitally important to investigate
contemporary reforms in medical governance while bearing in mind the need to
challenge current conceptual orthodoxies within both professional practice and
the academic literature.

**CHAMBERS, DONNA** (University of Sunderland, donna.chambers186@gmail.com)

**Tourism Studies and Epistemological Decolonization**

In this presentation I seek to promote a decolonization of tourism studies. This
requires taking seriously the ‘epistemic perspective/cosmologies/insights of crit-
ical thinkers from the Global South thinking from and with subalternized racial/
ethnic/sexual spaces and bodies’ (Grosfoguel 2007:212). In other words, episte-
ological decolonization requires that one take into account the ‘geo-political’
and ‘body-political’ location of the speaking subject (Grosfoguel, 2007) which
has thus far been largely ignored in tourism scholarship. This concept of decoloni-
ization bears a strong family resemblance to postcolonialism which is more widely
utilised to understand tourism development in the Global South. However, decol-
onal scholars have proffered strong critiques of postcolonial theory for its heavy
reliance on poststructuralist and postmodernist approaches which are consid-
ered to privilege European thinkers such as Foucault, Derrida and Gramsci, three
of the ‘four horses of the apocalypse’ (Grosfoguel 2007:211). This privileging of
Western thinkers has not advanced the goal of subaltern scholarship and further
places eurocentricism at the fulcrum of critique. Decolonization is envisaged as a
more radical project that seeks to change both the terms and the content
of the conversation, to foster a different ‘epistemic grounding’ rather than seeking
transformation within the context of the existing dominant Eurocentric paradigms (Mi-
gnolo 2007).

I argue that there is scarcely any evidence of this kind of decolonial critique
emanating from tourism scholars and practitioners in and from the Global
South. Rather, critiques of colonial/Eurocentric thinking emanate largely from
Western researchers, who write about tourism in the Global South, often with
little interaction with, and from indigenous peoples. I argue that tourism scholars
in and from the Global South need to reject Western epistemologies about tour-
ism as representing the ‘God -eye’ view thus enabling spaces to open up for an
other way of thinking about, and doing tourism.

Pouvoir (CERTOP - Toulouse), f.champy@yahoo.fr)

**The (vanishing?) Role of Phronetic Professions Faced By New
Public Management in Dealing with Political Problems: Doctors,
Architects, Magistrates**

This presentation will deal with a consequence of new public management and
more generally bureaucratization of professional work which has not been much
studied yet.

A former research shed light on the specificities of a kind of professions I
named phronetic or prudential professions, using Aristotle’s concept of Phronesis
(usually translated with “practical wisdom” or prudence). These professions deal
with singular and complex problems which put the work under an irreducible un-
certainty. Actually, any human activity can be fulfilled prudentially. But phronesis
explains some peculiar traits of “prudential professions”. The main one is a high
propensity of their members to get involved in debates or struggles to defend a
peculiar normative conception of their work (for instance liberal vs. more author-
itarian educational patterns; palliative medicine vs. curative voluntarism; a justice
for teenagers focused either on their education or on the protection of society
e.g.) This peculiar trait of some professions is a direct consequence of the large
part phronesis plays in their work. As a consequence, the concept of Phronesis
helps us to study further than usually the political commitments of professionals.
Identifying phronetic professions as a very specific sociological object makes
new issues obvious in the debate about professions, peculiarly concerning the
consequences of NPM. Professional work is or used to be an opportunity to
launch societal debates. An issue is therefore the capacity of a society to be reflec-
tive about the ways of curing and caring, building the city or educate new gener-
ations. The presentation aims at showing that the possibility for professionals to
commit in debates about their practice is jeopardized by NPM and more generally
speaking by the bureaucratization of their contexts of work. What was often (or
at least could be) a critical and ethic activity becomes more and more a
technical one.

CEDAW and Women's Rights in Post-1997 Hong Kong

CEDAW has been applied to Hong Kong since 1996 when it was still under British rule, and since the transfer of sovereignty to China in 1997 continues to be applied to what is now one of China’s “Special Administrative Regions.” The passing of the Sex Discrimination Ordinance (1996), the establishment of the Equal Opportunities Commission (1996) and the Women’s Commission (2001) are often cited as landmarks in Hong Kong’s efforts to respond to CEDAW. However, NGOs have over the years published blow reports criticizing the inadequacies and systemic problems hindering full implementation of CEDAW’s articles. This paper discusses the Hong Kong situation in terms of CEDAW’s role as a key instrument to the promotion of women’s rights. In particular, how Hong Kong’s unique relationship with China and neo-liberalism has resulted in two glaring issues: (1) the marginalization of new migrants and migrant workers, a large proportion of whom are women, and (2) the inability for legislators and government to push forth policies which could enhance women’s situations. Firstly, the government’s attempts to speed up integration with mainland China in terms of population, economy and culture has been met with unforeseen levels of resistance from Hong Kong people, fueling exclusionary and racist attitudes amongst certain increasingly vocal sectors of the population. Secondly, the central government’s reluctance to push forth constitutional reforms to speed up the process of democratization has led to difficulties for effective governance, creating further obstacles for women’s full participation in economy and in politics. The paper concludes with insights from the Hong Kong case regarding the limitations of CEDAW, in particular the over-reliance upon the state and related central mechanisms to take up a key role to promote women’s full participation in society.

Reflected on Social Movement Unionism in Hong Kong: A Case Study of Dock Workers’ Strike in 2013

Traditionally, the trade unions in Hong Kong were politically divisive between the pro-Chinese Communist Party (Hong Kong Federation of Trade Unions or HKFTU) and the pro-Nationalist Party camps (Hong Kong and Kowloon Trades Union Council or HKTUC). Following the British colonial government’s suppression of the riot organized by HKFTU by in 1967, independent trade unions have been established since 1970s. However, the independent trade union federation, Hong Kong Confederation of Trade Union (HKCTU) was not formed until 1990. Hong Kong has witnessed a political shift to promote political democracy and social justice in Hong Kong and the Mainland China, was established by Hong Kong Christian Industrial Committee (“HCIC”), a church-based NGO, and was supported by the international trade union movement. In the past two decades, HKCTU has spent huge effort to organize the marginal workers in the communities. This has given HKCTU and its affiliates the characteristics of social movement unionism. However, the social movement unionism spearheaded by HKCTU has not aroused much public attention until 500 sub-contracted workers in HIT, one of the biggest cargo terminal companies in the world, staged a 40 day long strike in 2013. This strike was organized by the HKCTU’s affiliate; it gained tremendous public support and the union’s strike fund raised more than HK$4.8 million (1.2 million USD) from the public. This strike took place in the context of dropping strike rate in Hong Kong after most of its industries were relocated to the Mainland China. By studying this strike, this paper evaluates the effectiveness and limitations of social movement unionism. However, the paper was drawn from the author’s participant observation as a core member of an activist group that supported the strike and his previous experience as a transportation trade union organizer.

Gendered Organization Perspective in Context: Female Officers in the Hong Kong Police 1950s to the Present

This paper examines the transformation of women’s roles in the Hong Kong Police Force. Since the initial inclusion in 1950. Using documentary sources, secondary data, focus group interviews and in-depth interview data, I discuss policy changes in pertaining to women officers’ roles and career development, and how they are perceived and experienced by retired and serving male and female officers. Using Gendered Organization Theory as the organizing framework, I discuss the extent to which organizational and human resources policies (e.g. male and female officers carrying firearms, training of women in the Police Tactical Unit, the replacement of the pension system with the Mandatory Provident Fund system and changes in public order policing tactics) have benefited women’s work conditions and career advancement options in the male-dominated occupation of policing. Findings suggest that the extent to which the Hong Kong Police can be described as a gendered organization has undoubtedly changed over the years, particularly in the minds of most of the officers interviewed in this study. However, gender remains a key structuring factor in shaping the work and career of male and female officers when actual organizational practices and policies are considered. In addition, organizational culture specific to particular periods also play an important role in how police officers understand and experience gendered organizational processes. The paper concludes by reflecting on the contributions of Gendered Organization Theory and its application to the case of the Hong Kong Police.

Mismatch and Distrust: Institution, Interaction, and Increasing Doctor-Patient Tension in China

On March 23, 2012, a medical resident in Harbin, north China, was stabbed to death by an angry young patient. This was, unfortunately, not an isolated incident. The statistics released by the Ministry of Health in China indicates that violent incidents resulted from medical disputes increased by 70 percent from 2006 to 2010. A survey conducted among patients in 30 hospitals in east China in early 2013 reveals that only 10 percent of the respondents said they trusted doctors. How do we explain patients’ escalating dissatisfaction with doctors’ services and the increasing tension between doctors and patients? In this paper, I argue that there are multiple factors that contribute to the poor doctor-patient relation, and among which mismatch and distrust are the paramount factors. Mismatch refers to two levels of discrepancy. First, it refers to the discrepancy between what the public expects from “public hospitals” and what the public experiences in these hospitals. This discrepancy is constituted by state policies and institutional factors, particularly the financing issues of the healthcare system. Second, mismatch also refers to the discrepancy between doctors’ expectation and patients’ expectation. While doctors are longing for a dominance model of doctor-patient interaction as it is in Hong Kong, patients are expecting a bargaining model. Their discrepancy is produced by doctors’ increased exposure to the medical world in Hong Kong in conjunction with the general public’s increased awareness of their rights in a society with conspicuous social inequalities. The two levels of mismatch result in increasing distrust between doctors and patients that shapes their interaction. A vicious circle is produced by the mutual distrust between doctors and patients in conjunction with the general public’s increased awareness of their rights in a society with conspicuous social inequalities. The two levels of mismatch result in increasing distrust between doctors and patients that shapes their interaction. To mitigate the problem, I suggest that changes have to take place at the institutional level, in particular the first level of mismatch should be eradicated.
Cross-Border Labor Activism: Hong Kong-Based Students and Scholars Against Corporate Misbehavior (SACOM)

From “Looking for Mickey Mouse's Conscience” (The Disney Campaign, 2005-present) to “Ending Slavery” (The Apple and Foxconn Campaign, 2010-present), SACOM is devoted to organizing cross-border campaigns to amplify workers’ calls for decent work in globalized China. In the summer of 2005, SACOM was born out of bi-weekly meetings of some 20 students from Hong Kong’s universities during which we discussed issues such as the rise of global capitalism, under the guidance of three professors. Over these past eight years, SACOM organizers, students (including graduate students from the mainland) and scholars have joined hands to publish first-hand investigative reports to hold Apple, Foxconn, HP, Dell, Disney, Walmart and other multinationals responsible for worker abuses in their supply chains. The “fingers eating machines” were eventually replaced at the toy factory, a labor rights training program was conducted at two large electronics plants, and a short video titled “The Truth behind Apple’s ipad” was shared among Foxconn workers and concerned global consumers through social media. International campaigning is needed to spread our message, while worker participation is indispensable if we are to creating a lasting impact at the workplace level. Challenges of capital and censorship by the Chinese state remain strong, putting direct pressures not only on workers but also our allies based in China.

Foxconn Worker Struggles in China

The Taiwanese multinational corporation Foxconn, which recently soared to number 30 in the Fortune Global 500, holds more than 50 percent of market share in global electronics manufacturing. Its 1.4 million employees at 30 factories across China far exceed its combined workforce in 27 other countries that comprise its global empire. This paper assesses the conditions of Foxconn’s predominantly rural migrant labor workforce, with particular attention to collective agency of workers and the changing character of the workforce. A new generation of Chinese workers is at the center of just-in-time mass production at Foxconn and other producers. Our research examines the working lives of Foxconn workers on the basis of the intertwined policies and practices of Foxconn, international brands (notably Apple) and the local state, and the diverse forms of collective actions workers deploy to defend their rights and interests.

Changing Intergenerational-Caring Relations in East Asia

This paper is based on both international and comparative research on intergenerational-caring relationships in which women simultaneously provide care for their frail elderly relatives as well as young children/grandchildren in East Asian societies. The ageing of population, the decrease in average number of siblings and the rising average age of mothers at the time of child bearing, all suggest that new types of intergenerational care relations may increasingly become common in developed countries. East Asian societies are not exceptions. More over such intergenerational caring relations may possibly be more prevalent in East Asia than other European counterparts as facing with acute demographic changes, different family values and carer regimes embedded in the societies. This paper will investigate how these sandwich generations experience a double responsibility of care, by analysing resources available to them from local policy configurations and from their personal and kin networks. We will extend our analysis to the influence of changing family-centred welfare regimes in East Asia on generational caring relations and experiences of women therein.
youth in India which have their impact on Indian Society. In the recent past, In-
dia has experienced Anti-Corruption Movement led by Anna Hazare in 2011 and
Movement against Sexual Abuse and Rape of Young women after the Delhi gang
rape case in 2012, in which young people have taken a lead. These movements
were not only led by Indian youth but have great influence on Indian youth as
well. Both the movements were different in nature from previous protest move-
ments as they have used information technology and modern digital devices for
various purposes. These two protest movements have used social media and mo-
bile phone to a greater extent to mobilize the youth. The present paper examines
the characteristics of these two protest movements and it tries to evaluate the dy-
namics of the movements and its methodology. The paper also explores the im-
pact of these movements on youth in particular and Indian society in general.

The present review article seeks to probe into gender considerations and
their implications for higher education in Indian context from cultural perspec-
tive. There appears to be fierce debate among the educationists and educational
planners about the persistence or otherwise of gender bias, discrimination and
the resultant gender inequalities in higher education in India. This article is an
attempt to analyse and substantiate both the arguments based on supporting
information available with various governmental and developmental agencies.
Having analysed the debate in the light of contemporary social reality pertaining
to the state and status of higher education and the major limitations and con-
straints in achieving the envisaged and aspiried levels of expansion, excellence,
quality and access for its inclusivity, the article reveals diverse ways in which
gender considerations come to condition the statics and dynamics of higher ed-
ucation, including access, exclusion, distribution and composition and even the
governance of institutions of higher education and the centres of excellence. An
alternative is made to ascertain how quantitative and qualitative shift taking to
higher education alone could be misleading and a misconception about the status
of women's education without a corresponding change in the qualitative aspects
such as relative importance and value of the courses in terms of opportunity
for employment, importance of the sector that the courses offered can open for
women, that is, the extent to which the higher education being accessed by wom-
en can empower them in true sense of the term.

The Role of Housing and the Neighborhood Environment on the
Process of Social Exclusion/Inclusion: A Study with Reference to Sri
Lankan Plantation Worker Community
When the British colonials started the tea and rubber plantations in Sri Lanka,
the local peasantry did not show interest to work as wage laborers. This led to
the forced migration of a large number of South Indians to the plantations.
During the last 50 years, the economic, social and political context in planta-
tions has changed drastically. The management of estates have changed hands
from British companies to Sri Lankan government and then to local private com-
panies. From the original position of stateless migrant laborers, the worker
community has now achieved the citizenship of Sri Lanka.
However, the estate community remains alienated from the mainstream so-
cial, political, and economic life. The available quantitative data and the qualitative
studies point out the strong socially excluded nature of the plantation communi-
ty. Their production system, consumption patterns, educational attainments and
other social development indicators confirm this status.
The community was originally provided with estate owned barrack type shelter
called line rooms. Majority of the plantation workers still live in these compact
and dilapidated housing units. The self help detached housing project imple-
menced during the 1998-2004 period improved the living environment of around
14% families.
This empirical qualitative study carried out in a rubber estate located 40 km. to
the south east of Colombo, investigates the role of housing condition on the social
exclusion/ inclusion process of the community. It explains that the social stigma
associated with line room environments strongly contribute to the socially exclud-
ed context. The new detached shelters positively contribute to the social inclusion
of the workers. 
The study points out that the social capital of the community has a crucial link
with the housing conditions. The families with strong bridging social capital have
entered into the detached housing construction programme. It also shows that
line rooms develop bonding capital and encourage social detachment.

Gender Policy in India: A Dialogue Among BRICS Partners
More than one third of population in India falls under the category of youth and
more than seventy percent population is below 35 years of age (0-35 years).
Given to this age structure of Indian population it is quite reasonable to claim that
India is a young country. This demographic bulge of youth is expected to contin-
tue till 2030. After noticing the rise in youth population from 1981 onwards, the
Government of India has formally drafted a youth policy in 1988. It was revised in
2003 and recently in 2013. Focus of youth policy has been shifted gradually from
development of young people. The thrust of latest youth policy in India is to enhance the skills of young people so that they shall play the role
of agents in the development process. The present paper examines the National
Youth Policy in India with special reference to current youth development indica-
tors. The present policies of Indian government for young people are examined
to understand the socio-economic status of youth in India. A critical appraisal of
youth policy in India informs us that there is still a big gap in educational and
income opportunities between the upper caste youth, economically upper and
middle class youth and the socially disadvantaged youth such as lower caste
youth and economically lower income class youth. Finally, the paper also tries to
develop a dialogue among BRICS partner with special reference to youth policies
in their respective countries.

Intelligent Sexism: Gender Differentials in Academics
Academics has emerged as a leading profession in India and there is increas-
ing competition for academic positions. Higher education in India has witnessed
phenomenal expansion since 1980s with establishment of large number of State
Universities, Deemed Universities, and private universities. Pay are on par with other prestigious services in public
and private sectors, rendering it highly sought after sectors of employment. It
encompasses graded disciplines and positions with differential status, recogni-
tion and rewards. It is hypothesised that, distribution of academic positions and
accession of disciplines could be determined by the social forces and extraneous
considerations among which gender is an important variable. The paper address-
s this issue in the context of Indian universities in which the number of women
faculty is on the steady rise in the last two decades. Data collected through inter-
views with women faculty in 13 Indian academic institutions reveals that,
gender segregation of academic disciplines and positions are discernible with
consciousness of women academicians in soft disciplines as well as at lower
academic positions. The core hard applied disciplines, being where the faculty
could be more visible, receive more research grants, claim consultancy and pat-
ents have predominantly male faculty. Even in terms of cadre composition, the
proportion of women faculty decreases with successive higher academic position.
Study further reveals that, even among women academicians religion, caste and
and urban background are pertinent in determining the patterns of segregation
subjecting women faculty to double discrimination.

Meaningful Aging in the Middle of Nowhere: Community,
Subjectivity, and the Elderly in Rural Japan
By ethnographic research done in 2007, 2009-2010, and 2011, this paper il-
lustrates the dreams and struggles of a group of aging residents in O town, a
remote and depopulated town in Hokkaido, Japan. While they managed to pursue
a better quality of senior life, their livelihoods have been largely damaged by the
uneven geographical development under the neoliberal regime. The neoliberal
regime has also created an urban ethics of entrepreneurialism that requires citi-
zens to organize, operate, and assume the risk for business ventures. The entre-
preneurial ethics has diffused in the countryside and formed a cultural hegemony
that constricted the development of alternative ethics.
Working with members of a local organization "ODC", I found that the aging lo-
cals, even those who encounter the challenges created by the forces of new mean-
gings in their everyday lives. Members of the ODC have worked for 8 years on a project
of local revitalization called the "Bochibochi Village" Project (BVP). The BVP aims to
attract urban retirees to settle themselves in O town by offering a "slow living"
lifestyle, cheap rent, and a communal farm. As voluntary helpers of the BVP, local
residents introduced the newcomers to the natural surroundings and delicacies
from mountain and sea. The ODC members expected the BVP to be a solution to
the resultant gender inequalities in higher education and the major limitations and
constraints in achieving the envisaged and aspiried levels of expansion, excellence,
quality and access for its inclusivity, the article reveals diverse ways in which
gender considerations come to condition the statics and dynamics of higher ed-
ucation, including access, exclusion, distribution and composition and even the
governance of institutions of higher education and the centres of excellence. An
alternative is made to ascertain how quantitative and qualitative shift taking to
higher education alone could be misleading and a misconception about the status
of women's education without a corresponding change in the qualitative aspects
such as relative importance and value of the courses in terms of opportunity
for employment, importance of the sector that the courses offered can open for
women, that is, the extent to which the higher education being accessed by wom-
en can empower them in true sense of the term.

The Rise of Vernacular Capitalism: Neoliberalized Localities in Rural Japan

This paper analyzes the formations of a unique mode of capital accumulation, vernacular capitalism, in contemporary Japan. The vernacular capitalism thrived on the basis of the uneven geographical development that dispossessed local cultures and resources to accumulate capital. Based on comprehensive survey of the literature and governmental documents, I claim that chiki(region or locality), as a crucial motif of Japan’s modernity, has been involved in the post-industrialization of Japanese society in which vernacular capitalism came into being. In the wake of neoliberal reforms, rural communities were forced to become entrepreneurs that creatively turn available cultural and natural resources into commodities to compete with each other in a cultural supermarket.

In this paper, I will first discuss the unique enthusiasm of consuming locality in contemporary Japan that implies a mode of accumulation through commodification of the local. To understand its political economic foundation, I will investigate the history of the five Comprehensive National Development Plans (CNDPs) to reveal how the state envisaged and managed localities in the postwar period of high economic growth. The transformation of CNDPs shows how Japan’s strategy of rural governance has turned from “managerialism” to “entrepreneurialism” in the process of neoliberalization. That is, government collaborates with private capitals to form a “public-private partnership” for business ventures. Finally, I will delineate the strategies and struggles of rural communities under the neoliberal regime and how their efforts construct the substance of vernacular capitalism. In the conclusion, I will characterize vernacular capitalism with its four features: serendipity, entrepreneurial community, local branding, and the discursive complex of food, health, and environment. At the end, I argue that the inter-local competition brought by vernacular capitalism has become the major principle of rural governance in contemporary Japan. Although the competition pleased urban consumers, it caused new problems and challenges to rural communities.

Behavior Homophily and The Dynamic Network Distance In A Combination Of Friendship and Antipathy Networks

Studies have confirmed a strong tendency of behavior homophily in a social group. Prior research mainly focused on studying the association of a bunch of friendship network features and behaviors to confirm such tendency. However, interpersonal relationships are naturally managed in multiple ways, and social relationships change over time, same as individual’s behaviors. Positive, high intimate friendship can play a significant effect on promoting behavior homophily; on the contrary, negative, low intimate antipathy relationship might downplay it. Thus, in this study, we, methodologically, recognize the necessity of change and multiplexity of relationship and behaviors to redefining the tendency of behavior homophily. Thereby, we aggregate structural network effects and transform them into an index of network distance from two opposed social relationships (i.e., friendship network and antipathy networks) in a longitudinal data to redefine the association of dynamic network distance in relationship multiplexity and group members’ behavior homophily over time.

Analyzing Public Attitudes Towards Sexual Assaults in Taiwan

Analyzing Public Attitudes towards Sexual Assaults in Taiwan
Sexual Assault
Abstract
Several laws and regulations concerning sexual assault have been passed in the last couple of decades in Taiwan. The meaning of sexual assault in the legal system has changed from offense of social morality to violation of sexual autonomy, emphasizing the importance of the consent of the involved individuals. However, the success of enforcing the reformed laws also depends on the awareness of the public about the law itself and meanings behind those stipulations. This paper utilized the data of Taiwan Social Change Survey conducted in 2011 to examine Taiwanese people’s attitude towards sexual assault and study the discrepancy between those reactions and the newly-passed laws. The statistical findings show that most respondents agree punishing husbands forcing wives to have sex and teenagers having sexual behaviors. In contrast, there are clear variations on punishments against adults involved in sexual behaviors in the nature of a reasonable consent or power relations. Among socio-demographic variables, age stands out to have consistent effects on most attitudes. However subjective variables representing individual liberalism or protectionism are more important indicators than respondents' socio-demographic backgrounds. Taiwanese seem to uphold the ideas of “individual's consent” and “self-responsibility” more than the complexity of the power relationships and quid pro quo conditions embedded in sexual behaviors. These reactions differ from stipulations of the law. Thus it is difficult to conclude if feminism hinders or facilitates the progress of gender equality in Taiwan. We discuss the implications of the discrepancy between laws and attitudes of ordinary people in the last part of the paper.

The Income Effect on Men and Women in East Asia

The Income Effect on Men and Women in East Asia: Before and After the 2008 Financial Crisis

East Asian countries had known for having rapid economic growth as well as income equality during the development trajectory. The picture had become dismal in the late years of 2000 as income distribution had been favoring the rich in Korea and Taiwan. The real wages even declined in Taiwan since 2005. Globalization has made the world economies more vulnerable to external dynamics. East Asian countries are particular so as the international trade activities are crucial to the economic growth in the region. The 2008 Financial Crisis started in the U.S. and many Americans experienced immediate job and investments loss and mortgage foreclosures. In 2011 a later-on worldwide well-known Occupy Wall Street movement occurred and lasted for several months in New York City in the United States. People in other countries also experienced economic misfortunes caused by the Financial Crisis, such as Greece, Italy, Portuguese, and Spain. East Asia countries are no exceptions. The economic growth rates dropped and unemployment rate increased in Taiwan, Korea, and Japan in recent years. The author wishes to study the impact on labor income because of the financial crisis. This paper uses four waves of East Asian Social Survey (EASS), conducted in 2006, 2008, 2010, and 2012 respectively, to study the (possible) decline of work earnings in real values and the deterioration of income inequality in Japan, South Korea, and Taiwan. Specifically the paper explores if women workers suffered the most due to their vulnerabilities in labor markets, controlling for generational and class differences. Preliminary analyses show the increase of the proportions of labor in lower income categories and women being disadvantaged positions.

The Increasing Role of Human Capital and the Decline of Institutional Factors in Shaping Occupation and Income Patterns in Market Reform: A Case Study of Five Factories in Dongguan, China

This article examines social inequality among factory employees in different household registration (hukou) categories in a rapidly growing labor market, based on concepts drawn from both migration and market transition studies. The researcher uses survey data from five factories in Dongguan, a city on the southeast coast of China, to examine the determinants of factory employees’ occupation and income. By distinguishing administrative staff and skilled workers from unskilled workers, an examination shows that rural households and individuals without political connections (but who are more educated) are increasingly competitive with urban households in the manufacturing sector. The results suggest the importance of individuals’ manner and level of commitment in the labor market, in which the low entry requirement in the manufacturing sector reduces the influence of the hukou system and Communist Party membership on job recruitment.

Charity and Social Exclusion in Taiwanese Education System for Disabled Students

Under Special Education Act, no school is allowed to reject students with disabilities in Taiwan. Nevertheless, lack of accessible environment and assistants for disabled students are still common. To overcome the deficiency, Schools usually encourage parent, mostly mothers, to support their children’s care needs in
school or ask classmates to be the "little angels" to support disabled students. This paper uses institutional ethnography to explore the social organizations of Taiwanese education system for disabled students and the experience of disabled students and. This paper will demonstrate that charity model in Taiwanese education institutions construct disabled students as "dependent" and "inferior." The discourse of charity will further marginalize and exclude disabled students in the regular classroom.

Examining the Destination Effects on Immigrant Integration and Wellbeing: The Case of Vietnamese Marriage Migrants in Taiwan and South Korea

Literature on international migration tends to focus on how migration impacts the sending or the receiving societies. Rarely have studies contrast the effects of different destinations on migrants, because of the difficulty obtaining comparable data and controlling the effects of origin. Depending on migrants' nationalities/ethnicities and different motivations for migration, destination effects that are significant to migrants' social integration and wellbeing range from country-specific economic conditions, regional cultural traditions, to socio-political policies. This paper uses mixed-methods to compare the integration experiences of Vietnamese marriage migrants (VMMs) who migrated to Taiwan and Korea, for similar reasons and share similar sociodemographic backgrounds. Fifty-five qualitative interviews, four focus groups, and small-group surveys (N=403) were collected during a 10-month field research. Other than the differences in Taiwanese and Korean societies' manner of organizing migration, preliminary analysis of qualitative data shows that three crucial factors determine VMMs' process of social integration and wellbeing in Taiwan and South Korea: (1) how their Confucian gender systems influence domestic women's social roles/status and to what extents it applies to VMMs; (2) how these two societies fare in the regional and global economy, which affects the possibilities that VMMs achieve economic integration in the domestic labor markets; and (3) how national integration policies include marriage migrants of different ethnicities in reconstructing national identities, and specifically in addressing the integration of VMMs as they represent the largest migrant group without ethnic ties to the host societies. The paper ends with a discussion on how social welfare organizations and grassroots movements in Taiwan and South Korea may affect VMMs and other marriage migrants' integration and wellbeing in the long run. By untangling the effects of origin and destinations, this study suggests that policy adjustments can result in sustainable co-development for both the sending and receiving societies and improve migrant integration and wellbeing.

Exploring the Role of Sport and Leisure in Lifestyle Migration Decision-Making: A Case Study of South Korean Migration to New Zealand

Little is known about the key lifestyle factors involved in migration decision-making. According to Benson and O'Reilly (2009) and Benson (2010), lifestyle considerations, including sport and leisure participation, may play an important role in migration decisions. Yet, there is little explicit research examining the nature and extent to which sport and leisure play in lifestyle migration. Thus, this paper explores how both macro level social structures and micro level individual choices, influence lifestyle migration decisions of South Koreans moving to New Zealand. More specifically, the paper examines how South Korean migrants consider sport and leisure activities as factors within their lifestyle migration decision-making. The findings highlight a variety of risk factors in South Korea, which influenced migration including: (1) excessive competition and inequality (2) conflicts between North and South Korea, (3) obsession with education and (4) conflicts between traditional and contemporary values. As a result, Koreans reflected on their lives with many realising that: (1) they could not live the (slow and leisurely) life they wanted; (2) they could not spend adequate time with their family; and, (3) they could not distinguish themselves from fellow Koreans who had similar social status and ability. Under such circumstances, South Korean migrants to New Zealand revealed that they were looking for a new/better/different lifestyle, and that sport and leisure activities played a role in the process of lifestyle migration decision-making.

CHANG, JASON CHIEN-CHEN* (Chinese Culture University, jchang.taiwan@gmail.com)

Parentocracy and the Life and Death of Secondary Education for All in Taiwan

Since mid-1990s, the Taiwan government has implemented a populist educational policy, which was in fact initiated by the grassroots reform movement aiming for a universal system of upper-secondary and higher education. After twenty years, the quasi-compulsory high school system is widely argued to have failed in carrying out its promise of equalizing educational opportunity among social classes.

While the “third wave” of Western educational development in late 20th century was characterized by an ideology of parentalism promoted from top-down, the current educational expansion in Taiwan has adopted, in contrast, an ideology of parentocracy formulated bottom up, i.e. from the liberalist citizens. Therefore, this paper provides a different point of view from that of Richard Pring's, according to whom secondary education for all is doomed to death due to a rigorous system of testing. Specifically, it presents, first of all, a diachronic relationship between nationalism and individualism, and then, a corresponding relationship between the state's educational production mechanisms and the class-based parenting practices. Along these theoretical considerations, this paper analyzes how a civil ideology of educational parentocracy gave birth to the state policy of universalization of senior high school education (and college education as well), and how the former might lead the latter to such a dead end that marketization, accountability, and competition are all left in education. The author instantiates empirical research findings from Taiwan to support the arguments formed in this paper.

Ethnic Identity and Gender Differences among Indigenous Youths in Two Single-Sex High Schools in Taiwan

Many quantitative studies in Taiwan showed that indigenous youths own high ethnic identity, but the relationship between ethnic identity and gender differences was not clear. Ethnic identity is constituted in every individual's living context, so it is necessary to explore the above findings in the individual context. In the article, the authors adopted ethnographic approach in two elite single-sex high schools to observe gender identity, ethnic identity and gender differences, and to answer if gender differences existed and why they had differences through students' daily experiences. The research found the boys outnumbered girls in strong indigenous identity, and there were more girls who were assimilated. The reasons were due to both of the cultural and school contexts. In the cultural context, boys belonged to the traditional age-set system in the community, and many cultural activities were still strongly related to the age-sets. Therefore, boys had more opportunities or even obligations to participate in cultural affairs, and developed their ethnic identity through participation. Girls lacked formal social organizations traditionally, so girls expressed they felt they were like outsiders or visitors in the cultural activities. In the school context, a few indigenous teachers devoted themselves to indigenous education in the boys' school. Boys could share their cultural experiences in the formal or informal school activities, and they had more chances to get acquainted with other indigenous fellows. However, there were no indigenous teachers in the girls' school. There also were stricter rules in girls' behaviors, and girls' school life was usually restricted to their classes and academic studies. The results showed that the gender differences in ethnic identity were constituted by gender stereotypes and gender segregation in the patriarchy society.

Confucianism and Discontents: The Repertoire of Disobeying in Recent Taiwan's Protests

Confucianism is like a buzzword for the discussion of East Asia cultures. And yet people disagree on whether Confucianism is just a kind of state ideology, promoted by elites, or actual civil culture prevails in ordinary life. The paper thinks that the two layers of Confucianism can co-exist intertwinedly. In one level, where elite intellectuals are prominent, Confucianism exists as a body of systematic knowledge, identity, and moral standard. In the civil level, it exists as the underlying logic of people's daily practices, with an emphasis on folk wisdom and practical rationale, helping people manage their interactions and actions in daily life.

This paper will look at the relation between Confucianism, as state ideology and as civil belief, and the repertoire of protests. By repertoire, follow Charles Tilly's definition, an ensemble of contentious performances. This paper will study two particular kind of repertoires that have public's attention in recent social movements in Taiwan. One repertoire is Guibi or Kwotou, meaning to kneel down with one's forehead touching on the ground, and the other is throwing objects, like

Repressive Coverage In An Authoritarian Context: Threat, Weakness and Legitimacy In South Korea's Democracy Movement

While most studies on the repression-mobilization relationship have focused on the impact of the former on the latter, recent work has shown that characteristics of protest can influence state repression strategies. This article corroborates recent work on the repression of social movements and shows that both weak and threatening attributes of protest events contribute to the “repressive coverage” – the likelihood and severity of repression – of social movements in an authoritarian context. In addition, results from logistic regressions show that authoritarian states not only respond to weak status actors and situational threats but also strategically to repress social movements that challenge their political legitimacy. This article extends the scope of the repression-mobilization literature by differentiating the role of threat in eliciting repression in a non-Western democratic setting and showing the strategic dimension to the repressive behavior of authoritarian states.

Global Environmental Change, Fishing Community Development, and Inequality: The Case of Jeju Island

The paper aims at addressing unequal development of fishing community in Jeju Island, South Korea. For this aim the paper studies three fishing community associations in the Island. The Island's fishing community is a traditional livelihood unit consisting of fishers and women divers. The community forms along the coastal line of the island, which is about 200 kilometers long. It is organized with 100 fishing community associations (called ecohongye in Korean language), which are demarcated by regional, administrative boundaries. While the associations were originally drawing upon fishery law in 1962, the island’s membership includes 12,994 individuals as of December 2011. The unequal development of the fishing community in terms of economic output is conditioned by fishing ground difference. It is reported that fishing ground for each fishing community association differs in terms of geographical characters and diversities in marine resources. Negative marine resource changes may be an emerging factor that is likely to structure further development of the fishing community. The change has been visible particularly with stones along the coastal line having turned into white and unlivable for marine plants to grow on. The stones under the seawater are reported to exhibit the same problem. With plants being unable to grow, sea goods such as seashells and sea urchins which live upon the plants and women divers collect for their livelihood have significantly decreased. Fish has also disappeared with lack of sea plants they diet. While fishing activities by the community are getting challenged with negative marine environmental change, the activities are now increasingly turning into the objects for tourists' gaze and experiences. However the touristic development has not equally taken place across the associations. By looking into three fishing community associations, this paper clarifies unequal patterns in fishing community development in the global environmental change era.

Long-Term Effect of Parental Conflict and Parenting on Adolescent Health-Related Behavior Trajectory Patterns

Objectives: To investigate health-related behavior developmental trajectory patterns in childhood to late adolescence and examine the long-term effect of parental conflict and parenting.

Methods: Data was obtained from the Child and Adolescent Behaviors in Long-term Evolution (CABLE) project. Participants included 1514 students followed from the 4th to 12th grade (2001-2009) in Taiwan. Group-based trajectory model and multinomial logit model were mainly used in the statistical analysis.

Results: In 4th-12th grade, health-related behavior trajectory patterns were found among boys (n=776): persistently low(11.1%), low to medium(11.4%), medium and declining(39.4%), and persistently high(38.1%). There are also 4 but different patterns in girls (n=738): low and declining(23.3%), low to medium(24.7%), medium and declining(22.4%), and high and declining(40.7%). Parental conflict and parenting (parent-child interaction, parental support) in childhood had significant effect on the health-related behavior trajectory pattern in childhood to late adolescence.

Conclusions: Health lifestyle in childhood and adolescence usually persist to adulthood and is difficult to change. In Taiwan, most students go to college after graduating from high school (10th-12th grade). They have less time staying in family and living a more independent life, so making good health habits before going to college is important. We found four patterns of health-related behavior development trajectory in boys and girls. After controlling parents’ socioeconomic and marital status, the long-term effect of parental conflict and parenting in childhood and early adolescence on adolescent health-related behavior trajectory still existed. Conflict with a spouse may let parents feel exhausted and invest less time to their children, thus fail to form health-related lifestyle. Based on our findings, we recommend that parents should give more support and parent-child interaction to help their children to form health lifestyle before they go into adulthood.

Discourse Distortion in University Communication

Universities are led to a world standardization of their activities, management and financing; the (non-)resistible construction of a unique higher education and research system. That construction is conducted under the slogan-keywords “autonomy”, “new public management”, “excellence”, “modernity” while these words are contradictory with the reality they label. This distortion of language creates a bizarre newspeak, symptom of the double binds in which searchers, teachers and academic staffs are trapped. The more significant double bind unites and opposes the ancient institutions, still legal and justifiable, with the new forms of organisation, management and evaluation in which the state supervision as well as the numerous “partners”, in fact the new authorities enhancing new standards, constrain the academic authority to obey. This bizarre social discourse, mate of the neo-capitalistic re- framing of university, ratifies the path to extinction of university language. The paper will provide a description of some speech items and interactions specific of the new university communication.

Employment Standards and Their Enforcement In Australia: Successes and Challenges In a Time Of Transition

Over the last six years, the Fair Work Ombudsman (FWO) and its predecessors have revolutionized regulatory enforcement of employment standards in Australia. Historically, minimum standards were enforced by trade unions and relatively under-resourced labour inspectors at the State and federal levels. Through its active, targeted detection and enforcement strategies, the FWO has been a high-visible presence in the labour market, and trade unions continue to play an enforcement role in certain industries and sectors. Nevertheless, there are areas of the labour market where both employment standards and their enforcement are inadequate, with aged care a prime example. While there has been some limited activity by the FWO in this sector, in community-based aged care, in particular, inadequate government funding works to limit the improvement of minimum employment standards and provides some pressure on employers to ‘read down’ existing entitlements. At the same time workers may be reluctant to insist on their rights—often because they are working with more vulnerable people than themselves. This paper will explore these challenges to effective employment standards enforcement with reference to the example of home care workers in the aged care industry.

Contraceptive Sterilization: A Rational Choice?

The rapid spread of medical contraception and new reproductive technologies in Western countries complete the process of separation between sexuality and procreation started in the early 20th century. It also contributes to strengthen the body sex medicalization, conceptualized by Foucault in terms of Biopower. Contraceptive sterilization is one of the links in this process, affording the opportunity to integrate all sexual and reproduction based activities into the same field of action. It is often promoted as an effective way to control fertility, a rational action, a method that can be chosen under the guise of the individual’s autonomy. However, this method involves a number of health risks, psychological implications and concerns about the long-term impact on the individual’s health. It is important to consider the implications of contraceptive sterilization on the individual’s autonomy, bodily integrity and right to self-determination. The paper will explore the reasons why contraceptive sterilization is a rational choice for some individuals and the potential consequences of this decision.

Big Data in Indian Social Context: A Case Study of Aadhaar

In the history of Indian society, the era of big data has commenced. The data is not from secondary sources but the society’s 1.2 billion citizens themselves, in face to face situation. Collection and analysis of biometric identification of each and every one is creating a repository. This Big data is an attempt to convert Indian society into a system under constant observation of the government; which would have future use for the state, the non-government, the corporate, the media, political parties and the academic researchers. India is a highly diverse society where more than 70% people are living in villages, more illiterate and literate, the majority of urban population is in unorganized occupations and rural communities are engaged in agriculture and artisanship. This paper explores the problems of the big data through a case study of Aadhaar. The project at the moment is generating massive amounts of data popularly called the Unique Identity Card or ‘Aadhar’ literally meaning ‘the base’.

Through an analysis of secondary data, mostly from media, regarding Aadhar, the paper explores the future of this unprecedented social statistical exercise. Given the massiveness, even with pitfalls that are inbuilt into collecting, recording and distributing the social data in a society like India, the paper concludes that the identity of Indians so brought online in government records would impact the future of the democratic functioning. The marginal and traditionally deprived sections including women would hopefully be participating in their life activities and life stages consciously with a defined identity. But a question is raised that continuing updating and revising the data, even if the collection is on, would result into sophisticated statistical tools and new patterns of citizen behavior may emerge.

Capabilities Approach for Educating Women --- A Flyover ‘MOOC’

Capabilities Approach for Educating Women --- A Flyover ‘MOOC’ Enabling of women is a concern and struggle in many cultures because of the gross inadequacy or lack of education - education in class rooms (training of skills and knowledge) on site has traditionally and currently been monopoly of men because of the lags structured by the gender construct in underdeveloped and developing societies. Several experiments by government and non-government agencies including pedagogy of capability building have been tried and despite genuineness, failed. On site education in the West (USA and UK included) is becoming exceedingly costly beyond the reach of the middle classes. Student loan is critical; the institutions departing higher education have raised their fee. Media reports indicate that the phenomenon of deserted campus is a matter of time. To overcome this enrollment crisis the regular institutions are opening up for MOOC. This paper is an attempt to find out the possibility and description of a fly over through which the migration of education through MOOC can be targeted to the women in hinterland, to underdeveloped and developing regions and contribute inculcating capabilities among them. Such capabilities will have their usefulness being global and to mainstreaming the women population and finally making themselves self dependent. This should not be left alone to busy colleges and universities as there is no reason for them to do capability building among the needy. A fly over the busy paths of education is required which a two pronged sponsorship with the government and women organization as co-participants in MOOC to combine ‘functioning’ with social policy with emphasis on local change and deconstructing the gender inequality through educating women such content which would help make them capable and dignified. Impact of Leisure on Quality of Life and Social Development: Reflection on Urban India

Quality of life has been vital for social development of a community. Earlier it was economic development, now it is a social development with better quality of life. Today, quality of life include safe existence, healthy life, non exploitative free thinking and good education with awareness and of course good and quality leisure. The creative utilization of leisure has been crucial to social development. Urban India has been accustomed with leisure in various manners. Traditionally people took pleasure in performing rituals, meeting kin and relatives or going for a pilgrimage. Of late things have changed. People have started combining leisure with pilgrimage, kinship with pilgrimage and so on. The present paper analyses a few cases taken in this regard in the City of Lucknow. It is clearly pointing out to the fact are in urban India the affluent section have more opportunity for creative utilization of leisure but in practice they do not avail it, whereas, the lower strata neither have avenues nor have financial support for creative utilization of leisure because they lack an average quality of life.

Health Care Equity In Taiwan: How Are Medical Schools Educating Future Doctors?

Towards the end of the 20th century, the island nation of Taiwan had substantial gaps in health insurance and close to 50% of the population had little or no access to healthcare. Today, close to 100% of Taiwan’s 23 million population enjoys almost free access to health care with no waiting lines, and National Health Insurance (NHI), a public insurance system administered by a single entity – the Bureau of National Health Insurance – has a satisfaction rate of over 70% and is strongly supported across the political spectrum. The democratization of health care in Taiwan, the result of a decades-long process culminating in 1995 with the passage of NHI, contributed significantly to health equity by reducing utilization rate differences and morbidity and mortality differences for conditions preventable through the administration of medical care. However, no efforts were made to change the training or societal role of physicians to produce a professional type better suited to the new model of health care premised on egalitarian principles.

Curricular changes are currently underway to overcome these deficiencies and strengthen medical students’ grounding in humanistic principles. Whether these changes are also educating future physicians in an ethic of service that prepares them to contribute to Taiwan’s commitment to health care equity is unclear. The goal of this pilot exploratory study is to understand how the medical school curriculum contributes to the good fit of future medical professionals with an egalitarian ethic of service and to identify challenges and opportunities for this fit. We explore what motivates students to pursue a career in medicine, how medical education shapes their initial motivation, and how consistent are their evolving goals and professional identities with Taiwan’s conception of health care as a right. Our presentation discusses preliminary results of this ongoing investigation.

CHAUHAN, ABHA* (University of Jammu, abha1chauhan@yahoo.co.in)

Dalit Feminist Theory: A Challenge to Multiple Hierarchies in India

The early nineteen nineties in India saw the assertion of autonomous Dalit women’s organizations both at the national as well as the regional levels, throwing up crucial theoretical and political challenges. The demands by Dalit, tribal and other lower caste women were made for inclusion of their concerns in the mainstream politics as well as for analysis of the gender relations that are inflected by class and overlapping hierarchies in the form of caste, class and patriarchy. A significant shift in the feminist thought of the 1980s and 1990s at the international level was the increasing visibility of Black and Third World feminist work which stimulated and renewed national debate in India about the politics of caste feminism. The implementation of contentious Mandal Commission report in 1989. At this time, the focus on caste acquired a new meaning in gender studies with the realization that within patriarchal male domination, caste-based mechanisms of oppression needed to be addressed in a more systematic and meaningful way and through Dalit women’s own accounts of their experiences. This concern can be visualized in the contemporary democratic upsurge and the awakening of the...
self-consciousness of oppressed women backed by the growing critical feminist theoretical and ideological paradigms of protest and resistance. This paper argues that Dalit feminist theory from the Global South (India in particular), like similar theories in the world, forms an important addition to the feminist theories as it challenges the multiple hierarchies that critically impact gender relations.

CHAUHAN, ABHA* (University of Jammu, abha1chauhan@yahoo.co.in)

Work, Family and Agricultural Economy: Changing Gender Relations in Northwest India

In rural India, the percentage of women who depend on agriculture for their livelihood is as high as 84 percent. Women make up about 33 percent of cultivators and about 47 percent of agricultural labourers. Their work in agricultural economy in Northwest region of India has been indisputable. However, since a long period of time it was treated as insignificant, invisible and unrecognized as it was regarded as a mere extension of women's domestic work comprising of subsistence economy. It was the effort of women's organizations and other agencies in the 1980s and 1990s that women's subsistence work in agricultural economy began to be 'quantified' and 'counted'. This also led to the increase in women's 'work participation rate' substantially. Beyond this, it was realized that though women's participation significantly to agriculture, their control over resources remained marginal. Critical resources such as land were also unevenly distributed by gender. Women seldom enjoyed property ownership rights directly in their names. Given this scenario, their participation in agricultural work of various kinds affected gender relations within the family and kin groups. In the present times significant changes are witnessed due to globalization as this part of Northwest India is rich in world famous basmati rice. Many migrants, including women also come to this area during peak season. This paper examines the impact of agricultural work on gender relations within the family and the changes in them due to globalization in Jammu region of Northwest India. The intersectionality of caste and class is also taken into account as most of these women belong to lower castes and poorer families.

Professionalization of Medicine in India: Competing Systems in the Era of Globalization

The paper attempts to examine the nature and development of the process of professionalization of medicine in India in the era of globalization. It also assesses the people's response to various forms of competing medical systems. The paper is divided into the following sections: (a) introduction; (b) the setting of profession and people's response to the competition of systems of medicine in India: an historical perspective; (iii) re-emergence of earlier existing systems and the case for alternative medicines; (iv) people's selective and careful response to different systems of medicine and; (v) conclusion. The professionalization of medicine especially the allopathic medicine started during the British rule in India, challenging the then existing systems of medicine like Ayurveda and Unani. But Allopathy succeeded in establishing its supremacy over all the other existing systems- making inroads in urban as well as in rural areas. The setting up of the AIIMS at New Delhi and decades later at a few other places like Bhopal have been a significant development to protect the people of India from some chronic diseases.

On the other hand the hitherto under-represented systems of medicine like the Ayurvedic, Homoeopathy and Unani have also made a comeback, of course with the support of the government, under the umbrella term called AVISH. India has seen a rise of re-emergence of these alternative systems of medicine with the support of various governments and thus acquiring legitimacy in the process. The patients have given a careful and selective response while going for their treatment under these competing systems of medicine for various diseases. The paper aims to understand and examine the relationship between the use of internet and youth behaviour. The paper is divided into six parts like the following: (i) introduction; (ii) the use of internet and the theory of gratification; (iii) the use of internet and the widening world; (iv) the use of internet and other systems of communication; (v) internet and youth behaviour in India-an analysis; and (vi) conclusions. In the globalizing world today the social scientists have found gratification as one of the important reasons for the use of internet. The conceptual and theoretical relevance of the notion of gratification has been found as different in the Indian society in comparison to the western societies. Some of the important conclusions have also been discussed towards the end of the paper, these are like the following: (i) the use of internet has had its impact on the cultural behaviour of the youth preferring the new relationship than kinship relations; (ii) in India instead of seeking gratification the youth has found internet as useful for their studies; (iii) the use of internet has developed a sense of freedom among the youth; (iv) the youth has been able to combine the use of internet with their mobile phones and (v) it has been found as useful for purchasing books, laptops, different softwares and seeking admissions to different universities in India and the world.

A Globalization of Extremes: The Middle Classes Facing the Return of Pareto Distributions and Power-Laws

We are primarily taught that Queetelet's normal distribution is the key of social knowledge. This could be true for the middle classes but in the sociology of the top end of the economic distribution, this is entirely wrong: wherever the concentration of socioeconomic power is observed, the Gauss distribution gives no appropriate representation and the Gibrat's log-normal as well. This is more than statistical, since the highest in the society of extreme classes where extreme variables are outrageously over-represented, CEO's compensation, wealth accumulation, position in the hierarchy of internet and fame, scientific quotations follow extreme distribution shapes. This is the realm of the Extreme value theory related also to advantage that go with the “Matthew effect” (the rich get richer and the poor get poorer), typical of hoarding processes on scarce resources. These processes going with the Pareto curve mean that the logarithm of the gains is inversely proportional to the logarithm of the rank in the hierarchy.

In the sociology of extreme classes, the Pareto law and power tail distributions are vital for representation of functioning of elite categories, of wealth concentration, accumulation and transmission. In the old industrial world, where old money (i.e. family wealth) is a central source of power, the normal distributions fail in the explanation of family structures functioning, assertive mating, homogamy, and economic power transmission. Here, the Extreme value theory reveals new reality, at the top we detect extreme concentration of wealth, ab-normal social behavior, including over-homogamy, or massive participation in the political sphere. Today, the global emergence of an extreme class means the destabilization of the Queetelet based “Golden Age middle class” and of the “wage earner middle class based society” and the expansion of the Pareto based wealthy-power-elite as a global re-emergence of the model of the European Belle Epoque capitalism.

Static and Dynamic Inequalities in Europe: Intergenerational Mobility and Income Inequalities

Although static inequalities and dynamic inequality have long-standing traditions in economics and social sciences, only few studies are devoted to the analysis of both dimensions simultaneously, especially in a comparative perspective. McCall and Percheski concluded recently that “the precise social and economic mechanisms underlying the relationship between income inequality and intergenerational mobility [...] are not well understood, and changes over the period of rising income inequality have been difficult to estimate precisely” (2010: 339). This paper aims to contributing to this gap by testing if the so-called Great Gatsby curve from recent economic literature (Corak 2013) - displaying the macro relation of (a) income inequality for different countries by the Gini coefficient of the x axis and (b) the generational earnings elasticity, i.e. the degree to which (dis)advantages are “inherited” over generations, on the y axis - can also be applied to sociological conceptualisations of intergenerational mobility, i.e. occupational mobility. We believe moreover that mobility patterns differ for the bottom and the top of the parental income range and examine these thus separately.

Our empirical contribution lies in the comparative analysis of 20 European countries based on the most recent 2011 module on intergenerational transmission of disadvantages of the EU Survey on Income and Living Conditions (EU-SILC). In this way, we are able to construct indicators of dynamic inequality and analyzing static inequalities at the same time (shares of incomes, percentile ratios and summary statistics of inequality). Whereas the first shows the fluidity of a society reflecting the mobility over generations (intergenerational mobility), the latter shows the socio-economic inequality at a particular point of time (hierarchy).
investigate different dimensions of intergenerational mobility: the transmission of education, of occupational status/social class and of (simulated) income (ranks).

Carnal Framings: Race, Class and Crisis in a Multi-Ethnic Labor Group

This paper uses in-depth ethnography to investigate the internal emotional effects of frame shift within a multi-ethnic labor-rights organization in the United States. The brief historical window opened by the 2006 national movement of coordinated mass street protests for immigration reform generated a sudden change in the day-labor center's opportunity structure facing the group. Within this study, a Chicagobased worker center organizing agency day laborers. Whereas the group had previously made the “day labor worker” its central mobilizing figure, it was now enrolling day laborers of multiple backgrounds into the pressing fight for migrant rights. The shift was exacerbated by a political trip to Washington where the group almost exploded along ethno-racial lines. As the giant migrant marchers had generated huge hopes among many activists and organizers concerned with reinvigorating progressive movements, a new immigrant-centered discourse threatened to dispose black members of their implicit but traditional centrality within organizing efforts for which immigration had not previously been a theme of choice. That frame shift rather than job competition, ethnoracial animosity or organizational diversity, primarily accounted for the suddenly exacerbated cleavages within the group. Based on extensive participant observation both in day-labor agencies and in the worker center, this study illustrates the discursive conditions under which emotions can travel from the sphere of employment to that of protest. It emphasizes the multi-layered scales of material, symbolic, linguistic, emotional and bodily contexts that give frames and frame shifts their political potency and intimate significance for the actors involved. It calls for further recognition of the carnality and multiple embeddedness of collective action frames, which matter to social movements not only for their external performance, but also for their internal cohesion.

CHEE, HENG LENG* (Universiti Sains Malaysia, cheehengleng@gmail.com)

Moral discourses in medical travel

Recent works that highlight the embodied aspect of medical travel have drawn on the conceptual frameworks of affect and authenticity. This paper will contribute to this line of works by drawing on interviews with medical travellers for cardiac procedures (to treat potentially life threatening conditions) and orthopaedic surgeries (for chronic and disabling but not life threatening conditions) in two Malaysian hospitals. I will focus on the discourse of moralities of these international patients in their experience of what is ‘good’ or ‘bad’ (and why it may be so) in their medical travel experiences. As juxtaposition, I will also draw from interviews with international travel intermediaries as well as hospital staff who have direct interactions with patients. The different discourses will be examined in order to tease out the tensions and collisions between (possibly) different sets of moralities, and to uncover the unspoken ‘rules and regulations’ that govern practices in medical travel.

CHELLAN, NOEL* (University of KwaZulu-Natal, chellan@ukzn.ac.za)

Historical Formation Of Social and Economic Inequalities In South Africa – A Marxist Perspective

Twenty years after South Africa achieved a democratic dispensation, it is still one of the most unequal societies in the world. Twenty-first century South Africa is still characterised by high levels of poverty, crime, HIV/AIDS, social and cultural racial polarisation, large volumes of economic wealth and land in the hands of the few, rampant corruption in both the private and public sector and high unemployment levels. August 2012 witnessed the black government of South Africa shoot and kill 34 striking miners in the township of Marikana. Whilst the relatively new democratic dispensation has delivered many new freedoms for the people of South Africa, the legacy of colonialism and apartheid is still evident in many spheres of South African life. For many decades South Africa’s gigantic problems have been largely attributed to racial intolerance and antagonism. Whilst race has been a major factor in deciding the haves and the have nots of South African society, this paper argues that a Marxist analysis of South Africa is the most appropriate conceptual framework in which to truly understand the unequal nature of South Africa and more importantly to chart a way forward for a more equal and just South Africa.

CHEN, BOWEI* (Nanhuia University, chenpowei6967@gmail.com)

This study examines Taiwanese gay male masseurs and their labor practices in (simulated) service industry. Specifically, it unpacks the intersection between body, work and un-controllable (male gay) desire embedded in the labor practice. Drawing upon in-depth interviews with 15 gay male masseurs, this paper focuses on the following three facets. First, it explores variation in the performance of intimate labor caused by the intersection of the sexualized service work with the racialized and classed specific service expectations of diverse customers. Through clients/masseurs interactions, we identify how social inequalities intersect with each other and how their intersection changes what they are. Second, the body/ work relationship in massage parlors will be examined, paying particular attention to the “shadow-work” of employees and forms of aesthetic labor they embodie. By understanding how aesthetic labors are differently performed, we examine the extent to which gay male masseurs’ constructions of work identities are (not) regulated by homo/heteronormativity. Third, this paper examines how labor practice in erotic service is complicated by the production of desiring labor, exploring how gay male masseurs construct and/or distanciate their sexualities from servicing the bodies of others. Through desire/work relationship experienced by masseurs we sketch out how the boundaries between intimacy and the commerce of sex and between public and private life are redrawn. This study hopes to provide insight into not only the importance of embodiment for current understandings of work but also the centrality of (gay) desire for the study of intimate and sexualized high-touch serving work.

Women’s (no) Naming Right Under the Shadow of Patronymy: A Study of Law and Social Change in Taiwan

Patronymy is part of the cultural, social and legal mechanism of male supremacy, and a denial of women’s equal right to name the child. In Taiwan, patronymy is a long-lasting tradition reflected in and constituted by the law, as the old children’s surname law mandated that, with limited exceptions, all children shall assume their fathers’ surname. The law was revised in 2007, which stipulates that children’s surname shall be decided through parental agreement. This legislation is considered a hard-win success for women’s equal rights, but the practices it turned out to be a disappointment. Since the law came into effect, approximately 1.54% of all newborns were given the mother’s surname through parental agreement. Does this fact suggest that people’s attitude toward naming remains unchanged irrespective of the change of law? Can legal reform promote women’s naming right, or does it mostly function to reinforce patronymy? We use data from the 2002 and 2012 Taiwan Social Change Survey to answer these questions. Our study find that significant changes have occurred in people’s attitudes toward children’s surnaming. The change in people’s attitudes, however, does not translate into the change of actions. We have identified double gaps – gap between people’s attitude in general and behavior intention, and gap between behavior intention and actual action taken. We also notice gender, marital and parental status, and gender equality consciousness differences in people’s attitude, and identify the profile of people who might benefit from the new children’s surname law. Our study leads to the conclusion that a liberal children’s surname law might be accompanied by a positive change in people’s attitude toward children’s surnaming, but cannot actively promote women’s equal right to name the child.

A Study Showing Research Has Been Valued over Teaching in Higher Education Based on the Theories of Neoliberalism and Academic Capitalism

Research has been valued and given priority over teaching for a long time in academia. In recent decades, the Taiwanese Ministry of Education has pursued objective and quantitative research criteria and has encouraged higher education institutions to ask teachers to publish papers in SCI or SSCI journals as part of the criteria for promotion and evaluation. This policy strengthens the concept that research has priority over teaching because teachers must devote more time to research than to teaching in order to be promoted and evaluated.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
The purpose of this study is to explore the influences that cause teachers to value research over teaching. To achieve this purpose, the study will apply document analysis and questionnaire inquiry as research methodology. First of all, the study will collect and analyze the documents for teacher promotion and evaluation of ten different universities. In order to collect the differing requirements of the reward system in different areas, these ten universities' areas of specialty include general studies, education, medicine, vocational studies, and arts. Then, the study will use questionnaires to collect teachers' opinions of task priority and the time involved on research and teaching duties. The data collected from the above two methods will be analyzed and discussed based on the theory of Neo-liberalism and the regime of Academic Capitalism. Some suggestions will be proposed according to the results.

Buddhism in Taiwan Under Globalization: Diversity and Hybridity

Taiwan's Buddhism has undergone significant transformations since late 1980s. Globalization has played an important role on the new constellation of Buddhism in Taiwan. In addition to the mainstream and local Chinese Buddhism, other traditions of Buddhism from the Tibet, Southeast Asian countries, and Japan have also established numerous centers and attracted many Taiwanese followers. Globalization has thus brought diversity and hybridity to Taiwan's Buddhism. In my paper, I will explore this phenomenon of Buddhism in contemporary Taiwan. I will adopt Nattier's (1998) classification of religious cross-country transmission as the analytical framework to identify how foreign traditions of Buddhism have been transported to and practiced in Taiwan. Then, I will investigate how these foreign traditions of Buddhism have influenced the landscape of Taiwan's Buddhism. Finally, I will inspect how Taiwanese monks and nuns respond to these newly converted traditions of Buddhism, which shares some common teachings and practices with the local tradition but differ from one another in certain teachings and practices. In sum, Taiwan's recent transformations of Buddhism provide an interesting case for understanding the interactions among different traditions of Buddhism and its effects on the behavior of local tradition as well as local believers in the age of globalization.

Justice and Claims in Popular Protests in China

This paper studies the conceptions of justice in growing social protests in China. It examines claims made in popular protests, relying on a news database the author collected and constructed, with more than 3,000 mass protest events in 2000-13. It first describes the trends and characteristics of popular protests in contemporary China, and then analyzes the patterns of protest and the biggest category of protest claims focused on income-related issues, accounting for about half of all protest claims. The other major protest claims included administrative issues (e.g., government misconduct, specific government policy or regulations, rights issues, forced evictions, environmental issues, and student rights), and incidents events. In the rural areas the most important issue that emerged in the early 2000s and accelerated after the mid-2000s was linked to land seizures in suburban villages where local cadres underpaid or embezzled compensation due to peasants for the seizure of their lands. The second confrontational rural issue related to local government misconduct and cadres' corruption, followed by rights issues such as forced eviction, pollution and environmental protection, and so on. Then this study shows which factors were related to different protest claims in urban and rural villages, and discuss how protestors' notions of justice have affected their claiming choices and protest tactics.

Gendered Differences on the Attitudes and Solutions Toward Extramarital Sex in Taiwan

Although it is commonly claimed that women's status is greatly improved and women's rights are well-protected in Taiwan, extramarital sex (EMS) is criminalized in Taiwan. Taiwan indeed is one of the few countries in the world that still keep adultery in its criminal law. Moreover, the campaign on decriminalization of extramarital sex launched by Awakening Foundation is facing tremendous challenges from some other women's organizations and ordinary women in general. The debate to some extent is considered as 'women's war' (i.e. the war between the first wife and the 'other woman'), and men who engage in EMS are hardly problematized.

Using the data drawn from the 2002 and 2012 Gender Module of the Taiwan Social Change Survey (TSCS), this research intends to elaborate the gender differences on the attitudes and solutions toward extramarital sexual permissiveness in Taiwan. The following questions will be thoroughly investigated: (1) Do men and women differ in the tolerance of EMS in Taiwan? (2) Do gender differences in social-demographic characteristics and views toward gender equality explain some of the gender differences in the attitudes toward EMS? (3) Do men and women present different problem-solving approaches to extramarital sex (such as compromise, consultation, or confrontation) when he or she found out that a marital partner was having an extramarital affair with someone else? (4) Whether the EMS-related attitudes and patterns change over the past decade in Taiwan. With the scrutiny of these questions, this research is not only able to establish the extensive understandings of EMS-related patterns but also be able to examine whether the 'revealing intimacy' argued by Giddens (1992) exists in current Taiwan.

Gendered Sexual Migration Across Taiwan Strait

Globalization and the uneven development of global economy accelerated both transnational commercial sex and global sex tourism. Since late 1987 when Taiwan lifted martial law (1949-1987), every year there have been thousands of Chinese women coming to Taiwan either as marital migrants or undocumented workers, to seek a better life in a relatively richer and freer Taiwan. On the other hand, the growing economic power of East Asia, Taiwan, as a destination of sex tourism, now gradually appears as a sending country of sex tourists. Geographical closeness and cultural intimacy in terms of language and Han-ethnicity have served to turn China into a hot sex tourism destination for Taiwanese men.

Based on six years' empirical research on (undocumented) Chinese migrant sex workers in Taiwan and Taiwanese men's sex tourism in China, the paper aims to conceptualize transnational commercial sex and sex tourism as sexual migration to challenge the mainstream discourses regarding migrant sex workers and male sex tourists; i.e. the former as poor ‘trafficked sexual victims’ and the latter as sexual subjects who exploit local women. I would argue that the framework of ‘anti-trafficking’ not only implies a strong sense of criminality and thus stigmatizes (undocumented) Chinese migrant sex workers, but also fails to recognize migrant sex workers as sexual subjects who are either struggling for a better life or simply for survival. Moreover, the gendered sexual migration is complicatedly shaped by gender, ethnicity and regional economic hierarchy. It is Taiwanese men travel to China to buy sex, and Chinese women to Taiwan for selling sex. I therefore would draw on an intersectional approach to carefully examine the ways in which
the gendered sexual migration is embedded in the cultural, socio-economic and political context between Taiwan and China.

Legislative Behavior in the Aftermath of Disaster: Estimating the Effects of Cosponsorship Networks and Adaptation Cognition

Legislation is one of the core components of policy constellation for realizing adaptation strategies and disaster management. However, compared to policy content analysis, studies examining how legislators respond and take actions in national law-making arena are limited. The present paper focuses on legislative behavior in the aftermath of Morakot Disaster of 2009 that was the deadliest typhoon to impact Taiwan in recorded history and has since stimulated nationwide debates about adaptation measures for moderating the impacts of climate change. According to conventional wisdom, positions of legislators are divided and grouped in terms of ideological proximity, party affiliation, and local interests. However, risk perception awakened by natural disaster may transcend such segmentations and forge a viable consensus in legislative chamber. It is assumed that bill sponsorship and cosponsorship networks of Taiwanese Legislature Yuan had formed a web of supports leading to more successful environmental legislations in the aftermath of Morakot. Based on these networks, the study employs network analysis to clarify the linkage between the network configurations of cosponsorship and the effects of adaptation cognition of legislators, in comparison with personal attributes effects. The expected contributions of the study are two-fold. It methodically applies network analysis to gain deeper understanding about legislative behavior in relation to disaster, and theoretically verifies the degree to which adaptation cognition upholds successful legislative actions.

The Changing Patterns in Living Arrangements and Their Impacts on Intergenerational Transfers of Older Chinese

Recent studies have claimed that coresidence with children in China has declined over time. It raises the concern that whether or not changes in such living arrangements will undermine traditional support mechanisms for older adults. Literature suggests that China does not have a clear aged society. This study attempts to fill this gap by investigating current understanding of living arrangement dynamics among older Chinese people from the Chinese Person Survey. The study examines the associations between living arrangements and the financial well-being of older adults in China. The study employs network analysis to examine the impact of a normative regime. Data from the 2004-2009 World Value Survey indicates a substantial idealational gap between men and women across countries. Controlling for individual socio-demographic characteristics through hierarchical linear modeling techniques, results show that most likely the more men are in their gender attitudes, the higher the level of women's life satisfaction. In contrast, women's overall egalitarian tendency has the opposite effects. When the two effects are taken together, the larger the Venus-Mars differences at the country level, the lower the subjective well-being of women in that country, regardless of their personal ideological positions. Interestingly, this macro-level gender gap has a negative effect on men's perception of their own well-being, as well. This negative effect of gender discrepancy is even stronger for older men. Although existing literature has shown a universal up-turn in gender egalitarianism, men's persistent reluctance of catching up in gender egalitarianism would significantly limit improvements in both men's and women's subjective well-being.

Developing Indicators for Biocapital in an Era of Bioeconomy

This paper aims to explore the frontier of developing indicators of biocapital, an emerging health-related notion with the rise of bio-technoscience. Different from other forms of capital, biocapital corresponds to a biocoeconomy, in which the biotechnology contributes to a large portion of economy. According to policy agenda proposed by OECD, elements of the bioeconomy include biotechnological knowledge, renewable biomass, and integration across applications, which are regarded as basic dimensions of the biocapi. As a concept tout neuf, biocapital is still too ambiguous to spread wide in the sociological community. However, it has been a trend for many countries to include the bioeconomy in their policy agenda, blueprints or visions for the coming decades. Like other forms of capital, such as social, cultural, human, and symbolic capital, biocapital is useful for sociologists to observe resource distribution in a society. To cope with potential problems associated with its even distribution, it is necessary to make the biocapital measurable. Several obstacles prevent it being measured. First, it is a multi-level concept ranging from individual, organizational, societal to national level. Second, it involves networks of heterogeneous workers, hence disciplinary boundaries. The paper suggests several possible approaches for overcoming the obstacles. First, experiences of developing intellectual capital are inspiring, as the biocapital consists of the bio-technoscience. Second, also known as external control of organizations, a resource-dependant perspective of organizational study is heuristic for developing indicators associated with heterogeneous networks of bio-technoscience. Finally, in the aftermath of Morakot Disaster of 2009 that was the deadliest typhoon to impact Taiwan in recorded history and has since stimulated nationwide debates about adaptation measures for moderating the impacts of climate change, it is assumed that bill sponsorship and cosponsorship networks of Taiwanese Legislature Yuan had formed a web of supports leading to more successful environmental legislativen in the aftermath of Morakot. Research on the Potential Age Discrimination to the Senior Citizens in China

Background: The "Law of the People's Republic of China on Protection of the Rights and Interests of the Elderly" has forbidden the discrimination and insults to the senior citizens in China. However, in daily lives, the elderly still have to confront various forms of discriminations.

Method: This is a qualitative research, using intensive interview research method. 28 senior citizens were interviewed in Beijing and Wuhan City.

Result:
1. There are three different types of age discrimination: Positive, negative and "side-effect" discrimination. The positive discrimination is a behavior that directly insults the elderly such as scolding the elderly. The negative discrimination is the ignoring of the appeal of the elderly. The "side-effect" is a byproduct when helping the elderly. For instance, the deaf elderly may be grounded due to safety reasons. The negative and "side-effect" discrimination make up of the potential age discrimination.

2. The family, community, society and policy are all involved in the potential discrimination. On the aspect of the family, the excessive care given to the elderly is a form of discrimination to their self-care ability. On the aspect of the community, those living high in the apartments or disabled are often not invited to the community activities. On the aspect of the society, the media and press reinforce the frail stereotypes of the elderly. On the aspect of the policy, the existing defects contribute to the discrimination of the elderly.

3. In order to solve the problems of the potential discrimination to the elderly, the policy, media and press need a relevant change. The effects of the social work should be emphasized, too. This will be a hard and long-lasting task.

CHEN, XU* (Wuhan University, cxsw1986@126.com)

Research on the System of Long-Term Family Support for the Disabled Elderly in China

Background: The long-term family support is widely used by the disabled elderly in China. As the group of the disabled elderly expands, the problems of long-term family support become obvious.

Method: Both quantitative and qualitative methods are used in this research. It combines the original data of Beijing of the "Second National Survey on the Disabled" with the records of indoor intensive interviews with 28 disabled senior citizens in Beijing and Wuhan city.

Result:
1. Family support is of vital importance for the disabled elderly in China. There are five characteristics of the family support: family-orientation, structure of grade, complexity, concentration and long-term.

2. The "family-orientation" depicts that most disabled senior citizens prefer family support due to the reason of income, filial piety, and the distrust of the non-family members. The "structure of grade" defines the relationship between the caregivers and the disabled elderly. The caregivers are mainly spouses, sons and daughters. The "complexity" means the family support is characterized by the core of "disability". Thus, we have to take various patterns of the family support due to the complexity of the disability. The "concentration" depicts the contents of the family support for the disabled elderly, which can be summarized as the basic support, daily living support, mental support and so on. The "long-term" means the family support is a hard and long lasting task.

3. The defects of the family support are low-level quality, instability, negative influences on the children and so on. In order to solve these problems, we have to develop other forms of support, such as community and institution support.

The Formation of Environmental Consciousness: From Conscious of Money to Conscious of Environment

According to the The East Asian survey on people's sense of culture, life and environment (2010-2011) which was conducted by Doshisha Research Center for East Asian Studies, a relative high percentage of proenvironmental behaviors stem from the motivation of save money (Japan, 38.7%; Korea, 61.0%; Beijing city of China, 50.3%). While from this data we draw the conclusion that the environmental consciousness is not high, it is also valuable to focus on another consciousness, the frugal consciousness. The present study based on the theory of balancing of interest, takes Beichen village of China as the research object, and aims to clarify the collapse process of frugal consciousness and the formation process of environmental consciousness in this village. The hypothesis in this paper is that people's behavior intention is the result of interest balance in one's mind. Frugal consciousness comes from the helplessness of the life but also is a rational choice when facing the reality. It is the result of interaction of production mode, life style, social norm and personal norm. These factors which play critical roles in frugal consciousness also supply some benefit on the formation of environmental consciousness. This paper divides the frugal consciousness into different types and discusses the ways that how to transform them into environmental consciousness respectively. The result of this paper indicates that in the formation process of environmental consciousness, balancing of interest plays a fundamental role and social norm is also an important driving force.

Early Family Financial Stress and Adulthood Quality of Life: An Investigation of the Mediating Process

Past research has shown the salient influence of early family financial stress or poverty on behavior adjustment and quality of life during adolescence and young adulthood (Conger & Elder 1994; Conger, Conger, & Monica 2011). On theoretical level, both family stress model (Conger et al. 1994) and life history theory (Belsky, Schlomer, & Ellis 2011) address that early adversity operationalized by low family SES, unstable family environment, and unpredicted social environment in late childhood and early adolescence contributes to involvement in crime and delinquency, excessive use of substance, and risky sexual behavior in later adolescence and early adulthood. However, little is known about the factors mediating the early adversity and later adjustments.

To address this question, current study is set to investigate this early-later link using a prospective panel study, Taiwan Youth Project (TYP). Using data spanning across 8 years (from age 13 to age 20), in this paper we plan to answer two research questions. Structural Equation Modeling (SEM) with tests of mediation will be used in data analysis and hypothesis testing. First, to establish the early-later link, we will explore the association between family financial stress at age 13 and happiness, self-report health, and depressive mood at age 20. Second, based on Côté's idea of identity capital (Côté 1996, 2002), we explore two possible factors (family cohesion and self-esteem) during adolescence that mediate the aforementioned early-later link. The results of current study can help developmental researchers better understand the mechanisms of the long-term effect of early adversity.

Housing Low-Income People in Globalizing Taipei

The idea of "becoming a global city" has strongly influenced the urban policies in Taipei, since the 1990s. The Taipei City Government has implemented several mega projects in the city; claiming to improve Taipei's global status, such as building the highest building in the world and creating a new financial district. Meanwhile, the government has improved social welfare policies. This paper will firstly examine the status of low-income housing in Taipei's urban affairs. Second, based on the motives of the government, this paper will examine the status of low-income housing in Taipei's urban affairs. This paper will firstly examine the status of low-income housing in Taipei's urban affairs. Third, based on the motives of the government, this paper will examine the status of low-income housing in Taipei's urban affairs. Then, it will explore the status of low-income housing in Taipei's urban policies. This paper will draw on several theoretical concepts, including the right to the city, neoliberalization in East Asian cities, and worlding cities, to discuss the problem of low-income housing in globalizing Taipei.
on communities’ networking. Networking is hypothesized as associated with performance. Two forms of networking, within and beyond community, are defined according to types of social capital. Two traits of performance include effectiveness of carrying out the services and innovation regarding the long-term service development. Key organization factors are leadership, community capacity, and funding sources. The direct and moderating effects of these organization factors are included and examined.

Studied are 640 community development associations (s) in Taiwan, a probability sample of a secondary face-to-face survey in 2011. The results of multiple regression analysis show that networking beyond community enhances a CDAs’ effectiveness and innovation. Networking within community is found negatively associated with the overall performance probably because of the potential tension between a CDA and political entities in the same neighborhood. Additionally, the study finds the desirable effects of organization networking vary by certain organizational factors. Networking beyond community enhances effectiveness of a CDA; such effect is strengthened by leadership and weakened by community capacity. Within-community networking leads to effectiveness improvement only for CDAs having mixed funding sources. Implications about applying a social capital perspective on community organizations and none-European-American societies are discussed.

Bridging Differences: Feminist Alliance Framing of Peruvian Women’s Health Movement

How do divergent social groups build and maintain their alliances for collective action is the central question in this paper. To explain the networking and cooperation between social movements groups or even different social movements the resources mobilization theory and the political process approach emphasized on the external factors of the movement building. This paper attempts to argue the long-term alliance between divergent social groups can make the communication in alliance difficult. Emphasizing the role of life-world experiences that intermediate the contextual change and the we-ness construction in an alliance, I argue the long-term alliance between divergent social groups can not be explained without considering their different oppression experiences that make the communication in alliance difficult.

The collaboration experiences among participants. To outline this argument, I study the experiences of Peruvian women’s health movement from 1980 to 2000. The collaboration between women from different social classes – NGO-feminist and the grassroots women- suffered tension and conflicts as their activities extend from self-help groups to medical institutions. From an intersectional perspective I analyze the experiences of both groups, and show the dynamic framing strategy of feminist NGOs to bridge these different experiences and to maintain their alliance with the grassroots women.

How to Become a Feminist Activist after the Institutionalization of the Women’s Movement: Young Feminists in Mexico

The institutionalization of the women’s movement in civil society (in such organizations as feminist NGOs) and the academy (for example, gender studies majors at universities) offers a new context for the development of feminism. The main question of this paper is: how do today’s young women develop their feminist consciousness and become activists within this new context? This study investigates the consciousness building and political activities of young feminists in Mexico City through qualitative analysis. The results reveal that the feminist institutions established in the academy and in civil society are crucial references for the development of young feminist activists in a controversial way: on one hand, they provide the field for feminist consciousness building, but on the other hand, they don’t offer sufficient space for young feminists to play leadership roles in organization and political action. The inter-generational tension in the background of this context is also discussed. La presentación oral puede ser en ambos idiomas, inglés o castellano.

Intergenerational Transmission of Family Formation: Socio-Economic Differentials in the Timing of Marriage and Childbearing Among Young Taiwanese Adults

Previous studies on marriage and family have consistently explored the familial and parental influences on the development of adolescent sexuality, mate selection, union formation, and eventual childbearing, either through family trajectory models or life-course developmental models. However, recent changes in social and economic inequalities for women’s adoption of adult roles, with main focuses on two life events including the timing of first marriage and following childbearing. Data are taken from the Taiwan Youth Project, which is a longitudinal panel study of 2660 students in junior and senior high schools since the year 2000. Since part of respondents has been married, it is an adequate time to analyze their disparity on sexual attitudes and mate selection practices and major trends in the timing of entry into first marriage. We also compare the tendency to young adults to different social and economic backgrounds to choose partners of specific characteristics, and childbearing intentions and outcomes. Based on these results, we are able to examine the relative effect of perceived parental influence on their adult children’s mate selection, union formation, and reproductive behavior in contemporary Taiwanese society.

A Study On The Educational Policies On After-school Programs and Educational Equity In Taiwan

Since the year of 1960, the educational policies started to focus on the issues of disadvantaged students and their schooling. How to disenchant the struggles that disadvantaged students face during their daily school lives become the priority that educators and administrators need to consider especially the issues related to the afterschool programs. Like the Title I of ESEA in the United States and Educational Priority Area (EPA) in the Philippines, Afterschool programs have been emphasized to examine the relative effect of perceived parental influence on their adult children’s mate selection, union formation, and eventual childbearing, either through family trajectory models or life-course developmental models. The principal investigator collects the theories related to disadvantaged students and school including Flawes, Coleman, Sen, and Young to figure the possible solution of afterschool programs and conducts a survey on the questionnaires on disadvantaged students and afterschool programs. Furthermore, the researcher host three focus group discussions to provide useful reflections from the quantitative findings. As the results, the author provides conclusions and suggestions to the further discussions, research, and policy making.

Keywords: Disadvantaged Students, Afterschool Program, Educational Equity, and Educational Policy

Culture and Defensive Modernization in Thailand, 1855-1932

How can “Siam/Thailand” be brought, as a new non-western case, into the corpus of comparative-historical sociological cases without falling into the trap of methodological nationalism (which glorifies its own agency behind its ‘success story’ of independence) and globalism (which sees its as a periphery within the capitalist world-system)? This paper traces the unfolding course of defensive modernization in Siam/Thailand through a critical (re)examination of four discourses and their accompanying sites of practice, i.e., the political economy, the discourse of civilization, the humanitarian discourse, and the postcolonial discourse. Situated within the overlapping spheres of the British and French imperial expansions and encroachments, Siam/Thailand (from 1855 to 1932) has been considered as one of the exemplary cases in which the modernization occurred as a direct response to the Western imperialism. Such form of modernization, nonetheless, still lacks a conceptual basis and theorization. This paper attempts to go deeper into the case of defensive modernization in Siam/Thailand by integrating relatively recent case studies by Thai revisionists about Siam/Thailand in this period and by providing a new theoretical angle to analyze those cases. The main argument of this paper centers on the constitutive role of culture in the construction and elaboration of the programs of defensive modernization by the Siamese/Thai ruling elite. The three contributions that this paper gives are: 1) bringing empire, imperialism, and colonialism into historical sociology; 2) providing a new non-western case to the comparative-historical studies of modernization (beyond the old-fashioned paradigm of the “modernization theory”) as well as state and imperial formations;
and 3) creating an ongoing dialogue with the macro-social theories that choose to walk a tightrope between the methodological nationalism and globalization.

Young Workers: Accumulation Of Educational Resources and Professional Trajectories

In 2009 thousand young workers of industry (processing, hi-tech productions) at 13 regions of Russia were polled; in 2010 a part of them were interviewed. Accumulated educational resource (school education, professional training and training during work) has a direct influence on demand for renewal and size of salary. However, growth possibilities are limited by technological possibilities of production. It stimulates an exit of a part of youth from working profession. Among those who became workers having a large educational resource (full secondary school or secondary professional college) intensively accumulate a human capital and achieve higher qualifications; about one third of them are not stabilized in this status and aspire to leave working profession, this position is transit for them. But two thirds of such workers remain in production. However, the highest stability of working profession belongs to workers, having a small baggage of school education, preparation at technical college or at the courses - and to whom this base education prevents to move upwards on educational and qualification levels.

Typical trajectories “Horizontal” (57 % of a massive): low school education, training of working professions at technical college and at a working place leads to mass and low qualifications. Those not stimulated to professional advancement and study make the most stable personnel satisfied with a low salary work. Here stability is sooner forced - few alternative possibilities.

“Progressing” (27 %): large volume of school capital, intensive accumulation of educational-professional resources, achieving high qualifications. Partially “transit” workers are formed.

“Vertical” (16 %): base secondary education or secondary professional college, intensive improvement of qualification, most qualified personnel. Big educational ambitions are expressed in getting higher (or secondary professional college) education (by correspondence course) that leads to achieving positions of a technician or an engineer.

Social Justice in a Changing Society

The BRICS states have different recent histories. Some of them, like Brazil, have been developing as market-based economies and emergent societies. Others, like Russia or China, came to development from the incipient stage of state socialism. The supposed difference between them underlies the main hypothesis of the study of social justice: former socialist societies tend to embrace the idea of distributive justice, the market-based are habituated in a market environment and therefore are more tolerant towards meritoric forms of inequality. The results of the survey based on an All-Russia sample show tend to put the above hypothesis in doubt. The Russian population tends to endorse the idea of equity as the primary principle of social justice rather than the idea of equal distribution. In later stage of their evolution the socialist societies stress the idea of equity and procedure much more strongly than the idea of equality. The Russian society is inclined towards the logic of accepting the difference in income if it relates to education, skills, work input and entrepreneurial skills. Procedural justice is viewed as an important guarantee of the equity principle. The difference in income must be linked to the measurable criteria such as the level of education credentialed by education institutions, the quantified amount of work, or skills confirmed officially as the grades or other occupational standards.

The perception of justice varies according to class or other social conditions. While evaluating their income as just or unjust the Russians tend to rely on the standards of their community or their social group rather than on some general principles. The general principles of equity are more salient in the groups dependent on the macro-context such as pensioners or students.

School-to-Work Transitions before, during and after the Global Financial Crisis in Australia

School-to-work transitions are becoming more complex as labour markets restructure due to technological innovations and closer economic integration between nations. Entry into the labour market is becoming increasingly contingent upon having appropriate educational credentials consequently, leaving some workers completing secondary education may experience multiple experiences of precarious employment. Although the Australian economy weathered the recent Global Financial Crisis (GFC) better than many other advanced economies, in August 2009 the combined unemployment and underemployment rate for young people was double the rate for the working age population. During economic recessions, young people tend to delay entry into the labour market preferring remain in school until the economy rebounds and jobs are easier to secure. The flexibility of the Australian education system coupled with the availability of welfare payments for full-time students allows young people to transition between education and employment multiple times and provides a refuge from harsh economic conditions. This paper presents the results of analyses of the first 12 waves of the Household Income and Labour Dynamics in Australia data tracking the fortunes of three cohorts of young Australians: those who completed school prior to the GFC; those who completed school during the GFC and those who completed school after the GFC to examine the effect of the crisis on school-to-work transitions.

Cross-National Income Disparity and Life Expectancy

This study examines cross-national relationship between income inequality and population health. It has long been speculated that income inequality is detrimental to population health due to material and psychosocial deprivation, given the robust relation found between income and individual health. Though test of this thesis initially corroborated a negative relation across counties and countries, whether the relation is causal in nature remains in question. During recent years, the thesis has brought under a more careful scrutiny with the use of more robust methodological tools due the increased availability of longitudinal data and prevalence of corresponding statistical models. Most of the longitudinal studies reported null finding. However, longitudinal studies are also plagued by lack of comparable data and hence many of them can only examine the relation across limited number of countries and/or time period. In this study, a more comprehensive dataset, Standardized World Income Inequality Database (SWIID) with wealth range of countries and time period together with improved comparability is analyzed. Given previous findings concerning the thesis, three hypotheses are tested: (a) income inequality has detrimental effect on life expectancy, (b) income inequality has a more detrimental effect on life expectancy if household gross (pre-tax, pre-transfer) but not net income inequality is used, and (c) income inequality’s effect on life expectancy is not stable across different years. With the improvement of data coverage, fixed-effect analyses with Huber-White sandwich estimators are carried out to examine the thesis across about 150 countries and...
Western Christianity on this discipline. This paper, therefore, examines the role of ritual by analyzing the development of Taiwanese folk religion, paying particular attention to how traditional belief competes with, if not replaced by, religions in modern Taiwan. In response to the crisis of the religious legitimation, Taiwanese temples produce cultural capital by emphasizing the cultural value of their rituals. The ‘culturalized’ ritualistic activities further create for the people a modern connection with folk religion. It is through ritualistic participation that the religious taste of folk religion is reproduced and maintained in the popular. This study will analyze why bodily technique is essential to the construction of religious taste, and how its practices contribute to the participants' traditional belief.

**Sustaining The Women's Ghetto: Gendering, Masculinization and Feminization Of Newspaper Organizations**

This paper aims to explore the reasons why women are still unable to escape from marginalized, belittling and disadvantaged positions at work. Previous studies on gender and women's employment have acknowledged that the gendered construction of labour has either excluded women from the labour market or restricted them to the middle or bottom of the power structure within work organizations.

Using NotTDaily as an example, I argue that, apart from using the 'gendering' process, the organization may at the same time be attempting to feminize some particular units to intensify the gender segregation. In so doing, the organization may still appear to be segregated by gender, but the nature of the horizontal gender segregation is different from what it was before. To explain the differences, we have to employ feminization as an explanatory tool. In other words, to understand the way in which organizations are gendered, we have to examine the processes of both 'masculinization' and 'feminization', in order to acknowledge more clearly the difficulties women are confronting in the labour market.

In this article, I suggest that the women's page was feminized by two means: isolation and normalization. The women's page was isolated spatially. It was also isolated in terms of professional practices. The isolation reified the unimportance of the women's page in the sense that the women's page was a neglected and dead-end sector. The organization then normalized the labour process of the women's page to render the working routine of the women's page compatible dead-end sector. The organization then normalized the labour process of the women's page in the sense that the women's page was a neglected and dead-end sector. The organization then normalized the labour process of the women's page to render the working routine of the women's page compatible dead-end sector. The organization then normalized the labour process of the women's page in the sense that the women's page was a neglected and dead-end sector. The organization then normalized the labour process of the women's page to render the working routine of the women's page compatible dead-end sector.
sociopolitical change, the possibility of widespread and long-term psychological well-being should not be overlooked.

*How Different Are the Young Women with Forced First Premarital Sex in Their Romantic Relationships? A Life-Course Perspective from the Taiwan Youth Project Surveys*

Studies have well established the negative relationship between forced first sex before marriage and a wide range of family, social, and well-being outcomes in non-Asian young women. However, due to the data inadequacy, surprisingly few studies have examined this relationship among Asian young women, and even less has been analyzed on the long-term consequences. Based on the life-course hypothesis, this study contends social norms prescribe the appropriate timing for important transitions and sanctions apply to non-followers which may produce long-term negative consequences. In East Asia, particularly in Chinese societies, collectivistic orientation has been proposed to be a salient social trait. Adolescents situated in this particular cultural context are exposed to strong normative influence. Conservative social norms expect Taiwanese youth to be well-behaved and not to practice non-standard behaviors in adolescence such as engaging in active sexual behaviors before marriage. Hence, forced sexual initiation in adolescent romantic relationships becomes a serious concern and it implies adverse public health and social consequences such as risky behaviors, psychological distress, and a higher probability of intimate violence or divorce after marriage.

Building upon Bronfenbrenner's ecological model (1979) and life-course theory, we use the longitudinal panel surveys of Taiwan Youth Project (2000-2011) and examine Taiwanes young women on a wide range of family, social, and well-being outcomes. Young women who experienced forced premarital sex are compared with those who did not. Results show that, consistent with theoretical expectations, forced premature sex adversely influences psychological and relational well-being and has increasing consequences over time. A focus on the long-term consequences should be emphasized and future research should examine the complex co-occurrence of different types of victimization and their interpersonal consequences.

*Globalization and Nationalism at a Crossroads: The Identity Politics of Competing Imagined Economies Across the Taiwan Strait*

Even before the implementation of the Economic Cooperation Framework Agreement (ECFA) between China and Taiwan in 2011, the increasing rate of cross-Strait economic integration and the potential volatility of Taiwan's ambiguous international status has been the subject of intense political debate and academic research. The island's shift away from an imagined community of 'One China' to part of an 'imagined economy' inextricably linked to mainland China is not just a projection or re-geotyping of national sovereignty onto the global scale, but rather an ongoing process of the re-imagining of space and scale, in which both concepts are mutually constitutive of one another. While the symbolic act of closer economic integration between two parts of a divided nation bring justication and legitimacy to a priori definitions of globalization as a project, at the same time, the process continues to stretch the traditional confines of national sovereignty. The aim here is to analyze how through the act of selection, specific historical periodizations have been reframed to form a dominant narrative of the relationship between national identity and the spatial limits of economic possibility for current contexts.

Specifically, this paper provides a discourse analytical perspective on the social forces and ideas that have sought to dominate the narrative of harnessing an externalized concept of globalization on the one hand, and harmonizing regional security and prosperity as a crucial cornerstone to national development on the other. Particular attention is made to the framing of post-2008 cross-Strait economic integration as a source of national economic uplift in the context of Taiwan's increasing economic integration. It is argued that ideas of the imagined economy heavily influence the framing the possibilities of political action.
Following Chalmers Johnson (1982) seminal analysis, Japan is known and debated as prime example of a developmental state and state-led capitalism. However, a closer look to its historical development shows that Japan’s industrialization is not a simple case of state-directed capitalism, but much more complex and marked by turning points. Already before its full reintegration into the world体系 of Western technologies, Japan experienced a proto-industrialization primarily driven by private entrepreneurs. During the late 19th century, this proto-industry was the economic foundation, which allowed Japan to embark on a modernization and industrialization path and to withstand colonization pressure by Western powers. The industrialization effort was embedded into the introduction of a nation state including modern administrative, educational, juristic and military institutions and was initiated by the state, but quite early key industries were privatized. Accordingly, the role of the state in economic development was surprisingly limited in Japan as a late-comer and up to the 1930s the economy followed a liberal model. This changed fundamentally during the years of war (1937-1945), which saw the introduction of an increasingly state-managed economic system oriented towards the war efforts. The developmental state not only survived the years of U.S.-occupation (1945-1952), but after fierce social conflicts in the early postwar era state-led developmentalism became from the 1960s onwards the central piece of Japan’s new social contract. Since the collapse of the bubble economy in the early 1990s and the following decades of economic stagnation, the model of Japanese capitalism is increasingly questioned and submitted to structural reforms. Abenomics is just the latest attempt to lead Japan back to developmentalism. This paper will analyze the driving forces behind the turning points of Japan’s capitalism(s) and discuss its consequences for our understanding of the variety of capitalism.

Making One Health Experts: The Formation, Reinforcement, and Transformation of Epistemic Communities

This paper explains how an international One Health epistemic community was gradually assembled and shaped through the interventions of international agencies. In response to H5N1 avian flu outbreaks, the international community has gradually developed a “One World, One Health” approach, which was endorsed by multiple international agencies. These international agencies include the World Health Organization (WHO), Food and Agriculture Organization of the United Nations (FAO), World Organization for Animal Health (OIE), and other agencies. For the purpose of deliberating and defining One Health strategies, the WHO, FAO and OIE mobilized experts from their research laboratories and collaborating centers, international agencies, researchers, public health workers, and other actors. This paper argues that the emergence of the One Health community has been intentionally constructed by international agencies, instead of simply growing out of shared understandings and goals. The study therefore challenges and extends Haas (1990, 1992)'s theory of epistemic community by revealing how an epistemic community co-evolved with global policy formation. In addition, I illustrate that although international agencies have attempted to expand the networks, experts affiliated with their laboratory networks are still crucial participants to define and fulfill One Health.
As a complex problem requires the investigation of interdisciplinarity, the causes that lead to the development of a research instrument that measures the relationships and their effective emergences. The EIA is a base of data that in case of observatories, does not mean a "Huella Significativa" that is constructed and related to:

- La Epistemología Genética. - This helps to explain and explain the construction and the development of the lineages of cognitive representations in a formal environment.
- Sistemas Complexos. - It is a set of elements / relations heterogéneos e interdefinidos that are managed as a total reality. La Cibercultura. - It is completely dedicated to the cultivation of different types of information, Culture of Knowledge and Culture of Communication.
- Sociocultura. - It is a set of objects that provide the auto organization of whom we integrate.
- Investigación Interdisciplinaria. - It is established by elements of interdisciplinary that interact in practical integration / differentiation in a constant synchronization dialectical.

This can be seen in other bodies: in order to conform the "Fases Dinámicas Solidarias", these are: Lev Yotsky with the Objeto Mediatizado and Zona de Desarrollo Próximo, Engstrom with the Teoría de la Actividad Ampliada and Ausubel with the Aprendizaje Significativo. Esto, nos permite explicar y justificar, el sistema que nos deja ver representado el cómo aprendemos, como enseñamos for living in community.

This system, permits what is captured in forms of routine, since processed systemically the Cibercultura, for that it can be observable from where to sociocentrism, pursuing the interaction of the sciences, the cultures and the technologies.

CHITO CHILD, ERICA* (City University of New York, echitoch@hunter.cuny.edu)

A Global Look at Mixed Marriage

Mapping attitudes toward intermarriage—who is and who is NOT an acceptable mate—offers an incisive means through which imaginings of belonging—race, ethnicity, nationhood, citizenship and culture—can be critically evaluated. In particular, social constructions of race and difference involve discussions of purity, race identity and taboo about interracial sex and marriage. Drawing from qualitative interviews and ethnographic research in six countries on attitudes toward intermarriage, this paper explores these issues of intermarriage in a global context. Through a comparison of qualitative data I collected in Australia, Brazil, Ecuador, Portugal, South Africa and the United States, I offer a theoretical framework and provide an empirical basis, to understand the concept of intermarriage and what it tells us about racial boundaries in a global context. For example, in the United States, the issue of intermarriage is discussed as interracial with less attention paid to inter-religious or inter-ethnic, to the point that those concepts are rarely used. Similarly in South Africa, despite the end of apartheid decades ago, marriage between Jews and Moslems is still highly problematicized and uncommon. Yet globally there is less consensus of what constitutes intermarriage—sometimes intercultural, interethnic, or any number of words with localized meanings. In South America and Australia, the debate seems to revolve more around indigenous status, citizenship and national identity such as who is Australian or who is Ecuadorian? As indigenous populations rally for rights and representation how does this change the discourse on what intermarriage mean? Looking globally, what differences matter? What boundaries are most salient in determining the attitudes of different groups toward intermarriage? How are various communities responding to intermarriage, particularly if there are a growing number of "mixed" families? This research on attitudes toward intermarriage adds to our understanding of constructions of race, racism and racialized, gendered and sexualized beliefs and practices globally.

CHI, HUA-MEI* (National Sun Yat-sen University, Taiwan, fschiu@gmail.com)

Taiwan’s Anti-Nuclear Movement after Fukushima Nuclear Disaster

Two years after Fukushima nuclear disaster, the revitalized anti-nuclear movement in Taiwan has gained an unprecedented momentum. On 9 March 2013, 220 thousand citizens attended demonstrations in four cities. The turnout has shown a great leap in two years. In Taipei, the number of protesters has grown from 5 thousand in 2011 to 120 thousand in 2013. The activists are no longer limited to the green groups, and the veteran campaigners but include many new faces such as young people and various celebrities. However, living in a small island country with three nuclear powers plants in operation and the Fourth Nuclear Power Plant (NPP4) under construction, plus sharing similar geographic conditions with Japan, Taiwanese people seem to belatedly response to great nuclear risk. Besides, the urban and rural veterans are active stand for the policy, but a certain amount of the protesters in 2013 demonstrations claim that they are ‘not anti-nuclear but anti-NPP4 only’. This divergence has never been found in the three-decade-old anti-nuclear movement. How can we explain the revitalization of Taiwan’s anti-nuclear movement after Fukushima disaster? Why does the stand for ‘Anti-NPP4 only’ appear? It seems that the accidents and problems newly discovered in the nuclear power plants and the political responses from the government and Taiwan Power Co. also play a role in stimuliing or cutting back the movement. The paper will, first, explore the formation and strategies of the movement in order to understand how the movements gain its strength and challenge the nuclear-addicted government. Second, the authors will focus on why certain groups have focused on the goal of stopping the construction of NPP4 while other some organizations have made efforts to develop discourses to compete for the legitimacy over no-nuclear energy policy, energy democracy and alternative development. Finally, some predicaments of current movement will be discussed.

CHI, HUA-MEI* (National Sun Yat-sen University, Taiwan, fschiu@gmail.com)

Irrelevant or Interconnected?—the Environmental and Labour Movements Against Electronic Industry in Taiwan

Since the early 1980s, the development of Taiwan’s Science Parks where the electronic industries cluster has been seen as a model of the developmental state’s capacity to hatch a strategic national industry through a process of upgrading and modernisation. The leading industries in Science Park, computer and peripherals, semiconductor and optoelectronics, have been successfully promoted by the government and the corporations as a clean high-tech industry, which is ideal to replace the high pollution one. The industry has been depicted as golden-hen of the national economy because of its economic success and hence Taiwanese society witness a significant expansion of electronic industry and the model of high-tech Science Park. However, the negative environmental impacts, hazardous consequences and social injustice, and the repression of labour right in the industry have gradually emerged since the late 1990s. As a result, the environmental movement activists, community neighbourhoods, farmers and fishermen and farmers’ right campaigners have collaboratively worked in the movement against electronic hazards and the expansion of Science Park since 2005 and the campaigns for electronic employees’ working rights have gradually emerged during 2008 economic crisis. Despite of relating to electronic industry, the two movements have seem remained irrelevant in the beginning, but the growing awareness of the impacts of high-tech industry, especially on environment, community and environment, and the lack of social and environmental responsibilities of electronic capital seem to provide the potential interconnected relations between the two movements. This research concerns the relations between the environmental and labour movements in challenging the electronic industry in Taiwan. The author will explore the composition of activists and the trajectory of the two movements, and discover the difficulties and potentials for the formation of environmental-labour alliance challenging the electronic high-tech industry in Taiwan.

Social Capital, Mobilized Information Networks, and Risky Investment

This study reviews several Taiwanese researches that relate to the behavior of participating in risky investment from the view of social capital to the view of sociology of knowledge, and attempts to bring extant quantitative data into conversation with extant qualitative research. After comparing the former studies, I construct a model emphasizes on typology of mobilized information networks to explain the behavior of participating in risky investment. Since this paper focuses on how investors get information, I use the data of Taiwan Social Change Survey period 5th time 3rd (2007) and classify sixteen types of investors by distinguishing mobilized information networks into sixteen types. These types of mobilized information networks indicate each of the sixteen groups of investors has different "information-knowledge" social ability, by which investors recognize the reality of financial market. Without knowledge foundation, investors can just understand very limited information; without special information channels, investors cannot form complete information-knowledge. I argue that mobilized information networks can explain risky investment behavior better than general social capital capacity.

This paper controls several important social and economic status variables, and controls risk acceptance degree of investors as well, and then run following models separately: (1) use social capital variable as independent variable on risky investment behavior, (2) use social capital variable as independent variable on sixteen types of mobilized information networks in each group, gauge students' opinions on their desired number of children in the contexts of "ideally", "likely", and "realistically" number of children desired. Students are currently enrolled in primary schools, middle schools, high schools, and universities in the four communities. The data also touch upon the students' current size, parents' family size, families' Socio-Economic Status (SES), Parents' occupations, educational levels, as well as parents' place of birth.

The crisis is clear: the independent union movement is losing its strength in traditional manufacturing sector and failing to represent workers in emerging industries such as electronic and service industries where in particular the irregular employment is prevailing. Several students of labour studies have identified the specific institutional and cultural constraints on Taiwan's union movement. However, the recent development of labour movement, regarding to how the movement breaks through the predicaments, is worthy to take a closer look. The author will first illustrate the efforts and crisis of the labour movement in the hostile institutional and political environment. Second, without a strong and solid national union federation, the role of local federation, industrial federation, and labour NGO will be discussed. Finally, the amendment of Trade Union Law in 2010 removed several rigid regulations on union formation and has encouraged a plenty of organising campaigns in largely unorganised industries. In final part the author will focus on these new organising strategies and evaluate their effect and possibilities.

A Value Organization With The Sports - As a Candidate That Face Up With The Nation States And The Corporations Under The Global World-

IOC claims that IOC is not a sport organization but a value organization with the sports. Although it is a fascinating idea, not well supported by the people out of the sports stakeholders. This idea is investigated from the organizational sociology approach. Religious community and Regional community were well recognized as the value organization in the history. Both of them could invent tradition and were the main bodies of the imagined communities. They still claim themselves as a value organization, however, the power and influence to the public are keep decreasing under the globalization world. The global world prefers a value that set over the boundaries and not by God. Hence, the necessity of a value that can pick off an extreme nationalism and capitalism is well recognized and discussed as the quest for ideal value system, but not as an ideal organization that embody the value. Firstly, currently existing major organizations and groups based on Family, Ethnicity, Religion, Army, Party, Union, Kingdom, Nation State, Corporation, NPO and Sports organization are compared for their nature and character by Purpose, Economical situation, Membership principle, Internal rule and governance, Invention and Share of a value and several other points. Secondary, by comparing the organizations that put God, Region or Sports as the core value, the necessary conditions to be a value organization under the global world is discussed. This investigation discovered that the organization with the sports as the core value has the similar nature and character with that of Religion and Regional community. Besides, an organization with the sports is more adaptive for a free membership and value diversity. Such nature and character are summarized as “Sports rationality” against “Economic rationality”. The sports rationalism will naturalize the nationalism and capitalism, and then bring better harmony into the society.

Impacts of Immigrant Health Care Policy: Micronesian Immigrants in Hawaii

The immigration policies of the host society and their foreign country relationships contribute to changes in the influx and composition of immigration populations, and the social context of the host society influences the integration of new immigrants. Hawaii has been one of the primary destinations for Micronesian immigrants due to its geographic proximity, as well as the unique social entitlement and benefits endowed by the United States due to the Compact of Free Association between the Federated States of Micronesia and the United States. The friendly state health policies and exhaustive efforts of community health workers toward Micronesian immigrants, in particular, have helped them gain access to health care services in spite of their low socio-economic status and the cultural and linguistic barriers. However, in 2009 the State of Hawaii attempted to restrict access to the state's comprehensive Medicaid (pub. no. 144) coverage for Compact citizens. This study examines differences in incorporation and integration in health care access of Micronesian immigrants in Hawaii before and after 2009. The interview and brief survey data were collected with Micronesian immigrants and the ethnic community leaders, as well as local health care providers in 2005 and 2013. The results show the notable decrease in securing professional health care services and increased perceptual barriers (e.g. fear and frustration) to health care access. Suggestions and implications are discussed.

2012 Naggomsu-bikini Event as a Social Performance

This paper aims to approach ‘2012 Naggomsu-bikini event’ not from an existing perspective of social movement but as a social performance proposed by Jeffrey C. Alexander. When a problematic situation occurs, members of society try to resolve it through a social performance. Analytically, a social performance consists...
of systems of collective representation (background symbols and foreground script), actors, observers/audience, meanings of symbolic production, mise-en-scène, and social power. This paper demonstrates how the fusion and defusion of these components of social performance characterize the '2012 Nagomosu-bikini event'. The data demonstrates that the foreground scripts for '2012 Nagomosu-bikini event' were constructed from Korean traditional cultural structures and '2012 Nagomosu-bikini event' as a social performance evolved through five stages along with the fusion and defusion of all components of social performance. The methodological merit of this paper lies in the fact that it shows how cultural structures guide social actions in concrete historical events instead of remaining in the textual analysis of cultural structures.

**Hong Kong Family Play, Childhood Culture, and Social Reproduction**

Scholars have established that ethnography of family consumption practices is a fruitful way of analyzing parental beliefs and practices, meanings of buying to children, the commodification of parent-child intimacy and peer connections, and the reproduction of social class and gender differences and hierarchy. Post-developmental early childhood education scholars argue that the ethnography of children's play shows differences in children’s capacity and involvement of play due to social and cultural differences. Power, as consumption practices, is integral to play. There is a convergence that scholars from different disciplines study consumption and play in context. Nevertheless, no one to date has used visual ethnography to examine the relationship of family play, social reproduction and market, although play is increasingly commodified in recent years.

In Hong Kong, people generally regard family as the most important component of human life, and children's status has changed from economically worthless to emotionally priceless. Emphasizing on academic achievements, scholars argue that Hong Kong parents are instrumental to children's play. Parents worry play may divert children's attention to study, but they increasingly ask children consume commercial eduplay and enrichment activities for alleviating parental anxiety and serving parents' hopes and aspirations for class mobility and maintenance.

This paper examines the labour market experiences of migrant agricultural workers in the Republic of Korea. In 2003, the Korean government institutionalized a flexible foreign labour importation system, labelled the Employment Permit System (EPS), to address labour shortages in certain sectors of the economy, such as manufacturing, construction, agriculture and livestock and fisheries. The EPS serves as the foundation and framework for the admission of foreigners into low-paid jobs shunned by local job seekers. For this reason, the EPS intends to tie migrant workers with their employers. In principle, an EPS worker is required to work at the workplace s/he was initially placed. Mobility in the labour market is highly restricted. The Korean government regulates the supply of EPS workers in each sector, and mobility between sectors is prohibited. However, EPS workers employed in the agricultural sector choose to become undocumented to seek better-paying jobs in the manufacturing sector. While the EPS is designed to use foreign labour to maximize economic benefits, it has created tension between EPS workers and Korean farmers. The EPS also resorts to the principle of rotation; EPS workers must leave the country after the completion of their contract. While this paper draws attention to the precarious status of migrant agricultural workers in South Korea, it also highlights resistance strategies employed by these migrant agricultural workers. Both qualitative and quantitative methods are used to analyse the experiences of migrant agricultural workers in Korea. Questionnaires and surveys are currently being conducted among both migrant agricultural workers and their employers across the country.

**Age Differences or Socioeconomic Disadvantages? Factors Shaping Negative Marital Outcomes in Cross-Border Marriages**

Cross-border marriages, sometimes referred to as international marriages, between women from less developed countries and older men from developed countries have increased rapidly in the last two decades. Women from Mainland China have joined the trend and married out to places such as Hong Kong, Taiwan, South Korea and Japan. Being one of the most popular destinations for marriage migrants from China, this type of marriages have now constituted nearly 35% of newly registered marriages in Hong Kong in 2011. The marital quality of cross-border marriages have started to attract scholarly attention because age and cultural differences between the marital partners seem to be built into their union formation (the difference thesis). Furthermore, the mechanism of self-selection often means that men from lower socio-economic backgrounds are more likely to have a foreign wife because their economic disadvantage inhibits them to find a partner locally. Marrying a husband with a disadvantaged background also means that foreign wives may experience more financial stress compared with other women (the disadvantage thesis). Using couple data collected in Hong Kong, this paper compared the negative marital outcomes, measured by marital conflict and psychological aggression, of local and cross-border couples and tests the difference and disadvantage theses. Our analysis showed that foreign wives’ financial stress, husband’s traditional gender role attitude, and a 6-9 year old age gap between husband and wife significantly increased the probability of marital conflict and psychological aggression in cross-border marriages, thus providing some preliminary support to both the disadvantage and difference theses. We, however, did not find significant differences between local and cross-border couples in terms of factors that shaped their marital outcomes, hence providing some evidence that a large age difference and socioeconomic disadvantages may affect the marital outcomes of local and cross-border marriages in similar ways.

**How to Historicize the Invisible and Inaudible Women's Experiences?: Thesaurus Construction of Women’s Oral History and Gender Politics**

Women's oral history has a distinctive nature in that these are based on the daily experience and women's life history. Generally women have tendency to narrate their life histories focusing on birth, marriage, childbirth, illness and death of family members. Researchers also have paid attention to interpret and analyze women's subjective experience and the character of women's narratives. So we are developing thesaurus of women’s oral history in the light of the attribute of women’s oral discourses. This will shed light on exclusion and marginalities of women’s experience considering the implication of gender and sexuality, family and labor in women’s life history.

This thesaurus will not only contribute to more specific date search for women’s oral history researchers, but confront with existing classification and category in which it prescribe what is important and significant in history. The thesaurus construction of women’s oral history in the feminist perspective will critically reflect on patriarchal prejudice, male-dominant norms, and the ideology of normative nuclear family embedded in classification and categorization itself.

**Uncomfortable Compromise Between Developmentalism and Welfarism?: Politics of Social Investment in South Korea**

While South Korea (hereafter Korea) has been experiencing unprecedented social risks together with the weakening stability of family and the labour market, a comprehensive set of social protection schemes has been introduced and expanded during the past two decades. In the process of building the welfare state, one of the noticeable aspects is the emphasis on social investment policies and social services, less favorable to cash-providing schemes such as pensions. Free childcare services, a range of active labour market programs, and the long-term care insurance are the significant outputs of the policy trend. The recent development of the Korean welfare state, however, leaves many interesting research
questions in comparative perspectives. The questions that this paper pays attention to are about the politics of social investment policies and also whether these policy developments are functional outputs against increasing social risks or political outputs in the course of emerging welfare politics. The Korean welfare state has revealed the vulnerability of its income maintenance schemes against ‘old social risks’ such as the highest old-age poverty rate among OECD countries. Comparing to other ‘developmental’ welfare states in East Asian region, one could easily notice that social investment policies and politics have been much more visible and stronger in Korea than any other countries. This paper will trace the origin and the development of social investment discourse in Korea and discuss why and how these social development policies and politics have been possible. In so doing, it will explain ‘developmentalism’, the important legacy of the Korean welfare state, and discuss how this legacy has been transformed in the waves of socio-economic-political changes. It will argue that it is crucial to analyze social investment politics to understand the dynamics and the identity of the Korean welfare state.

Livelihoods On The Move: Understanding The Linkages Between Migration and Household Food Security In India

Using the Sustainable Livelihood approach, this paper aims to highlight the role of migration as a livelihood strategy in influencing the food security outcomes among rural households in India. Food security is a key global challenge and India accounts for nearly a quarter of the world’s 870 million undernourished people. A large majority of India’s food insecure population resides in rural areas that is either landless or own small agricultural holdings and thus, excessively dependent on wage labour to meet their income and food needs. However, the undeveloped rural labour markets imply that they have to seek the wage income in the distant labour markets. The traditional importance of migration in the livelihood systems of rural poor notwithstanding, recent years have witnessed an unprecedented surge in rural outmigration in India. It is important to note that the most dominant pattern of rural outmigration involves migration by relatively younger males while the other household members stay behind. From the perspective of food security, this pattern of migration implies that through channels such as remittances and changes in gender roles, migration can have a potential bearing on household food security outcomes. Drawing from the primary survey of 400 rural households in the eastern Indian state of Bihar, this paper attempts to highlight these linkages. The findings suggest that despite the distressed-induced nature of rural migration from Bihar, remittances contribute positively to household food security and food diversity outcomes. Not only migration income helps improve the ability of household to buy food from the market, it also provides additional resources to invest in agriculture which in turn, improves the own-production food entitlements of migrant households. The findings warrant policy attention to remove the barriers to mobility which could foster the food security outcomes of rural households in India.

A Sociological Study of Nursing Profession: A Case Study of Baroda City of Gujarat State in India

The role of sociology in the field of nursing profession continues to cast new light on many aspects of health and illness in society. Over the last 20 years, nursing profession has seen sociological knowledge as a valuable clinical tool, both in the diagnosis of a wide range of illnesses and long-term conditions. The study of health and illness and of the professionals and other organizations devoted to health care is one the most fascinating fields. Health is an important factor in assessing the quality of a society’s life. Medicine and health are not only dependent upon the biological and physical sciences, but also on health service organizations, medical profession, and social organizations. By social organization, it is meant the interdependence of parts. Interdependent parts consist of some of the following tasks, roles and activities which are being undertaken by individuals in hospitals. Adopting a sociological approach, this paper tries to bring light to the role of nurses with others in role set in hospital as an organization. Paper also tries to examine the socio-cultural and economic background of the nurses from where they come and what factors motivate them to join this profession. The paper also focuses on aspects of role performance and interpersonal relationship among the para-medical staff. The paper also delves into the professional problems of nurses. The present study is based upon the primary data collected from 100 nurses working in the public and private hospitals of Baroda city in Gujarat state of India.

Is This Our 9/11 Moment? Young Men and Gender Violence in India

The December gang rape in Delhi has become India’s 9/11 moment. It galvanised people around the country to come together in mammoth vigils. In Delhi, street protests so completely unnerved the police and the administration that roads to the iconic India Gate, where protestors of all hues had gathered in the heart of the city, were blocked. For once, people said, gender violence became a central concern. Despite the compelling magnitude of the rallies around this specific event, we need to trace the political history of outrage and we need to ask if, like 9/11, the 2012 event of the gang rape stigmatised a group. ‘Reform the boys’ has become a battle cry. We also need to step back and ask if collective protest has unfortunately resulted in a form of colonial regulation of young working class men as objects of reform emanating from above. The particular instance of the December gang rape is the terrain for discussing issues of larger concern – mainly the way hegemonic and subaltern masculinities are produced. Popular responses to awaken state responsibility across the globe are linked with the production of regulation and control of young men. It is immi- grant has a special exposure tension between the goal of social development and the goal of economic growth because scholars assume that the efficient provision of affordable social services would have to come at the expense of local industry. Based on extensive interviews in Kenya, Uganda and Tanzania, I this paper I show that, under certain conditions, this is not necessarily the case. I find that three conditions are particularly essential for imports to contribute to local production: (1) that the ‘social development’ market – the one nowadays often funded by the Global Fund to Fight AIDS, Tuberculosis and Malaria and by the U.S. President’s Emergency Plan for AIDS Relief (PEPFAR) – does not a-priori exclude local manufac- turers, (2) that the drugs purchased are effectively monitored, and (3) that local manufacturers can gain access to technological know-how even when this technology is not easily provided by the market. All three countries show that it is only the presence of these conditions that allow for industrial upgrading to follow social development but a comparison between Tanzania, Kenya and Uganda is particularly useful because companies in these countries had access to technol- ogy through different means and different degrees of government support.

Reconstruction of Opposition Norms and Social Inclusion in Indonesian Urban Poor: A Study of Street Vendors Restructuring in Jakarta

The study discusses the implementation of policy on the street vendors restructuring in some strategic traditional markets in Jakarta. The implementation applies a new different approach which attempts to involve strategic stakeholders in planning of arrangement. The approach encourages stakeholders’ participation in the whole stages of process. The approach creates debates of pros and cons among the stakeholders in the area of the market. The debates reflect a hidden structure of the market. The existence of actors such as thugs (preman) in various level forms an opposition norms which regulates the urban economic activities. The Jakarta local government, through the policy, has forced and reconstructed the existing opposition norms. Consequently, the policy results in resistances.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
The local government accommodates the actors of the hidden structure into the restructuring process. The consistency of local government has reconstructed successfully the integration of hidden structure and opposition norms into the structure of state formal policies. The direct impact of such policy is the social inclusion of small scale urban economic actors who are also the urban poor groups. The pro-poor policy becomes a contrasting policy amidst the neo-liberal economics policy that tends to benefit the large scale capital. The study applies qualitative method by interviewing the economic actors and the policy makers. It is also supported by the secondary data collected from the Indonesia printed news media. The context of the study is Tanah Abang Market as one of the largest Southeast Asian Traditional Market.

Reenergizing Fair Trade through CSA: A Sharing Economy Perspective

Sharing, obviously, is an indispensable component of human history. But as the market economy became dominating over the past 200 years, production and consumption became highly atomized. People seemed to lose instincts of sharing and habitually adapted to “either private or public”—a dichotomized view of goods, which is apparently an ideological myth. In real life social context, a large number of quasi public goods like club goods or common pool resources (Ostrom, 2010). The recent revitalization of the sharing economy is gaining popular attentions (The Economist, 2013). It is largely a result of the IT revolution but currently further going offline, promoting various experiments in daily lives. The defining characteristic of the sharing economy lies in ownership transformation. Comparatively, the existing social economy, including fair trade, is still private property based, aiming at the internalization of social costs and benefits. For instance, the stress on environmental and labor standards, in the language of economics, is to achieve a comprehensive accounting of external costs, and reflect the “genuine prices” of commodities. Under the current study potentials of reenergizing the fair trade movement through its integration with community supported agriculture, an alternative economic activity that not only moves from “fair” to “cooperation”, from “trade” to “co-production”, but also carries a greater touch of the sharing economy, will be explored.

Girl Child, Leisure and Outdoor Sports in Kolkata: An Intersectional Enquiry

The social institution of sport reflects a society that presupposes the values, mores, norms, and standards of the majority and subsequently determines who can participate in sport and who can be identified as an athlete. Sport Sociologists consider sports as an important leisure activity which facilitates intellectual, physical and moral development of the young generation, especially children. Consequently, more and more girls and women are increasingly participating in outdoor sports and physical activity from the late 1970s. Sport sociologists have attempted to bridge women and sport by bringing women into the sport. Women athletes in India, however, are still a minority of sports population and remain an uncharted territory for sociological analysis. The ‘secondary’ or ‘inferior’ status of Indian women athletes which centres on the overriding importance of femininity is furthered by the complex union of class and sexuality, language along with gender intensify their subordinate experiences within varied spheres of social institution including sports. Susan Birrell advocates that ‘sports’ should be conceived as a critical arena for divulging multifaceted nature of discrimination on women athletes, influenced not by gender alone but also by their multiple social identities which are inextricably linked. In fact, a new proliferation of researches in North American and European societies adopting intersectional approach within sports sociology has brought to the fore the ‘multiple oppression’ of women athletes. Conversely in India, the interrelationship of sports and gender and more specifically of sports and other social variables has remained an uncharted territory for sociological analysis. The ‘secondary’ or ‘inferior’ status of Indian women athletes which centres on the overriding importance of femininity is furthered by the complex union of class and sexuality, language along with gender intensify their subordinate experiences within varied spheres of social institution including sports. In real life situation, the “inbetween” women运动员s have participated in sport and who can be identified as an athlete. In real life situation, the “inbetween” women athletes in India: A Tale of Intersectional Inequalities.

This retrospective feminist analysis focuses on a series of thinking circles, action research and feminist networks that trace their roots back for over several decades. It could be argued that an initiating group was a network of activists from the Economics of Women in a Non-Economic World (EWWN). Alternatives with Women for a New Era. DAWN was clearly one group who held a leadership role, convincing people such as me to participate in the series of UN Conferences that came to be known as the UN Conferences of the 1990s. The key focus of Environment and Social Justice Network also took on such a role. We started in Rio in 1992, and this reflection will focus specifically on the World Summit for Social Development. Its alternative thinking, such as the idea of conceiving of economics as “an enabling environment,” came from our participation at its “PrepComs” and surrounding meetings of the 1995 Summit. The paper reflects on organizational models, process and content of these alternatives and explores the types of relationships within and between these and other networks.

Creatives As “Urban Pioneers” – Towards the Empowerment of Socially Disadvantaged Neighbourhoods

By the example of socially disadvantaged neighbourhoods in Berlin and Hamburg suffering from manifold social problems and from persistent negative images I will report from a research project investigating initiatives which are mobilised by “urban pioneers”. These activists are creative people from arts and culture interested in places providing opportunities to try out ideas. They are fascinated by the atmosphere of wear and tear, see the potentials of places and work at helping residents “to find their feet within this system”, as one urban pioneer put it. Hence, empowerment is an integral goal of these pioneers. Some of the initiatives are short-lived, the most of them, however, are long lasting and well-organised. While it is clear that the actors are unable to solve complex (social) problems in the short or medium term, their projects—such as the organization of innovative
Regional Develop & Structural Planning, christmann@irs-net.de

Local Perceptions of Vulnerabilities in Times of Climate Change
How the German Cities of Luebeck and Rostock Construct Potential Threats

The paper reports from a research project studying coastal cities of the southern North Sea and Baltic Sea pursuing the research question of how local sociomaterial practices in colonies and the dynamics of international relations in Asia then, 1. Analyze how Japan's colonial agricultural policies and its fruit crop was conditioned by the material enforcements in colonies, such as population, climate, crops, rice varieties and so on, and, on the other hand, constrained by the western imperialists who competed to grab East Asia from the late nineteenth century. Based on this I argue that, while Developmentalist State scholarship provides an effective framework, especially exemplified by the comparison between Japan and the newly industrialized economies and Southeast Asian or Latin American countries, to demonstrate the significance of the state and its administrative measures in post-war prosperity, it requires more attention to the pre-war historical conjunctures which allowed the genesis and function of Japan-styled statecraft which should not ahistorically be assumed. The exploration of the spatial-temporal background of Japan's colonial statecraft helps avoid the conventional dualism to evaluate Japan's legacies, as shown in the fierce debates among Japanese and Korean scholars about whether Japan contributes to the post-war economic miracles in its colonies. It also sheds light on the methodology of the comparative study of East Asia and other regions with a holistic comprehension of their respective dynamic. The focus on food will as well steer reconsideration toward the future challenges facing East Asia that may not be resolved anymore solely by developmentalist ideology and statecraft.

Rostock – only 100 km away from Luebeck and confronted with the same disaster scenarios – surprisingly, such a mode of interpretation does not play any role in the perception of climate change. The East German city perceives climate change much more as an opportunity. Long periods of warmth might help to make the region more attractive to tourists which will have a positive effect on the job market and will make the city resilient compared to its precarious economic situation. Against this background, it will here argued that the concepts of "vulnerability" and "resilience" which have been strongly influenced by ecology and natural hazards research need to be widened. A theoretical concept will be suggested that is enriched by cultural dimensions and particularly by the aspect of the social construction of reality implying that actors may develop different perceptions of potential threats as well as of precautionary measures – even though from the perspective of scientific scenarios the endangerment seems clear and proven. This does not mean, however, that materiality should be neglected which is why considerations from actor-network theory will be taken into account.

Social and Labor Market Integration Processes of Young People during a Continuous Economic and Financial Crisis

The proposed presentation research intends to focus on Greek Youth social and labour integration process, based on analysis of two important factors, namely, social and cultural capital on one hand, youth agency on the other. Strong social bonds constitute an important integrative factor for youth, in conjunction with prevailing traditional social and cultural values. Public education (secondary and higher), as well as employment in the public sector, constitute, in this context, a private mobility strategy, which is mainly formed by medical classes, family members and sustained by the Greek public education system. However, given the current global economic crisis, and more particularly the Greek one, there is enormous liability to state finances, provoked by the accumulation of a staggering public debt and an increasing budget deficit. This has caused not only an imbalance but also a radical transformation of the current social setting. Rising unemployment, drastic decline in state employment, as well as social and employment risks push for an emergency rearrangement of both individual and family strategies. Youth's social capital is undergoing a deep transformation, characterized by an expansion of social networks on one hand, and a proliferation of loose social ties on the other, resulting in a boost for professional and geographical mobility. On the other hand, we observe groups of young people that tend to adopt social disobedience practices, as well as an active oppositional stance against the established social and political order, in the framework of their reaction to social risk and economic crisis. This may result in promoting a new form of social mobility, improved communication capabilities and, at the same time, has offered new opportunities for spontaneous mobilization of anti-government protesters.

Social Justice on Sale in the Globalized Education Supermarket

This paper is aimed at enquiring into the very demanding idea of social justice against the impacts of marketization and globalization on education. In order to do so the consequences of injustices resulting from the effects of global capitalism and the influences of education markets will be briefly firstly. Then the mission and myth of social justice relating to education reform will be detailed. Since the achievement of justice in a certain society often entails an injustice done to other societies especially in the era of globalization, the barriers and borders of social justice should not be neglected. As regards globalization, the competition and cooperation of both domestic and international senses represented in higher education have shown relationship with the market principle. Educational systems, especially universities, facing the era of global economy characterized as “knowledge-based” have been required to “produce a workforce more adequately prepared to meet the challenges of globalization” (Rizvi and Engel, 2009). Under these circumstances, education policies for social justice will be challenged against their societal borders, not to say their practical barriers from within.

In this paper the idea of “global democracy” proposed by some authors such as D. Archibugi (1998), I. M. Young (2000, 2007), N. Fraser (2009), D. Held (2008, 2010) shall be borrowed and reconceptualized to help go beyond social justice. In doing so, some cases of education reform or education policies pertaining to social justice together with a few international conferences focused on the issue of education and social justice are to be analyzed to reveal the central problem of taking social justice as granted.

Keywords: social justice, global democracy, education markets, globalization.

‘Racist Friend: Consequences of Privatization Creep in Australia’

In this paper, the privatization of Australian Federal, State and Local utilities is juxtaposed to the classics of aboriginal literature (Pritchard’s Coonardoo, Gere’s Fringe Dwellers, and Mudrooroo’s Wild Cat Falling), and an evolving sociological canon (Goldmann’s Sociology of the Novel, Green’s Literary Methods and Sociological Theory, and Bourdieu’s Rules of Art). For instance, Local participation in political decision-making has dried up like the well in Coonardoo, since the Council amalgamations of Australia’s three tiered government paradigm. An abolition of Federal run Job Networks generates the dual labour market of Fringe Dwellers. And lastly, the State suburban Rail grid sell-off imposes a Northern Ireland style paramilitary regime upon an anonymous commuter population, like the protagonist of Wild Cat Falling. In contrast to official views of friendly Reconciliation during the age of indigenous Land Rights, Mabo, and a Stolen Generation apology, in an opposition that includes the UN some see the Northern Territory Intervention as the low point of a newly established Apartheid system in Australia. I argue that the plight of aboriginal peoples is becoming a model for wider repression of Australian citizens in general, exemplified in these three case studies of privatized essential public services. While a sociology of literature can point to the fetishistic (Goldmann), semiotic (Green), and capital (Bourdieu) factors in a theoretical discussion, in practice this new White Australia Policy, just as covert and unjustly inserted as the low point of a newly established Apartheid system in Australia. The third volume explores, in the author’s own words, “homecomings—the ways people recover and renew their roots.” In essence, it represents an attempt to bridge roots and routes, or the local in the global, in ongoing negotiations of traditional futures. The proposed paper will be an adaptation of a larger review essay on Clifford’s trilogy, to appear in the journal boundary 2.

The Affective Politics of the Precariat

What are the consequences of the new field of precarity on the political possibilities of collective transformation? In his influential 2011 book on the Precariat, Guy Standing argues that the lived experiences of chronic and pervasive insecurity for precarious-employed workers has undermined the collective politics of resistance and solidarity. Not only does the process of precaritisation deprive workers of the affective ties and associative bonds associated with clear occupational and labour union membership, but the low wages, insecurity, and the perceived nature of precarious jobs intensifies the felt and embodied experience of “being rootless,” denied the relations of trust, accountability, empathy and solidarity that characterized the previous era of industrial jobs that defines the class condition for the precariat. In this presentation, I will reflect on the relationship between precarity and solidarity by examining concrete efforts by precariously-employed workers to challenge the process of precaritisation. In doing so, I pose alternative conceptual frameworks for identifying the political possibilities of solidarity and collective transformation in the age of global precarity.

Lenin and Wine: The Birth of “Civil” Movement Sector As a Institution

This paper investigates the birth of the field of “civil movements” in South Korea, focusing on the rise of the Citizens’ Coalition for Economic Justice that established its own niche in the movement field that used to be overwhelmed by revolutionary “Minjung” movements. Drawing on the perspective of the New Institutionalism, this paper examines the role of entrepreneur of the movement organization in creating the field of “civil movements” as a new institution. The success of the Citizens’ Coalition is due to its two-stage strategy in the movement development. In the inception stage, the Citizens’ Coalition chose a reserved strategy by presenting itself as non-political and oriented to the public good. Once the organization became stabilized, it launched hegemonic struggles against the Minjung movements shifting instant classification of democracy/anti-democracy to that of safe movements/dangerous movements, us/them, people/citizen, liberalism, social democracy/ radical leftist. This study has implication to the reestablishment of the relationship between the state and civil society in South Korea after the democratization in 1987.

Development of Social Research in Japan from 1945 to the 1970’s

This study examines the originality of social research in Japan from 1945 to the 1970s. During this period, Japanese sociologists initiated social research adopting the framework of American sociology. This research was conducted in order to understand the sociologist’s approach to research, which was necessary for the reconstruction of sociology subsequent to World War II. I will take a historical approach to this issue by considering the development of Japanese sociology.

Most studies deal with this era of social research mainly in the context of American sociology being adopted in Japan. However, this study refers to not only American sociology but also German theory of ideology because the development of social research in Japan was closely linked to Japan academia prior to 1945. This approach may also contribute to understanding the history of the sociology of culture in Japan.

This study first discusses the development of social research in relation to American sociology. It explains that the process of social research development partly depended on the course of quantitative research based on positivism. The study then analyzes the investigations of collective mentality, including the results of working-class studies and mass communication studies. This analysis reveals that some Japanese sociologists adopted the American sociological approach critically; furthermore, the results suggest that they introduced the German theory of ideology, from a historical perspective, to their work. As some Japanese sociologists applied both American sociology and the German theory of ideology to Japanese sociology, this study concludes that Japanese social research developed during this era had some originality.

Protest Repertoires As Expressive Cultures: Reconceptualizing the Struggles of Informally-Employed Workers in South Korea

Dramatic acts of resistance and solidarity are a mainstay in South Korea’s public landscape, especially among the many precarious- and informally-employed workers in the country. Whether opposing the labour repression of authoritarian industrialization between the 1960s and 1980s or the market-driven policies of neoliberal democratic regimes during the 1990s and 2000s, workers and their advocates have relied on an array of protest acts to challenge the legitimacy of ruling authorities — from workplace strikes and occupations to hunger strikes and worker suicides. While many labour and social movement scholars have examined the instrumental, organizational and structural factors that promote strategic forms of worker collective action, much less attention has been paid to the expressive, embodied and aesthetic dimensions of workers’ protests. This paper focuses on the characteristics of a new pattern of popular contention in Korean workers’ already radical repertoire of collective action: the prolonged embodiment of emotional, physical, and financial hardship. In particular, we seek to better understand why workers and their advocates choose to express their collective opposition through corporeal resistance and bodily sacrifice, and explore what such protest performances reveal about the expectations and aspirations of dissenting political subjects.

The Taste and Politics of Rice: Understanding the Construction Process of Quality Food in Taiwan

Concern about the meaning of rice in Taiwan has been increasing in the recent decade. Meanwhile rice has become a product that satisfies more than the subsistence demand. The question of what constitutes demand involves the food choice of people; that is to say, by which criterion people decide to consume what food? This paper analyses the processes of constructing the quality of rice in order to understand both, the coding mechanisms and the struggles around the shaping of taste.

Through the concept of “qualification” the interaction between consumer and product can be understood; therefore, we can examine the active and passive actions of consumers in the process of constructing quality, and the formation of taste. Accordingly, we adopt the cultural economy approach to examine the transformation of the consumption of rice in Taiwan, especially the experiences and the recognition of rice in the sphere of exchange, in which the stable appreciation system has been shaped.

This paper suggests that the quality of rice has changed in history. The state and scientists have dominated the “qualification” of rice for a long time. During the recent decade this influence was bypassed. The change, including the “qualification” state, has moved from the sphere of production to the sphere of marketing, including the more influential process of aestheticization and ethnicization.

We examine the accounts of selected linguistic properties of three families of the North American Indian languages, i.e., Algonquian, Iroquoian and Eskimo, as a result of which the evolving interpretations reflect the evolution of the main frames of reference to these accounts in academic research contexts throughout the last four centuries, and consequently they will be accounted for in terms of the historically changing conceptual and theoretical frames of reference.

Changes in the Social Understanding of Quality of Life As a Result of the Economic Situation

This presentation aims at describing some selected trends of changes in the social understanding of quality of life. The trends were identified in a program for monitoring the quality of life in one of the Polish cities. The program “Indicators of the Quality of Life in Poznań” was initiated in 2001, as one of the projects aimed at streamlining the work of the Town Council, maintaining contact between the authorities and the residents of the city and building up the image of the city.

The program is based on the idea of measurement of the most important domains of life, such as life situation of residents, communal infrastructure, health condition of residents, social exclusion, standard of living, social security, public security and crime rates, natural environment, leisure, work and income, education and population processes. The essence of the project is the simultaneous investigation of the actual situation by means of objective statistical data as well as the level of satisfaction with particular aspects of life. The ten-year program allowed us to identify changes in the social understanding of quality of life. The most fundamental changes include:

1. changes in the significance of particular domains of quality of life for the general perception of quality of life
2. changes in the criteria of quality of life in particular domains of quality of life.

The presentation involves two major aims. It intends to show the changes in the perception of significance of particular domains of quality of life in opinions of respondents. It also aims at demonstrating the evolution of the significance criteria of particular domains, depending on the perception of changes in the economic situation, particularly with respect to the recent economic crisis.
Every form of society contains several types of stratification, of a political and economic, artistic and cultural, professional and religious nature. Therefore, religious phenomenology too is subject to these socio-experiential factors. Differentiation of functions, roles, aims and modes of action is also produced, directly and through example, inside the constellation of movements and the composite religious experiences that characterize the vast panorama of Christian and other religions. Were we to limit ourselves to the socio-territorial context of Italy alone we would soon discover that the Muslim like the Sikh, Buddhist and Hindu and the various other religions practiced here, all contain within their folds a variety of structures, rituals, customs, rules and beliefs and that Christianity, the country’s numerically prevalent religion with its Catholic, Protestant and Orthodox congregations, is certainly no exception to the rule and that it too also contains a truly broad spectrum of forms.

CIPRIANI, ROBERTO* (University of Roma 3, rcipriani@uniroma3.it)

Origins of Italian Sociology

How come Italian sociology, which contributed to the development of the very first studies of social sciences in Europe, lost ground and did fall behind other national European sociologies? Can a sufficient explanation be that the fascist movement was in power from 1922 to 1945? Or other reasons are at the origin of the impossible continuation of such a scientific approach? Are there subtle links between a quite promising starting phase of studies and the new steps which occurred by the middle of the twentieth century, after the slow down during the period between the two world wars, in the 1920s, 30s and 40s? Or shall we say that there was an interruption, a hiatus which separates the first moment, far off now, and a second moment, relatively more recent? Probably the past dynamics and those acting now are much more complex than might apparently seem without a deep investigation.

Natural Disasters Discourse As a Profit-Making Mechanism of the Turkish State: A Case Study in the Karapınar Regeneration Project in Eskişehir

Serious worldwide natural catastrophes lead scientists, governments, and civil society to intensify the research on prevention of disaster risks and provision of disaster relief. On the other hand, in the era of neoliberalism, natural catastrophes might provide political authorities to create a discourse on their forthcoming “fatal” risks in order to push profitable urban strategies which result in state expropriation of land of local populations, and apply on a huge scale urban projects. In the last years in Turkey there has been a broad and fashionable campaign to regenerate 40% of the Turkish cities against the destructive effects of natural disasters. Especially after the Van earthquakes, killing 544 people in 2011, the government and its supporters found the justification for urban regeneration activities which they present as the “salvation” of the country, whereas, the lack of government’s earthquake relief supplies and recent hunger strike of the earthquake victims, who were forced to leave their container houses, created large public debates.

Similarly, the Karapınar regeneration project in Eskişehir, which is applied by the public-private partnerships under the same campaign, is claimed to be the “remedy” for poor housing qualities of the quarter that is located under the “zone of risk”. Yet, my ethnographic research reveals the enormous economic profits of the partners which they gain through the construction of luxury villas, a five star hotel, commercial and shopping centers, while forcing locals to move in new 10-11 story buildings which will be given in return of monthly payments depending on the size and legality of their previous houses. However, the locals are already worried about the payments and the new living conditions in the multi-storey buildings next to rich newcomers while some have already decided to move elsewhere at the outskirts of the city.

Photographic Monitoring As an Interdisciplinary Tool to Confront Objectified and Perceived Levels of Use within Protected Natural Areas: Methodology and Deontology

This communication proposes a reflexive presentation of an interdisciplinary case study crossing sociology and oceanography. The recent creation of the National Park of the Calanques (April 2012) has raised debates regarding the increasing impact of leisure massification on biodiversity conservation. In this context, our research program has developed innovating tools to confront objectified levels of use and perceived levels of use on the one hand, and on the other has evaluated the pressure and the impact of anchored boats on a protected sea grass, Posidonia oceanica and gathered the social discourses of users regarding their awareness about biodiversity conservation and their acceptance about related policies. To do so, we were associated a qualitative (44 interviews) and a quantitative (133 questionnaires) field surveys and a one year photographic monitoring focusing on two hot spots in terms of overuse and conservation: The Sormiou bay and the Frioul island. The results reveal a gap between objectified and perceived levels of use, due to cognitive processes, socioeconomic and cultural factors (habitus effects and territorial identity). The photographic monitoring and the prioritering of the sociological samples reveal a significant scale effect on both objectified and perceived use. This communication focuses on the interests and limits of the photographic monitoring as in interdisciplinary tool. The methodological implementation of the monitoring as well as its deontological implications will be discussed.

The Refugee Body: Reconstructing the Body in the Context of Extreme Social Change

The sociology of the body has tended to look at the “glamorized body”, whether in sport, fashion or popular cultural activities such as body building. Losing from these studies is a concern with the suffering body in the context of drastic and unchosen social change and displacement, and how individuals who experience such traumatic changes re-imagine and re-create their body images. This paper looks at such a case: the refugee body. Two principle issues are raised. On the one hand the experience of the body in situations of deprivation, crowding, forced contact with strangers, mixing of religions, boredom, and often hunger and physical insecurity. On the other, strategies of reconstruction of the body image in these conditions and/or when undergoing resettlement, being “stuck” indefinitely in camps, or when photographic monitoring and the prioritering of the sociological samples reveal a significant scale effect on both objectified and perceived levels of use and perceived levels of use on the one hand, and on the other has evaluated the pressure and the impact of anchored boats on a protected sea grass, Posidonia oceanica and gathered the social discourses of users regarding their awareness about biodiversity conservation and their acceptance about related policies. To do so, we were associated a qualitative (44 interviews) and a quantitative (133 questionnaires) field surveys and a one year photographic monitoring focusing on two hot spots in terms of overuse and conservation: The Sormiou bay and the Frioul island. The results reveal a gap between objectified and perceived levels of use, due to cognitive processes, socioeconomic and cultural factors (habitus effects and territorial identity). The photographic monitoring and the prioritering of the sociological samples reveal a significant scale effect on both objectified and perceived use. This communication focuses on the interests and limits of the photographic monitoring as in interdisciplinary tool. The methodological implementation of the monitoring as well as its deontological implications will be discussed.

Medicalization to and Fro: Informational Trajectories Around Performance Consumptions

The stretching of the boundaries of medical intervention encompassed not only a growing catalogue of phenomena, but the functional span of that intervention. Expanding from treatment, backwards to prevention, and forward to enhancement, medicalization can be said to have logically paved the way for a commodified management of human performance, which pharmaceuticalization dynamics furthered still. However, ultimately that process also eroded the medical markers of normality that signaled those functional distinctions and, with it, the control of the agents that regulated the legitimate use of therapeutic resources for those purposes. In that sense, a medicalized genealogy of performance management through therapeutic resources does not entail a continued medicalized regulation of that phenomenon. Therefore, that arena constitutes a privileged site to observe to what extent and in what planes is medicalization still a driving and regulatory force in the expansion of a therapeutic plasticity in the management of our lives and bodies. With the professional, institutional and national borders of regulation of the production, distribution and access to therapeutic resources also eroding, this field could potentially represent a social reinvention of the use of therapeutic resources beyond medicalization. To assess whether that is the case, drawing on extensive and qualitative data from a study on youths’ therapeutic consumptions for performance purposes, in this paper, we focus on the informational trajectories through which individuals organize those consumption practices. These trajectories will enable us to ascertain: i) to what extent and in what planes are medical sources present in the social organization of performance consumptions, ii) what new roles they may take on there, given the displacement of their centrality in expanding infoscapes, iii) whether the rationales that govern informational flows and articulation of different sources of information to assess and access these resources may retain and prolong in new ways structural elements of their medicalized genealogy.

Then and Now: A New Look at Methods and Findings from the 1974 Xenia, Ohio (US) Tornadoes

As part of a project constructing a Community Resilience Index (CRI) intended to predict community resilience pre-event, we undertook a series of historical case studies. The goal of the case studies was to explore elements of community resilience from disaster events. We used field study data from the E.L. Quarantelli Resource Collection at the Disaster Research Center. This article focuses on the 1974 Xenia, Ohio, USA tornadoes. This case study was the most fully developed with 23 boxes of thin and faded paper. It was also challenging in making sense of the data, given the shifts in terminology and theoretical orientations between 1974 and the present. This was especially relevant for this case study due to the focus on mental health. Disaster mental health policies and guidelines changed significantly since the 1970s. Nevertheless, this data set presented several advantages. We discovered that, while the data available was delicate and fraught, there was more primary data available than some of the more recent studies. We hypothesize that this may be due to the influx of technological advances between 1975 and 2005. Since much material is now generated electronically, serendipitous field discoveries may be impeded, even as other data is widely available.

Coping with Uncertainty in the Field of Health in Arakan (Burma)

Based on fieldworks conducted in Arakan (Burma), in a Theravada Buddhist context, my paper describes the approaches used by Arakanese people to cope with uncertainty in the field of health. According to the local conception a person’s state of health stems from a complexity of factors such as the person’s karma, his mind, the relationship he has with the community and the spiritual world, the climate, the food and the planetary influence. Because of the unstable nature of these factors and the complex relationships uniting them, people never know for certain whether they are well protected against diseases or not and thus live in a permanent state of uncertainty. The effort to maintain the harmony at all levels and be protected by dangers is a matter of the daily ritual through prayers, offerings, good deeds, etc. Moreover, there are occasions where the risk of danger is higher and more concrete, whether because has been predicted by an astrologer or because the person or the community lives temporarily in a vulnerable state (during childhood and pregnancy or when the karmic and planetary situation is adverse). In these cases, people resort to short-time protections focused on the vulnerable factors: they wear amulets, avoid specific foods, etc. Despite these precautions it happens that they face diseases and thus try to restore a certain state of well-being by acting on all the factors they consider involved: they buy medicines, consult an astrologer to positively orient the planetary influence, ask their doctor to prescribe this or that, contact a feng shui expert, etc. Although these recourse intentions are intended to cope with uncertainty they also involve a part of uncertainty. The choice among different practices and healers and the relationship people have with them is always imprinted with a complex interplay between trust and mistrust, risk and hope.

Subjective Action As Utopia: Horizontality and Autonomy In Youth Politics In Latin America

Young people’s political action in contemporary Latin America can be characterized by two key qualities: horizontality and autonomy. Horizontality and autonomy are not altogether new in Latin American political action. These qualities are reflected in the region’s persisting aspirations to find alternatives to authoritarianism that has characterized both civil and military governments alike since independence until contemporary times. And these qualities have been fostered by social movements that emerged in the 1980s that sought to challenge longstanding social hierarchies sustaining authoritarian politics, including feminist, indigenous, environmental and urban neighborhood.

Yet, young people today give new meanings to horizontality and autonomy in their political action due to new conditions created by the dominance of the market and media, individualization, consumerism and globalization. Youth choose forms of political action that allow them to be directly involved in decision-mak-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
ing and to have freedom – personal and collective – from others’ control. And young people see their own subjective action, rather than government action, as the solution to their demands and problems. By constructing their own action as utopia, not as a goal to work towards but rather as an inspirational starting point from which to act practically in the present, young people challenge longstanding notions of an ideal future society that have historically sustained political action in the region.

Drawing upon our own empirical studies as well as a systematic review of secondary literature, our presentation/paper will explore how young people in Latin America understand horizontality and autonomy in their political action, where these understandings come from and what the consequences of these are.

The Economic Empowerment of Portuguese Women at the Crossroads: An Accomplishment Facing the Tourniquet of the Crisis

The gradual integration of Portuguese women in the labor market has enabled remarkable levels of economic autonomy, producing profound transformations in their economic and social roles. In the 1960s, Portuguese women still shared the backward position of Southern European women. The evolution observed since then has brought Portuguese women closer to the status of their Scandinavian counterparts, while Italy, Spain and Greece have evolved at various and disparate rhythms (Maruani, 2000, pp. 25, Travail et Emploi des Femmes, Paris, La Découverte).

The economic crisis is threatening the sustainability of that process. On the one hand, new generations of graduated women are facing more and more difficulties in entering the labor market, particularly in sectors more favourable to female employment, such as the public sector, including the education sector, which is also being severely affected by the sharp decrease in birth rates. On the other hand, the failure of many SMEs in traditional manufacturing and services sectors is generating high levels of unemployment and inactivity for many middle aged and low-skilled women.

Moreover, the government priority given to the elimination of state budget deficits in a short period of time is causing abrupt wage and benefit cuts and a general decline in public services with a very detrimental impact on the middle classes. The reduction of women’s purchasing power is, in turn, damaging numerous domestic jobs traditionally performed by less educated women (housework, catering, care for children and other dependents, etc.).

In this communication we intend to characterize and discuss the on-going multidimensional processes that are threatening Portuguese women’s achievements in terms of economic autonomy and empowerment.

Towards an Embodied Sociology of Youth and Identity

The body has become a key sociological theme of academic study. However, while the body has emerged as a central focus of much theoretical work, in youth studies the physicality and materiality of the body is more often than not taken for granted, or is an ‘absent presence’. This paper contends that questions of identity and subjectivity, fundamental to youth studies, are connected to understanding bodies as sites of experience through which young people embody and actively respond to their socio-cultural and historical context. As such, young people’s bodies are a contested site particularly regarding where the ‘naturalness’ of the body ends and the ‘sociality’ of the body begins. Nevertheless, the body often remains implicit, or as a site upon which societal inequalities play out, rather than directly addressed in the study of youth, it is that warrant much closer attention.

This paper is submitted for: ‘Theme VI - Other Methodological and Theoretical Advances’.

COHEN, DANIEL ALDANA* (New York University, aldancohen@nyu.edu)

How Global City Labor Markets Are Undermining Low-Carbon Policymaking

Climate thinkers from across the political spectrum have long argued that cities are uniquely suited to tackling climate change. But now, scholars are pausing to consider what Harriet Bulkeley calls a gap between rhetoric and reality in cities' low-carbon policy. I offer a new explanation for this gap by focusing on the way that polarizing labor markets in global cities subtly shape the urban politics of climate change so as to undermine potential alliances between middle and working-class constituencies, alliances necessary for any government to push through far-reaching reforms. Based on 18 months of fieldwork, including over 100 interviews, in New York and São Paulo, and on secondary data on labor markets, wage levels, and consumption, I argue that well-meaning environmentalists have often ignored working class demands for collective consumption—including housing, and transit—while foregrounding those of middle- and upper-middle-class city residents. This despite the fact that working class political projects frequently make similar demands for liveable, compact cities—albeit it in a different language. I argue that evolving labor markets associated with Saskia Sassen's global city thesis offer the best explanation for this divergence. And I close by suggesting that the rise of Occupy Wall Street and Occupy Sandy in New York, and the explosion of protests sparked by transit price hikes in São Paulo, demonstrate that it may be possible to build a rapprochement between working and middle class urban political projects on the basis of resisting the growing inequalities bolstered by global city strategies.

RC21-365.6
COHEN, DANIEL ALDANA* (New York University, aldancohen@nyu.edu)

The Hidden Protagonists of the Low-Carbon City: A Social Backcast Approach to Urban Climate Governance

How can we understand where contemporary urban politics are going in a warming world in order to find the best path forward? More specifically, why are cities struggling to slash carbon emissions despite widespread consensus that there are ample co-benefits to be had in doing so (Bulkeley 2011)? Increasing, social scientists interested in how thinking futures can influence the present are using the backcasting method first pioneered by Robinson (1982) and now discussed extensively in journals like Futures and Technological Forecasting and Social Change. To grapple with contemporary climate politics, I revise the policy-centric backcast and develop a social backcast approach. Since we know that the compact city is not low-carbon urbanists advocate requires radical changes to housing, transit, and land-use policy, I study not just urban climate policy entrepreneurs (the norm in urban climate studies), but also conflictual housing and transit movements that rarely (if ever) speak of climate change, but who advocate a similar transformation of the city (this group is much larger than the relatively small environmental justice community). Based on 18 months of fieldwork in New York and São Paulo, including over 100 semi-structured interviews with green policy entrepreneurs, housing movement activists, and state actors (both political appointees and career bureaucrats), I argue that prevailing accounts of urban climate governance have left out the most successful grassroots movement fighting, substantively, for a compact city; I explain why the policy-centric focus of urban climate policy entrepreneurs has blinded them to potential, poor people’s allies; I demonstrate that absent a rapprochement between middle-class environmental and lower-class social justice activists, eco-apolitie is the most likely outcome of contemporary green politics; and I point to emerging examples of collaboration in both cities that warrant much closer attention.

The Social Construction of Body in an Urbanization Context in Senegal

The Senegalese lifestyle mutation by an urbanization process associated with the combined effects of demographic, nutritional and epidemiologic transitions (Popkin, 1997), has consequences on body conceptions: evolution of body size standards, new perceptions of sickness-death, food and sexuality (Thomas, 1990)
and emergence of a more demanding bodily appearance (Cohen, 2012), which need to be clarified.

To do this, we employed a cross analysis of qualitative and quantitative data (40 semi-structured interviews and two Factorial Correspondence Analysis – FCA 1 and 2 – on 593 subjects) by a comparative study implemented in a representative sample of Israeli adults from Dakar and a village from the Kaolack region.

The qualitative study shows that sickness-death is less associated with per- cutaneous from supernatal entities, widely questioned by more prominent Islamic and modern values (Fassin, 1992). The food gradually loses its status as scarce resource and as a symbol of affection and care. Between generations, the reproductive sexuality is gradually replaced by Islamic and modern guilty quests of pleasure (Biaya, 2001). Then, the FCA 1 shows an association between the rep- resentation that human cannot control the sickness (1), the food has a sacred status (2), the sexuality is restricted to the reproduction in marriage (3), the desire to use one's body for the group (4) and the rural area (5) (p<0.001, n=111).

This has implications in the relationship to health, diet and aesthetics which fully reconfigure the relationship to the body (size) – the big person is no longer associated with well-being (sickness-death/health), wealth (food/diet) and fertility (sexuality/aesthetics), but with dysfunction, idleness and sexual un- desirability (Fischler, 2001).

COHEN, MARK* (New York University, mark.simon.cohen@gmail.com)

The Late Nineteenth Century As Critical Juncture: A Comparison of Russia and Japan

Around 1850, Russia and Japan were economically undeveloped countries with quasi-feudal political institutions. In subsequent decades, both states undertook programs for economic development and military buildup in order to compete with the capitalist powers of the west. This paper will compare the trajectories of these parallel state-led projects. While pre-existing domestic institutions and geo-economic relations had some influence, the outcome in each case was substantially determined by domestic political processes. In Russia, top-down reforms adjusted but fundamentally reproduced an essentially pre-capitalist structure of agrarian relations, generating political and economic pressures that would explode in the revolutions of 1905 and 1917. In Japan, the interaction of strategies of state officials, rural elites, and peasants generated a fundamental transformation in its agrarian economy—to an extent that political accounts of the Meiji state often do not do justice to. Comparing Japan's trajectory with that of Russia, instead of with an idealized conception of western European develop- ment, leads to the conclusion that state elites in Japan were able to secure a stable domestic base for their ambition to extend Japan's military power into northeast Asia not because agrarian social relations remained "semi-feudal" but instead because they became basically capitalist. The paper will thus discuss that the late nineteenth century was a critical juncture in which political actions and struggles had long-term consequences for the historical trajectories of not just Russia and Japan but also East Asia as a whole, because of the long shadows cast by both the Bolshevik Revolution and Japanese imperialism.

Immigration from Israel, 1980-2010: Has the "Brain Drain" Intensified?

The paper focuses on changes in the selectivity of immigrants from Israel to the US over time. Rising inequality (a proxy for returns to skills) in the US since the 1980s implies that the incentives for high skilled Israelis to immigrate to the US have increased. They thereby increase the brain drain from Israel. To test this brain drain hypothesis, we analyze both Israeli and US data. The Israeli data, Labor Force Surveys from 1980-2010 tell us the characteristics of the population from which the immigrants were drawn. The U.S. data, 5% PUMS Census data for 1980-2000 and 1% ACS data for 2006-2010, are informative of the size and charac- teristics of immigrants from Israel to the US during this period. We focus on "recent" immigrants, namely, those arriving to the U.S. in the 5-year period preceding the census year (namely 1976-80, 1986-90, 1996-2000, and 2006-2010).

The education and income of recent immigrants are indicative of the skills with which they have arrived in the U.S., before any meaningful economic assimilation has occurred. Comparing the gaps between the education and income of recent immi- grants in Israel and their counterparts who immigrated to the U.S., we find no major changes in the educational selectivity of Israeli immigrants over time. By contrast, cross sectional quintile regressions estimating the incomes of recent cohorts of Israeli immigrants in the US provide some support for the brain drain hypothesis, but only until 2000: they show that the income advantage of recent immigrants over demographically comparable US natives has increased over time among those at the top 25% of the distribution, but not among immigrants located at lower percentiles of the income distribution. This suggests that the unobserved, productivity-enhancing traits of the most skilled Israeli immigrants to the US have increased between 1980 and 2000.

COHN, SAMUEL* (Texas A&M University, s-cohn@tamu.edu)
Development, Globalization and The Gendered Division Of The Work World: How The Logic Of Employers Shaped The Demand For Female Labor From Victorian Britain To The Contemporary Global South

A persistent weakness in the Sociology of Development has been its under-at- tention to gender dynamics. However, there is a parallel weakness in the Sociol- ogy of Gender and Development of under-attention to the capitalist logic that motivates the decision to employ either men or women for particular jobs. The much-needed drive to restore women's agency to narratives of development has had the ironic effect of producing insufficient attention to capitalist agency and the discretionary choices involved in opening up economic opportunities to wom- en.

This paper presents a demand side theory of occupational sex-typing. Male employers are conflicted between the dual imperatives of seeking the cheapest possible labor, which generally implies hiring women, and maintaining patriarchi- cal preserves of male privilege, which implies reserving jobs for men. The struc- tural forces which shape this decision have changed profoundly over time due to the dual (and conflicting) dynamics of development and globalization.

The author begins with a case study of two large Victorian British white collar employers to lay out a theoretical model of how cost structure and buffering from labor competition economically facilitates or hinders the introduction of women- to traditionally male occupations. The findings from Victorian Britain are then contrasted with those from the twentieth century United States, and from the shifts in demand on female employment in the Global South. The differential distribution of global wage competition and protection from such competition, the rise of commodity chains, the rise of education and its complex effects on the availability of adolescent labor, differential pressures to conform with either tradi- tional gender systems or Western gender systems, and the increased importance of organized female employment have led to family enterprises that combine economic and patriarchal utilities – have led to a profound trans- formation of the occupational sex-typing process beyond what was observable in nineteenth century Britain.

COHN, SAMUEL* (Texas A&M University, s-cohn@tamu.edu)
Late Victorian and Early twentieth Century Economic Forward-Leaps and Collapses – How to Select a Small Population of Nations Escaped Their Destinies for Better or for Worse

Recent scholarship by Salvatore Babones and James Mahoney provides strong evidence that the relative ranking of nations in terms of economic development and modernity has changed relatively fixed over periods of time. Nations that were rich in 1600 tend to be still rich in 1800 and 2010. The same holds for nations that were poor. The advantages that pernated to rich nations in the era of the Reformations have reproduced themselves up through the present day de- spite changes in modes of production and dominant technologies. There are a handful of exceptions, but they are just that – exceptions.

That said – these exceptions are of fundamental analytical importance, be- cause they identify the key to what was essential to obtaining or maintaining core status in the various eras of capitalism. This paper identifies nations that had disproportionate high or denominator-low growth from 1870- 1950 – disproportionate given their level of development in 1870. Autocorrelation levels are high – and only a small set of nations show non-trivial differences in ranking from their 1870 position. Most of these tend to be nations that do NOT remove all of attention in traditional "grand macrosociological" histories of the evolution of the world system. England, France, Germany and Japan – traditional centerpieces of historical comparative sociological discussions make no appear- ance. Venezuela, Switzerland, Finland, Egypt and India all have stories to tell. What seem to be the common themes? The rise of petroleum was extremely important. Not all former colonial powers were able to make use of its resource base – but those who did saw dramatic forward leaps. Debt crises were devastating. Some nations never recovered from the international debt crisis of the 1870s. The addi- tional roles of arbitrage, war and colonial administration are considered.

Employment Success and Long-Term Aspirations of the First and Second Generation of Recent Refugee Arrivals: Evidence from Australia

This paper focuses on the employment and social inclusion of humanitarian arrivals in Australia (for brevity, ‘refugees’ in further text). Previous research shows that refugees, in the context of a sharply skilled-focused Australian immigration program, suffer from lower employment outcomes of all immigrant categories. They suffer from higher unemployment, as well as under-employment and under-utilisation of their formal qualifications. The employment woes are not always due to a lack of human capital (skills and language proficiency) but often to employment discrimination and channeling of refugees into undesirable ‘employment niches’ where labour shortages continually exist. The paper is based on an initial analysis of a survey of 500 refugees from South Sudan, Somalia, Congo, Iraq, and Burma, currently settling in Brisbane. The survey asked about current employment experiences and long-term occupational aspirations of recent (with a minimum of one year residence in Australia) refugee arrivals in Australia. In this context we also collect data on the ways in which parents communicate employment aspirations to their children. This collaborative project, funded by the Australian Research Council, started from the premise that appropriate employment is a key to successful settlement and social inclusion of immigrants, and that refugees, in most cases visibly different minorities in the Australian context, are especially vulnerable to social exclusion. As experiences of main Western immigration countries show, this is especially critical in the second immigrant generation. We therefore also explore the intergenerational communication in the refugee family and how it is affected by migration and acculturation in Australia and how this, in turn, may affect the educational and occupational chances of the second generation.

**Financialization in the Backyard: Shrinkage, Welfare State Restructuring and New Housing Investments**

The paper discusses the interplay of local planning policies, welfare restructuring and global financial markets in the “making” of social segregation. It builds on an empirical study in Halle-Neustadt, a shrinking New Town in East-Germany and uses a mix of survey data, interviews and document analysis as well as fieldwork.

In Halle-Neustadt, the paper argues, different developments come together: First, Neustadt has experienced dramatic population losses, which stimulated large scale demolition programmes as well as planning policies which aim to transform parts of the neighbourhood to a green space. Second, Neustadt has experienced two waves of privatisation in the last two decades, leading to a complete change of ownership structures. Thereby, municipal and cooperative owners have been largely replaced by national and international financial investors which hold their stock as an asset and aim on short-term gains, rather than long-term development. Third, welfare cuts have put more pressure on welfare-recipients to accommodate in cheapest housing available on the local market which led to a “business-model” profiting on low, but state-subsidised, rents in peripheral estates. The paper discusses how these developments work together to produce new concentrations of poverty households in a prototypical shrinking city. With this, we expand on the already fairly developed debate on the financialization of urban development and provide new insights on (a) financialization in shrinking, low-demand markets, and (b) the relation between planning, state-restructuring and financialization in a German context. We demonstrate that the political economy of housing follows different dynamics here which are owed to both the weak-market situation and the path-specific restructuring of the German planning and welfare system. We conclude that research should put the state more into the centre of explanations and take different paths of state restructuring as well as different socio-economic contexts more seriously.

**COLINI, LAURA** (ENEC Sorbonne Paris IV, laura.colini@gmail.com)

**Financing European Sustainable Urban Development: (un) Intended Policy Breakdowns?**

The paper critically discusses the financialization of sustainable urban development projects with Jessica instrument introduced by the European Investment Bank during the Cohesion Policy 2007-2013. We argue that the normativity of the concept of sustainability, as used in Jessica, is instrumental to entrepreneurial market behaviour, which has little to do with expected outcomes in terms of green policies in cities. Using quantitative and qualitative data from a recent Study (Ramsden, Colini, 2013), the paper focuses on two cases London Green Fund and Poznan urban regeneration in which Jessica has currently invested for the creation of holding funds.

The main criteria for Jessica financial investment, is that it must be applied in European cities in relation to integrated plans for urban regeneration in which public participation is strongly encouraged. The analysis of these two cases in this paper highlight three main potential policies breakdowns. First, the creation of highly complex financial mechanisms (which ostensibly have high transaction costs, lack of transparency, legitimacy and accountability) serve the purpose of excluding civil society, and undermining public debate around public moneys. Second, the accessibility to these financial investments imposes new forms of multi-level governance whose criteria of sustainability shape planning decisions at local level. Third, that new entanglement between state, civil society and the private sectors are created under the conceptualization of sustainability, but whose sole scope for relation is mostly driven by strategies for accessing public funding. Building on current debate around financialization of the urban, the paper concludes that the neoliberalization of sustainability principles must be studied as multi-level phenomenon: with this the ultimate scope of the paper is to unveil the intrinsic tensions and contradictions of sustainable urban development by stressing its financial mechanisms as main drivers of the reproduction of inequalities.

**It's Not Just (Her) Personality: Structural and Cultural Foundations of Impostorism**

The sense that one is an impostor—undeserving of one’s successes or accolades—is a pervasive problem among high-achieving individuals from traditionally lower-status groups (e.g., women, first-generation college students, and members of many historically disadvantaged racial and ethnic groups). Described as an offshoot of the ‘intellectual puzzle’ of why individuals from lower-status groups (e.g., women, first-generation college students, and members of traditionally ‘visible minority’ groups) are underrepresented in fields that require high aptitude. However, we find that the more vague a conception about what makes a good father is, the more these ‘impostors’ fear that their true incompetence will, at some point, be uncovered. Although this fear is almost always unfounded, it has tangible adverse effects including vulnerability to both psychological distress and job burnout and may lead to a relatively limited academic or professional career aspirations, influencing occupational sex segregation.

There is relatively little agreement on the origin of impostorism or why it is more pervasive in particular social groups. Because, to date, impostorism has been studied almost exclusively in psychology, research tends to treat it as a person-level construct and focus almost exclusively on antecedents related to family background (e.g., family dynamics, childhood environment) and fixed personality characteristics (e.g., neuroticism, perfectionism). However, the fact that there are high rates of impostorism among high-achieving, lower-status individuals suggests structural factors may play a role. This paper draws on work on social psychology (e.g., status characteristics, double standards) to posit a more sociological explanation to account for increased incidence among particular groups and to suggest a research program to test structural and culture accounts for impostorism.

**“They’re Doing Their Own Things”: Identity Processes in Fatherhood**

In this paper we explore the disconnect between “culture” and “conduct” of fatherhood. We are specifically interested in why changing ideas about fatherhood have had such a minimal influence on men’s actual parenting. Our explanation lies in theories of self and identity. We argue that key to this disconnect is the unique way that fathers’ performances are evaluated because the definition of fatherhood is in flux. There is no standard to live up to. The lack of a widely-accepted and realized standard of a “good father” influences behavior in two distinct ways. First, it gives men little specific role direction or guidance in how to be a good father. Second, it allows fathers flexibility in choosing their reference group. Furthermore, when something keeps fathers from living up to their idealized vision, there is forgiveness and accommodation because fatherhood is about ultimately about articulating commitment and intentionality, even if they are unable to carry out those intentions.

We draw on social psychological theories to demonstrate the different effects of conditional versus clear definitions of fatherhood for both men’s contributions to the household and their sense of self. Using data from in-depth interviews, collected as part of the Time, Love, and Cash in Couples with Children (TLC3) study, we find that the more vague a conception about what makes a good father is,
the more difficult it is—for either the fathers themselves or their partners—to evaluate a father’s performance. By contrasting fathers who have abstract or conditional definitions of fatherhood with fathers who have clear, specific definitions, we demonstrate the negative effects of vague definitions and the importance of identity standards for caretaking behavior, relationships, and positive self-conceptions.

**Abstract**

*Intercultural Opening*.

**Abstract**

Even when interviewees seek to deconstruct fixed identities in their practice of discourse, they seem to be strongly shaped by the interviewees’ perception of culture and the accompanying forms of identity work. Postcolonial and critical whiteness studies are merged with institutional work, a concept routed in organization theory, to theorize upon how de racializing identity work reproduces or disrupts racism as a societal institution.

The findings show that the interviewees’ perceptions and implementation of Intercultural Opening strongly correlate with their position towards racism in Germany: a critical stance towards racism goes along with a broad perception. The concrete implementation and the accompanying forms of (de)racializing identity work seem to be strongly shaped by the interviewees’ perception of culture and their self-positioning. Ethnic minority employees constantly have to negotiate role aspirations and their identity work. Some proudly claim for themselves the role of an ethnic minority representative, while others only strategically apply it. Dominant ethnics are mainly busy masking their white identity. In some cases the identity work of dominant ethnics and ethnic minorities coincides. The paper discusses the ambivalent effects of certain forms of identity work that emerge even when interviewees seek to deconstruct fixed identities in their practice of Intercultural Opening.

**To Choose or Not to Choose: Questions about the Role of Gatekeepers in the Australian Healthcare System**

Since the 1990s and the spread of neo-liberalism across many of the world’s healthcare systems, patient ‘choice’ has increasingly become a central topic of debate. One focus in the emerging literature concerns the capacity of patients to make choices about their own healthcare services. This paper examines whether the implementation and the spread of the influence of wealth, education, and geographical location on the production of greater levels of choice for some social groups of patients. Of less concern to date has been a focus on the role of ‘gatekeepers’ - health professionals, hospital administrators, policy researchers and policy-makers – whose actions directly or indirectly have an effect on patient ‘choices’ and thus shape patient trajectories as they make their way through the healthcare ‘maze’.

This paper reports on a study, funded by the Australian Research Council, of gatekeepers in the Australian setting: a highly regulated, semi-market context where patients ‘must’ engage with private or public services and practitioners. Drawing on qualitative, in-depth interviews with a selection of private and public sector gatekeepers located in both low and high socio-economic areas, and employing Pierre Bourdieu’s concept of the ‘field’, results point to the way the perspectives and actions of the gatekeepers are structured not only by their habits and forms of capital, but their location within a specific social arena and its social rules of engagement. The study therefore reveals the particular salience of institutional and market location on the views and actions of both public and private sector gatekeepers, avoiding the tendency, well-established within medical sociology, to focus on professional self-interest as the sole explanation for the behaviour of doctors and other health workers.

**Prgramme Articulation As a Communication Strategy Element on the Theatre Field in Spain**

Throughout their programme, cultural institutions express their outlines and their vision of culture, selecting what is considered essential and adequate for their audience. On this situation could be considered that the programme is part of the mission and definition of these institutions and should be reported as such.

Nowadays, on Spanish cities, some cultural institutions develop a certain specific role on the society; as social and cultural centres; as elements to identify socio-cultural attitudes; as well as educational centres and entertainment infrastructures. Therefore theatres are playing a special role on several cities in Spain, so that they are decisive in creating a theatre and culture experience and in influencing the culture consumption of the immediate society.

On a globalised world the proliferation of communication strategies of different kind of cultural institutions are basically essential on a contemporary crisis of the cultural sector. Spain and its theatre field is not an exception. Actually, throughout their programme, theatres express their outlines and their vision of culture, selecting what it is considered essential and adequate for their audience. The model proposed for the analysis is based on three different aspects: the first one is the cases selection criteria; the second one is the analysis of the programme and the third one is based on the analysis of the communication done in each case. A comparison between programming strategies – based on the analysis of the documents but also on some in depth interviews - before will provide insights on whether the programme is influencing the theatre field not only in terms of the look specific performances but also in the content priorities and, therefore, in the message. Hence this paper focuses on the actual controversy about public theatres and their audience, relating the programme structures with theatre communication strategies.

**Social Media As a Key Element for Cultural Global Events**

Events have become an important channel for the exchange of cultural symbols at global level, with sporting events such as the Olympic Games, cultural events such as the European Capital of Culture and business forums such as the Cannes Film Festival helping to generate and circulate symbolic value. In doing so, many of these events help to configure the fields and the consumption in which they operate, either at global, regional or national level.

Actually most events, as well as cultural events, are taking place on several places around the globe transforming the uniqueness of one events developed on a certain time on a certain place, to be global events.

Social media, is a clear element used by these kind of events, but are this media used in the same way? This research is focused on the analysis of social media use by one of the most global music festival in Spain, The Barcelona International Advanced Music and Multimedia Art Festival, Sónar. Some previous results underline the importance of these media to be connected not just with audiences then with collaborators, partners, artists and other stakeholders.

**COLOMBO, ENZO* (University of Milan, enzo.colombo@unimi.it)**

**Who Is a (good) Citizen? Who Is Italian? Rhetoric Of Inclusion, Exclusion and Belonging Among Young People In Italy**

The paper aims to explore the mapping of belonging and identification representations among both autochthonous children and those of immigrants in their later years of secondary education in Italy. It aims to analyse how specific articulations of ethnicity and nationhood contribute to define the social boundaries between ‘Us’ and ‘Them’.

The analysis is based on qualitative data (narrative interviews) gathered among 118 young men (18-22 years old) attending Italian higher secondary school in Milan (Italy). While 74 of them have Italian parents, the other 44 are children of immigrants.

Discussing the criteria for obtaining citizenship, emphasis is placed on the participative dimension rather than on the dimension of attributed belonging. Citizenship remains an important formal question but requires an active attitude in order to be deserved. The ‘honest life’ then becomes the main criterion for granting citizenship. Citizenship has to be deserved, showing ourselves as respectable, economically-independent, observant of the law citizens. Differently from Marshall and his classical analysis, it is possible to note a marked shift of emphasis from rights to duties, undermining the inclusive and universal meaning attributed to citizenship. In fact, despite the apparently universalistic character of duty rhetoric, specific intersections of ethnicity, race, class and gender are important to fix the quantity of duties necessary for being recognized as ‘good’ or ‘appropriate’ citizens. In this way, “Italianness” is represented as a ‘natural’ characteristic...
of the dominant group and ethnic and racial issues remain crucial when identifi-
cation is the main contend.

Institutional elements – first of all a citizenship law strictly based on jus sangui-
nis, that considers children of migrants born and grown up in Italy as foreigners
and migrants, refusing them full citizenship – contribute to transform ethnic or-
igin, kinship and political features into tools for differentiation and division be-
tween 'us and them'.

Liveliness Survival Strategies: The Commodification of Cultural Objects During Disasters

This study examines the commodification of culture as an adaptive strategy
among local street vendors. As migration from rural to urban zones occurs as a
result of disasters, competition in market areas increases. These forces produce
constraints on the market's ability to absorb new vendors, but also create new
opportunities. Vendors are forced to alter their offerings in order to compete.

One adaptation has been to commercialize aspects of traditional culture to pro-
duce items specifically for the tourist trade. In parts of Ethiopia, this has includ-
ed specializing in making traditional toothbrushes. While some are marketed to
recent émigrés, others are carved more elaborately and marketed to tourists in
the region. Some vendors have focused on creating new niches within traditional
tourist items. In Mozambique, wood carvers have adapted a traditional tourist
item, the three monkeys or "starving men" representing "hear no evil, see no evil,
speak no evil," to include a fourth: "do no evil." This represents the impact of HIV/
AIDS in local communities. These markets developed in areas heavily frequented
by missionaries and NGO activity. This study tracks the trend of expansion and
adaptation of marketed items and provides vendor impressions of adaptation to
disaster conditions.

Sexual Vulnerability Among Internally Displaced Woman in Northern Mozambique: Livelihood Options and Intervention Opportunities to Break the HIV/AIDS Chain

This talk examines the prevalence of sexual harassment and of predation upon
female street food vendors and other internally displaced women in Northern
Mozambique. As a result of economic marginalization, women engaged in the
informal sector of the economy are subject to additional risks and hazards then
some of those engaged in the wage labor system, including sexual predation and
HIV infection. This talk examines the social construction of working zones, the eco-
nomic forces, and cultural practices that put these women at greater risk. Issues
such as migration status, length of time in the area, and the need to engage in
resource scavenging contribute to women's vulnerability. Findings demonstrate
that internally displaced women's vulnerability is amenable to policy intervention
that could reduce risks associated with street food vending and reduce the need to
for women to engage in more risky livelihood options, such as prostitution or
engaging "patrocinadores" ("sugar daddies"). This talk provides suggestions for
policy makers.

Global-Local Internet Activism in Brazil: Campaigns, Online Petitions and Action Organization As a Borderline Movement

This paper examines the relation between the local, national and global sphere
relations within the communication process occurring within Avaaz, a global plat-
form for migrants' petition, with respect to Amazon deforestation and public policy
definition in Brazil, such as Forest code, among others trend environmental top-
ics. Avaaz (meaning "voice" in several European, Middle Eastern and Asian lan-
guages) is a website platform started in 2007 with the purpose to operate globally
from its office located in the US and it's 16 language platform content customi-
ization, it has acquired millions of members spread in 194 countries, even if it do
not have local formal representations in them. From its launch to nowadays
the online platform has been able to implement a series of actions from campaigns
and alerts to online petitions and organization of protests and events around the
world. In their words, it is "a global web movement to bring Internet-powered pol-
tics to decision-making everywhere". By examining this case, we intend to discuss
this new form of appropriation of the political and collective action and its impli-
cations for the communication and awareness of the Convention on Biological
Diversity and the mobilization of topics related to the environmental agenda are
confronted with the theoretical perspective of the globalization critiques developed
by the Latin American authors such as Escobar, Quijano, Mignolo, that propose a
kind of politics of place that could be regarded as a sociotechnics frontier move-
ment, in which local movements are linked to continental or global movements,
composing transnational networks movements (meshworks) for democracy.

CONLEY, HAZEL* (Queen Mary University of London, h.conley@qmul.ac.uk)
Valourising Equality: Politics and Equality Legislation in Crisis

Can the cost of implementing equality legislation in organisations be calculat-
ed? Does the cost of NOT implementing the legislation need to appear some-
where in such a hypothetical equation? Is there a limit to the amount of equality
that can be usefully achieved in organisations? Should organisations that seek to
go beyond 'marginally productive' equality be discouraged or even legally pre-
vented from doing so? To a sociologist these questions seem incongruous but
they stem from a neo-liberal view of equality reflected in recent political discourse
on equality legislation in Great Britain. The new discourse signals changing social
policy on equality legitimised by the hegemonic view that austerity is the only re-
sponse to economic crisis and promised by an underlying assumption that equality
is profligate. Business case arguments for equality, which are underpinned by
a concept of 'value-added', have dominated managerial discourse for some
time but up until now they have had virtually no impact on equality legislation.
Indeed, in policy terms, the 'monetisation' of equality stands in stark contrast to a
proactive, 'reflective' approach to equality legislation that was beginning to mate-
rialise in the years leading up to the economic crisis. Interestingly, powers to de-
vote some aspects of equality legislation in Great Britain to Scotland and Wales
have highlighted the rift in these approaches. The effects of austerity measures
on the intersections of gender, class, ethnicity and disability are becoming widely
documented but little has been reported on the ability of equality legislation de-
veloped prior to the crisis to protect women from its disproportionate impact.
In a period when it is argued that little separates the main political parties in the
UK, this paper examines two quite different social policy approaches to equality
legislation separated by only a brief time period but intersected by the economic
crisis and a general election.

CONNELL, RAEWYN* (University of Sydney, raewyn.connell@sydney.edu.au)
How Mainstream Sociology Can Now Change in a World Context

Starting from the Japanese Sociological Society's welcome initiative, this paper
will reflect on how mainstream sociology can now change in a world context. Sim-
ply, globalization of the dominant social-scientific models has produced distortedso-
cieties around the world, as those frameworks grow out of the unique social
experience of the global centres of power in Europe and North America. Different
social theories, research methods, and agendas for research are all generated
from the social experience of colonization, cultural domination and neoliberal glo-
balization, which in turn differ across the global South. For bodies like ISA, the
problem is how to bring different intellectual projects into dialogue with each oth-
er, ina context marked by global inequality and with US and European hegemony
currently being restored though new forms of hierarchy and competition in the
neoliberal university. Some recent examples of creative social-scientific work out
of the South will be mentioned, including indigenous methodology, postcolonial
gender theory, and research on neoliberalism.

CONNELL, RAEWYN* (University of Sydney, raewyn.connell@sydney.edu.au)
Rethinking Gender Theory in World Perspective

Abstract

Rich and sophisticated analyses of gender have been produced around the
postcolonial world. But the theory in this work gets little recognition in the cur-
rently predominant, economistic, and part of a world economy of knowledge
that treat like global issues adequately than it appreciates the colonization of gender, seeing the gender dy-
namic in imperialism and the significance of global processes for the meaning
of gender itself. The agendas, concepts, methods and epistemology of gender
theory can now be re-thought, as seen in formidible texts already written about
local violence, interpretation, social movements and other issues. An alternative
economic of knowledge is emerging that can re-shape the global terrain of theory
and its connections with practice.

Conceptualising Privacy, Securing Identity: An Information Solution

Data collection has long been a tool of nation state, ensuring accountability and informing public policy. and for the common citizen this has been crucial to the smooth running of day-to-day life. However, developments in international information politics driven by public safety, policing and national security interests have served to legitimise creeping advances in surveillance practice and the collection of personal data by those in power.

This paper confronts the problems associated with the collection and storage of personal information, the manipulation of stored identities and the socio-political impact of information and its control. Drawing empirical evidence from a selection of national cases including Ireland, it seeks to reconcile the tensions that arise, finding a new generation of understanding of the value of privacy, the nature of modern identity and the instruments we use to protect it.

The perspective draws on the liberal paradigm of privacy protection, aligning to the assumptions that privacy, and to some extent control of our private information, is important to our personal autonomy and identity (Westin, 1967).

Identity formation is closely linked to individuality, implying the existence of private space, in which one’s attitudes and actions can define one’s self (Clarke, 1994). Identity is also social and cultural and engrained in our membership and commitment to groups. As governments serve to individuate through imposed categorisation and classification, we lose hold over these freedoms. Identification processes deindividualise and the common man is increasingly vulnerable to social control and exclusion.

This paper investigates how the impact of ubiquitous surveillance practice on personal privacy and identity makes vulnerable objects of common citizens.

The paper presents recommendations for best practice for the protection of personal information, from socio-political and cultural perspective, followed by a set of case-specific recommendations for Ireland.

The European Citizens’ Initiative: Promoting Active Citizenship in Transnational Discursive Spheres?

European Union citizenship was introduced in the Maastricht Treaty as a form of activating citizenship. It has to be seen in light of the EU’s democratic and community deficits, considering its double purpose of activating its citizens to engage in EU politics and creating a sense of awareness of European political community. Twenty years later, EU politics is still characterized by a fundamental gap between citizens and the EU institutions. The introduction of the European Citizens’ Initiative (ECI) in the Lisbon Treaty raises relevant questions as regards both the democratic and the community deficit. From the outset, the ECI has been hailed as an innovation that translates individual and the common man is increasingly vulnerable to social control and exclusion.

This paper investigates how the impact of ubiquitous surveillance practice on personal privacy and identity makes vulnerable objects of common citizens.

The paper presents recommendations for best practice for the protection of personal information, from socio-political and cultural perspective, followed by a set of case-specific recommendations for Ireland.

Governing Agriculture Sustainability: Multi-Stakeholder Initiatives, Sustainable Intensification and Systematic Change

Efforts to increase sustainability are increasingly being promulgated using non-state forms of governance. In the United States, there are currently multiple initiatives developing sustainability standards and metrics for agriculture. These include: LEO-4000, Field to Market, the Stewardship Index for Specialty Crops, the Agricultural Stewardship Council and the National Initiative for Sustainable Agriculture. Each of these initiatives is a multi-stakeholder initiative in that it includes a variety of stakeholders and uses democratic procedures. Using the sustainable agriculture initiatives as case studies, this paper examines whether multi-stakeholder governance is producing ecological modernization of agriculture in the United States. To do this, the ways that each initiative is framing sustainable agriculture is reviewed. Second, using Paul Thompson tripartite sustainability framework, the implications of the different proposed sustainability standards and metrics for United States agriculture is assessed. In concluding, we argue that the current sustainability initiatives are advancing a program of sustainable intensification, and do not have the capacity to generate systematic change.

Poultry Grabs, Venture Capital, and Debt Bondage: Contracting Access to the Means of Production

The paper applies a sociology of agrifood conceptual framework combined with a commodity systems analysis methodology to investigate the case of poultry grabs to inform discussion on the globalization of economy and society based on neoliberal restructuring. The topic of land grabs is a central discussion in the literature on agrifood globalization. The vertically-integrated commodity system has been advanced as the model of agrifood globalization based on flexible accumulation in production and processing. The contract model of production most common in the poultry industry is a form of sharecropping that allows the integrating firm to control the production process without incurring the fixed costs of land and buildings, as well avoiding the responsibility and liability for labor and production externalities. The processes of vertical integration plus horizontal integration has resulted in a system of monopoly opportunism whereby the poultry corporations discipline the growers through debt bondage. Companies such as Tyson Foods, Inc. of the US, JBS of Brazil, and Charoen Pokphand of Thailand are diffusing this model into developing countries. Proceeding from a financialization of agrifood regimes framework, we investigate two cases of venture capital poultry grabs, one by Goldman Sachs in China and the other by TP Capital in Australia, to illuminate the particular characteristics of the venture capital poultry grabs.
 Médias Et Pouvoir : Les inégalités Contemporaines

La « médiatisation de la vie politique » est liée indissociablement à la transformation du cadre politique des sociétés modernes situant progressivement la question des médias au cœur des débats. La relation entre médias et vie politique constitue de nos jours, un facteur important de la compréhension des enjeux liés aux pouvoirs en vigueur, un domaine idéal pour l'analyse socio-anthropologique du « politique » contemporain.

Les grands orateurs ont partiellement disparu, remplacés par des techniciens de la parole. L'utilisation de la caméra électorale se présente en tant que la plus ancienne privilégiée de construction de la réalité politique et signifie surtout l'imposition des symboles, d’images et de discours. C’est à dire les constituants d’une mythologie politique contemporaine (où la logique de la communication semble l'emporter sur les logiques politiques) qui se reflète dans la forme caractéristique importante du politique contemporain et qui consiste à la « gestion » (forme) des exigences des pouvoirs économiques. Cette transformation se trouve au cœur de l’approche du sens du pouvoir dans la société « mondialisée ».

Le politique est ainsi « vidé » de son sens étymologique. Les inégalités contemporaines, ne s’expriment plus dans le jeu politique et les pratiques de la « gestion » sur la « logique politique ») ; cette « mutation » va de pair avec une autre caractéristique importante du politique contemporain et qui consiste à la « gestion » des enjeux des pouvoirs économiques. Cette transformation se trouve au cœur de l’approche du sens du pouvoir dans la société « mondialisée ».

Violence Domestique Et Crise : Récits Filmiques

Un des sujets préférés des séries télévisées les plus regardées (parce qu’elles reflètent des questionnements « courants » sur la vie quotidienne), a toujours été la description de la vie familiale et surtout de la violence conjugale dans toutes ses formes (ex. dans la série « Desperate Housewives »).

Les résultats des recherches confirment que, à partir du début de la crise économique, on assiste à une augmentation des demandes d’aide de personnes aux prises avec la violence conjugale. La « crise » est ainsi racontée aussi par les histoires de violence (vraies ou fictives).

Le faiteur « multiplicateur » (qui est selon les statistiques la crise économique) est-il déjà dans les films, et surtout dans des séries les plus appréciées par le public international ? Nous avons choisi de voir dans cette recherche, non pas les séries qui traitent spécialement ce sujet (comme par exemple la série « Fred et Marie » censée « sensibiliser » les publics sur la question) mais des séries qui traitent spécifiquement de ce sujet par les représentations contemporaines, dans le but de découvrir si ce facteur y est davantage présent et recensé ; plus particulièrement, on s’efforce à déjouer le « part de l’influence de la crise sur la violence conjugale récrite par la fiction télévisuelle » où elle intervient comme un facteur de prise en conscience de ce facteur par les représentations contemporaines. Dans ce sens nous procédons à des analyses de contenu des séries très regardées par tous les publics ; il s’agit souvent de séries à grande audience (abstraction faite des séries comiques) telles que : NCIS, Plus belle la vie etc.

Youth Micro-Groups Between Offline and Online: Fulfilment Of Neo-Tribal Metaphor?

The paper proposes a photographic field research (offline and online) about some youth micro-groups: traceurs, emopunks, a crew of street artists and danchall queens. In the contribution I make some considerations about the research technique, I give a brief description of each group, using the photographs and an online inquiry on web pages, myspace, etc. of the considered subjects. Some items allow to articulate a discourse on how the components of these groups reflect the characteristics of participatory cultures (Jenks): young people - thanks to the «forms of individual mass-production» and the «structures for intermediation and distribution of contents», both allowed by CMC (Castells) - realize practices of «media belonging», «media expressiveness», «problem solving» and «flow sharing». The theoretical contribution considers the link between these groups and the Maffesoli’s theory: can they be considered as realizations of the Neo-Tribal metaphor developed for «a contemporary paradox» or «the constant “go and come back” process» established between the increasing massification and the development of micro-groups, called “tribes”? Micro-groups are like «many punctuating marks of the show of contemporary megalopolis». These are part of a discourse that interprets the social bond as tribal, which is expressed in a special way as a «succeision of ambiances, feelings, emotions». The visual techniques show that: each micro-group has a privileged place of meeting, both online and offline, where the body has a particular role in terms of physical competition and aesthetics. The “furmit – gegeneinander” is important, instead of «having a goal to be achieved, an economic, political, and social project to be realized» (Maffesoli).

The Impact of the Global Economic Crisis on Homelessness in Spain. The Experience of Madrid

With more than three million inhabitants, Madrid is one of the largest European cities. Like in other major industrialized cities, Madrid has a significant number of homeless people. There are an estimated 2,000 homeless people in Madrid, among them roofless people without a shelter of any kind (homeless people in the strict sense of the ETHOS classification), and those people living in shelters specifically aimed at this population. This contribution analyzes the recent evolution of homelessness in the city of Madrid, paying particular attention to the impact of the global economic crisis since 2008. Data are drawn from the Survey Night of the Homeless in the City of Madrid between 2006 and 2012. In addition, the analysis presents the evolution of the profile of the homeless people from before the crisis until now. This paper discusses the emerging trends regarding homelessness on the streets of Madrid in recent years and whether there has been a real change in the magnitude and the modes of homelessness. Given the persistence of the economic crisis in Spain, it can be expected that homelessness will remain an urgent social issue to be dealt with by the city of Madrid.
of the identified research link between homophobia and suicide prevention. This also flowed on to youth work funding for youth support groups.

The NSPP coincided with gun control (although it did not directly inform the policy, which was a response to a specific mass shooting). Since tighter gun controls were introduced in the late 1990s, there has been a reduction in suicides (including youth suicides using firearms, and no increase in the use of other lethal means). The main lethal means of suicide for young people in Australia is hanging, followed by poisoning. There is still some way to go, especially in rural and remote communities, where social attitudes are more entrenched and particularly young Indigenous people are more marginalised. The programs need further development and maintenance to address these specific inequalities.

The Ambivalence Of Community: A Critical Analysis Of Rural Education's Oldest Trope

The concept of community has been central to the discourse of rural education for generations. At the same time, community has been, and continues to be, a deeply problematic concept. This paper will interrogate the idea of community and look at the way it has been used historically in rural education. In fact, rural and community conceptions confused rural images placed attachment is often held up as an example of the kind of solidarity that once existed before the advent of modernity and ubiquitous strangerhood described in the writings of many contemporary social theorists. Community is, in rural education discourse, a well-worn trope that connects pedagogical, curricular and political arguments. The educational leadership needs to problematize 'the idea of community' and develop it in ways that avoid playing into nostalgic and retrogressive notions of the rural. This argument is based on a conception of place that keeps in focus multiple and complex understandings of emerging postproductionist globalized rural spaces.

Compelling evidence over the last twenty years documents a retreat from the public especially in those societies that wholeheartedly adapted a neo-liberal agenda and promoted the economization of everyday life. In Ireland and other European countries such as Spain and Portugal, massive speculation in the housing sector brought about near financial ruin in 2008. The ensuing imposition of austerity has forced these countries to come to terms with the stark social costs of the profligacy of the past. This paper suggests that one unintended (and indirect) consequence of economic retraction and austerity has been the growth of interest in urban agriculture. As the property market deflated, incomes dwindled, jobs were lost and those in jobs had to work harder than before, a ‘grow it yourself’ movement began to take off in Dublin and other urban centres around Ireland. Similar initiatives are also underway in countries across Europe, and in particular, in Spain and Portugal. Drawing on a case study of the city of Dublin, Ireland set against the European context,[1] this paper argues that the re-emergence of urban allotment gardens in and around the city after a long period in abeyance represents a reassertion of the public realm, although this reassertion is not without its own contradictions. Allotments are perhaps best viewed as liminal spaces or middle landscapes that are mutually constituted through public and private practices which are held in tension with each other. [1] The author is grateful to David Fink on Urban Agriculture Europe made available through COST ACTION TD1106 of which the author is a member. More than twenty European countries are linked through the ACTION focusing on a range of issues from governance to public policies to spatial relations in the landscape.

The French sociologist Maurice Halbwachs was in the 1920s the founder of the Sociology of Memory and was responsible to introduce a subject that has not been considered yet. Their formulations, roughly try to demonstrate how the memory does not refer to static set of past events, but rather to systematic re-formulations shaped from the present condition. Assuming such formulations and inspired by the reflections from the chapter La mémoire collective des groupes religieux contained in inaugural book Les Cadres Sociaux de la Mémoire , this paper aims to develop an explanatory theory about the required relationship that religions (which are intended to be universal) have with their own religious memory in order to prevail their own interests and judgments over other collective memories related to others social groups - understanding social group as the halbwachian concept that represents an intermediate category between the individual and society. The central idea is that although the religious memory wishes to be timelessly valid -due to its construction of moral truth about human life- it is constructed from the pressures from the social and political interests of the present. Namely, the religious memory, in order to satisfy their political interests to maintain its position within a society, would be concerned with demands arising from others social and political groups. By assimilating, occasionally, these external interests and values, religion reconstructs its own past, incorporating them to their own religious system of values. Nevertheless, religion assumes that this new set of values is linked to the religious historical origin, thus omitting part of its historical past. To exemplify the idea that religious memory is a product of constant real re-formulations that are presented as non historical, we use some historical cases concerning to the Catholic Church.

The Sustainable Tourism Discourse - a Critical Discourse Analysis

Despite the fact that the sometimes emotive debate on sustainable tourism in tourism studies continues (McDonald, 2009) sustainable tourism will almost certainly become the mainstream within a decade (UNESCO, 2013): two powerful organizations in the world of travel and tourism that already intensely promote sustainability in tourism development are UNWTO and WITC. UNWTO defines itself as the leading organization in the field of tourism and is the agency of the UN which is responsible for the promotion of responsible, sustainable and universally accessible tourism. WITC is the forum for the hundred true business leaders in the travel and tourism industry. Both organizations contribute to the maximization of the socio-economic contribution of growth and prosperity through sustainable tourism development, while minimizing its possible negative impacts on people, planet and profit.

McCool and Moisey (2011) raise many questions concerning the current definition of sustainable tourism in theory and in practice. Moreover, Mowforth and Munt (2009) state, among others, that sustainable tourism is not more than just a new concept of Western-defined pleasure, which does not truly change former
The Role of National Member States and the EU in Fighting Violence Against Women in 10 European Countries

Domestic violence is an important source of premature mortality for women worldwide, with an estimated one in three female homicides committed by an intimate partner. Among women in high-income countries it can be even higher, with up to 1 in 2 female homicides being perpetrated by an intimate partner. The aim of this paper is to discuss the role of the National Members States and the EU in advocating, promoting and monitoring policies against gender violence; the paper will also present existing quantitative data on violence against women in ten high-income European countries (Finland, France, Germany, Italy, Netherlands, Portugal, Slovenia, Spain, Sweden and UK).

In the first part, we will analyze similarities and diversities in policies to combat violence against women, and the extent to which the different Member States, as well as the European Commission and Parliament have been players in policy-making, items such as the National Welfare pattern, government funding, non-governmental actions and community responses will be considered. Is there a European Welfare pattern in this context? Or, rather, are policies against gender violence strongly influenced by national societies and local activist movements?

The second part of the paper will compare domestic violence rates between Northern and Southern European countries. Based on an updated review of existing literature and a survey of official statistics homepages, the paper will examine in-depth the latest available national or provincial prevalence figures in these ten countries. Where data allows, it will be examined which sub-populations, e.g. younger or older women, or regions have a higher risk of femicide.

Retelling Ones Life Story - Using Narratives to Improve Quality of Life

During the last years research in the field of narrative based medicine showed the efficiency of using illness narratives to stimulate coping processes. Following this we examined the utilization of the narrative approach in aphasia, a neurological language disorder. We developed an interdisciplinary approach of biographical-narrative work to improve Quality of Life (QoL). Many persons with aphasia experience reduced social participation and a loss of QoL. Although life story work can support processes of sense-making, only a few studies use a biographical-narrative approach in aphasic patients because of the impaired language abilities (Shaddern, 2005). In our approach we target identity renegotiation and social participation through an adapted biographical-narrative intervention.

The study was set in a pre- and post-test-design with a follow-up assessment three months after the intervention. Five face-to-face biographical-narrative interventions and seven group sessions were conducted over ten weeks with a sample of 17 participants with chronic but different types of aphasia.

In accordance with our hypotheses, we found a significant and stable improvement in health-related QoL. Also self-reported states of mood as e.g. “happiness” grew significantly. The results show the efficiency of working with narratives as a supplementary method for improving QoL. The transferability of this intervention to other patients is an open question for discussion and further research.

The current work is supported by a grant of the German Federal Ministry of Education and Research (BMBF, FKZ 17510X11)

Cooperation and Reputation in Dynamic Networks: An Experiment

We study the effects of 1) network embeddedness and 2) partner choice on the emergence of cooperation. Previous research suggests that, separately, both mechanisms can influence cooperation. Network embeddedness can promote cooperation through reputation effects, while partner choice allows ostracizing non-cooperative partners. In many social situations, however, both mechanisms are present. Such situations can be characterized as dynamic social networks. It is an open question how the combination of these mechanisms affects cooperation; both mutual reinforcement and mutual impediment can be argued. We address this puzzle by running laboratory experiments in which opportunities for partner choice and network embeddedness are systematically varied, such that the effect of partner choice and reputation can be compared, both in isolation and
combined. Results indicate that the evidence for reputation effects is limited, but that partner choice has a negative impact on cooperation.

Brazilian National Councils of Health and of Social Assistance and the Restructuring of Political Inequalities

Fora with societal participation – such as participatory budgeting and public policy councils and assemblies – have been set up in Brazil throughout the last 20 years in nearly all governmental areas. Among these, stand out the public policy councils for being significantly spread across the country. They are present in municipalities and federation states; there are also 32 councils and two national commissions operating at the federal level of management. These fora are supposed to promote the democratization of the State and democratic governance at the different levels of government. The paper presents the results of a research aiming to verify to what extent this assumption can be confirmed, regarding the National Councils of Health and of Social Assistance. It presents an analysis of the workings of these councils, in 2010, using mostly data from the detailed minutes of their plenary meetings. It also examines councils’ legal and administrative documentation and interviews with councilors. The study concludes that institutional history and specific patterns of political inequalities, in each policy area, limit the scope of democratization they foster. Public policy councils change some aspects of the sectoral structure of political inequalities, but in doing so they help to shape new ones.

Co-Constructing Legal Formulations in Family Mediation

We focus on the mediator’s profession in family justice in Brazil, with a specific attention to the practice of formulation. It was originally described by Garfinkel & Sacks (1970:171) as the practice of “saying-in-so-many-words what we are doing (…)”. In the ethnomethodological tradition it is a method used by participants in interaction to create intelligibility and solve problems of indexicality in the here and now of encounters.

In professional discourse, however, we can associate it with regular performances of participants, i.e., with their roles in an institution. We have selected moments when legal issues pop up in interaction via formulations. Based on a corpus of real interactional data of three mediation cases, amounting to a total of 6 pre-mediation interviews and 12 mediation sessions (approximately 14 hours of talk), we undertook a qualitative interpretative study, within the theoretical framework of Interaction Analysis. During the first phase of data analysis we counted on a collaborative work of the mediator in joint data analysis.

The study reveals that legal formulations occur when the mediator explains her own position to participants, trying to make them adhere to the ongoing work when she furnishes legal official explanations regarding rights and duties of parents, in a consultative mode, among other uses. Particularly, one type of sequence called out our attention. A wrong initial legal understanding which emerged in a utterance of one of the parties is changed by the mediator via questions and answers, which co-construct with parties a new legal point of view, making them collaboratively change his/her mind. Legal formulations are therefore associated with the more global issue of access to knowledge and (in)equalities, as the main conference theme indicate.

Cultural Industry and New Forms of Capitalism

It seems that relative agreement there is among scholars of social sciences that we are in a new period of capitalism, characterized by the rapid expansion of what Adorno and Horkheimer called as "cultural industry". Today this definition has been expanded comprising not only the phenomena linked to the mass media, from the original definition, but also find it more and more interrelated with the production of all kinds of goods and services whose "subjective meaning", to the consumer, is high in comparison with their utilitarian purpose *, as defined by A.J. Scott.

Characterization of the cultural industry is having a central impact on the definition of the new stage of capitalism that some have called cognitive and other "cultural industry". Today this definition has been expanded comprising not only the phenomena linked to the mass media, from the original definition, but also find it more and more interrelated with the production of all kinds of goods and services whose "subjective meaning", to the consumer, is high in comparison with their utilitarian purpose *, as defined by A.J. Socio-Demographic Portrayal of Same-Sex Couples: New Evidence from the 2011 Census of Canada and Spain

The global movement towards the recognition of same-sex couples as family units has spread out across countries with very different legal traditions and cultures (Festy and Digoix 2004), but for the moment it is circumscribed to Europe, the Americas, and Australia. Even legal recognition of same-sex marriages or partnerships implies an increasing statistical visibility, the difficulties in enumerating and portraying same-sex couples with available official data prevail (Festy 2007).

In this paper, we focus on Canada and Spain, two countries which have allowed the identification of same-sex couples in their census form since 2001. The strategy used is different: a specific item in Canada and an indirect path through the relationship between the members of the household in Spain. Moreover, Canada and Spain legalized same-sex marriage in 2005, which implies that the exposure time to marriage is the same in both countries. The joint analysis of the two countries allows comparing a) the effect of the two enumeration procedures and b) the likelihood of same-sex couples of getting married.

Using 2011 census microdata, we first analyze the socio-demographic profile of same-sex partners and spouses (age and education of the spouses; homosexuality status and distribution of the couples). Second, the article explores the differences between unmarried and married same-sex couples. Third, we focus on the household composition in order to obtain information on same-sex parenting patterns.

Preliminary results for Canada indicate that the proportion of married same-sex couples has increased importantly in this country in the last decade and currently reaches nearly one-third of all same-sex couples living together. They also show that the presence of children and educational homogamy have a strong positive effect on the probability of being married instead of cohabiting for same-sex couples.

Income Inequalities in Brazil: Changes in the First Decade of the Twenty-First Century

Income inequalities in Brazil: changes in the first decade of the Twenty-First Century

Unequal income distribution in Brazil, a country that is still one of the most unequal in the world, hasn’t been news for some time now, as a number of different authors have registered. The unequal distribution rates affect families’ living conditions, especially amongst the poor. That is why it is so important to continually evaluate the impact of income inequality on current Brazilian social conditions. The aim of this study is to analyze the general determining factors implied in the changes observed in domestic per capita income or just plain domestic income in the last decade. We have taken into analysis the period between 2001 and 2011, giving special emphasis to: 1) evolution and change in domestic per capita incomes in Brazil; 2) national and international structural characteristics; 3) domestic income inequalities as characterized by sex; 3) regional aspects of domestic per capita income inequality; 4) social stratification and domestic per capita income in Brazil; and 5) the impact of socio-economic factors on domestic income. The analysis was undertaken using the results of the National Domiciliary Research by Sample – IBGE’s micro-data (PNAD). Methodologically, the study aggregates two kinds of analysis. The first kind is a description of average domestic income variables; average per capita domestic income, sex, and occupation. The second is a linear regression used to test the effects of each independent variable (sex, age, race, educational experience, International Socio-economic Index of Occupational Status (ISEI), social protection, region and rural/urban, on the dependant factor, namely domestic income.

Youth As a Complex Issue: Notes on Brazilian Socio-Demographic Characteristics

Youth as a category is tied to a complex network of relationships as occurs in any given society. According to Sposito (2000), youth may not be categorized with any sort of precision, but this imprecision is exactly what makes defining youth relevant. The concept of youth is wrapped up in a complex representation thus it is understood in different ways and varies between different regions and/or countries. With this in mind, certain definitions will be taken into consideration so as to define the group that we consider as young in our study. Youth is a category that encompasses multiple social issues and brings may challenges for any society in terms of the kind of attention given to this socially defined segment. This concern links the study of youth with debates about major social and economic problems, since society still projects its future on youth, as part of a development ideal. In this paper we aim to analyze the general characteristics of the young population in Brazilian rural and urban areas, showing the differences among them by sex, education, working conditions, as well as the rates of violence and crime that draw a specific scenario for Brazil. The National Household Sample Surveys of 1989 and 2011 provide the principal data used in our study.

Naturalized Genocide. Study of Homicide in Brazil: Analysis of

The taxes of homicides in Brazil are raised between the most of the world about fifty thousand annual deaths. In some States a significant fall in the annual number occurred in the recent years (São Paulo; Rio de Janeiro, etc.) in others the number increased annually providing in the national total a stabilization in raised platform, annual superior to the wars as of the Syrian. The biggest number of the homicides occurred in the States that had increased the number of prisoners. This work examines the behavior of the historical series of the homicides and the imprisonments searching to identify the existence of some possible correlation. The partial results suggest two strong general correlations and other relevant informations. A direct correlation, of same direction, with the investments of the National Program of Public Security with Citizenship of the Ministry of Justice (PRONASCI) and another inverse one, of contrary direction, in absolute numbers, enters the taxes of homicides and taxes of imprisonment. It is observed that the jail population and of victims have similar characteristics and in the absence of adequate policies. The data had been gotten next to the Health Department and National Department of Prisons (DEPEN) of the National Secretariat of Public Security (SENASP).

Entrepreneurial Processes in Academia

Entrepreneurial Processes in Academy
Young Academics in a New Public Management Regime and Gender Implications
Ilse Costas, Stephanie Michalczyk Céline Camus
Management techniques are increasingly used in public sectors like administra-
tion and education. In higher education managerial thinking, rationalization and commodification have transformed working conditions and the incorporate behaviour of young academics.

The implementation of New Public Management (NPM) in universities has deteriorated the situation of young academics. Reforms which should enhance efficiency as well as competitiveness of universities increase precarious work since then. Not only scientific management skills are relevant to a career, but also “self-management” for a good performance according to new rules of scientific output regimes signify new challenges for young scientists. Quantitative performance indicators gain momentum and determine competitiveness. Market-relat-
ed processes and control instruments were imported to academia, intensifying competition for higher positions. This could be detrimental to efforts to obtain gender equality in higher education and research.

Flexibility and self-management are essential criteria of a career in academia. The requirements of high flexibility and strong competition could let women be come losers of this game - a tendency that foils efforts to increase female rates in academic careers. The typical “manager” is connotated with masculine properties and stereotypes, such as leadership, assertiveness, aggressiveness, competitive behavior elements as well as risk taking. Internalizing these gendered stereotypes, discouraging impacts on female academics’ self-perception and self-image are supposed to be the result – not to mention gendered ascriptions of deci-

REINECKE, JULIANE (Warwick University)

Embodied Protest in Occupy London: Between Homo Sacer and the Biopolitical Body

In this paper we discuss the relation of embodied protest and public space in Occupy London. We draw on Agamben’s notion of the homo sacer – the excluded individuals embodied by the figure of the homeless, refugee and so forth – to analyze how in protest camps embodied protest relates to resistance against sovereign power. Drawing on primary data gathered through participation obser-
vation of and interviews with participants in Occupy London, we investigate the extent to which the camp constitutes a biopolitical space of excluded inclusion as protesters sought to position themselves as homines sacri – “bare life” challenging sovereign power. Yet, we also show how protesters struggled to navigate ten-
sions between representing such “bare life” of the homo sacer and the biopolitical body. This lead not only to various difficulties in building protest community but also to the interactions with the general public and media. Particularly, tensions become manifest as the homines sacri of the homeless people joined the camp. We discuss the implications of Agamben’s biopolitical insights for the relation of resistance, public space and community building in protest movements.

First Nations Theatre in Postcolonial Context: Interpreting the Fusion of Premodern and Postmodern Cultural Forms in the Americas

The last four or five decades witnessed a remarkable renaissance of First Nations theatre across all the Americas. This hermeneutic artistic renaissance is grounded in a postcolonial context that challenges the modern definitions of national culture that had mostly ignored, eliminated and silenced the traditional and premodern forms of expressions of the pre-Columbian cultural traditions on the continent. Yet the renaissance of First Nations theatre shows not only that such traditions can be revived and transformed, but that the conditions under which they are performed blend easily with the most innovative experimentations of avant-garde theatre developed in the 20th century. The legacy of Antonin Artaud, Bertolt Brecht and Gertrude Stein can then be seen in the dramaturgical contributions of playwrights like Drew Hayden Taylor, Yves Sioui Durand and Monica Mojica, and theatre groups like Ondinnok or De-Ba-Jeh-Mu-Jig. The performative dimension of such a theatrical artistic renovation is also in touch with the political and legal transformations that accompany the wider cultural movement found in the contemporary postcolonial context of the Americas, and signals the presence of the transnational and transcultural processes at work in there. Using the conceptual tools of cultural pragmatics and hermeneutic theory, this presentation will focus on how the premodern and postmodern cultural forms converge and fuse in creating a hybridized theatre that reflects the transformation of the cultural hemispheric scene of the Americas.

COTE, JEAN-FRANCOIS* (University of Quebec in Montreal, cote.jean-francois@uqam.ca)
Phylogenetic and Ontogenetic Processes in Mead: A New Sociological Understanding of Self in Society

The legacy of G.H. Mead largely rests today on his conception of the self, on which most of the interpretations given to his social psychology have focussed; however, and strangely enough, his conception of society has remained in the meantime almost entirely ignored, or left unexplored in its fundamental determinations. In this paper, I want to argue that the concept of society has to be considered as the essential presupposition of Mead’s theoretical presentation of the self. By drawing attention to the concept of society at work in Mead’s evolutionary thought, I also insist in this presentation on the very core of Mead’s theoretical enterprise, it is also at stake in his reformist political vision of the (trans)formation of society by self-conscious individuals. Using schematic representations of these processes, I also insist in this presentation on both less known published and unpublished papers by Mead that establish the connexion between phylogenesis and ontogenesis in his thought.

Human Rights and Civilisations

In the last 30 years the Theory of Human Rights received many criticisms. The most important is the critique proposed from a civilizational point of view. This critique is advanced by many theorists from China, India and, generally, Asian countries. They said that a universalistic Theory of Human Rights is impossible without Asian Values, and demand or propose a Confucian or Neo- Confucian Theory of Human Rights.

The same critique is advanced from an Islamic point of view. The critique of a Western vision of Human Rights here is not only a theoretical question but a practical one. The Islamic world had emanated the “Islamic” and the “Arab” Declaration of Human Rights. The question now is: can we produce such theory? Which are his characters? A more and more inclusive and universal Theory of Human Rights can be two-fold: 1) this theory has to include all common values of cultures and civilisations but 2) it have to include also the diversity of cultures and civilisations. Unity and diversity: this is the main structure of a new and universal Theory of Human Rights. This Theory, for his universal characters is open to a cosmopolitan vision of citizenship.

Disparities in Homeless People’s Health Care in France

The French healthcare system is reputed to be one of the best in the world. In theory, it guarantees free access to medical care to everyone by offering specific medical security scheme for each social group. However, this nationalised system has increased disparities across social groups and classes. This paper will try to understand the reasons why normal patients and homeless people are treated differently. It will propose that the ontogenetic process of the formation of the self (in self-consciousness) relies on the phylogenetic process of the formation and transformation of society. These processes have then to be considered in their interrelation if we want to get a cogent sociological understanding of the self in society. As this interrelation between these two processes stands at the very core of Mead’s theoretical enterprise, it is also at stake in his reformist political vision of the (trans)formation of society by self-conscious individuals. Using schematic representations of these processes, I also insist in this presentation on both less known published and unpublished papers by Mead that establish the connexion between phylogenesis and ontogenesis in his thought.

Universalism, Cosmopolitanism and Human Rights

The global society of XXI century there are two main shifts. The first is a commitment to universalism, human rights and, finally, to cosmopolitanism; the second is a re-affirmation of local, ethnic, civilizational identity. It is evident in the abstracts regarding human rights. A critique against human rights theory say that human rights are a Western ideology and express the Western vision of humankind, and particularly the individualism of Western society and his vision of private property. In this sense are relevant the critiques proposed by the so called African Renaissance, by Chinese neo-Confucians or by Islamic world. It seems clear that in every culture and civilisation there are Human Rights. They demand f. e. that "Asian" or "Ubuntu" values are included in a new theory or conception of Human Rights. But these critiques implicitly admit that Human Rights are the general framework in which only these values can be legitimate. In other words, Human Rights are not only a product of a single civilisation.

The question now is: can we produce such theory? Which are his characters? A more and more inclusive and universal Theory of Human Rights can be two-fold: 1) this theory has to include all common values of cultures and civilisations but 2) it have to include also the diversity of cultures and civilisations. Unity and diversity: this is the main structure of a new and universal Theory of Human Rights. This Theory, for his universal characters is open to a cosmopolitan vision of citizenship.

Moving from Ideas to Action: Community Actors’ Local Implementation of Sustainable Urban Development in the Context of Montreal

The city is a place where many environmental issues are emerging. And these issues are at the head of disputes regarding access to green space or demands for protection in the areas of quality of life and the environment. These disputes are rooted especially in the many meanings that the term sustainable development takes in the eyes of the different actors, with their differing ideological positions, and in the numerous difficulties in the implementation of sustainable development that have been discussed in the literature. Our paper focuses on the local implementation of sustainable urban development from the perspective of the discourses on many levels: political, economic, social, cultural and ecological.
and practices of community actors in the context of Montréal. The paper is based on the findings of a qualitative study that used semi-structured interviews with various community actors in the Rosemont neighbourhood of Montréal. Our objective is to understand how community actors in this neighbourhood are fostering the implementation of sustainable urban development at the local level. Our hypothesis is that these actors use the concept in a way that allows for a re-framing of the issues towards the implementation of sustainable urban development with a broader social scope by incorporating notions of justice, equity, and democracy into it. In doing so, they are positioning themselves in opposition to a neoliberal vision of sustainability, where the environment and social inequalities are seen as externalities of development.

**The Use of Heritage in the Age of Austerity**

This paper uses evidence from research across the University of Leicester into the use of the ‘Heritage Paradigm’ to capture cultural value at local and regional levels. Traditionally, heritage has related to the management of historical assets regarded as central to the British national story. However, in light of the Localism Act 2011 and a restructuring of the executive governance of heritage assets, the UK now views heritage as central to a) place branding, and b) community empowerment. These developments present a way for regions to redefine their populations, economic relevance, and its legacies to the ends of ‘inspiring’ future economic prosperity. On a theoretical level, the pursuit of ‘heritage value’ has opened up democratic spaces to include a greater diversity than hitherto represented in official heritage discourse. On a practical level, the paper argues that the ‘networked governance’ approach, which includes heritage organisations, local communities, local authorities, universities, and private businesses, demonstrates an entrepreneurial approach to realise cultural value. Consequently, the heritage paradigm is less about securing the past, but about capturing cultural value as an over-arching economic rationale emergent from austerity economics. However, this approach is not without criticism, and the paper uses evidence to illustrate that conflicting relationships between public and private interests often limit its successful realisation. The paper will question the extent to which it realistically generates entrepreneurialism more broadly through examples that highlight the divergent rationales of public and private interests. To conclude, the paper argues, using evidence from Leicester City’s City of Culture that this entrepreneurial approach to realise cultural value offers a legitimate means to promote cultural diversity, cultural creativity, and civic pride; but without a choreographed approach to working with the private sector these schemes can offer little to longer-term economic development.

**Globalizing Forms of Elite Sociability: How Social and Service Clubs Foster Varied International Experiences**

Drawing from 50 interviews conducted in Paris and Milan, our research examines the expatriation practices, as well as the cultivation of transnational connections, cosmopolitanism and global class consciousness among members of elite social and service clubs: the Jockey, the Nouveau Cercle, The Travellers, the Automobile and the Interalliée in France; the Clubino, the Unionie and the Giardini in Italy; and the Rotary, as the main and most selective “service club”, in both countries.

Following two recent articles (2010, 2012) analyzing the multiple ways these institutions manage social capital as individual and collective resources for their members, this paper focuses more specifically on international ties. We compare how – according to their respective characteristics – various elite social clubs promote different kinds of bourgeois cosmopolitanism and connectivity, imagining as a whole from the more recent internationalism of upper-middle class service clubs such as the Rotary. Indeed, such institutional differences have a strong impact on the individual experiences of their members traveling or living abroad.

Each club’s peculiar ethos, practice and representations are related to the features of their networks through relations of mutual symbolic distinction; for example, some clubs emphasize the ‘utility’ of links while others prefer to stress their ‘genuineness.’ The varied forms of cosmopolitanism promoted by clubs partly replicate these logics of distinction, eliciting struggles over the authenticity or inauthenticity of transnational connections. Yet clubs also oppose each other according to the unequal emphasis they lay on international ties per se, potentially introducing a competing axiology within the symbolic economy of social capital accumulation.

These oppositions show that while the globalization of the upper class implies an increasing transnational mobility and the international deployment of social networks, these are not stratified homogeneously among the European economic elite, and participate in the drawing of symbolic boundaries between its fractions.

How do the inhabitants of the most privileged neighborhoods of big metropolises see the poor? How do they distance themselves (both physically and symbolically) from them? Can their representations of the urban poor be analyzed as part of traditional or neoliberal repertoires of action and justification? To answer these questions, our paper will be drawing on 240 in-depth interviews conducted in 2012 and 2013 with upper-class and upper-middle-class residents of the most socially selective areas (both in the inner-cities and in the suburbs) of Paris, São Paulo and New Delhi.

The history of the forms of domination, the structure of the elites, and the characteristics of welfare policies are indeed tightly linked to the ways the upper-classes produce, perceive and justify a city’s social-spatial order. Their representations of the poor – through frames, symbolic boundaries, logics of distinction and evaluation, narratives, etc. – are strongly influenced by the specificities of their country and of the metropolis they live in.

Therefore, on the basis of an international and inter-local comparative approach, we will present the differences between the cases studied. For each of them, we will also describe the particular articulation between five themes, whose possible mobilization as subjective reasons for self-segregation has been systematically tested in the interviews. These topics are: (1) insecurity and crime-exposure, (2) hygiene and the risks of contamination, (3) the attachment to a moral order that would need to be protected, (4) the naturalization (or racialization) of poverty, and (5) the various valuations of competition and merit vs. solidarity.

Our analysis shows how the rise of a neoliberal urban model, in Europe as well as in the Global South (in contexts characterized by the on-going displacement of the urban poor from the city centers), is also a matter of collective and individual meaning-making.

**Discrimination and Work**

How do individuals perceive and experience discrimination at work? Based on a qualitative survey consisting of 200 interviews and 4 sociological interventions, we distinguish four registers showing that discrimination constitutes a trial that varies according to the social context.

According to a person’s social trajectory and position, the experience of discrimination varies widely, thereby demonstrating the importance of access to equality. Indeed, whereas immigrants are objectively discriminated against, they do not feel this as discriminatory because they do not stake a claim to equality. In contrast, minorities experience the hurdles they face as being considerable sources of discrimination because they claim equal treatment. The same is true when comparing the working class and the middle class. The feeling of discrimination does not necessarily correspond to the nature of the trial one undergoes because the more people identify with society and participate in it, the greater and more unfair seems the discrimination.

According to the type of labor market, people feel more or less exposed to discrimination. In open markets such as the audio-visual sector, merit and talent are normally the only criterion. In recent years, this market has become much more accessible to visible minorities (actors, directors etc), despite their feeling a strong sense of discrimination. For each failure can be interpreted as the result of the market’s logic. According to their respective characteristics – various elite social clubs promote different kinds of bourgeois cosmopolitanism and connectivity, imagining as a whole from the more recent internationalism of upper-middle class service clubs such as the Rotary. Indeed, such institutional differences have a strong impact on the individual experiences of their members traveling or living abroad.

Each club’s peculiar ethos, practice and representations are related to the features of their networks through relations of mutual symbolic distinction; for example, some clubs emphasize the ‘utility’ of links while others prefer to stress their ‘genuineness.’ The varied forms of cosmopolitanism promoted by clubs partly replicate these logics of distinction, eliciting struggles over the authenticity or inauthenticity of transnational connections. Yet clubs also oppose each other according to the unequal emphasis they lay on international ties per se, potentially introducing a competing axiology within the symbolic economy of social capital accumulation.

These oppositions show that while the globalization of the upper class implies an increasing transnational mobility and the international deployment of social
COUTINHO-SILVA, RACHEL* (FEDERAL UNIVERSITY OF RIO DE JANEIRO, rachelcc@ccdf.ufrj.br)

Peace Building, Risk and Vulnerability in Favelas of Rio De Janeiro

The city of Rio de Janeiro will host two mega-events in the near future: part of the games of the Soccer World Cup in 2014 and the Olympic games of 2016. As a result, the State and local governments of Rio de janeiro devised new urban policies for the favelas aimed at bringing public safety to the city. The most important is the program called Police Pacification Units (UPP), which has been put in place since 2008 in several favelas under the control of the drug dealers. Other important programs such as Morar Caroica (Caroica Housing) and the PAC (Program of Development Acceleration) complement the UPP, focusing on housing, infrastructure improvements, and mobility within favelas.

This paper intends to analyze the impact of these programs on the building up of resilience and adaptive capacity in some of the communities where the pacification program was put in place. The paper focuses on the dimensions of risk, vulnerability, inclusion, safety and the construction of socio-environmental sustainability within the favelas and its surroundings. The study is based on empirical evidence from four favelas in Rio de Janeiro: Comunidade Dona Marta, Morro da Providência, Vila Pavão-Pavãozinho and Complexo do Alemão. It also uses data and information from government and non-government sources and when available, from the plans and designs put forward in these communities.

The proposed analysis as well as its implicit comparative nature will point out the advances and setbacks of these programs, and will indicate possible strategies for improvement. It hopes to contribute to better planning practices and ultimately to diminish social and environmental vulnerability of less privileged communities.

The Relationship Between Intellectual Groups and National States in Latin America during the Nineteenth Century

This paper analyzes how the aesthetic, cultural, political and social perspectives of intellectual movements shaped the social imaginary about modernization and national development in Latin America, especially in Brazil, during the nineteenth century, contributing on the setting of a political culture that had great influence on the consolidation of the Latin American states. The main objective of this research is to analyze the formation of homologies between intellectuals and political-economic elites during those centuries.

In Latin America, this process of alliance between intellectuals and political elites has developed through various stages, but, historically, the nineteenth century was a turning point. Since this period, Latin American states began to constitute themselves as modern orders par excellence, holding administrative control and, above all, symbolic control of the territory and the peoples living there. It's precisely at this crucial moment that the intellectuals movements, especially the avant-garde movements and the European avant-garde movements and rebuild it in favor of the consolidation of Latin American states.

The proposed analysis as well as its implicit comparative nature will point out the advances and setbacks of these programs, and will indicate possible strategies for improvement. It hopes to contribute to better planning practices and ultimately to diminish social and environmental vulnerability of less privileged communities.

Grandparents Who Care for Children While Parents Work: Characteristics and Time Use Patterns

Grandparents have historically underpinned the functioning of families raising children, particularly through emotional support and guidance. Recently, maternal workforce participation has propelled modern grandparents into a more active role, with many regularly caring for children while parents work. This trend has important implications for female workforce participation, and for childcare, workplace and ageing policies.

To date there has been little examination of regular care provision from grandparents’ perspective. This paper addresses that knowledge gap, using the most recent Australian Bureau of Statistics (ABS) Time Use Survey (TUS) 2006 (N=4,000). It investigates whether grandparents who provide regular care for grandchildren and while parents work differ demographically from other grandparents. It identifies which specific types of childcare activities regular grandparent carers undertake, and whether/how these compare with (a) non-regular caring grandparents; and (b) regular carers in other contexts (e.g. grandparents who care for grandchildren but do not provide regular care while parents work). It explores relationships between regular childcare provision and grandparents’ time in other activities (including leisure, personal care and paid work), subjective time pressure and satisfaction with the way time is spent. All analyses consider gender differences.

Gender is the strongest predictor of whether or not grandparents will provide regular care while parents are at work, but age, income, education status, being married (for men) and employment status are also salient. As for mothers, a high proportion of grandparents’ care is spent in physical, hands-on, care activities. Like fathers, more of grandfathers’ care time is spent in play or minding. Being a regular carer doubles grandfathers’ time (to about 5 hours a week) and triples grandmothers’ (to about 12 hours a week). However, grandfathers’ care composition changes most, to include a higher proportion of travel (to school or day care). Regular care provision impacts on both genders’ leisure, but only on grandparents’ housework, personal care and sleep. It doubles the likelihood grandparents will report being rushed or pressed for time.

BROWN, JUDITH (University of New South Wales)

Weekend Work and Leisure Time with Spouse, Children, and Friends: Who Misses Out?

We explore links between weekend work and leisure time shared with partners, children, other resident and non-resident friends, and using the most recent Australian Bureau of Statistics Time Use Survey 2006 (n=4,000 households). Drawing a sample of employed persons (n=3903) we test associations between weekend work and shared leisure time on the day of work and also, to see if shared leisure time is made up on other days, over the following weekdays. We stratify analyses by family type, specifically i) couples with no minor children, ii) couples with minor and iii) singles with no minor children. For all groups, weekend work is associated with significantly less shared leisure time on days worked. Results suggest some weekend workers recoup some forms of shared leisure time over the following week (e.g. more shared leisure time with partners or men in couple families) but most do not. Indeed for some categories of shared leisure, notably with partners and with children, there were further negative associations on weekdays. There were gender differences in amount of shared leisure, but interaction terms showed that all else equal, in families with children, weekend
work limits fathers and mothers leisure shared with spouse and with children to a similar extent. We conclude that it is families with young children who are most affected by weekend work, especially Sunday work, and most especially when weekend shifts are combined with long weekly work hours.

Indigenous Pathways in Social Research: Addressing Inequities Part 2

Indigenous peoples are colonizing research methodology so it serves their peoples’ needs and aspirations. These needs are rooted in trauma created by colonial agendas that remove tribes from their land, break family bonds, and disrupt identity. Aspirations are about justice, the return of lands, and living as indigenous peoples. This panel of Indigenous researchers brings this agenda to life, describing how they are decolonizing research methodologies within their countries. Polly Walker is a Cree woman and Assistant Professor of Peace and Conflict Studies. Her presentation, ‘Emplooclaced Research: Reducing Epistemistic Violence toward Indigenous Peoples and their Knowledge Systems’, explores research that engages in relationship with Indigenous people, the natural world, and the spirit of the place in which the research is carried out. Juanita Sherwood is an Aboriginal woman of Australia and Professor of Australian Indigenous Education. Her presentation, ‘Complex trauma a conduit for inequity’, examines pathways to prison for Aboriginal Australians that are often about mental health dis-ease as a result of unresolved grief, loss and untreated complex trauma. Hazel Phillips is a woman from New Zealand and an independent researcher. Her presentation, ‘Kāpo Māori counter narratives’, will critically reflect on the implications of outsider research for Māori who are blind and vision impaired, and for an insider, kāpo Māori by kāpo Māori, approach to research. Sonja Miller is a Māori woman from New Zealand and post-doctoral fellow at Victoria University of Wellington. Her presentation, ‘Ma tātou doing it for ourselves’, will describe how an Indigenous tertiary education initiative is improving access for Māori to maori marine science. Simon Passingham, an Indigenous researcher in Papua New Guinea, will present on building Indigenous researcher capability through apprenticeship-style training. Fiona Cram, an independent Māori researcher from New Zealand, will provide final commentary in her presentation entitled: ‘Decolonizing and Transforming Through Research’.

Enforcing French Law and Imprisonment or Implementing Aboriginal Justice in French Polynesia?

This paper explores present day violence on women in French Polynesia and the current institutional mechanisms and responses to prevent and sanction criminal offences. Based on alarming statistics of Polynesians overrepresented in the prison of Papeete as well as recurrence of criminal activities such a sexual abuse, my paper will focus on establishing the correlation between local cultural practices, enforcement of « imported » penal institutions and the gap of resolving intrafamily violence in small polishmen communities. I will discuss what are the current discourses of gender-based violence in French Polynesia and consider if the cultural etiquette in French Polynesia cultures can be filled/replaced through the introduction of aboriginal justice as it is experienced in New Zealand or Canada. While widespread aboriginal preference tends for “peacemaker justice”, can violence towards women be lowered thanks to following community healing based on traditional teachings? Can aboriginal justice help perpetrators to take and develop responsibility for their own lives?

CREESE, GILLIAN* (University of British Columbia, gillian.creese@ubc.ca)

“I Was The Only Black Child In My School: Hip-Hop and Gendered and Racialized Identities In Vancouver

This paper examines how second generation youth with parents from sub-Saharan Africa negotiate racialization processes and gendered identities in Metro Vancouver. The study is based on interviews with second generation African-Canadian men and women who grew up in metro Vancouver, and explores the gendered impact of growing up in neighbourhoods where they, and their siblings, were often the only African/Black children. Although Vancouver is a diverse multicultural metropolis, the African/Black population is both very small (about 1%) and hyper-visible. In this context, the second generation engages with representations of Blackness’ widely circulated through American popular culture, and especially through hip-hop, which forms a central element of North American youth culture. Hip-hop constitutes the dominant frame of reference for representations of Black masculinity and femininity among non-African peers, providing spaces of acceptance for African immigrant boys who can successfully perform hip-hop culture. In contrast, hip-hop culture provides few avenues of acceptance for African immigrant girls who must find other avenues of belonging.

CREMASCHI, MARCO* (University Roma Tre, marco.cremaschi@uniroma3.it)

Re-Working Cosmopolis in Post-Colonial Cities: The Cases of Kolkata and Buenos Aires

The paper questions how memories are re-signified through the making of space. However, we adopt a specular (yet not incompatible) approach to the usual concern with the construction of space through memories. The question concerns the process of space through the elaboration of collective memories; and how places came to be a relevant part of cosmopolitan memories (Barthel-Bouchier and Min Hui 2007). Nobody questions in fact the powerful contribution that symbolic place gives to the construction of collective memory since Halbwachs. However, the re-imagining of an urban space through global concerns, and the rise of a cosmopolitan, collective memory of place is another matter. Whether this is the case or not, is matter of a broad investigation. Citizens deal with their built environment, and national history in many different ways. There are times and opportunities when the elaboration process coalesces. The paper will offer an initial exploration of the factors determining the emergence of different urban cosmopolitan places. These factors are often chosen because they have some features in common in the context of social and political changes brought about by globalization. The aim is to discuss a few general warnings about the hybrid nature of postcolonial cities (Harris 2008), which are inspirational cases for reconsidering hybridity among the general qualities of the present era (Canclini 1989). Asian and South American cities often are considered precisely because they do not fit into the role model of capital accumulation in the process of modernization, and even so in neoliberal times.

CREMIN, COLIN* (University of Auckland, c.cremin@auckland.ac.nz)

The End of Employability: Occupying the Absent Centre of Labour in Precarious Times

The most succinct definition of the reversal constitutive of drive is the moment when, in our engagement in our purposeful activity (activity towards some goal), the way towards this goal, the gestures we make to achieve it, start to function as the goal in itself, as its own aim, as something that brings its own satisfaction.

It has been said that being exploited by capital is preferable to not being exploited at all. Utilising psychoanalytic concepts, the paper offers a theoretical account of the current dynamics of the labour market with regard to a subject increasingly ‘surplus’ to the needs of capital but compelled to ‘improve’ their employability. Describing employability as a master signifier, the paper argues that employability operates at the level of drive in that satisfaction lies in the aim (there is no object to attain) rather than the outcome (an actual job). Irrespective of whether we have a job, we cannot get rid of employability and we cannot get enough it; there is no end to employability because there is no job that can end dissatisfaction or be materially secure in duration and no movement currently able to force a more stable compact between capital and labour. The lack in the
specific employer symbolised by the job vacancy can be filled, it is the void of Capital that necessitates constant adaptation and renewal in which drive is located. The paper considers the consequences of this for the individual and the possibility of reframing the injunction for political purposes.

CRESPI, ISABELLA* (University of Macerata, isabella.crespi@unimec.it)

Gender Identities and Cultural Values in Multiethnic Families in Italy

Living in a multiethnic family is a challenge that implies that the couple, the families of origin and the broadest social context allow and facilitate the possibility of combining differences and negotiation as best as possible. These families are a micro example of what is the meaning of living in a multicultural society nowadays at the macro level. Differences and similarities are played everyday in the life-course of the couple and their families and requires the entire family group itself (including previous generations) redefines the overall arrangement of cultural equilibrium: it becomes necessary to rethink relational dynamics, but especially to reconsider the hierarchies of values, both individual and familial, due to the different cultural belonging of the partners. Negotiation, therefore, is also about compromise, recognition and respect of differences, openness to dialogue and communication. The family dynamics of mixed couples are based on a continuous negotiation of the partners' historical and cultural differences. Identity is perceived as a set of "experiences of recognition, which allows each individual to recognise themselves over time and which no individual can disregard. They also require the creation of a new gender culture, able to transform difference into a valuable asset, which helps promote open minds and acceptance of the other. The paper shows the results of a research project which investigates 35 multiethnic families (with life stories collected for each partner 70 in total) living in the centre of Italy. In particular, the paper focuses on some specific questions: what connections can be identified between negotiation and conflict of reciprocal identities in the family life of multiethnic couple? How do cultural and religious values affect family and personal identity? What is the relevance of cultural and familial belonging for the partners when they begin their life together? How and if this changes during life-course?

CRESSWELL, ADELE* (Nottingham University Business School, adele.cresswell@btinternet.com)

Structural Interests and the General Practitioner in the English National Health Service

In England the responsibility for commissioning most health services has transferred to groups of general medical practices known as Clinical Commissioning Groups (CCGs). Interagency partnerships, called Health and Well-being Boards (HWWBs), have also been introduced. The paper presents the findings of an empirical study based in an urban area serving more than 500,000 people. The study took place between November 2012 and November 2013. It develops Robert Alford's theory of Structural Interests, which modelled the relative pattern of interests between doctors, managers, and patients, arguing that a dynamic of dominance, challenge, and repression exists between them. This study re-examines the patterns of complementary and conflicting interests that exist between these groups, with a particular focus on the implications for the general medical practitioner. It presents a nuanced definition of interests, recognising that these differ between types of General Practitioner. Karl E. Weick's sense-making theory is used to provide insight into how different legacies create different types of general practitioner, and that this in turn affects the formation of interests. It also argues that the interests of general practitioners and managers are often blurred associated with the spread of clinical leadership, and the emergence of the hybrid doctor-manger.

The study traced commissioning activities at three levels. Level one commissioning was at the level of the general practice and its approach to managing referrals and drug budget spend. Level two commissioning was those activities that doctors did in collaboration across an area to secure contracts for services from hospitals and others. Level three commissioning was those activities to commission and provide services in partnership with non-health agencies. All three levels included the commissioners' interpretation of a policy known as "Any Qualified Provider" designed to open the English NHS to the competitive market.

Who Finds out and Contributes to Energy Decisions in Switzerland after Fukushima?

Switzerland has a turbulent history with energy and nuclear energy in particular (i.e. many public demonstrations, popular initiatives on the subject, a ten-year moratorium accepted in 1990, etc). After the Fukushima accident, the Swiss Federal Council opted for withdrawal from nuclear energy in the horizon 2035. The issue of energy was intensively addressed in the media after the accident, following mainly four frames for science-related policy debates: the frame of governance and public accountability, of scientific and technical uncertainty, of alternative path, and, less frequently, of economic development (Cretzavon Roten, 2013). Surveys after the accident reported that public opinion were negative about nuclear energy. Is there a long-term effect of the accident on the population, or does the wider pattern of concerns (such as economic crisis, climate change) push into the background the energy issue?

This presentation aims to answer those questions by examining a survey realized on energy in a big town of a French-speaking part of Switzerland in 2013. Is the political decision, which occurred after little public consultation, accepted by the population two years after? What is the public affective imagery of nuclear power? Does the population continue to inform and debate on the subject? Do we find that trust relationships towards various stakeholders have been modified?

The Reappearance of Public Matters: Housing Experiences during the Post Earthquake Period

Since the early XIX century, both house and domestic space have gone through a series of technological, programmatic and typological transformations in accordance with the changes in dwelling practices. These range from their progressive connection to utility networks (water, telephone, gas internet, etc.) to the change in number and proportion of places, in their relation with street space or the integration of new devices and technologies. One of the main consequences of this transformation has been the emphasis in private and intimate space as scenario for domestic matters with detriment to different ways of dwelling, which are more permeable to public space.

This presentation intends to understand how the nonuse of these spaces caused by the last earthquake that shook Chile on February 27th, 2010 questioned this compact, autonomous and multipurpose housing condition forcing its dwellers to (re)discover more spaces and practices that depend on the public sphere. In the outbreak of public/private categories after the earthquake and destruction of entire zones in the city as in Concepcion or Talca, urban conducts and their related spaces also damaged and tumbled down causing a new and transitory urban order where apparently contradictory situations cohabit. Because of the obvious enclosing of neighborhoods by residents, the fear for pillage and the privatization of streets, this presentation is focused on the counterpart of this situation that took place in the same place and nearly same geography. It is about the appearance of the idea of a “house” that is more permeable to the public sphere than in a domestic context, forced to shared uses, eradicating traditional boundaries (established, in fact, by law) that divide citizens.

The Persistence of Gender Inequalities in Australian Workplaces: An Analysis of Two Generations

Drawing on the two-decade Life Patterns longitudinal study that follows the lives of two generations of Australians (popularly known as Gen X and Gen Y),
through their transitions from education into the workforce, this paper investigates the factors contributing to gender equality in workforce participation and in the labour market. Focusing on female participants in the Life Patterns study, we draw on qualitative and quantitative data to examine the micro and macro explanations that underpin this phenomenon. Firstly, we briefly analyse the impact of social and cultural values in the development of egalitarian approaches to the field of education that have contributed to the expansion of the participation of women in tertiary education and, subsequently, the workplace. Secondly, we focus on neoliberal sensibilities and values underpinned by the concept of choice to understand the egalitarian values that exist alongside persisting gender inequality. Finally, we argue that while institutional arrangements are needed to address persistent inequalities around women’s roles and participation at work, there is also a need to scrutinise social and cultural beliefs about work and gender to achieve greater equality.

Constructing and Maintaining Campaign Boundaries: The Interaction of Organizational Identity and Image -- CANCELLED

Recent studies of organizational formation have highlighted the centrality of organizational boundaries as manifest through dynamic interplay between internal and external forces. In this paper we draw directly on the work of Montgomery and Oliver (2007; 2005) and their theorisation of the process of group formation, particularly the role of centrifugal and centripetal forces in shaping organization boundaries. We seek to extend the insight offered by Montgomery and Oliver (2007) drawing on organizational identity literature to explore interactions between social identity and image. Whereas Montgomery and Oliver (2007) link social identity theory and institutional theory to the development of group boundaries, we argue that ‘image’ is central to the effectiveness of an organization which relies upon a balance between how organizational ‘insiders’ view themselves and how ‘outsiders’ view the organization (Albert and Whetten, 1985). Our empirical case is that of informal organization as we study a network of campaign groups that formed to oppose the development of a high speed rail line (HS2) linking two major cities (London and Birmingham) in England. Drawing on qualitative data, we explore the process of group formation with a focus on the campaign network against HS2, in particular the evolution of organizational identity. In so doing, we contribute to our understanding of the effective management of multiple organizational identities and explore how tensions are mediated at the organizational level.

Runaway Train: Public Participation and the Case of HS2 -- CANCELLED

In recent years, public participation has increasingly featured in policy decision making. While top-down, or formal methods of participation are upheld as an endorsement of democratic decision making, there is limited understanding of public participation as an informal, or organic phenomenon. This paper contributes to debates about public participation by exploring the interplay between top-down (formal) and bottom-up (informal) interactions between policy makers, planners and the public. In focusing on the motives and experiences of ordinary people as they seek to influence decisions around a prolific policy issue the paper engages with theories of deliberative democracy and public deliberation (see for example Bohman, 1997; Elster, 1998; Dryzek, 2000; Fishkin, 2009; Marsbridge et al., 2012). By exploring these interactions a more nuanced understanding of multidimensional public participation is developed, highlighting some of the challenges for policy makers when consulting about major policy developments and illustrating how the public might drive deliberations about a policy issue. Our empirical case focuses on the informal participatory mechanisms that informed debates concerning the development of a high speed rail network in England (HS2). In particular we seek to understand 1) how social actors respond to formal consultation opportunities around high profile policy issues, 2) how social actors strive for public deliberation and 3) how ‘informal origins’ of participation emerge and develop.

The Influence of US Corporate Interlocks on the Pattern of Congressional Lobbying

There is a long history of research into the relationship between US directorate interlocks and campaign contributions drawing PAC funding data, generally demonstrating the importance of such contributions to sectors reliant on government concessions in some form often associated with bipartisan hedging strategies, alongside some clusters of interlocks with deep-seated conservative funding patterns. But the extent to which contributions amount to policy advocacy are largely circumstantial and the notion of a close link has been hotly contested by protagonists.

Since 1995, however, the lobbying of Congressional decision makers has been subject to the extensive requirements, including the formal registration of those engaged in lobbying activity and the publication of quarterly returns detailing clients and income from these, expenditure on lobbying, targets of lobbying and the issues of advocacy. This provides data on the actual domestic policy advocacy pursued by US corporates and thus a more rigorous basis for considering the relationship between directorate interlocks and corporate political activity than contribution data alone.

Building on earlier research on the central position of the large corporate director interlock structure in the pattern of lobbying of the UK government (Cronin 2012), this paper considers the position of the US interlocking director structure among the SP200 within the pattern of congressional lobbying in general. As in the UK, the US Corporate interlock structure proves to be remarkably central, albeit with strong House and issue delineations.

Sustainable Social Development

The question of Sustainable Development is still very contentious in the developing world. In South Africa, after Apartheid, political, economic, social and legislative redress were required aimed at eradiating inequality and discrimination, to create a broad participation base, and, in the process, enhance sustainability in the country. Currently, twenty years after democracy, these efforts have not yielded, by far, the positive results that were expected. This paper critically investigates this situation. Reasons for the gap - amongst others - include wrong approaches (e.g., macro and top-down) are still being implemented, a huge division between policy and practice, ‘inappropriate’ ties between government and other sectors and poor service delivery.

A Social Licence to Operate within the Iron ORE Industries of South Africa and Sweden: A Clash of Corporate and Community Cultures

When analysing the effectiveness of Corporate Social Responsibility (CSR) programmes, other developmental projects and Stakeholder Engagement (SE) in local communities adjacent to the operations of large multi-national corporations, the clashing of ‘corporate culture’ and ‘local culture’ becomes increasingly evident. In this regard, the contentious issue of a Social Licence to Operate (SLO) strongly comes to the fore. A Social Licence to Operate (SLO) goes further than formal documentation and legislative requirements (e.g. a mining or a water licence or regulated labour practices), and focuses more on the real processes and practicalities regarding the acceptance of a specific company by the relevant community or communities.

This paper reports on the issues of a SLO within a comprehensive comparative study between the iron ore industries of SA and Sweden. Two main conceptual pointers guided the research: firstly, the processes followed from the side of the company in order to ‘receive’ a SLO, and – in the second instance - the capacity of and empowerment within the community to grant such a SLO. In terms of the communities, different approaches and models were scrutinised, e.g. top-down/ bottom-up approaches, participation and communication, self reliance and resilience within communities.

Key findings of the research (from perspectives of both the company and the communities) will be presented in terms of similarities and differences between the industries of South Africa and Sweden. Recommendations are also being made in order to make the granting of a SLO a less cumbersome process and to ‘merge’ the two different cultures; in this regard, the role of different stakeholders (companies, communities, government and NGOs) have been highlighted by the research. Methodologically, a mainly qualitative approach (personal interviews with key informants of the companies and the communities, focus groups with community members and workers, as well as objective personal observations).
Our research examines the impact of citizen court monitoring on several courtroom variables including judicial process, courtroom actors' behavior, victim/defendant experience and ultimately, case disposition and sentencing. The study contains two parts. First, we experimentally manipulate the visible presence of court monitors (marked by monitors' use of red clipboards (an established identifier in the local context) and assess the effect of the monitors on the indicators listed above. A second inquiry contextualizes the experiment by conducting in-depth interviews with court monitors, program stakeholders, prosecutors, defense attorneys, judges, victim advocates, victims and defendants.

The Scope and Scholarly Impact of Survey Research: Evidence from Data Archives

We live in a world heavily infiltrated by systematic social research sponsored by universities, governments, think-tanks and private enterprise which is then, variously turned into public and private stocks of social knowledge with varying usefulness. Some overview of the volume of survey research can be garnered from surveys on surveys and from industry data but a particularly good source of information on the development of survey research is the metadata of surveys collected in data archives. This paper describes the overall development of survey research and data archives and then compares (especially Anglo-Saxon) countries in terms of the characteristics (subject-matter & methodological) of the surveys which have been archived. Information on use of surveys is also noted.

Comparative Research in Prostitution Studies: Challenges and Opportunities

This paper starts with a critical overview of comparative research in prostitution studies. More specifically, it outlines the scholarship that has looked at prostitution from a comparative perspective in social sciences, exploring methodological approaches used, scales of analysis adopted, and consideration (or lack of thereof) for the shifting meanings of concepts, prostitution-related practices and cultures across the units of analysis compared. The paper asks what lessons have been and can be learned from doing comparative analysis in this field, and whether more work needs to be done to refine this methodological approach.

Transformation of the Urban Periphery and New Forms of Production of Inequality in Brazilian Cities: A View on the Recent Changes in the Dynamics of the Real Estate Market

This article's objective is to discuss recent transformations in the periphery of Brazil's largest cities, considering the expansion of real estate, strongly supported by the government housing programme “Minha Casa Minha Vida” (MCMV). Using historical and theoretical analyses, we will demonstrate the shifting of the primacy of the contradiction between capital and labour, dominated by industrial capital, to the primacy of an urban contradiction, dominated by financial capital. In that context, we will recollect and discuss the literary production which has problematized the formation of the periphery in the 1970's, interpreted as the process that decreases the cost of labour power reproduction and characterized by self-built housing, in a scenario of strong industrialization and high immigration rates. In this sense, the periphery was consolidated as an important instrument to amplify industry gains and expressed through the intense inequalities in the Brazilian urbanization.

Considering the recent dynamics, we will investigate the changes in the peripheries, produced by the dissemination of large housing developments aimed at the lower income population. The role of the State, through a policy of access to financing and subsidies to achieve a target number of three million housing units, was determinant in the intense real estate appreciation in these territories. To better understand this dynamic, we also need to comprehend the process of financialization and capital centralization in real estate, marked by the dominance of large and expanding real estate developers.

Our hypothesis is that the appropriation of the periphery has consolidated into an essential strategy in the amplification of the gains and expansion of real estate. As a consequence of this strategy of appreciation, the access to property in the periphery tends to become a temporary condition and seems to be imposing new inequalities, which we will discuss using different case studies from Brazilian cities.

Percepción De Los Valores y ética Profesional Que Los Integrantes De Los Cuerpos Académicos Señalan Para Su Desarrollo En Los Estudiantes De La Universidad Autónoma De Campeche (México)

El trabajo de investigación en la Universidad Autónoma de Campeche (México) resalta el proyecto interuniversitario sobre ética profesional entre la UNAM y 14 universidades de la República Mexicana (Hirsch y López, 2008), actualmente plasmado en uno de los objetivos del proyecto de la Red temática de colaboración “Red de investigadores y cuerpos académicos en filosofía, teoría y campos de la educación” (REDICA) del Programa de Mejoramiento al Profesorado (PROMEP) de la Secretaría de Educación Pública (México).

A partir de lo anterior el trabajo analiza la percepción de valores y ética profesional que los integrantes de los cuerpos académicos señalan para su desarrollo en los estudiantes de la Universidad Autónoma de Campeche (México). La población de estudio fue 86 profesores conformados en diecinueve Cuerpos Académicos (CA) reconocidos por el PROMEP de las cuatro Dependencias de Educación Superior (DES) que conforman a la Universidad Autónoma de Campeche: veintiséis Profesores de Tiempo Completo (PTC) de siete Cuerpos Académicos de la Dependencia de Educación Superior de Ciencias Sociales y Humanidades (DESCSH), cuarenta (PTC) de siete Cuerpos Académicos de la Dependencia de Educación Superior de Ingeniería y Ciencias (DESCI), quince PTC de cuatro Cuerpos Académicos de la Dependencia de Educación Superior de Salud (DESS), y cuatro PTC de un Cuerpo Académico de la Dependencia de Educación Superior de Ciencias Agropecuarias.

El instrumento aplicado a la muestra seleccionada de PTC de los diecinueve Cuerpos Académicos está integrado por cincuenta y cinco preguntas con una escala de valoración de uno a cinco, clasificados en cuatro competencias: 1.- Competencias cognitivas y técnicas; 2.- Competencias sociales; 3.- Competencias éticas; 4.- Competencias de actuación reflexiva -evaluativas. Afectivo - evaluativo (Hirsch, S., 2006). Se diseñó la encuesta en la página web: e-encuesta.com, se envió vía correo electrónico a los integrantes de los CA, se realizó la interpretación descriptiva de la información con el software estadístico SPSS.

Teachers and Administrators Speak! Examining the Concept of Social Justice in Education in a Neoliberal Age

In this paper I explore the meaning of social justice for teachers and administrators in Australia. I take the concept of social justice from its theoretical isolation and put it in the immediate context of material disadvantages of rural schooling (e.g. lack of resources, high staff turnover) within the dominant neoliberal context in Australian education. Within the neoliberal project I focus particularly on the impact of three policy technologies -performativity, accountability and marketization- on the work of administrators and teachers. Drawing on the work of Iris Marion Young (1990) and Nancy Fraser (2008) I apply three dimensions of social justice: distributive, recognitional and participation to construct a plural model of social justice that overcomes the shortfalls of the liberal-egalitarian model -which usually equates social justice solely with distribution of resources. By examining administrators and teachers' voices, I offer an important contribution to understanding what is going on in rural schools, which dimensions of social justice are being applied and what the real needs are. These voices also reveal the contested
nature of the concept of social justice and its context-dependence, highlighting tensions between the different pressures in schools of neoliberal policy technologies, and its impact in the morale and work of school staff. Moreover, exploring the subjective element of social justice can make an important contribution to understanding how social injustices are experienced, tolerated and perpetuated in disadvantaged settings. It can also assist in outlining an agenda for change.

CUNHA, MÁRCIA* (University of São Paulo, marcia.cunha@gmail.com)
Lasting Effects of Marketization in Welfare State Policies - the Brazilian Case

Lasting effects of marketization in Welfare State policies - the Brazilian case

Brazilian social policies have undergone similar transformations suffered by policies of other countries during the 1990s. Despite the dismantling of the Welfare State in Brazil has taken place even before its consolidation, the idea that public intervention to solve problems of poverty and inequality should be guided by principles and practices from the market had strength in that period, organizing efforts and investments during the government of President Fernando Henrique Cardoso (1994-1998 and 1999-2002). For this reason, the opposition to discourses and policies identified them with what has been classified as the neoliberal bias of those years.

The election of President Luís Inácio Lula da Silva carried much of this criticism. Through his two successive terms (2003-2007 and 2008-2011), the government discourse and some new policies have been developed based on the assertion that their guidelines differed from those of his predecessor, by recovering the centrality of the State and by the privilege of the poorest. The decline in poverty rates eventually left the image of marketization of social policies even more distant. However, would it be marketization a process as ephemeral as a political-partisan government program? Would be changing policies in the passage between governments enough to restore a background of social security policies, as advocated in a Welfare State scenario?

The paper aims to present the hypothesis of the research on which it is based. According to it the changes occurred in those 1990s have produced effects that have been limiting the later possibilities of social policies development. More than that, despite the advances of the government of President Lula, the conditions that underlie the process of marketization maintain their historical and social validity, simultaneously restraining more steady changes and creating new challenges to analysts.

Neoliberalism Beyond Economics

Neoliberalism beyond Economics

The 2008 economic crisis encouraged theses about post-neoliberalism. The idea of expiration of a period and beginning of another, in which hegemonic projects have succeeded, takes neoliberalism mainly as economic doctrine. Would not both diagnoses of few practical alternatives to neoliberalism and difficulty of understanding yet beyond its particular forms of manifestations be a sign that neoliberalism have been consolidated as more than a strictly economic set of measures, policies and practices?

The aim of the presentation is to put this hypothesis in debate, mobilizing three distinct – but potentially productive – approaches. The first and most comprehensive is the understanding of the neoliberalism as a political rationality. The second reference is the idea of social neoliberalism, which designates a new function of state, made explicit in its response to demands for social equality and justice. The third one refers to neoliberalism as a shared mental model, ie, a cognitive model oriented to ideological and practical articulation of social groups.

Despite the particularities of each one, the common point among them is the wider view of the social setting in which neoliberal economic policies gained strength. It allows analyzing the conditions that permitted such predominance as well as the required and perennials transformations regarding relations of power and domination, development of public policies and social relations.

These approaches do not discard diagnostics produced by scholars working on post-neoliberalism theses, but open new possibilities of considering them through another point of view. The gain, we believe, is the potential of observing the recent phenomena in historical and more comprehensive perspective.

CURATO, NICOLE* (Australian National University, nicole.curato@gmail.com)
Crowdsourcing and Democratic Deepening: A Critical Appraisal

The past three decades have witnessed a range of democratic innovations – from the much celebrated participatory budgeting in Porto Alegre to sit-ins to protect green spaces in Istanbul. Although the precise consequences of these innovations leave a mixed picture of success and failures, the importance of public participation and deliberation in political life has been generally considered important for democratic deepening.

Crowdsourcing legislation is one of the most recent additions to these innovations. In Finland and potentially the Philippines, ordinary citizens are given the opportunity to draft and/or comment on bills subject to parliamentary consideration through the use of technology. The lawmakers’ process is viewed to be more participatory, epistemically superior and responsive to citizens’ opinions by aggregating the “wisdom of crowds.”

While crowdsourcing legislation has the promise of creating more inclusive and direct forms of political engagement, this paper aims to take stock of crowdsourcing’s normative and practical assumptions using a deliberative democratic framework. It is argued – albeit tentatively – that while the crowdsourcing can be an innovative platform in collective problem-solving, it also creates and reinforces existing hierarchies in participation.

‘then the 25th (birthday) Arrived and at That Point I Wanted to Take a Decision about My Future’: Time, Rhythmicity and Waithood in Youth’s Uncertain Transitions

Youth transitions literature considers the investigation of procrastination and interruption of (what used to be) linear paths as a core theme. From the classic idea of Erikson’s moratorium (1968) onward, the notion that young people find themselves taking time before embarking on one path or another, or while doing so, has been seen as a constitutive element of transition, whether in erratic forms or under institutionalised shapes – such as ‘gap years’ spent travelling. However, while the need for exploration brings along openness to the future, forms of ‘time taking’ such as ‘waithood’ are more slippery and often hide ambivalent ways of looking at the future.

Departing from the notion of waithood, this presentation reflects on the rhythm of imagined futures as emerged in the analysis of 300 essays written by 18 year-old Italian students who were asked to imagine to be 90 and narrate their future lives (in the past). In this extremely rich material, two contrasting temporal narratives emerge in relation to the work dimension: one where aspirations result in devitalization due to the underestimation of time and efforts normally involved in developing those paths; another, where it is expected that a few years will be spent waiting for something to happen (a job to be offered, the ‘right’ mentor to be met etc).

Drawing on youth transitions literature, but also on studies on the life course and temporality (as in Brannen and Nilsen, 2002), this paper ultimately relates these themes with the context where they emerged, in an effort to reconstruct the meanings that young people give to the phases and rhythmicity of their transitions to adulthood.

“They Think I Am a Free Lunch”. Why Everyday Interactions Between Emigrants and Sending Communities May Actually Discourage Return

The recent research on transnational fields has had the great merit of claiming attention to the important topic of the relations between Emigrants and the sending communities. Such research has documented how international migration is a factor of social change not only in receiving societies, the traditional focus of research, but also and may be even more - in the places of origins of emigrants. The potentiality of such approach, however, have been unduly constrained by the widespread - and often implicit - tendency to assume that transnationalism is perceived as a challenge only in receiving states and societies. We will argue, on the contrary, that receiving communities show a deep ambivalence toward their emigrants. We will document how it is possible to identify in many sending communities a set of social mechanisms - operating at the kinship, interpersonal, communal and symbolic level - that severely constrain the maintenance and development of long-term transnational relationships. Such understudied mechanisms may actually weaken such transnational spaces and contribute to prevent return migration.

These arguments will be grounded in an analysis of the data collected in a long-term, ethnographic, multi-sited project on female migrations from some Eastern European countries to the household services sector of some Mediterranean countries. Researchers have carried out in coordinated way ethnographic observations of foreign caregivers both in the sending and receiving contexts over several years. A particular importance has been given to following some informants in their trips back home as well as carrying out ethnographic fieldwork in the place of origins while they were absent.

The Implications Of Demographic Changes On Intergenerational Relations and Social Policies. The Case Of Mexico City

Demographic changes have been experienced by societies all over the world. Senior people experience social exclusion, poverty and cumulative disadvantages. Now, Mexican population is ageing rapidly and this situation is a challenge for the government at both the federal and local level. At the local level, in Mexico City, the capital of Mexico with a population over 9.5 million, there were registered changes in government policies in recent years. In Mexico City, the Party of the Democratic Revolution (PRD) came to power in 1997, implementing the social policy based on the principle of universality. In that context, two major programs of direct money transfers began, i.e. The Senior Subsidies Program (Programa de Adultos Mayores) and the PrepaSí Subsidy Program. Between 2001 and 2011, the number of beneficiaries of the Senior Subsidies Program has nearly doubled, from 250,000 in 2001 to 480,000 in 2011 and for 2013 the same limit, 480,000, remains. Theoretically, all Mexicans living in Mexico City aged 68 or more receive financial transfers, which is equivalent to 85USD. However, in Mexico there are at least 600,000 adults over 68 years, so 120,000 adults do not receive aid. The other program is the money transfer for public high school students in Mexico City, the PrepaSí Subsidy Program. Actually, a total of 210,000 teenagers receive money transfers that are equivalent to 30, 40 and 50USD depending on their school academic performance. The question is, how to design new old-age and youth social policies, different from those of money transfers that result to be costly for the local government, which will respond the demographic changes and improve the well-being of the elderly and the youth? The hypothesis is that money transfers are insufficient to fight poverty among the elderly and among the youth in Mexico City.

Bangsamoro Challenge in the Philippines

Bangsamoro challenge in the Philippines

In terms of ethnic relations, the Philippines - as other states in Asia-Pacific region - are characterized by extreme diversity. As many as over 168 ethno-linguistic groups are recognized there. To make situation even more complex, linguistic and religious divisions overlap each other.

Bangsamoro or Moro people are members of minority Muslim ethnic groups which constitute 5% of population in this predominantly Christian country. The most important ethno-linguistic groups of Bangsamoro are: Tausugs, Maguindanaos, and Maranaos.

Despite enduring activities to establish one independent Bangsamoro state, new patterns of Muslim inter-ethnic relations have emerged recently. This year Moro National Liberation Front (where Tausugs dominates) was involved in several incidents (Sabah Ride in February of 2013 and Zamboanga atrocities in September 2013) aiming to postpone peace negotiations between the Government of the Philippines and Moro Islamic Liberation Front (organization dominated by Maguindanaos). Even though both leading separatist organizations speak for Moro people, the tensions among Muslim ethnic groups seem to be more visible.

At my presentation I intend to discuss the ethno-religious nature of Bangsamoro identity in order to point out the emerging patterns of the complex ethnic relations in the South of the Philippines.

Public Religion, Collective Memory in a Multicultural and Global Society

The new times we live are characterized by the public role of religion (Casanova): not only the religion as an institution, but the real dimension of religions entering and pervading the public sphere: affecting the relationships between religion, family, cultures, public policies, welfare state, health problems: this phenomenon is not a return to medieval time where church and political systems tried to dominate one upon the other, but the neoliberal modernity, or post-traditional society conveys at the same time the autonomy of religious sphere respect to the political one, but at same time the partial exit of religion from the boundaries of the religions institution still influencing many aspects of social life.

Public religion or civil religion (R. Bellah) is closely related to a collective memory which is a social construction and representation of reality, but it is also a sedimentation of symbolic capital within a cultural system, in a given historical time and space. It is also a stratified reality almost as an archeological circle where the present, the past and the projection toward the future constitute a collective memory. The analysis of collective memory leads up to the discovery of the magma of popular religiosity, the families lineage, the mythological points, the grounding meanings (M. Weber) the collective unconscious (Freud, Jung, Neuman) the place of transcendence in the social life (R. Bellah) The analysis of collective memory can be analyzed in a small community in the South of Italy as I have done in my researches and in the Symbolic Construction of Reality or at global level by analyzing the cultural bases and the collective memory in a process of development and globalization, as I have done in my work on the Grammar of Development.

The Dynamics Of Rational and Non Rational In The Process Of Social Change and Desease Of Contemporary Society : Pareto and Freud

The paper will focus of the dynamics of rational and non rational exploring in a new light the contribution of Pareto to the structure of social action beyond the only interpretation of T.Parsons and confronting the concepts of logic and non logic action with the analysis of S.Freud on the role of the unconscious. It is possible to establish any connection between the concepts of residui and derivations developed by Pareto with the dynamics of unconscious for the disease of our civilization and at the same time to use the processes of rationalization to make sense of the substratum laid in our culture and of its ground meanings. Probably in the symbolic construction of reality there is a meeting point for the interaction between so distant thinkers whose fortune has been unequal in developing the sociological and psychological analyses of modern society. The interest of the analysis of residui in Pareto and to what extent they can fit not only in the social action but also in the archeology of Pareto and Freud. At the same time the process of rationalization linked with the concept of derivation can be related not only with super ego and the ego of Freud, but also with the process of rationalization of M.Weber which ends up with the iron cage of bureaucracy and the irritation of charisma in the social fabric of reality.

Une Recherche « Avec » Les Personnes En Situation De Handicap Mental : Un Projet Utopique ?

Ces dernières années, la compréhension du phénomène du handicap a largement évolué. Nous sommes passés d'une compréhension du handicap comme déficience liée à une réalité personnelle, au handicap vu comme un construct socioculturel, résultat de la rencontre d'un individu avec un environnement incapacitant (Sen, 1999). Contrairement à ces travaux, notre propos est de dépasser cette perspective et de considérer le handicap comme un phénomène social. Il est à noter que le terme de “handicap” est entré dans le langage courant et que de nombreuses organisations internationales ont adopté des définitions du handicap en utilisant le terme “handicap mental”.

Ethnic Discrimination and the Collective National and Ethnic Identities of Turkish and Moroccan Minority Students in Flemish Secondary Schools

Many scholars focused on the negative consequences of racial/ethnic discrimination on different behavioral and psychological outcomes. However, there is a lack of large-scale quantitative studies giving insight in the experience of racial/ethnic discrimination by peers and teachers within a school-context, especially in non-Anglo-Saxon contexts. The impact of perceived racial/ethnic discrimination on the anti-school attitudes of students of Turkish and Moroccan descent in Flanders (the northern part of Belgium). Furthermore, in the literature, racial/ethnic discrimination is seen as a risk factor that increases the probability of negative outcomes without directly causing them. As such, it is interesting to focus on factors that can buffer or compensate for the experience of racial/ethnic discrimination. Research in the US shows that identification with collective national and ethnic identities both compensate for and buffer against the impact of perceived discrimination. It is theoretically interesting to test this for Turkish and Moroccan minority students in Flanders. Hence, the second goal of this study is to analyze data from a large-scale study (N=767 students of Turkish and Moroccan descent, 47 schools) collected during the school year 2011-2012 and designed to study ethnic discrimination and racism in Flemish secondary schools.

The Impact of Perceived General and Ethnic Victimization By Peers and Teachers on the School Belongingness of Ethnic Minority and Minority Students in Flanders

The relationship between ethnicity and educational inequalities, especially in relation to the achievement of ethnic minority students, is an important topic in educational research. However, the present study does not focus on achievement, but wants to examine a less researched factor that plays an important role in the academic success of students of ethnic minority background. Belongingness has a positive influence on the behavior and motivation of both ethnic minority and majority students, and because of that it is interesting to explore if both groups of students feel to belong in Flemish schools. In addition, it seems very interesting to examine if the influence of perceived discrimination is similar for ethnic minority and majority students, especially since the determinants of school belongingness received little research attention. This study focuses on the impact of victimization. We might expect that victimization will have a negative impact on school belonging, but we have little knowledge about this impact for ethnic minority students. Furthermore, in relation to ethnic minority students, it is important to differentiate between general victimization (e.g. because of clothes or appearance) and ethnic victimization (e.g. because of race, ethnicity or skin color). In sum, this study focuses on these three research questions: 1) Do ethnic minority and majority students feel to belong to Flemish schools? 2) What impact does it have to examine the Impact of school belongingness and does this differ for ethnic minority and majority students? 3) Is there a difference in impact of ethnic and general victimization on the school belongingness of ethnic minority students? To answer the research questions, we will analyze data from a large-scale study (N=4322 students, 56 schools) collected...
Participation and Transnational Restructuring Agreements

The literature about the “Europeanization” and the “internationalization” of industrial relations has increasingly been dealing in recent years with transnational framework or company agreements and the European Commission database on transnational collective agreements currently contains over 200 such texts. Do these new forms of transnational industrial relations at the company level also constitute a new form of regulation? What kind of employee participation do they entail? How have they changed with the crisis? First different levels and actors of transnational industrial relations will be identified, among which multinational firms, Global Union Federations, European Industry Federations, and/or European Works Councils. Then existing transnational forms of regulation will be analyzed with particular attention to restructuring and the crises. This communication is based on ongoing field work about transnational framework agreements with a focus on restructuring. The conclusion will reconsider the notion of “industrial democracy” and outline the evolution of the notion of “participation” as applied to the transnational level.

“Offshore Workers”: The Case of Mexican 1.5 Generation Returnee Migrants Working in Mexico City’s Bilingual Call Centers

Over the past few years, return migration from the U.S. to Mexico has been an increasing phenomenon. As it involves the conventional return migration, composed in its great majority by males adults who migrated to the United States in a traditional worker migration pattern, it also concerns a less common category of returnees which is composed by young people who belong to what the migration academics calls the 1.5 Generation: the children of the first generation migrants who were not born in the U.S. In the US-Mexican immigration context, it also often implies that these children are, as their parents, illegal migrants. It is estimated that today in the U.S. more than two millions individuals face such situation.

The case of these return migration trajectories is worth attention at least for two different issues: first, it does not correspond to the conventional return migration to Mexico which in its great majority is composed by males adults who migrated to the United States in a traditional worker migration pattern. Secondly, more than deportees – an increasing phenomenon that implies more and more long stay Mexican and Central American migrants – we identified a considerable group of young voluntary return migrants. The motives of their return to Mexico, a country that most of them barely know, as they grew up most of their lives in the U.S., are plural. Among these decisional factors, the impossibility of social and economic ascension – Glass Ceiling – due to their illegal status and the reverse family reunification processes in Mexico, play a crucial role.

In this paper, based on thirty interviews with 1.5-generation returnee migrants working in English-speaking call centers in Mexico City and Monterrey, we analyze these new return migration trajectories which interrogate, on the background of the Dream Act debate, the social and economic obstacles that 1.5-generation are confronted with and the role the latter play in decision making process to return to their parents’ homeland.

Step By Step Self Learning? the Quantification and Interpretation of Walking Activities

In recent years, the rise of sensors and tracking devices in the field of health and fitness has renewed the ways people trace and represent their physical activities. Promising “self knowledge through numbers”, the Quantified Self movement has helped popularize the continuous use of electronic devices that can automatically collect data (wristband, watch, mobile phone, etc.) is key to a better understanding of one’s body, mind and self. Nevertheless the many ways people start and/or stop using such tools, experience and experiment with them are not well documented, especially when it comes to spheres other than sports activities.

Drawing upon an empirical study of how individuals equip and experience –lastingly or not- footsteps tracking devices (Fitbit, Jawbone, etc.), we consider issues of appropriation, embodiment and interpretation these mobile technologies entail. We focus on the practices that allow one to: describe one’s own physical relation to the tool(s) and user interfaces; read into generated data and upcoming application messages; and possibly share these and new data.

Our findings underline the role of meaning making and reflexivity in making pedometers and accelerometers technologies wearable and usable in everyday life.
life's embodied experience, and ensuring that measurements, data sets and comparisons can be performed. When it comes to confrontation with traces of one's own—apparently trivial—walking activity, much encoding/decoding and multiple interpretations are at work. For some, the knowledge produced can be criticized for being inaccurate or even pointless, whereas others find motivational support and unexpected ways of relating to their physical activities, on their own or through the online sharing of data and experience. At some point, all users are confronted with the normative dimensions (excess weight, inactivity, illness, etc.) scripted and embedded in these devices and the advice they produce. This in turn questions the sociopolitical implications of these embodied technologies.

New Constitutional Framework, Persisting Authoritarian Practices: The Case of Morocco after the 2011 Constitutional Reform

Following one of the largest waves of protests that the country had experienced since its independence, Morocco witnessed the drafting and the adoption of a new and arguably less authoritarian constitution. The subsequent electoral success of the Islamist Parti de la Justice et du Développement (PJD) and the formation of a PJD-led government were considered tokens of goodwill demonstrating the monarchy's commitment to the reforms. Nevertheless, the optimism faded away in the face of increasingly repressive responses from the state to the protests, the continuing inability (or unwillingness) of the PJD government to pursue its reformist electoral promises, the extremely slow pace of the drafting of organic laws pertaining to the enactment of various constitutional provisions, and the awkward responses of the government to scandals that elicited popular outrage and sporadic protests.

The overall picture emerging from a review of the political situation in Morocco in the years following the adoption of the new constitution is that of a political system unable or unwilling to follow through with the process of reforms in which it engaged itself. Thus, this paper argues that the Moroccan state seems unlikely to be able to move beyond the repressive modes of authoritarian governance that it has hitherto relied upon, given the deeply entrenched interests of its elites, a factionalized and divided opposition, and a population that mistrusts institutionalized politics and is wary of the risks associated with revolutionary changes. It also analyzes the uncomfortable position of the PJD, caught between its inability to deliver on its electoral promises and the recurring snubs that it receives from the monarchy and its allies. Finally, this paper suggests that the reform in itself is better understood as being more of a show of goodwill targeted at the international community rather than a sincere commitment to democratization.

RC02-58.12

Dahiwale, Samarth* (Rdtd. University of Pune, smdahiwale@yahoo.com)

New Economic Policy and Its Impact on Marginal Segments in India

The essay deals with the impact of New Economic Policy (NEP) on poverty, employment, farmers' suicide, displacement of peasants and adivasis (aborigines), slum dwellers, etc. Wage employment schemes under the Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) of the Congress led United Progressive Alliance (UPA) government has helped alleviating poverty in rural India. In the reform era, the overall employment rate in organized sector has come down, but it has increased in private sector with uncertainty of both income and job security.

The UPA government has described its economic growth "inclusive." The government saw inclusion in terms of social inclusion and financial inclusion. In social inclusion, the government devoted poverty alleviation, employment generation, health, education and social welfare, and in financial inclusion, subsidies, loans and social security benefits to be directly credited to the accounts of the beneficiaries. Since there are reports of corruption in the implementation of welfare schemes and social services such as education and health have become privatized/commercialized, marginal sections, viz., Scheduled Castes, Scheduled Tribes, Other Backward Classes and Muslims remained excluded from the benefits. Inclusive growth, therefore, is questioned. And, thus NEP has become a stumbling block to supporting the development of social sector in general.

Second-Generations Asking for Citizenship. The Italian G2 Network Against the Consequences of Migration

Migrants’ descendants associations are now quite common in Italy. Their main claims are focused on the issue of citizenship, demanding a redefinition of the law that takes note of the changed conditions of the country after migration flows. This is the case of Rete G2 that, along with other more or less formalized groups, have recently given birth to the media campaign on the rights of citizenship named “I am Italy, too” (L’Italia sono anch’io), and to a large number of petitions and claims.

A lack of recognition of equal opportunities in the labor market, but also the exclusion from active participation in the political and social life of the country to which they feel they belong are the main topics of their claims. Thus, the “right to difference”, often invoked by their parents, becomes a handicap for their full social integration: being different involves the risk of becoming “second-class citizens.”

Second-generation youth believe they have gained the same rights of mobility of their native peers, but they often remain anchored to the subordinate social position of their parents. They do not feel like foreigners even though they are placed as such, at least from a legal point of view. They live the complexity of migration without being migrants adding to the typical adolescent insecurity conflicts emerging from the inter-relationships between home country, parents and receiving society. In this context, the construction of a balanced definition of identity in a plural sense often becomes uncertain.

The paper aims at examining the underlying reasons of migrants’ descendants protests relating to social inclusion, as unexpected and unwanted consequences of migration, and looking at these associations/movements as one of the possible agents of legislative/institutional as well as cultural change. The speech will also be articulated referring to empirical data collected on the ground.

Economic Crisis, Social Policy and Health Inequalities: A Systematic Review of the Research Literature

Purpose: The purpose of the systematic review is to collect and review research that has examined how economic crises have impacted on population health and health inequalities and to which degree the welfare state has played a modifying role. Based on the available evidence the ambition is further to develop testable theories and hypotheses for the empirical analyses to follow. The review is part of the contribution to the seminar "Against the Consequences of Migration: Second-Generations Asking for Citizenship. The Italian G2 Network Against the Consequences of Migration" presented at the XVIII ISA World Congress of Sociology in Seoul.

The overall picture emerging from a review of the political situation in Morocco in the years following the adoption of the new constitution is that of a political system unable or unwilling to follow through with the process of reforms in which it engaged itself. Thus, this paper argues that the Moroccan state seems unlikely to be able to move beyond the repressive modes of authoritarian governance that it has hitherto relied upon, given the deeply entrenched interests of its elites, a factionalized and divided opposition, and a population that mistrusts institutionalized politics and is wary of the risks associated with revolutionary changes. It also analyzes the uncomfortable position of the PJD, caught between its inability to deliver on its electoral promises and the recurring snubs that it receives from the monarchy and its allies. Finally, this paper suggests that the reform in itself is better understood as being more of a show of goodwill targeted at the international community rather than a sincere commitment to democratization.
parative data sets to study health-related consequences of the current downturn in Europe.

Background and Research questions: We will draw from insights and findings from Brenner's earlier studies of business cycles and mortality and Ruhm's more recent studies. Also experience from countries that have undergone deep crisis or transformation, such as Russia and other Eastern European countries will be scrutinized. Further, the experience of recessions in the two Nordic countries during the early 1990s, Sweden and Finland, will be examined, in particular the hypothesis that the welfare state was able to buffer the detrimental consequences of the economic downturn. Studies of the current recession by e.g. Stuckler and collaborators will certainly provide valuable material. In the review, we will try to identify the following dimensions of crises that we suspect will have an impact on the outcomes: What kinds of crisis are we facing, (economic, political, fiscal, social), what is the speed with which it has evolved, how has the state responded to meet the crisis, and how are the changes in social and health policy.

Methods: We will comply with guidelines issued for instance by the Campbell collaboration by developing clear inclusion/exclusion criteria, having an explicit search strategy, and a systematic coding and analysis of included studies.

Saying ‘I’ - Gender, Identity and Social Status In Japanese Pronouns

The question of ‘I’ and first-person pronouns is one that needs to say differs between and within cultures and contexts, and in this presentation I will focus on the case of Japan, and specifically on the first-person pronoun use of individuals who identify as x-jendaa. ‘X-jendaa’ (x-gender) is a term that emerged in Japan in the late 1990s, and simply put, refers to identifying as neither woman nor man, although the definition of the term and its specific usage depends on the person employing it. There are a number of first-person pronouns in Japanese, and a person is not limited to using just one fixed pronoun throughout their life-course, but rather shift pronouns depending on social context. The use of social pronoun depends on a number of different factors – social hierarchy (especially in a business or work context), geographical region, and significantly, gender. Although there do exist pronouns that can be considered gender-neutral, most first-person pronouns have a notable gender bias, and one would be expected to use a specific pronoun depending on how one appears and passes gender-wise. Based on interviews conducted with individuals who identify as x-jendaa, in this presentation I will seek to examine how these individuals choose what pronouns to employ in their daily lives, and at the same time explore the social ramifications that these pronouns have in turn. It should also be noted that it is possible to communicate in Japanese without using first-person pronouns, which is a tactic that some of my informants also use. Through this presentation, I seek to bring forth the restrictions as well as possibilities that language brings forth, and how using or not using personal pronouns reflects as well as forge one’s social experiences.

“Forever Young”. Biomedical Innovations and Temporality:

Sociology of Anti-Ageing Promises

According to anti-age advocates, the « elixir of life » has finally been discovered. Hormone replacement therapies, that aim to compensate the natural decline in hormones secretion during the ageing process, stand as one of the major medical strategies developed to address biological ageing. With anti-ageing medicine, biology is no longer destiny but an opportunity. The body is construed as biological mechanism; organisms seem amenable to transformation and optimization.

Since the mid-1980s, scientific claims have raised hope about a sex steroid – the DHEA – which came to be presented as a “fountain-of-youth” molecule. In the 1990s, these expressions of hope were bolstered by the efforts of other scientists, DHEA consumption rose all around the world and bolstered the very idea that biomedicine could "cure ageing". This paper, relying on an analysis of DHEA trajectory in France (1980-2010), will show that understanding the institutionalization of anti-ageing promises – and the challenges of these promises – requires exploring the interactions between different spaces: scientific and political spaces. Anti-Ageing Medicine as a new medical offer convey a new conception of the aging body in our society. Aging is no longer seen as a state of life, but a lifelong reversible process, the greatest risk factor for every age-associated pathology. By considering the impact of biomedicine on the conception of old age, this presentation will contribute to the study of the articulation between biomedical innovation and temporality in our society.

Sport, Nationalism and the Politics of Language in Canada:

Celebrating Francophone Belonging at the Pan-Canadian Francophone Games but Avoiding the ‘National Question’ at the Quebec Games

Canada’s Official Languages Act aims to advance the equal status and use of English and French while also supporting the development of English and French linguistic minority communities. While this legislation establishes the bilingual character of the Canadian nation, Canada is not composed of two demographically equal linguistic communities. Indeed the 2011 census showed that less than 25% of Canadians had French as a mother tongue or spoke French at home. Only in the province of Quebec are the tables reversed where Francophones represent

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
the majority and English-speakers are the minority. The comparative study of the 2008 pan-Canadian francophone games and the 2010 Quebec games illustrates the complex relationship between nationalism and the politics of language at French-only large sporting festivals. The 2008 pan-Canadian Francophone Games funded by the federal government successfully serve to foster Francophone identity and sustain the Francophone community development. Organizers and youths proudly claim their Francophoneseness and celebrate French language and culture throughout the weekend. Conversely, the Quebec Games focus on their sporting character rather than their nation-building purpose. This annual multisport competition financed through the Quebec leisure and sport policy is also meant to foster a distinct cultural identity among Quebeckers (Harvey, 1999). Quebec is formally recognized as a nation within Canada, the use of the provincial Games as a vehicle to promote the Quebeccois distinct language and culture depends on the support of the day as well as on local organizers. The 2010 event avoided any reference to the 'national question' celebrating youth and sporting performances in a take-for-granted, but also unacknowledged, French environment. The comparative analysis outlines the distinct challenges of promoting a Frenchophone distinct majority vs. minority identity in today’s bilingual Canada.

Rising income inequality partly has been mitigated by public income redistribution in most highly developed countries during the past decades. However, a widening market income distribution not automatically creates government response. In a democracy, of course, citizens can address governments and demand an intervention into the distribution of market incomes. Disparities of market income might be hedged through a political majority. However, as the Median-Voter model and other explanations of redistribution from political sociology and economy pointed out, the poor need coalitions with the middle class to put through their demand for more equality. The poor resp. parties representing the poor, but also the middle class, have to endure in past are not powerful enough. So, the median voter should constitute political power within cross class coalitions of redistribution. Is this really so? Moreover, social scientists pointed to the fact that only political factors transfer voter demand into the political system. So class specific participation and the way parties represent different political cleavages and transit their demand, are decisive steps constitution politics of redistribution.

The paper to be presented wants to confront the assumptions underlying the model with data on political behavior of the median and the poor voter, on party polarization and the ideological shift of left parties and on the institutional incentives for political participation. These questions will be discussed: Do middle class voters sympathize with politics for the poor or do they rather support coalitions with the affluent? Did left parties shift to the middle of the political left-right-spectrum and did this make them successful in political competition? Is there congruence between voter demand and actual political programs? Data come from Luxembourg Income Study, the Comparative Manifesto Program and attitude surveys (ISSP, ESS).

**Voter Demand and Politics Of Redistribution - Does Democracy Correct Market-Inequality?**

Rising income inequality has been mitigated by public income redistribution in most highly developed countries during the past decades. According to the classical democratic model citizens can address governments and demand an intervention into the distribution of market incomes. In this ideal model, "inacceptable" disparities in the market income distribution can be healed by a political majority. This basic model has been developed further and enlarged by political factors. Explanations of redistribution from political sociology and economy assume that coalitions between middle class and the poor are necessary to put through their demand for more equality. The poor resp. parties representing their interest in measures compensating the market income losses especially the poor had to endure in past are not powerful enough. So, the median voter is decisive for the political power necessary to build cross class coalitions of redistribution. Three points are decisive in that model: a) The political orientation and behavior of the median voter; b) the middle class voter; c) the transmission of voter demand into politics. Recent debates doubt that governments respond to demand.

The paper will confront assumptions underlying the model with data on the changing political behavior: middle class and poor voter behavior, on party polarization and the ideological shift of left parties and on the institutional incentives for political participation. These questions will be discussed: Do middle class voters sympathize with politics for the poor or do they rather support coalitions with the affluent? Did left parties shift to the middle of the political left-right spectrum and did this make them successful in political competition? Is there congruence between voter demand and actual political programs? Data come from Luxembourg Income Study, the Comparative Manifesto Program and attitude surveys (ISSP, ESS).

**Conspicuous Modesty in a Cosmopolitan Environment? a Study of Nordic Expatriates in Strasbourg**

Within the framework of my comparative studies on social distinction, I have emphasised that in some societies (such as those of Nordic European countries), social differentiations are more often than not under-communicated while same-ness is over-communicated. What can often be observed is a relative avoidance of distinction from one's peers.

The question arises, however, as to whether what I call 'conspicuous modesty' in those countries is a phenomenon that can also be observed among Scandinavians or Finns working abroad - and sometimes interacting with fairly conspicuous well-to-do people from other cultural areas. This paper summarises the results of a research about Nordic expatriates in the 'Euro-city' of Strasbourg along such lines.

**Voter Demand and Politics Of Redistribution - Does Democracy Correct Market-Inequality?**

Rising income inequality partly has been mitigated by public income redistribution in most highly developed countries during the past decades. However, a widening market income distribution not automatically creates government response. In a democracy, of course, citizens can address governments and demand an intervention into the distribution of market incomes. Disparities of market income might be hedged through a political majority. However, as the Median-Voter model and other explanations of redistribution from political sociology and economy pointed out, the poor need coalitions with the middle class to put through their demand for more equality. The poor resp. parties representing the poor, but also the middle class, have to endure in past are not powerful enough. So, the median voter should constitute political power within cross class coalitions of redistribution. Is this really so? Moreover, social scientists pointed to the fact that only political factors transfer voter demand into the political system. So class specific participation and the way, parties represent different political cleavages and transit their demand, are decisive steps constitution politics of redistribution.

The paper to be presented wants to confront the assumptions underlying the model with data on political behavior of the median and the poor voter, on party polarization and the ideological shift of left parties and on the institutional incentives for political participation. « Le Rôle D'aidant Familial Et La Vie Professionnelle En Période D'austérité. Articulations Et Points De Rupture. La Comparaison France/Japon »

Cette communication présente la méthode et les résultats de l'enquête comparative sur les aidants familiaux et leurs trajectoires professionnelles en France (l’île de France) et au Japon (à Osaka).

L’objectif de l’enquête est d’appréhender deux types de trajectoires, professionnelle et du care, et d’étudier leur interdépendance. Nous ne limitons pas notre recherche à un type de fragilité. Dans le contexte de prolongement de l’espérance de vie, un individu peut fournir de l’aide dans sa vie à plusieurs périodes, périodes qui peuvent être continues, discontinues ou chevauchantes. Il peut avoir également plus d’une personne à aider dans la même période. Dans les deux cas, il peut s’agir de fragilité de type différent. Ce constat appelle la prise en compte des temporalités et de la globalité de la vie de l’aident. Nous employons la méthodologie d’analyse séquentielle des données sur les trajectoires de vie de l’aident, afin de repérer et analyser les variables qui influent sur la trajectoire professionnelle. L’analyse séquentielle est complétée par l’étude de réseau de care constitué autour de l’aident interviewé, identifiant les acteurs qui interviennent dans le déroulement du care.

Quelles sont les différentes figures d’aident qui peuvent être dégagées ? Comment éclairent-elles à la fois les conceptions et pratiques d’aide à un proche en situation de « dépendance » et certaines dynamiques à l’œuvre sur le marché du travail ?

Si les caractéristiques de l’aident, le sexe et la place dans la famille par exemple, semblent jouer un rôle important dans les trajectoires, les politiques publiques autour de la prise en charge des situations de fragilité dans chaque pays ont également une influence qui doit être évaluée. Dans quelle mesure les modifications de ces politiques sous l’effet de l’austérité, variables selon le type de fragilité et le pays, modifient-elles les articulations entre rôle d’aident et vie professionnelle ?

**National Answers to Global Challenges: An Example of Faculty Employment Regulation at Public Universities in Brazil and Germany**

All advanced national higher education systems around the world are challenged by the increasing and strengthened global norm of efficiency, above all, in the management of universities, in teaching, and in research. Through the argument of global competitiveness this leads in many countries to a greater flexibility of working contracts and insecure career opportunities and paths for the academic faculty. Although this is a global trend, there are significant differences between distinct national states. While some national higher education policies...
internalize the "new trends" in flexible management of their universities and the ideology of the market, others stick more to their own traditions and open up little to these new trends. One outstanding example of the first group is Germany, an example for the latter group is Brazil. Even though both countries are closely intertwined in the global market and challenged by global competitiveness in formation and knowledge production they follow distinct ways to meet those tasks. Through the example of employment regulation of faculty in public universities in Brazil and Germany, this paper seeks to analyze the influence of national traditions and state politics in dealing with the global challenges for the national higher education systems.

Educational and Professional Ambitions of French Girls

Educational and professional ambitions of French girls.

With the European research project GOETE (Governance of educational trajectories in Europe), we are able to deepen the educational and vocational guidance by taking the teenagers' point of view.

To explain and understand the construction of educational trajectories, GOETE associates a double quantitative and qualitative approach in 8 European countries. Data was collected by questionnaire aimed at teenagers in the last year of lower secondary school and from questionnaires aimed at their parents, and also by interviews with teenagers, parents, and professionals (teachers, guidance counselors, supervisors, social workers, nurses, youth workers).

The first statistical results reveal that on average the girls' vision for their future includes a longer educational trajectory than the boys', with sometimes large gaps in their favor as in Slovenia for example. Contrary to this, in France, despite better success in schooling, young women remain less ambitious than young men.

Following a general panorama of the perspectives of these young European people, we will focus on French youth to understand this phenomenon. We will expose the objective and subjective barriers: how the French teenage girls cope with divergent advices from guidance counselors, teachers, parents and why they limit their educational trajectories - often marked by their gender and their social background.

DANIC, ISABELLE* (Université Européenne de Bretagne, isabelle.danic@univ-rennes2.fr)

Teenage Girls and Leisure: The Social Construction of a Plural Culture

Teenage girls and leisure: the social construction of a plural culture.

In an intersectional perspective, this paper aims to highlight inequalities in accessing leisure by focusing on teenagers in France.

Based on quantitative and qualitative data collected in three French regions in 2013, the focus of this paper is to shed light on the leisure activities of teenagers in terms of differentiated social practices according to gender, age, social class, physical and social morphology of the neighbourhood, and relational and situational criteria. Their leisure is channeled by public policies as well as educational, family, and socio-educational care that structure their time and space. However, this paper also aims to highlight the subjective dimension. Gender, age and social network define living conditions and possible futures. More or less forgotten by the authorities (and by researchers), the teenage girls studied have different leisure practices - often marked by their gender and their social background.

Inequalities in the Elementary Teaching System in São Paulo (Brazil)

In São Paulo, the Brazil's most developed state, it was promoted a process of transferring Elementary Teaching's supply (ET) from the state level to municipal level in recent years: in 1995 were enrolled 5,263,112 students in the state net and 646,500 in the municipal nets. While in 2011 there were respectively 2,563,326 and 2,359,825 students.

Many believed that this would bring positive effects, such as best access conditions to the ET and a better students' performance, due to higher accountability in the municipal nets and greater management capacity as a consequence of the reduction of the state net's enormity.

The public system showing a better students' performance, would be possible to think that a growing percentage of different social classes members would prefer it, giving to students from variable familiar origins background to compete in an equal way as position of quality either in subsequent stages of learning or in the labor market.

Viewed this way, the so called decentralization of the ET may be understood as one of the adopted policies by state of São Paulo government to reduce the educational inequalities.

The data reveals that the model in which the most economically deprived and lower status groups feel more radical in terms of welfare distribution not exactly true for Russian and Chinese cases but in different ways. There is the evidence that in Shanghai those with higher status position express less radical but functional egalitarian demand as they view the changes in distributional arrangements as unfair zero-sum game in which some high status groups and privileged citizens appropriate much economic benefits, whereas in China the perception of distributional regime aligns with different variable-social principle and provokes functional egalitarianism with focus on introducing reformist measures for social inequality reduction.

The data shows that in Shanghai those with higher status position express less radical but functional egalitarian demand as they view the changes in distributional arrangements as unfair zero-sum game in which some high status groups and privileged citizens appropriate much economic benefits, whereas in China the perception of distributional regime aligns with different variable-social principle and provokes functional egalitarianism with focus on introducing reformist measures for social inequality reduction.

The paper raises a question of egalitarian demand in the transforming societies such as Russia and China. It involves unique comparative data from the survey of adult population of two big cities (St.-Petersburg and Shanghai) that show the consequences of the dramatic social transformation. The research shows that individualists values and egoistic claims increased so fast in these societies.

Russian society is a telling example of the trends. There seem a lot of 'naked individualism' and alienation in the way people arrange their lives and in social practices due to the institutional changes aggravated by unadjusted rules and norms. The trend is arguable as the phenomena contain traits of pseudo-individualism and a kind of patron-client relationships. The paper searches for explanation in the field of competing theories. Changing paradigm of social development in these societies and the fall of the safety of individuals rather led to the mobilization of traditional mechanisms of survival and self-preservation, with the consequent transfer into modern as well as patron-client relationships. The structural framework in which individuals and groups act is constantly reinterpreted and in this way the social setting acquires new shapes and agency.

Changing Nature of Individualization in Post-Communist Countries

Changing nature of individualization in post-communist countries.

In post-communist countries the process of individualization has been reinforced and accelerated during last two decades. Not denying similar globalizing factors, the extra pushing forces of individualization in these countries seem to be different from those in the western societies. Such forces are encapsulated in the consequences of the democratic social transformation. The research shows that individualists values and egoistic claims increased so fast in these societies. Russian society is a telling example of the trends. There seem a lot of ‘naked individualism’ and alienation in the way people arrange their lives and in social practices due to the institutional changes aggravated by unadjusted rules and norms.

The study reveals that Russian citizens produce more radical egalitarian demand as they view the changes in distributional arrangements as unfair zero-sum game in which some high status groups and privileged citizens appropriate much economic benefits, whereas in China the perception of distributional regime aligns with different variable-social principle and provokes functional egalitarianism with focus on introducing reformist measures for social inequality reduction.

The data shows that in Shanghai those with higher status position express less radical but functional egalitarian demand as they view the changes in distributional arrangements as unfair zero-sum game in which some high status groups and privileged citizens appropriate much economic benefits, whereas in China the perception of distributional regime aligns with different variable-social principle and provokes functional egalitarianism with focus on introducing reformist measures for social inequality reduction.
Emotions and Movement Identity: Emotional Boundaries in Memories of the Global Justice Movements in Italy, Germany, and Poland

Collective memories play a crucial role in movement identity. Next to providing a sense of continuity, these narratives draw emotionally loaded boundaries that distinguish the movement from the outside as well as provide internal differentiations. This paper examines the emotions activists of the Global Justice Movements in Italy, Germany, and Poland attach to boundaries drawn in collective memories. Which emotions are attached to internal boundaries, which to external ones? How does this differ across different constellations of the Global Justice Movement in Europe?

The analysis draws on 48 narrative interviews conducted with Italian, German, and Polish activists in 2011 and 2012. Italy, Germany, and Poland constitute different constellations of the movement with respect to actors, repertoires, and size. The analysis shows that a broad range of emotions are linked to boundaries across countries. In particular, it reveals that the relation between emotions attached to internal and external boundaries varies with the degree of movement cohesion. In constellations with a high degree of movement cohesion emotions attached to external boundaries clearly differ from those attached to internal boundaries: feelings such as mistrust and anger are linked to the first, while trust and sympathy predominate in the second. When cohesion is lacking, emotions linked to external and internal boundaries either converge or are reversed.

Stay or Return, When and Where Family Reunion Will Happen?

Since early of 2000, due to a high demand for their labor, Vietnamese women have dramatically joined and out-numbered men in spontaneous migration streams especially from rural areas to cities and industrialized zones (General Statistical Office 2005b, 2010b). Participating in the movements are not only single but also married women, many of whom had to leave their families behind. General Statistical Office and IOM Vietnam (2012) reported that married female migrants who moved alone to work made up the single biggest group of migrants in their study. However, until now little is known about the group. This paper will contribute to the knowledge gap by exploring the plan for family reunion among mother-migrant/father-stay-at-home families in contemporary Vietnam. Based on in-depth interviews carried out in 2013 with married husbands-wife pairs in the receiving city and the sending villages, this paper counts the commonly-held view of internal migration that migrants moving for work once arrive in the city will try to remain and live there. This paper argues that wife-out-migration for work after getting family consensus does not lead to spousal abandonment. Family reunion will definitely happen often in village of origin due to the commitment to ancestor and elderly, the land or house ownership in the sending village and the unfamiliar feeling with city life. The decision on when family reunion happens tends to be the choice and negotiation of migrant wives while the decision on where it happens more likely belongs to stay-at-home husbands. By claiming that family reunion is certainly happening in the village of origin, this paper also stresses the need to provide more social supports for migrant mothers/wives and their left behinds in maintaining family ties while living apart and readapting into family and community once migrants return home.

Changing Scenario of Bunt Women, a Study with Special Reference to South Kanara of Karnataka, India

The position of women has been different from society to society and from time to time. India is no exception to this. Women in India is essentially feminine and noted for feminine virtue, gentleness and tenderness. Indian women's life encompassed various dimensions of personal, domestic and community life. Women studies in India understood as a body of literature that embodies the concerns for women, equality and development. It seeks to find explanations and the factors, the historical evolution and the present state of women's social position. It strives to find remedies for unequal position of women and the methods to empower women.

Early research on women in India were primarily done by social historians, indologists, anthropologist investigated the position of woman, mainly of the high caste and elite sections of the society and to find the solutions to the social evils like child marriage, sati, the general oppression of widows, illiteracy. Indian society of institutions and practices which were believed to be deterrents to national resilience and progress and which gone India a bad name in western world. Research on women is significant to generate new and organic knowledge through intensive fieldwork. This would help to generate the data essential for understanding emerging areas of academic analysis into higher to neglected sectors. The present paper looks into the understanding and investigation of problems of Bunt Women and her status, problems in a closer way and also an attempt to highlight how Bunt women have undergone a series of changes in her positions and roles and also to know how the Bunt women participate in decision making process of the family, political participation, economic and cultural spheres of life.

Investigating Financial Contagion Links in the U.S. and Eurozone Financial Crises upon Non-High Income Countries

In this paper we are investigating the relationship between high income countries on the one hand and middle and low income countries on the other hand. The paper analyses the effect of financial contagion of the U.S financial crisis of 2008, and later of the Eurozone crisis on non-high income countries. The paper utilizes social network analysis combined with regression analysis. Several hypotheses will be tested: most notably, (1) financial markets (countries with developed financial markets have been affected worse than those who do not have developed markets), (2) trade links (export dependent countries affected more than those with little export), (3) international aid and remittances (countries dependent on aid were hit harder, if aid-flow decreased to these countries). This paper is part of a larger project on the effect of the economic crises (U.S. and EU) on child poverty in middle and low income countries, and therefore, special attention will be given to this matter (inequality, poverty, etc.).

Enhancing Local Users in Water Resources Decision Making in Burkina Faso: How to Modify the Balance of Power

People in the watershed of the Bougouriba 7 are facing multiple issues to ensure their access to water for drinking and irrigation purpose, livestock watering and fishery activities, but also in terms of quality as artisanal mining activities or bad fishing practices led to water pollution. In 2010, a local water management committee, the CLE, has been set up in the context of a broader Integrated Water Resources Management policy developed since 1998 in Burkina Faso. But after its establishment, the CLE remained inactive for 3 years, largely because water was not a priority for its president, the High Commissioner, whose mandate concerns the overall development of a province that is much larger than the Bougouriba 7 watershed.

However, the CLE is meant to be a dialogue platform where representatives of deconcentrated technical administration, decentralized government, users and civil society can discuss local water management issues. Whereas the CLE has been created with the hope that it would «give a way to take over the usual and exclusive focus on an administrative regulation, which puts public authority and its departments at the center of the institutional, legislative, statutory, and normative plans» (MAHRH, 2004) our study shows that local users have still limited
decision-making power which is not an isolated situation as the comparison of 13
other CLE has shown.

In this communication we analyse the process of implementing the CLE to
show that it was not a "bottom up" approach. Then we describe how we have given
voice to users and local stakeholders to express their viewpoints about water
issues in the context of national to provincial administration representatives. As result,
the CLE has been stimulated, the users have pushed and built their own action
plan, some of them envision now to ask for decisional positions in the new board.

Inequalities Faced By Women in IWRM Policies in Burkina Faso and Ghana

The aim of our communication is to show the inequalities still faced by women
in the uses and the decisions related to water management despite their recogni-
tion as central to Integrated Water Resources Management (IWRM). Since almost
20 years, IWRM is at the core of the water policy framework of more and more
countries, specially in Africa. One of the Dublin principles of IWRM includes « par-
ticipatory water resource management and inclusion of women » (Prakash, 2007, 293). The Action Plan for IWRM in Burkina Faso and the National Water Policy in
Ghana insist in the involvement of women in water management. Notably be-
cause of their numerous activities in rural areas they are considered as one of
the crucial components to alleviate poverty and increase food security. Nevertheless,
studies we have conducted in the South West of Burkina Faso and in the Upper
East Region of the Ghana shows that women are still facing inequalities in terms
of access to water and in decision making process about this resource. Several el-
ements lead to this situation : a land tenure in customary and modern systems al-
low them to cultivate small and less fertile lands, at best ; an ineligibility to obtain
large loans to expand their farming and processing endeavors ; a disconnection
between the women that address women issues in the boards of IWRM institutions
from local to national levels, where their integration is weak. We show that a par-
ticipatory modelling approach, called Companion Modeling has been useful to
give them more room to express their voice.

Global Economy Network, Leisure and New Urban Teenager Life Style in Jakarta. -- CANCELLED

This paper is the result of two undergraduate student thesis at undergraduate
program of Sociology University of Indonesia, by using two different methods
which are quantitative and qualitative. "Kongkrong" or hanging out style, 95% agreed to hangout is mails or Seven
Eleven (Sevel) and using Behel (dental braces), Blackberry, and Belah tengah (even god hair style) called "3B" is urban teenager life style preference in jakarta to spend their free time. Hanging out in some places has become urban teenager culture. 63% of them agreed to spend their free time at Seven Eleven (Sevel). Seven Eleven as one of global economy groceries network oversees the business opportunity in Indonesia. They are providing comfortable stools and benches and Wi-fi. It creat-
ed a new lifestyle for urban teenager in jakarta to spend their free time (60%). This lifestyle preference called "anak Sevel". Interestingly, parents have become pri-
mary contributor of hanging out style, 95% agreed to hangout is mails or Seven
Eleven. On the other hand, sociology study about dental brace (behel) found inter-
esting findings. At the beginning, dental brace was used to re-align and straighten teeth. Nowadays, it has become a part of teenager lifestyle beside Blackberry mo-
bile phone and even god hairstyle. Dental brace used as part of dental health be-
came one of lifestyle accessories in particular social class. This teenager lifestyle is
threatening social deviation in association perspective also from health point of
view. Dental brace is sold as one of accessories which are below health quality standard. It expected can increase social status in urban teenager association. Both studies found, teenagers from particular social class want to proclaim their social class status is higher than the others by using "3B" and become a part of "anak Sevel". This social symptom is becoming social prestige for urban teenager
as indirect cause from global economy network.

Embeddedness In Action: The Socio-Cultural Institution Of Gift Giving As a Resource In Consumer Markets

Social embeddedness is often presented in the research literature as framing
economic action, and socio-cultural institutions are portrayed as influencing the
preference function of markets actors, rather than as a flexible resource in the ac-
tual process of economic exchange. But what happens when institutions become
an interactive part of economic action? By focusing and analyzing the context
and content of daily sales encounters in a computer chain store in Tel-Aviv, Israel, this
study presents how and when sellers and buyers mobilize the socio-cultural insti-
tution of gifting to further their diverse socio-economic interests as they buy and
sell. The article divides the empirical manifestations of the socio-cultural institution of gift giving into three phases of the sales process: Pre-sale gifting, closing gifts and post-sale gifting. In each case the distinct mobilization of gift giving is described and analyzed as part of the interactive sales encounter. Discus-
sion centers on the flexibility of gift giving as it becomes a resource in economic transac-
tion, and on the more general claim that the notion of social embedded-
ness of economic action can be strengthened by examining the mobilization of socio-cultural institutions in action, that is as part of interactive sales encounters.

Dances on Hooves: Embodiment and Interspecies Communication through Dressage to Music

Horses and humans have a long shared history, spanning millennia and continents. Once vital to the development of human societies via agriculture, transport and warfare, the horse is now predominantly a leisure animal, partnering humans in sport and other forms of physical recreation. Following on from popular success in the 2012 Olympic Games, dressage to music (DTM) represents a contemporary manifestation of the horse-human relationship. DTM is a form of interspecies dance. Combining the quiet, controlled power of traditional dressage with original choreography and musical interpretation, DTM offers an opportunity to consider some of the complexities of embodiment in action. The ultimate goal of equestrian sport is to achieve “a oneness with the horse, a kind of fluid intersubjectivity” (Birke and Brandt, 2009: 196) and through DTM horse and rider try to achieve this mutual becoming as a form of dance. This paper draws on an ethnography of DTM, including participant observation, interviews and autoethnographic reflections, to consider how the horse-human dance is developed and performed.

If dance is a form of bodily education, then DTM is about training human and non-human bodies, and an attempt to decrease the boundaries between bodies and between species, albeit temporarily. In this paper I consider how DTM, as a form of interspecies dance, encourages human participants to focus both on their bodily movements and on their mental/emotional state, as they attempt to lead their equine partner through the complex dance routine. DTM is a form of competitive sport, which is judged for both technical and artistic merit, and the public performance of the interspecies dance offers an opportunity to consider how the musical interpretation of complex physical practices (dressage, in this case) is produced on and through bodies, human and non-human.

How to Measure Religious Plurality and Mobility in Sub-Saharan Africa? Lessons from Research in Rural Mali

The study of religious affiliation of individuals in sub-Saharan Africa faces distinct challenges to those encountered in Western countries. The strong influence of traditional religions, coupled with the recent implementation of universalistic religions such as Christianity and Islam in West Africa, contributes to the adoption of non-exclusive religious practices (syncretism, religion changes). Even though debates on the plurality of religions and dynamics are present in sociology and anthropology, they are rarely based on statistical data, which would allow measuring the diversity of practices and resulting social differences. Conversely, quantitative studies, although they often collect information on the religion of peoples, ignore the diversity of religious practices and mobility. In this paper, we evaluate, based on a case study, the relevance and feasibility of a statistical approach to religious practices, taking into account the complexity and variability of practices in the individuals’ lives. Our data comes from a population followed over 25.1 years in Southeastern Mali, in bwa villages where traditional and Christian religions coexist.

Text and Contexts: A Pragmatic Approach to the Interpretation of Biographical Interviews

According to the methodological concept of interpretive social research, analysing biographical narratives is conceptualised as a process of re-construction. Methodological writings usually concentrate on theoretical arguments for this approach ("why") and present more or less idealised methodical steps for the procedure itself ("how"). Of course, they can hardly show exactly "how it works". In my paper I will focus on the question what we are really doing by "re-constructing" the meaning of a text. I will suggest a notion of "co-construction" which draws attention to the contexts that are made relevant by the interpreter when she or he produces an interpretation (or better: various 'readings') of a text, e.g. a transcript of a biographical narrative interview. I will introduce a model reflecting on some text-context relations which play an important role in the research practice and will exemplify them by using the case provided by the session organisers.

RC55-882.1

This study aims to explore social backgrounds of domestic violence in adulthood toward female in Japan. Researches of domestic violence against female have pointed out that experiences of violence in their childhood are related to the occurrence of domestic violence in their adulthood. Based on this finding, this research will verify whether this phenomenon is observed as well as in Japan by national sample data, and analyze whether this is related to other factors such as social stratification of origin, home discipline types of father and so on. These analyses are based on the Japanese General Social Survey 2008 (N=2060). This data set includes three types of violence: punched or beaten experience in childhood, punched or beaten experience in adulthood, severely criticized or yelled experience in the past 5 years by their spouse or intimate partner. According to basic analyses, we found that female respondents experienced domestic violence much more than male. For example, 9.5% of female respondents reported that they experienced physical violence by intimate partner or spouse, while 0.5% of male respondents reported. Moreover, 11.8% of female and 3.6% of male reported that they had experienced of verbal violence. We also found that people who were victimized by violence in childhood also tended to experience domestic violence in adulthood, both physically and verbally. In addition, the types of home discipline from father were slightly related to likelihood of domestic violence experiences. On the other hand, social stratification variables didn't directly affect violence experience in adulthood. Overall the findings indicate that their status of origin is less significant when we predict the likelihood of domestic violence in adulthood. Other outcomes about the relationships between social stratification and disciplining will be discussed.
In 1989 the Sociological Institute initiated a longitudinal panel study among parents expecting their first child in 8 settlements in Hungary. In the first phase of the study 300 women in the last trimester of their pregnancy were asked to fill out standardized questionnaires. In the second phase, the families were revisited 3-13 months after giving birth. Then altogether 194 families (both mothers and fathers) for four times a year and received more than 50 in-depth mother interviews were made. From 2011 a 3 year research is funded to (re)continue the study of this special family panel data, to follow up the life history of the families taking part in the research 20 years ago. This data collection aims not only to find and ask the parents, but to involve their children born then, and grown up adults by now. In the 3rd wave 110 families were interviewed.

Our presentation is a journey in time with an interesting account of the societal and demographic changes 20 years after the transition. We give a thorough and detailed picture of the childbearing intentions of both, the parents as well as the young generation. What are the differences? What causes diverging intentions realized their childbearing intention, and what are the reasons behind the postponement or abandoning of childbearing intentions of the young generation.

Testing the Equivalence of Values in Europe with the New PVQ-RR Scale

Investigating whether European societies share common values requires that the values in the first place comparable. Since its inception in 2002 the European Social Survey (ESS) has included a short version of 21 questions to measure ten basic human values (Schwartz 1992). This enabled studying European values across countries and over time. Studies assessing whether and to what extent these values are comparable across European societies have led to partly disappointing results: Whereas it could be shown that associations between values and other theoretical constructs of interest may be meaningfully compared across countries, statistical tests of equivalence demonstrated that value means may not be comparable. Methodologists have suggested that this finding was a consequence of the efforts of the ESS to maintain value coverage while using nonhomogeneous items to measure each value. This might change now. In 2012 Schwartz and colleagues have proposed a refined value theory with 19 more finely distinguished values and a new instrument, PVQ-SX with 57 questions to measure these values. This scale has better reliability properties of the older ESS instrument, takes only 2.5 minutes longer to complete, and most importantly, first results suggest that it displays better equivalence properties across countries and may allow comparing means of at least some of the values across some European countries. The current study investigates the comparability of values in Europe with this new instrument, and enquires if sufficient levels of equivalence are achieved, to study the similarity, commonality or uniqueness of value priorities across European societies.

A Multicultural Perspective on Leisure in the 21st Century – Tradition and Modernity

The paper focuses on the perception of leisure in Israel in terms of time, activity, value, and self-realization. Our aim is to explore the changes in the perception of leisure in Israel over the 65 years of the state’s existence; identify the factors that shape the perception of leisure and styles of leisure in Israel, a young state that has fought for its existence for many years, and whose citizens also experience existential anxiety, and as a state whose cultural foundation combines tradition and modernity, a state whose social fabric includes longstanding new immigrants, minorities, religious and secular individuals. We will explore the leisure culture in Israel and the changes that have occurred in it. This paper may have practical implications for the educational challenge of leisure education that promotes understanding of others, tolerance, and may even pave the road to unity.

The Role of Food Safety Risks in Facilitating Agricultural Transitions: Alternative Beef Production in Alberta, Canada

Alternative beef production in the Province of Alberta, Canada is evaluated in the context of recent discussions of sustainability transitions. By combining the insights of Archer’s sociological Reflexivity/Morphogenesis Theory with Sustainability Transitions Theory, we analyze the findings of a qualitative case study comparing the interviews of conventional and alternative beef producers, treating alternative beef production as a niche operating within the dominant regime of global industrial agri-business. In particular, we highlight the role of food safety crisis events—some of which emerge as a direct consequence of the socio-ecological contradictions embedded in industrial agriculture—represent opportunity windows for the further establishment of system niches with the potential for contributing to sustainability transition. Further, the anticipated common identity among niche producers was not borne out empirically; to the contrary, producers are motivated to support this niche on the basis of a wide diversity of histories, rather than their expansion.

ROBINSON, KERRY* (University of Western Sydney, k.robinson@uws.edu.au)

Reconceptualising Family: Negotiating Sexuality in an Era of Neoliberalism

Based on qualitative research, this presentation examines the complex kinship relations involved in constructing queer families. We focus on the heterogeneities of queer families; the difficulties encountered in association with processes of recognition and how this is negotiated across different contexts within queer families, extended families, and bureaucracies; how sexual subjectivities are articulated within the context of family, and concerns raised by queer families in relation to children’s early schooling. Of particular importance to this discussion is awareness that in a governmental climate of neoliberalism, there are contradictory and competing discourses about queer subjectivities, the child, and constructions of family. The queer subject is frequently and increasingly positioned as a targeted consumer and this consumption extends to accessing foster care, adoption, reproductive technologies, the healthcare system, and education. However, despite the invitation to queer families to be consumers in these contexts, the normative family is still viewed as heterosexual, with queer families continuing to be excluded and rendered invisible in representations of family. Early education should include knowledge of diverse kinds of kinship relations including queer families, non-biological formations of family, including fostering and adoption, and alternative reproductive practices and technologies through which many young children are now conceived. Currently, most early childhood education and primary school curricula in Australia do not reflect the reality of many young children living in queer families and young people and young families and sexuality is critical to children becoming socially informed citizens and politically active members of their communities who can participate in creating alternative and more equitable futures.

DAVIES, SHARYN* (AUT University, sharyn.davies@aut.ac.nz)

Gangnam Style Versus Eye Of The Tiger: People, Police, and Procedural Justice In Indonesia

This paper explores whether people in Indonesia would welcome a procedural justice model of policing, I take procedural justice to involve the quality of police decision-making, the quality of treatment extended by police to the public, and moral similitude between police and citizens. While a large volume of work has been published on procedural justice and policing since Tyler’s model was developed in 1990, this work has been predominantly quantitative (and largely grounded in psychology), and almost exclusively based in the US, the UK, and Australia. In exploring the applicability of procedural justice to policing in Indonesia, this paper extends the geographic scope of the procedural justice model, and provides a richly contextualised and nuanced account of people’s everyday experiences with police within a procedural justice framework. The article draws on data from nine months of ethnographic fieldwork on policing in Indonesia spread between 2011 and 2013. What this data suggests is that people in Indonesia would be receptive to a procedural justice model of policing.

DAVIS, HOWARD* (Bangor University, h.h.davis@bangor.ac.uk)

The Category of Religion in Alain Touraine’s Critique of Modernity

Alain Touraine’s distinctive contributions to sociological theory include his theory of action, his approach to social movements and his critique of modernity which offers a ‘post-social’ approach to contemporary societies. In Critique of Modernity (1992) his vision of the transition to modern society is one of conflict between the technocratic vision of industrial society (system) and new movements to liberation (subject). One of Touraine’s key subjects and focal points of the book is the category of religion and the relationship of religion to the categories of individual, subject and actor; religion, culture and the principle of universalism; and the capacity of critical sociology to capture the self-transforming character of social relations in modernity.

A Case Study in IP Arising in Art/Science Performance Research and Transdisciplinary Collaboration

In this paper, I discuss the projects and practice of the art/science collective Davis & Strathmann as a case study in transdisciplinary, collaborative, practice-based performance and design research with a unique history of unresolved trademark and intellectual property (IP) conflicts between members. Transdisciplinarity is examined through the history of two projects, Sink and Hunter/Symbiosis, as examples of work conceived by Davis and developed for the exchange between members from U.S. and Argentina and as part of a six-week art/science design residency at the Helen Riaboff Whiteley Center, University of Washington’s Friday Harbor Laboratories, highlighting the expertise of project members in audio and multimedia performance and art direction, publishing, concept and visual design, and on the application of these shared practices toward art/science research.

Issues arising from creative practices including divergent views on the role of art/science as documentation, media authorship, process versus product, ethics and professional discourse, and transparency are examined and, specifically, methods of production, communication, administration, and IP leading to the dissemination of the Davis & Strathmann collective. In particular, this study examines unresolved IP challenges after the residency including the abuse of online administrative permissions, exploitation, irresponsible behavior toward the collective identity, threats of legal action and IP misconduct with regard to the exhibition of future work, subversive efforts to deface fundraising platforms, and the withholding of media by collective members for personal gain.

This study examines contributions of members to the above issues, how these issues may have been avoided, and steps taken in preventing the recurrence of IP conflict. In closing, it offers suggested actions and recommendations for resolving complex performance, creative, and strategic agendas addressed by individuals and organizations seeking to avoid IP conflict and to improve communication standards in their field. Supported by the National Science Foundation under Grant No. 1142510.
since its ratification, various parties have deployed elements of CEDAW in an ef- fort to address gender inequality. This paper discuss the progress the country has made since it ratified the convention in 1985 and the ways it has negotiated customary laws and traditional practices, which are often in direct contradiction with the principle of CEDAW. The findings show how the settlement has adopted elements of the convention to improve gender equality, individually or together. This change in their community, and the convention can be further implemented to increase the rights of women in Zambia. This case offers important implications of how multiple agencies can effectively utilize CEDAW as leverage, and at times succeed, in changing negative gender ideologies.

Women’s Capabilities and Empowerment in Lusaka Zambia

Sen (1985) states that resources and agency constitute capabilities, which are the potential that people have for living in the way they want to and of achieving valued ways of being and doing. Drawing on Sen (1985), Kabeer (1999) defines empowerment as the ability to exercise choice, and states that this ability is composed of three interrelated dimensions: resources, agency and achievement. The concept of empowerment has been defined in several ways, including decision-making capabilities, and is often proposed as a way to improve women’s overall wellbeing. For example, due to women’s increasing risk for HIV/STIs, several organizations have promoted interventions that empower women as a way to improve their health outcomes and reduce their sexual risk. This study focused on women’s empowerment and its relationship to sexual risk and sought to delineate the roles of the family and social context in both empowerment and sexual risk. Data from the study, conducted peri-urban settlement in Lusaka, Zambia, includes observations, secondary analysis of in-country newspapers, 60 in-depth qualitative interviews with and the administration of a survey instrument to 205 women in the study community. Findings from this study highlight the complicated nature of the concept of empowerment. Results indicate that the nature of a woman’s relationship with her male partner is a crucial mediating variable in her sexual risk. A positive partner relationship was associated with lower levels of violence and men’s sexual risk behaviors. Further, joint decision making between a woman and her partner was associated with lower risk for HIV, whereas individual decision making by the woman or the man was associated with increased risk for HIV. This study lends support for empowerment interventions that take a holistic approach to risk reduction by not only involving women’s male partners but also targeting changes in societal and cultural norms.

The sexualisation of trans people is a thorny issue due to the pathologizing undertones within sexological literature. After many years of being on the one hand, silenced about sexuality or on the other hyper-sexualized, for fear of being pigeon-holed as unworthy recipients of medical interventions by the medical teams providing healthcare, transsexual and transgender people have started to explore and produce their “sexual bodies” and represent them in novel ways through prose, poetry and pornographic film. The political move to illustrate the wider ‘spectra of desire’ (Stryker, 2006) and experiences of trans-sexuality was announced to be politically important as a way of shifting stereotypical associations surrounding trans embodiment and sexuality generally. These projects of sexual representation rely on transforming spaces and discourses within cultural mediums in which transpeople explore their sexuality. Pornography and erotica are two sites that offer personalized accounts of trans-sexuality that often speaks back to medicalization. I argue, in the words of Kate Bornstein (1994: 163), these erotic productions offer “irreverence for the established order” and incorporate the “often dizzying use of paradox” which underpins my analysis. Using trans erotica texts, I will illustrate that ‘transsexualism’ and ‘transgenderism’ are not solely about gender, as a core characteristic, and suggest that sexuality is part of trans subjectivity too. I will suggest further that new representations of trans-sexuality within the erotic representations pose challenges to the medical policy and practices surrounding trans medicalization and the sedated ideas surrounding transpeople as either non-sexual or hyper-sexual. This focus on erotica allows for new analyses and conceptualizations of trans-sexuality that incorporate bodily aesthetic affects of the transitioned and transitioning body. Simultaneously, under-standing trans bodily aesthetic affects helps us move away from territorializing identitarian markers, such as gay, lesbian and bi and explore a wider spectra of trans desire.

The Revolution Will Be Televised: Youth, Political Protest, and Hip Hop From The U.S. To Egypt –CANCELLED

The impact of hip hop music has transcended borders and transformed global understandings concerning the relationship between music and protest. This paper will use the emergence of the hip hop movement by Arab youth as a lens to analyze the influence of United States hip hop and its subsequent influence on Middle Eastern culture. It examines in particular, the Egyptian rap scene and the crucial role of rap music in galvanizing youth to act and in articulating the betrayal felt by many Egyptians from President Hosni Mubarak’s oppressive regime. The use of hip hop as a form of solidarity and a tool against political oppression was brought to the fore during the Arab Spring in 2011, which set off a number of revolutions in the Middle East and North Africa. Rappers such as El General from Tunisia, the Arabian Knight and Deeb from Egypt, and the Syrian American artist Omar Offendum—frequently point to United States rappers such as 2Pac, Biggie, and Public Enemy as providing inspiration to their craft. I argue that the emergence of rap music in Egypt was fueled by many of the similar exigencies (high youth unemployment, failed revolutionary dreams, and political marginalization) that fueled the development of the hip hop movement in the United States but that its impact on the political establishment has been even greater. The Egyptian hip hop scene that came of age during the revolution showcases how rap music’s influence on citizens and political leadership has evolved in the modern global era. In other words, this paper argues that we can learn a lot about...
the current state of youth led social movements by examining Arab rap music during the Egyptian revolution.

Why Dead Ends May Remain Well-Trodden Paths: Epistemic Hopes and Obstacles in the History of the Delphi Technique

Quite in contrast to any conception of the scientific process as being determined by verification plus adoption versus falsification and dismissal, one interesting feature of ideas in the (social) sciences is the relative inertia that accompanies their identification as dead ends. Even if under relentless fire by a wide array of critics, proponents of a dead end idea can continue to believe in its quality and capacity and defend it against any kind of attack. This might, in some cases, be explained by reference to Leon Festinger's theory of cognitive dissonance, and the historian of science can analyze the ways in which proponents attempted to reduce the dissonance extant between their claims and reality. However, especially in the social sciences and humanities, a clear-cut event that causes the dissonance is missing. The paper proposes to use the concept of epistemic hopes for such cases. As an analytic category, epistemic hopes are the expectations towards capacity, productivity, efficiency, and impact of a scientific idea that guide the author(s) of this idea in its creation and development. Moreover, epistemic hopes can also be used as an explanatory category. They can draw attention away from the flaws of one's own idea and obstruct an objective assessment of its capacity, productivity, efficiency, and impact. In this, they are similar, but not identical to the Gaston Bachelard's epistemic obstacles. Referring to the history of the Delphi technique, the paper discusses the concept of epistemic hopes and its relation to Bachelard's epistemic obstacles.

ARE Water Conflicts Changing The Modern State? Reflections On Informalization In Mexico City

In the past decades, the sociological literature on environmental issues and natural resources has attempted to characterize the demands, the actors, and the international channels used by environmental movements, and in environmental protests and protests. This paper is located in this literature, focusing primarily on water conflicts in a large city of the Global South.

More specifically, using a political ecology framework, the paper explores how the notion of informality can shed a new light on hydropolitics through a discussion of the modern state's relation to non-state actors. The paper compares traditional institutions such as clientelism or electoral promotion with emergent informal practices such as the multiplication of intermediaries and water provision through a network of water trucks ambiguously subsidized by public institutions.

Through an empirical analysis of the various means through which people face hydric stress in Mexico City, the paper offers a reflection on the transformation of the Mexican modern state.

The chronic insufficiencies of the modern state (or of governments with fragile legitimacies) articulated with clientelistic practices channelled through local intermediaries can clearly show how formalization and informalization processes work in a country where formalization was never complete, but where the modern state has a long tradition of authoritarianism. The aim is to better understand the instrumentalization of the water crisis in current state restructuring processes, and its impacts on hydric precariousness.

River Doce: Water As an Environmental Perception Factor

The act of perceiving the environment where one is inserted awakens the notion for co-responsibility of the users, leading them to better understand the interrelationships between man and environment. Of those: cognition, perception and interpretation of levels and dimensions of river Doce's reality, its singularities and importance contribute to the understanding of visible and non-visible transformations, tangible or not, of the landscape, perceived and interpreted as heritage of the people, which must be passed on to future generations. The river Doce that bathes the city of Governador Valadares, Minas Gerais, Brazil, is the 10th most polluted river in the country, according to the Brazilian Institute of Geography and Statistics (IBGE). Currently, its water surface is extremely reduced, at serious risk of collapse. The city supply. Having been raised by its margins, River Doce represents memory, identity, culture and history to Governador Valadares. This study presents the social perception of water manifested in a survey of high school students and teachers from public and private schools of Governador Valadares. Analysis of data collected through the questionnaire allowed the assessment of links between attitudes, values and social practices with regard to the Doce river, natural and cultural heritage of the community. Preliminary information identified in this exploratory study is relevant to the formulation of public and private policies that focus on the sustainable development of the Doce river basin.

The Senses in Scene

The senses in scene.

This article reflects part of the trajectory of the collective Theater of the Instant, associated with the research group Poetics of the Body, from the Department of Scenic Arts at the University of Brasilia. This group, since 2009, gathers researchers and artists around the processes of scenic creation, and exercises inter-disciplinarity through the interface of theater and other areas such as literature, music, aesthetic computing and new media. It also aims at experiencing processes of reception, with research dedicated to provoking the spectator's different senses, and other aspects of experimental dramaturgical treatments.

This group's creation presents itself as a unfolding of the research begun by my doctorate in anthropology, which is described in the book Being in Scene: Flower in the Wind: Etymology of Hybrid Looks. The book took from training in traditional techniques such as the shinto-ho, a bodily education of Japanese origin that aims at rescuing and maintaining the body's sensibility and the yoga of voice, a technique that unites chanting traditions of indian, indigenous and african cultures.

The contact with these outlooks offers an exercise in displacement, the construction of a gaze and a body that transform day-to-day life and the situations of aesthetic performance.

In this friction between traditional and contemporary knowledge there is a focus on experience, with an emphasis on perception and the relationship with the senses, both in those responsible for the performance and in those watching it. There is an exploration of new sensorial experiences and an intention of expanding the potentiality of interaction and communication with the other. A notion of body-memory is at work, looking to create a field of activating imagination so that the fragments of each other's life-stories emerge in the direction of a web of fictional dramaturgic constructions.

Keywords: experience, senses, body-memory, imagination.

A Pharmacist without Sweets. Bending Incentives to Enlarge the Scope of Practice of Pharmacists in Primary Care

To improve patient safety in primary care regulatory agencies aim to enlarge the scope of pharmacists in primary care in the Netherlands. We started a study to measure the effect upon patient safety of the employment of clinical pharmacists in practices of general practitioners (GPs). For this study, we had to define the exact position and role of the clinical pharmacist in GP practices. We set two conditions. The first condition was to align the incentives for patient safety with pharmaceutical care. The second condition was to create a stable jurisdiction for the clinical community pharmacist.

The particular position of the clinical pharmacist in primary care in the Netherlands is a perfect case to conceptualize incentives and interests as ‘incentresses’. Financial incentives are important features of the position of pharmacists in the community pharmacy. In addition to financial incentives, an uncertain jurisdiction shapes the professional behavior and identity of pharmacists.

To conceptualize the ‘incentresses’ for medication safety, we conducted a literature study, analyzed policy documents and did a pilot study. In this pilot study, the first author acted as clinical pharmacist in GP practices. The data were analyzed with the agency theory in institutional economics and by sociological theory of new professionalism.

Based upon the analysis we came to the following intervention. From 2014 onwards, we will employ ten clinical pharmacists in GP practices. As the pharmacists have a fixed income, they have no incentives to dispense medication nor to stop medication. In addition, the clinical pharmacists will become part of the community of GPs as they share the offices and their case notes within the GP practice.

Domestic Violence and Rationality on Small Islands

Quality of Governance in Domestic Violence Policies in Small Island Development States (SIDs): A Case of the Dutch Caribbean

small island development states and territories face special difficulties in taking care of domestic violence policies. Characteristics of governance need their own fine tuning in a context of fear, a sensitive subject, and small scale territories, where everybody knows each other, professionals, public servants, politicians, victims and perpetrators. From a rational choice perspective we look at how professional and public servants in such a context deal with conflicting values, public service motivation, incidents and the public's view. How do the values of politicians and street-level professionals relate and what care institutions and juridical institutions do matter? The qualitative research (40 interviews with professionals and public servants) took place in the three Dutch Caribbean islands (Bonaire, St. Eustatius en Saba) in the context of the intended ratification of the CV90-Treaty (European Treaty against Domestic Violence and Domestic Violence). From an external perspective the coping strategies found could suggest irrational elements, while they were rational from an insular cultural perspective. Conflicting modern and traditional value systems slow the quality of governance.

DE CABO, ANNELIE* (University of Gothenburg, Sweden, annelie.de cabo@socwork.gu.se)

Prostitution Policy in Sweden

In 1999, Sweden became the first country in the world to adopt a law that criminalizes the client in prostitution – but not the person offering sexual services. Since then, Finland, Iceland and Norway have adopted similar legislation, making it illegal to purchase sexual services but not to sell them. The wording of the Swedish Sex Purchase Act is gender neutral. However, the law was politically motivated and created a gender disparity perspective between men and women of women selling sex to men, and prostitution was constructed as a part of the patriarchal oppression of women. In contemporary time, the law is largely uncontroversial and has been officially accepted across the political spectrum. However, questions regarding the effectiveness of the law remain somehow unanswered.

In this paper, the “language of prostitution” in a Swedish context is put under scrutiny and is analysed in relation to gender, ethnicity and sexuality. Drawing on empirical data consisting of interviews with Swedish police officers and social workers, my analysis indicates that the implementation of the Sex Purchase Act differs from those in the draft works. Firstly, practitioners do not seem to perceive the law as a mean to achieve gender equality. Instead, they cast prostitution as a ‘human problem’ and how they apply the law is largely dependent on stereotype notions that exist on certain groups involved in prostitution. Secondly, analysis shows that the enforcement of the law is highly gendered, racialised and sexualised. On a practical level, the law is used in a much larger extent in relation to men buying sex from foreign women working in Sweden, and used as a strategy for border control. In relation to men buying sex from men, however, the practitioners do not comprehend the law as applicable at all.

Social Networks and Popular Movements in Brazil

Brazil witnessed, in 2013, a growing wave of social manifestations that spread throughout the country, initiated by secondary school and college students, the movement took over an increasingly large dimension petitonalized mostly by the use of social networks. With diverse causes, the movements revealed a generalised popular insatisfaction, which is compared to that of specific historical moments of the country, such as the movement Diretas Já and the support towards the impeachment of president Fernando Collor de Mello. This article specifically intends to discuss the appropriation from the popular manifestations of a concept created by an advertisement campaign launched by and automaker on the 1st half of 2012 (N=294), reveal their aspirations in the work sphere. We use a quantitative data obtained by means of a framework of work values, similar to those that have been used in the World Values Survey research. We are mapping the main work values between this group. Inglehart’s thesis was observed in significant valuation question “interesting work”, however, in this group, there is still a predominance of aspiration “job security”. The data express a transversely this scale of values when analyzing the differences between the social origins, gender and scientific area of each course. Is important to note that this is an exploratory study, it is worth while track for future studies aiming to better understand the various dynamics experienced by university students, among them the aspirations in the sphere of work, as well as adjustments of these values throughout the process transition to adulthood.

DE DEKEN, JOHAN* (University of Amsterdam, J.J.DeDeken@uva.nl)

Nudging Wage Earners into Accepting the Burden of the Financial Crisis: The Politics of Choice and the Individualisation of Retirement Risks

During the last two decades of the 20th century a shift in the finance of old age pensions, from a PAYG logic towards a funded strategy based on equity finance, appeared to be a miraculous solution to the problem of an ageing society. Countries with a tradition of social insurance engaged on a path of gradually replacing the second tier function of their public pensions by privately funded occupational pensions. Countries with a Beveridgian tradition removed the PAYG elements from their funded second-tier by reforming their funded DB schemes (tampering with the indexation to wages and inflation of individual contributions and benefits), or by altogether closing down DB schemes and replace them by DC systems (in an attempt to limit the back-servicing liabilities that form a PAYG element in funded DB schemes). During the final decade these changes seemed to come at no cost to future pensioners, as stock markets were booming. But following the dot.com crisis with a turn of the century the first dark clouds started to appear, and after the banking crisis the risk, uncertainties and transaction costs of individualised forms of funded retirement provision became apparent. One way that policy makers seem to have sought to make these new risks and burdens, that individuals increasingly are exposed to, acceptable to the population, was to masquerade them under the mantra of individual choice. The paper investigates how this individualisation has taken shape in a number of different kinds of welfare states: Germany, Australia, the Netherlands, Sweden and the United Kingdom. It not only looks at the attribution of various risks, but also at measures that attempt to counterpose adverse effects of expanding individuality and responsibility: the myth of myopia and bounded rationality of the pension plan participants, and the possible opportunism of private providers of pension products.

DE JONG, BART* (Municipality of Haarlemmermeer, bart.de.jong@haarlemmermeer.nl)

Understanding Amsterdam Airport Schiphol through Controversies

Due to its ambiguous multi-actor character, the decision making process concerning complex governance systems, such as Amsterdam Airport Schiphol (AAS), is experienced as being incremental and highly indicative. That is why in these cases collective arrangements of involved stakeholders are often created to give advice on how to tackle these complex problems. In this paper I would like to stress that complex problems and policy deadlocks cannot be resolved by the use of specialist knowledge and technical expertise. Even the opposite may be true: There is a multiplicity of stake associated with specific issues while, at the same time, there are often disagreements about values, norms, objectives, research, information and knowledge; leading to complex and unstructured problems. This means that reductive solutions are not available.

To shed a different light on Schiphol's deadlock situation, I will use the Actor Network Theory (ANT). ANT not only takes the mutually intertwined impact of facts and values, governance and governance systems for granted, but it is more

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
focused on (collaborative) politics in the making through socio-technical contex-
tories. I will use these theoretical insights to analyse the quest for an alternate
route design for the Schiphol Spijkerboor departure in 2009-2010. Redesigning
this departure route became focal point of a major controversy between the
concerned actors. The case will point out that decision-making processes should
focus on the distribution of complexity, as a multiplicity of stakes and divergent
perceptions arise, disagreements, ambiguities and uncertainties ensure that the
decision-making process takes place in an undefined area somewhere between
facts and values, where science and politics are mutually intertwined. By shifting
the focus from ‘studying complexity’ to ‘studying the disposition of complexity’,
deadlocks can be understood in a different way, leading to new insights on how
to break free from them.

Scale Effects in Workplace Innovation

Workplace innovation is defined as the implementation of new and combined interventions in work organisation, HRM and supportive technologies, and strategies to improve performance of organisations and quality of jobs. Previous research into the relationship between workplace innovation and organisational performance. Through OLS regression we empirically tested whether firm size moderates the relationship between workplace innovation and organisational performance. We used a sample of 1,132 Dutch firms. Our database consist of variables from The Netherlands Employer Work Survey (NEWS; 2010) and balance sheets for non-financial firms (NFO; 2010 and 2011) collected by Statistics Netherlands (CBS). Organisational performance is operationalized as the labour productivity growth, employment growth, and growth of return on capital. Firms are categorised into four size classes: micro firms (<9 employees), small and large firms (10-249 employees) and large firms (≥250 employees). Workplace innovation is measured with four sub-constructs: strategic orientation, flexible work, smart organising and product-market improvement. We find a combined effect of firm size and strategic orientation on labour productivity growth. In terms of labour productivity growth strategic orientation is significant more beneficial for small and medium sized firms compared to small and medium and large firms. Additionally, the result show a combined effect of firm size and product-market improvement on labour productivity growth. For micro sized firms product-market improvement seems to have a negative effect on labour productivity growth, whereas it has a positive effect on labour productivity growth for small and medium and large firms. Furthermore, we find an interaction effect for firm size and product-market improvement on employment growth. For large firms product-market improvement has a negative effect on employment growth, however it has a positive effect on employment growth for micro and small and medium firms. This indicates scale effects exist and policy measures aimed at stimulating workplace innovation should differentiate between size classes.

Farmer Approaches to Animal Welfare: Understanding on-Farm Animal-Human Relations

In the last three decades, livestock production practices have risen to importance in scientific, political, and public debates on sustainable development. Topics of debate related to livestock farming’s environmental impact, food safety and security, and animal and human health have received considerable socio-
logical attention. Animal welfare issues, and particularly the farm animal-human relations implicated in these, have only recently become a topic of sociological scrutiny and remain under-theorised – despite an increasing public and policy attention for animal welfare. This paper aims to contribute to the understanding of approaches to animal welfare by a group of actors who see animal welfare as particu-
larly consequential for farm animal’s well-being: farmers. The paper argues that
to date studies of farmers’ stands on animal welfare have focussed too little on how these stands are informed by farmers’ embodied, and socially and material-
contextualised interactions with the animals. In this light, the paper develops a practice-oriented framework that allows for an analysis of the situated dynamics of farmers’ animal welfare approaches. Drawing on qualitative interviews with Belgian pig farmers about their implementation of EU animal welfare legislation that required them to group-house their gestating sows, the paper dis-
cusses how farmers ‘negotiate’ an amalgam of political, ethical, socio-economic, and practical demands when designing and managing their daily interactions with the sows. Furthermore, the paper analyses how farmers’ understandings of their sows’ welfare experiences and needs were affected by their daily interactions with these animals in the context of the new sow housing system. Moving beyond un-
derstandings of farmers’ involvement in animal welfare governance as economic rational actors or as rather passive recipients of governmental and market-based

norms, the paper ends with a reflection on the scientific and policy implications of its more situated understanding of farmers’ animal welfare approaches.

NEWMAN, KATHERINE (Johns Hopkins Krieger School of Arts and Sciences)

The “Born Free Generation” in South Africa: Vulnerabilities and Aspirations -- CANCELLED

Almost twenty years after the end of apartheid, South Africa remains one of the world’s most unequal countries. Despite promises of a ‘better life for all’, racial and class inequalities continue to shape young people’s identities, life chances and dreams for the future. ‘Black’ and ‘Coloured’ youth are especially vulnerable, with high levels of school drop-out, unemployment and large numbers of ‘discouraged work seekers’. The situation has given rise to a new moral panic around the country’s exceptionally large youth cohort. Yet little is understood about how ordinary young South Africans experience their reality of un(der)employment in the context of transformation and promises about upward mobility. This paper draws on 18 months of ethnographic research with 6 young South Africans of the so-called “Born Free generation” in the Western Cape. The study provides rich insights into the participants’ current life trajectories and their families’ back-
ground. Detailed family histories enable us to unravel how differences in racial categories, geographical location, and class influenced the decisions people made at the time of the transition. Such decisions continue to affect the socio-economic position of many young people today. In-depth research also enables us to focus on individual trajectories, for example, in the search for employment. The paper describes detailed trajectories in search of work and the “swallowed” patterns of youth transitions through employment stages. The discussion identifies gaps in our understanding of life with long term unemployment or constant short term employment, problematizing the ways in which employment or unemployment are generally measured and the category of young adults “Not in any kind of Employment, Education or Training”. The work notes severe psycho-social con-
sequences for young adults in un(der)employment, and offers detailed insights that are relevant to policy discussions about a Basic Income Grant or Youth Wage Subsidy in South Africa.

- Est-il légitime qu’il participe ou non aux J.O. ?
- Est-il avantagé par ses prothèses de jambes, au détriment des autres athlètes non appareillés ?

L’analyse des discours de cette controverse médiatique montre qu’Oscar Pistorius pose un problème de catégorisation anthropologique. En effet, tant qu’il court dans la catégorie “sport adapté”, il ne suscite aucune réserve. Par ailleurs, la controverse ne porte pas sur le fait qu’il soit handicapé, car dans l’histoire plusieurs handicaps physiques ont participé à des Olympiades sans provoquer ni rejets, ni débats. Mais pour la première fois, un sportif produit ses performances grâce à un appareillage technologique rajouté au corps et celles-ci se rapprochent des performances des sportifs “valides”. Ce faisant, Pistorius remet en question les imaginaires sociaux définissant la place des personnes handicapées ; elles sont « moins » que les personnes dites “valides”. Il oblige ainsi les sociétés à s’interroger sur la place des personnes qui, suite à un accident, une maladie, ou un choix personnel, vivrait avec un corps “augmenté” par une hybridation technologique.

Demography in the Early 21st Century: An Insight from French Doctoral Theses in Population Studies

French demographers have played a major role in the development of quantitative techniques in demography. More recently, population studies have more expanded to other social science disciplines and qualitative approaches have flourished in many countries. How does demography relate to population studies in recent doctoral studies in France? Which topics do these studies address? In which institutional context are they realized? To answer these questions, we draw on a database of doctoral theses defended in France during the last decade (2000-2012). This database has been built using the French Documentation University System and related indexing language. The topics are classified in 14 categories. Among 851 references, 746 theses have been selected and are analyzed using EXCEL, SAS and IRAMUTEO software. Analyses performed include principal component analysis and textual analysis.

Results show that the number of doctoral theses per year is relatively constant, with fluctuations due to institutional constraints. Doctoral students are mostly female (59%). Tendency of researches in six main geographic poles reflects the structure of demography training. Demography is the main discipline (65%) followed by sociology, geography, political science and economy. Studies on mortality and health tend to involve more modeling and to be more associated with population structure whereas fertility is often analyzed in conjunction with family and sexuality and tends to more frequently adopt a gender perspective. By contrast, migration, which represents the most frequent topic, is more associated with culture, minorities, using qualitative approaches. It also addresses issues related to environment and territory. This analysis provides insights into population studies boundaries as well as the way disciplines complement each other. In the longer term, our database should be completed with theses prior to 2000. It may participate in the constitution of a comparative international database of doctoral theses in population science.

The Membership in the Italian Democratic Party

Several parties throughout the world are democratizing their internal life. The most recurrent tools to this aim are the primary elections to select candidates and party leaders. This process of democratization has accelerated the decline of the party members figures. For this reason, the new key actor has become the “selectorate”, in which the members seem to have lost power compared to the figure of supporters. This paper tries to explain the role of the party members by using survey data relating to a web-survey carried out to the members of the Italian democratic party. We interviewed more than 13,000 members with regard to their relationship with the party (participation and activism), the use of information (including new communication technologies) and their role during the electoral campaign.

Community and/or Versus Gemeinschaft? about the Emerging Problems By the Translation of a Concept from ‘Central’ to ‘Peripheral’ Cultural Spaces. the Case of the Sociological Work of Gino Garmn

Community and Gemeinschaft certainly made a long and prolific way along the history of social sociological theory. They still remain key concepts, in the space of these theories and also in the broader political and cultural debate. These trajectories were not linear, and were marked by the deepest divergences between cultural fields as well as within them. Thus, Dewey, the authors of the Chicago School of Sociology and Parsons, in (North)American cultural field, and Torinns, Weber, Piessner and Königs, in the German one (among many other names that could be mentioned here), overlapped different layers of meaning on a conceptual construct which invariably refers to ways of living together, usually (but not always) positively connoted.

For very complex and historical reasons, it is an indisputable fact that both cultural fields (German and North-American) were for a long time (and still are even today) "central" in relation to other cultural fields, as the Latin American, which were so located as “peripheral”. In ways that still could only be exploratory, this paper aims to analyze some of the problems of translation which necessarily emerge whenever Gemeinschaft and Gemeinschaft concept were reappropriated, and created, re-contextualized with new meanings by different Latin American social theories, in also different historical contexts of problematization, since the 40s of last century to the present times. Special attention will be given to the work of the Italian-Argentine sociologist Gino Garmn, who in the 50s of the last century gave a strong impetus to what was then called “scientific sociology”, in strong connection with “modernization theories”.

Collaborative Governance in Intersectoral Strategic Planning for the Development of Healthy Public Policies: A Case Study of the Ontario Food and Nutrition Strategic Alliance

Society’s wicked problems are complex and intractable problems whose resolution depends on a whole-system approach that involves many actors from various policy sectors. The ability to undertake intersectoral policy action rests on the collaborative processes and structures of governance. The Ontario Food and Nutrition Strategic Alliance offers an excellent example of a system-wide initiative to tackle one of society’s most pressing wicked problems: failure of the food system to support healthy living and a vibrant regional economy. OBJECTIVE: To understand how, and to what extent, a multi-stakeholder strategic alliance is able to create and sustain the necessary conditions and requirements to undertake intersectoral strategic planning at a system level, as viewed through the lens of collaborative governance. METHOD: Yin’s qualitative case-study method is used, entailing three data-collection techniques: a review of documents; direct observation; and semi-structured interviews. Dimensions of interest include (1) stakeholder engagement in terms of level of diversity of perspectives, extent of agreement on goals, and degree of articulation of operating terms; (2) shared motivation in terms of trust, mutual understanding, and commitment; (3) capacity for joint action in terms of leadership, resources and governance structures and procedures; and (4) other factors supporting collaborative-governance sustainability. EXPECTED RESULTS: This case study will yield insights as to the enablers, barriers and lessons learned regarding the further development of collaborative governance arrangements. This knowledge will highlight opportunities to move beyond silo-based administration towards viable means of intersectoral collaboration for effectively addressing society’s wicked problems, and in particular, for building a strong and diverse food system through which to promote healthy eating, help prevent chronic diseases, and ensure both economic and environmental sustainability.

Human Rights as Capabilities. From Political Philosophy to Sociology. CANCELLED

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
In our global world, domination and critique use the same vocabulary: the "human rights discourse" has become a general framework of political conflicts. How can sociology deal with this new aspect of the "objective spirit" (as Robert Fine puts it) of our times? Sociology must overcome the traditional dismissal of human rights as an abstract universal masking Western imperialism. Nevertheless, the critique of formalism and hegemonic distortions is more than ever necessary. On the epistemological level, two discussions are to be connected: the discussion inside the political and legal philosophy on the idea of rights (Sen, Raz, Habermas...); the discussion of legal sociologists on the efficiency of legal institutions in a globalized world. The "Capability approach" to rights can be a fruitful approach if we supplement it with a pragmatic, institutionalist and pluralist sociology. On the empirical level, we should use the Capability approach in order to overcome the legalistic conception of human rights. Implementation of rights is more than sheer application of a legal rule; social control of human rights implementation is more than the establishment of social standards. Movements on the meaning of the rights are quite important (the "right to food sovereignty", for instance, in the "Campesino movement"). If used by a critical sociology, human rights can be an efficient way toward global justice.

DE SOUSA SANTOS, BOAVENTURA* (Colegio San Jeronimo, bsantos@ces.uc.pt)

Boaenware DE SOUSA SANTOS: Para descolonizar Occidente

Modern Western thinking is an abyssal thinking. It consists of a system of visible and invisible distinctions, the invisible ones being the foundation of the visible ones. The invisible distinctions are established through radical lines that divide social reality into two realms, the realm of "this side of the line" and the realm of "the other side of the line." The division is such that "the other side of the line" vanishes as reality, becomes nonexistent, and is indeed produced as nonexistent. Nonexistence means not existing in any relevant or comprehensible way of being. Whatever is produced as nonexistent is radically excluded because it lies beyond the realm of what the accepted conception of inclusion considers to be its other. What most fundamentally characterizes abyssal thinking is thus the impossibility of the co-presence of the two sides of the line. To the extent that it prevails, this side of the line only prevails by exhausting the field of relevant reality. Beyond it, there is only nonexistence, invisibility, non-dialectical absence. To decolonize the West offers a fundamental theoretical synthesis to question and reinterpret the modern Western thinking.

DE TERRSSAC, GILBERT* (UNIVERSITE TOULOUSE 2 CETROP CNRS, detersac@yahoo.fr)

Syndicalisme Face à l'organisation: Un Paraodxe?

The trade unionism and the organization in the sense of all the decisions and the choices which structure the work maintain a critical and sometimes distant relationship. On the one side, the trade unionism seems always late with regard to the organization. On the other hand, the employer holds the monopoly of choices and ways assigned to implement them, with the exception of the zones of dialogues planned with the labor union in the various committees, but we can summarize the labor-union intervention in his participation.

By leaving of spaces pulled by our studies in the territorial public service, we clarify on one hand, one news forms of the trade unionism which we call "trade unionism of organization"; it is situated between the trade unionism of opposition and the trade unionism associated with the power and it differs from the trade unionism of control (Touraine, in 1962). Supported by groups of exchanges and confrontations with union activists, we clarify on the other hand, in which and under which conditions the work of the union activist allows to act on the organizational causes of the organizational skids, of the degradation of the professional situations and the deterioration of the health.

The union activists are not against rules, but for working rules on the condition of participating in their training and negotiating them: on one hand, they react to the individual requests of the agents to analyze it as a faintness of the organization and on the other hand, act on the organizational deviations by trying to stand out as a normative power. The trade unionism tries to build controversies on choices and decisions taken by the managers and be recognized as competent to discuss these choices.

Brazil, Colombia, and Venezuela. Policies against Poverty and Inequality: A Comparative Analysis of Results 2000-2010

After the Lost Decade, Latin American countries started to explore innovative strategies aimed at reducing poverty and social inequality. Their search was conducted with a certain degree of independence from the dictates of multilateral organizations, which lead to two trends: (a) a renewed confidence in the state's capacity to guide social planning; and (b) a rejection of the rigid fiscal austerity measures typical of structural adjustment plans. This study looks at three countries: Brazil, Colombia, and Venezuela and their attempts at improving the social conditions of the poor. Special attention is paid to key policies implemented by each government: Family Grant in Brazil, Families in Action in Colombia, and the Social Missions in Venezuela. Flagship policies in Brazil and Colombia are of the Conditional Cash Transfer type, whereas in Venezuela, most social spending is channeled into a direct-service model. Attention is also drawn to reforms in social security: the three countries have all procured important reforms in pension regimes aimed at allowing non-contributing citizens, such as the elderly at risk, to draw welfare benefits. The reforms also seek to incorporate informal sector workers into social security. Data for the period 2000 - 2010 reveal that each country has made advances against poverty and inequality: poverty rates have declined and so have Gini coefficients. However, no key policy has been able to drive a substantial number of workers into the primary labor market, nor have they resulted in the expected vigorous participation by beneficiaries in the administration of policy at local levels. So far the policies' effects have been mostly compensatory. Reforms in social security have aided some targeted populations though statistics regarding the inclusion of informal workers into social security are vague and inconclusive.

Socioeconomic Mobility and Household Welfare of Female-Headed Households in Eastwood, Pietermaritzburg (South Africa)

Drawing from life-histories of female heads of households (FHHs), this paper examines social mobility and household welfare of FHHs in the community of Eastwood, which is historically a working class community in Pietermaritzburg, South Africa. This paper broadly assesses the working and dynamics of social mobility regimes against, on the one hand, the milieu of South Africa's increasing inequality and poverty, and, on the other, the context of increasing feminization of poverty and the workplace. As individuals squeezed by market forces and neglected by the state, I pay particular attention to the social networks and associations which female-headed households in the community of Eastwood belong to, invest in, and how they benefit from them. I also closely interrogate the kinds of exchange, sharing, reciprocity, trust and support systems that characterize these networks and associations that contribute to household welfare and socioeconomic mobility. Following Waite's (2000:155) assertion that FHHs cannot be understood as those entities associated with globalization as well. This 'culture' is being commodified and consumed and, in a certain way, represents Japan's modus

DEBNAR, MILOS* (Kyoto University, Graduate School of Letters, milos.debnar@gmail.com)

Skills, Occupations, and Inequalities Among the Europeans in Japan

In this paper, I consider the cases of skilled European migrants in Japan and attempt to deconstruct the image of highly skilled and privileged group often associated with them. The paper is based on empirical research among 56 migrants residing in Japan conducted between 2009 and 2012. Similarly to, for example, Shanghai (Farrer, 2010) the unvarying picture of the privileged elite from the West is getting distorted through increasingly diverse migration flows as well as persistence of the nationalism. Whereas on the basis of their residency status or Japan's standard occupation classification, the jobs many of my interviewees hold are classified as professional or high-skilled, they often engaged in very specific jobs characterized by their culture. Many Europeans in the job market are seen primarily as authentic bearers of the 'foreign' or 'Western' culture to Japan and, for this reason, are being commodified and consumed and, in a certain way, represents Japan's modus

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
vivendi of engaging with the global world. On the other hand, access to other spheres of job market is constrained by strong expectations of the majority population seeing the foreigners as intrinsically ‘other’, temporary sojourners rather than possibly more permanent residents possessing also professional skills not related to their culture as well as particularities of the Japanese job market such as high importance of the school to work transition in the career formation.

Consequently, such a closure of the Japanese job market produces a new class of skilled migrants located in segregated job niches that are not exerting the skills for which they are praised in policies and public discourse. Their positions are less privileged and inequalities with the majority population as well as other, more typical high-skilled migrants such as expatriates are produced.

BENVENUTO, GUIDO* (Sapienza University of Rome, guido.bvenenuto@uniroma1.it)

Continuity and Innovation in Higher Education. the Case Study of Sapienza University of Rome

The paper involves a secondary analysis of longitudinal data of administrative type for a description of the phenomena of student late performance and dropping out.

It focuses on the career of students enrolled in specific key moments before (from academic year 1991/1992 to 2000/2001) and after the DM 509/1999 - a drastic reform - (from academic year 2001/2002 to 2006/2007) at Sapienza University of Rome. Each of these batches (about 410,000 student enrolments) was monitored up to the official closing date of academic year 2006/2007. The analysis take into account ex novo enrolments, excluding both the re- registrations and students who have already obtained another degree. Longitudinal analyses (the generational approach) allow us to individually monitor students in a single generation for a number of years, reduce the risks associated with aggregate data.

The aim behind this research design is that the longitudinal perspective is able to provide an accurate frame of student curricula (that are monitored at intervals of six months) and to reconstruct the potentially relevant events to the outcomes of their university career. Longitudinal panel studies monitor the same generation of students (that is an aggregate of students enrolled during the same year) over several years; consequently these strategies are able to offer quite more accurate results because they reduce the risks related to the utilization of aggregate data.

From a practical point of view, we analyzed how the DM 509/1999 was introduced and implemented within and by the university organization (analyzing a wide variety of phenomena such as dropping out, delayed and decreasing graduations). From a methodological point of view, we came to the creation of longitudinal multidimensional models of the students’ careers, aiming at identifying the “mechanisms” through which an initial state $t_0$, a subsequent state $t_1$ is generated.

Police Officers’ Conflict Management and Restorative Justice

Generally, citizens call the police when things happen that deviate from normality and (may) lead to all sorts of conflicts. In particular, interpersonal conflicts have to be solved by police officers. Consequently, police officers’ respective conflict resolution activities need to be sustainable and fair to prevent conflicts from new and repeated outbreaks. Restorative justice approaches refer to the idea of sustainable and fair conflict resolution, e.g., by defining principles of restorative justice. However, there is only scarce literature on police officers’ daily conflict resolution.

The focus of this study is to analyse how police officers’ conflict resolution skills are practiced and to investigate whether police officers’ conflict resolution practices are sustainable and fair. A descriptive research design was applied, and which obstacles occurred during conflict resolution. Interview data were analyzed using grounded theory methodology. The research shows that police officers use cooperative as well as dominating strategies of conflict resolution. More obstacles are formal requirements and citizens’ role expectations of the “typical police officer”. Furthermore, restorative principles of restorative justice and police officers conflict resolution practices. Study findings can be used for police officers’ conflict management training.

DEGUCCI, HIROSHI* (Tokyo Institute of Technology, deguchi@dis.titech.ac.jp)

Toward Next Generation Social Systems Sciences - from Cross Cultural and Science of Artificial Points of View -

In this presentation, we focus on cross cultural analysis of social systems as a social science of artificial. There are many sociological ideal types and its systemic properties that are developed by sociology and social sciences systems. These models are sometime considered as cross cultural ones but sometime not. Compared to social systems, sociology dose not depends on rational nor normative standpoint. Where do the universality of the ideal types and its systemic properties come from? That is a basic question for social systems theory and the reason we need more cross cultural consideration and talks. Besides the cross cultural universality of the theory, we have to consider another universality of the theory for constructing new generation social systems theory. Nowadays our society is becoming more artificial day by day. On the one hand each society has its historical root, but on the other hand we are constructing artificial new global society. We have to design our society and life world from “as is” to “to be” by ourselves as something artificial. There is no sacred canopy. How the process should be analyzed, how it can be managed and what type of theoretical concept should be constructed? That are open and serious questions for social systems sciences.

We focus on basic concept of sociology such as individual, self, reference group, family, organization, society, social norm, micro macro link, meaning, role taking, function, structure etc. How these basic concept can be constructed in the artificial context and cross cultural context. We reconsider these systemic properties from theoretical and a cross cultural point of view.

Beyond Shame and Guilt Culture to Globalised Solidarity: Reappraising Keiichi Sakuta’s Sociology of Values As A Galapagosized Sociology

Keiichi Sakuta (1922) is Professor Emeritus at Kyoto University and one of the most influential sociologists in post-war Japan. In my presentation, I reconstruct the key ideas of

1. **Sakuta’s Social Theory**: Sakuta’s theory is based on the idea of a “shame culture” where individuals feel a strong pressure to conform to societal norms. This culture is characterized by a fear of being judged or criticized by others.

2. **Sakuta’s Sociology of Values**: Sakuta develops a sociology of values to understand the changing social norms and values in Japan. He argues that the traditional values of shame and guilt are being replaced by new values such as individualism, transparency, and a more flexible morality.

3. **Globalization and Post-War Japan**: sakuta emphasizes the impact of globalization on Japanese society. He argues that the post-war period brought new values and norms that challenge the traditional shame culture.

4. **Galapagosization**: sakuta introduces the concept of “galapagosization” to describe the process of Japan’s transformation into a post-war society. This term refers to the process of adapting and absorbing external influences while maintaining a unique identity.

5. **Reappraisal**: In this presentation, I will reappraise Sakuta’s sociology of values by placing it within a global context. I will examine how his ideas have influenced cultural studies, and how they relate to contemporary debates on globalization and post-modernism.
to Sakuta, people feel shuchi (embarrassed) when they are alienated from both reference group (state) and membership group (intermediate group) and lose their organisational support. As a result, these people seek solidarity that is not based on strong organisation.

Although Sakuta developed his inquiry into shuchi in line with post-war Japanese modernisation and mobilisation, in my presentation I reappraise his sociology as an innovative theory of solidarity in the age of globalisation.

DEUGCHI, TAKESHI* (The University of Tokyo, deuguchi@u-tokyo.ac.jp)

Critical Theory and Its Development in Post-War Japanese Sociology

In my chapter, I examine the process of the adoption of Critical Theory and its unique development in post-war Japanese sociology from the perspective of the theoretical response to capitalist modernization. In Far Eastern Japan, nearly all theories of social sciences have originated overseas since the government opened the country to the West and capitalist modernization began with the Meiji Restoration in 1868. In general, the adoption of social theories and their unique development has natural biases resulting from the social-cultural structure and development peculiar to the adopting country. Japanese society has been characterized by a historical situation never observed in Western countries: too rapid capitalist modernization. In particular, the post-war rehabilitation and economic growth have been so swift that during the process of rapid modernization, pre-modern feudal elements co-existed with the late modern—or sometimes seemingly post-modern—circumstances of mass society. That is, the power of democratization, which was imported from the West with outside pressure after the Second World War, remained at a superficial level of society and did not reach the foundation of the social structure. Hence, Japanese critical sociologists continued to have a sense of criticism against superficial democracy, which did not establish itself firmly in post-war Japan; and it is those critical sociologists and their critical sociology that I examine in my chapter. 'Critical sociologists' refers to those in the field of sociology who have developed a critical social theory under the strong influence of German critical theorists such as M. Horkheimer, T. Adorno, E. Fromm, H. Marcuse, J. Habermas and A. Honneth. To explain the uniqueness of this Japanese version of critical sociology, I will introduce it in comparison with Habermas's reconstructive approach, the concept of 'dialectical constructivism' or the 'dialectical constructive approach'.

Neoliberalism, Social Christianity and the State in Singapore

This paper explores the complex interrelationship between Christian organizations and neoliberal policies in the context of the island-city-state of Singapore. It departs from an understanding of the Christian rather than globally homogenizing, neoliberal ideas, practices and policies, which are embedded in specific socio-economic and politico-institutional settings and thus bring forth local variation and hybrid forms that are mutually constituted and evolving. In this regard, the Singaporean neoliberal model of governance can serve as an interesting case study as it manages to co-exist with two seemingly opposing logics: high levels of state intervention and regulation on the one side and the strategy of pursuing economic growth at all costs through deregulation, liberalization and privatization on the other. What emerges is a type of hybrid state, in the form of the neoliberal-developmental state, where neoliberal logics of the free market and the ideal of national communalism are deeply intertwined.

This form of governance has affected the relationship between Christian organizations and the state in considerable ways. On the one hand, the Singaporean government exercises strong bureaucratic and legal control over the functioning of all religious matters, therefore limiting the freedom of action for Christian organizations. Yet, on the other hand, Christianity is recognized and valued as a constructive social and stabilizing moral force within the multi-confessional and multi-ethnic Singaporean polity, which in turn has led to public-private partnerships between government agencies and Christian organizations. This paper argues that Christian organizations in Singapore have become to function as important non-state sites that do not negate neoliberal restructuring, but re-embed neoliberal logics by addressing social needs and providing certain social services that have gone unmet by the state. Empirical examples will be given from my ongoing Ph.D. project on Pentecostal organizations in Singapore.

DEITCH, CYNTHIA* (George Washington University, deitch@gwu.edu)

Displaced Workers in the Great Recession and Not-so-Great Recovery: Gender, Race, and Class Inequalities in the U.S. Labor Market

Early in the recession (2008-2009), OECD data showed much greater unemployment among men than women in many industrialized economies, leading to a media narrative of a “mancession” whereby men were depicted as suffering much more than women. Kang developed his critique on gender inequality was due to the higher concentration of men in sectors experiencing greatest job loss such as mining, construction and manufacturing. By 2010, reports showed men doing better than women in the recovery. Looking back over a quarter or yearly snapshot from the recession-recovery period over time, I examine how gender inequality in the U.S. labor market increased, decreased, or remained unchanged.

The media narrative of the mancession missed complex and intersecting dynamics of gender with race and class based inequalities. Men who lost job were disproportionately non-college, blue-collar workers. As among men, certain groups of women such as single mothers, non-college, and racial-ethnic minorities, were more likely to experience job loss and less likely to find new jobs than college educated white counterparts.

My research uses data from the 2010 and 2012 Displaced Worker Surveys (DWS), a supplement to the U.S. monthly Current Population Survey in January of even numbered years. In these statistically representative U.S. national sample household surveys, individuals are asked if they lost or left a job in the previous 3 years (covering 2007-2011) due to: a plant or facility closing, a layoff, or the abolition of their position or shift. Data were collected on household and individual demographic, economic characteristics, on wages and other characteristics of the lost job, on re-employment including characteristics of the new job. I conduct multivariate statistical analyses to examine intersecting race, class, and gender effects on (a) incidence of job loss, (b) patterns of post-displacement employment, and (c) changes over time.

DEITCH, CYNTHIA* (George Washington University, deitch@gwu.edu)

Mistreatment of Immigrant Workers in U.S. Workplaces: Are Discrimination Lawsuits Against Employers a Viable Remedy?

In many parts of the world, immigrant workers do not have access to the same legal protection against mistreatment by employers as citizens, and undocumented workers have less protection than "legal" migrants. Lack of access to legal protection is due in different contexts to varying combinations of shortcomings in the law itself, lack of enforcement, and to obstacles to making claims.

Currently, in the U.S., although it is illegal for undocumented immigrants to obtain employment, "illegal" workers are nonetheless protected (in principle) by U.S. anti-discrimination laws regardless of of immigrant or immigration status. While there is no civil or human rights protection against discrimination based on immigration status for se, immigrants are protected, to a degree, by laws banning discrimination based on race and national origin, as well as sex, religion, age, and disability. However, among many other obstacles, those who complain risk deportation. Additionally, immigrant workers are concentrated in low wage industry and occupational sectors where labor law and civil rights law violations are rampant.

Some scholars and human rights advocates find U.S. employment law, and the U.S. Equal Employment Opportunity Commission (EEOC) as the equal rights enforcement agency, inadequate to protect vulnerable immigrant workers. However, in recent years, the EEOC has filed and settled a growing number of employment discrimination lawsuits on behalf of immigrant workers, many of whom are undocumented. Most of these cases involve charges of sexual and/or national origin harassment. Harassment, in some of these cases includes threats or incidents of sexual and other physical assault as well as verbal and psychological abuse.

The lawsuits have resulted in significant monetary awards, court-mandated work enforcement agency, inadequate to protect vulnerable immigrant workers. How-
and migration flows from the Spanish Statistical Bureau). The analysis combines cross-section tests, focusing on 2001, and a longitudinal enquiry (focusing on the period between 1986 and 2008). Malaga illustrates the case of an international coastal destination developed by the real estate and the international touristic services sectors. We also examine the cases of two inland territories, Segovia (near Madrid) and Zamora, in order to contrast the role of second homes in two rural environments with different recent demographic trends. Results: In the case of the Mediterranean coast, the development of international tourism led to a real estate boom based on the purchase of second homes by foreign people. Many Spanish families also attractively buy a second home, which would be used as an asset and as a resource for family strategies (retirement of the elderly, emancipation of youth), contributing territorial restructuring processes.

In the case of inland second homes, there is a great complexity based on the degree of tourism specialization and the strength of counterurban mobilities. Demographic dynamics make second homes to play either a residual function in a context of depopulation or a revitalising role for new developed areas.

**Secondary Spanish Teachers: Advances of a Research on Educational and Professional Guidance**

This paper constitutes a first approach to a research project submitted to the Ministry of Economy and Competitiveness, in the call for research grants within the State Program of Research, Development and Innovation for funding corresponding to the State Program for the Promotion of Scientific and Technical Research, I + D + i.

Our goal is to present the progress of an ongoing research whose purpose is to analyze the social and cultural representations that influence teachers in the role and practice of counseling students, both educationally and professionally. It means to examine these social and cultural representations in order to identify guidance models deployed and practiced by teachers, according to the characteristics and socioeconomic and cultural conditions of the environment. So, with job opportunities, aspects such as the location and characteristics of schools, the social origin of the school population, its cultural capital and ethnic background, or gender ideology, become relevant in this analysis, due to its impact on the interaction between students and teachers and, consequently, in the construction of the valuations that teachers offer about students.

In this first approach to the phenomenon, we have chosen four autonomous regions: Balearic Islands, Basque Country, Andalusia, and Madrid to try to develop a typology of teachers' curricular models, considering the existing socio-economic sectors in the Spanish territory.

**A Federation for Informal Workers: Networking Workers Across Global Labour and Global Production**

This paper positions the Federation of Homeworkers Worldwide (FHHW) as a new organisational form within the global labour movement. The FHHW collaborates with a range of union and NGO organisations to support new organizing amongst informal, low paid women homebased workers in a broad range of sectors and global regions, although a large extent of its work has been in the textile, garment and footwear industries.

The over-representation of women in informal and precarious work suggests that the gendered nature of global production remains an important site of investigation. This is further informed by the challenges to understand how workers may gain legitimacy or assert influence in the global production network (GNP). The purpose of this paper is to describe and analyse the role and activities of FHHW within the global labour movement, to understand how it supports women’s networks to build new labour organizing for women. Through our examination of the efforts of FHHW in India, we illustrate some recent initiatives to establish and build organisation of Sumangali and camp labour textile workers in Tamil Nadu, India. Trade unions appear to have little presence in these mills and have been further marginalised by the employer strategies to keep unions out. NGOs in the Tirupur region have been actively campaigning on this issue since the early 2000s, but little progress has been made towards collective organisation.

The paper explores the question of why there is a need for a federation of informal workers and examines how it functions with minimal resources to work with informal worker groups, which in turn reveals important lessons for unions and human rights groups around the possibilities of organizing with few resources and employing participatory, grass-roots strategies as opposed to top-down approaches.

**The Refusal of the Vegetables Consumption : A Resistance Act ?**

We shall present an analysis of an experimental action of supply in fresh vegetables and premises implementation, in France, by one of the actors of the food aid. This experiment is connected with the will of an appreciation of the food of the disadvantaged said social classes. The consumption of vegetables (the set of three : hunger / bad balances food / problems of health) allows to build the Other one, “poors”, as radically different from ourselves and seems to serve as measure and to « make border ».

Considering the actors in presence: beneficiaries, volunteers, persons in charge of grocer’s shops, in their culinary practices and respective food representations, taking into account their routes and statuses ; observing food retailings in social grocer’s shops of the Southwest and the Central France, the concrete organization and the means of the grocer’s shop, we question the idea of the lack of taste of the beneficiaries for vegetables; suspected, of having none of it, and thus of foiling the initiatives.

It is during these daily relations voluntary / responsible for grocer’s shops / beneficiaries and within the framework of the intrinsic relations of power in the food network, as much as in routes and statuses of the profitable persons, that takes place the way the food practices build themselves.

Between the lines, we shall highlight how the border builds itself between the “good eaters” and the “bad eaters”. The representations of a “good food” revealing in hollow the “bonuses” or the places in the society that are looking for those who get involved there, particularly, the volunteers and those who refuse it, to whom this action is supposed to benefit, the beneficiaries, these categories sometimes confirming itself.

**Creative Parenting in Transnational Families and the Gender Diagonal**

Having followed immigrant families (coming from North Africa), in France, in Belgium and in the Netherlands over long periods as ethnographic observer and biographical-narrative interviewer, I have recurrently been impressed by the crossway of the parents’ project for a better life; for themselves, for their kin at home, and especially for their children (boys and girls) whom they invest with the responsibility of carrying on further this project. This project drives all their courses of action under harsh life conditions. Deprived of “capital” such as money, education, or “useful connections” (all “objective” resources), they can only mobilize their “subjective” resources, that is to say: themselves, their energies, their reflexivity, their character and creativity. A lot of creative parenting takes place in their homes.

In patriarchal societies where these parents come from, gender contrasts are very sharp. They entail differences in the hopes and aspirations that are projected onto sons and daughters by father and mother. Initially, fathers will tend to project upon their sons their own frustrated upward mobility aspirations. They expect good grades at school. Some sons will live up to their father’s expectations; but others will not, while some of their sisters will do better. In such cases the father’s hopes will move over the years from his son to his daughter. It is this phenomenon that we have come to call “the diagonal of generations”, or “the gender diagonal”.

This comes on top of the human society’s differential discrimination, which is stronger on boys. To avoid the damaging consequences of rivalries between brothers and sisters, and eventual splits, parents have to find ways to teach them to resist stigmatization (or “discredit”). We will show how family relationships are continuously shifting, under these dynamics, necessitating a continuous effort of creativity in parenting.

Analyzing Recurring Themes in a Life Story with Social Context in Mind

Every life story tells about the history of a person who has lived in a given social niche of a given sociocultural model. Thus sociocultural models may be built upon a lot from it about this social niche and cultural model; especially if multiplying life stories lived in the same social context. In analyzing the life stories I have collected myself, I usually follow three main steps. First, as Bertoaux (2007) indicates, I reconstruct the chronology of life events, which during the interview have usually been mentioned according to some semantic associations rather than strict chronology. Secondly, through thematic analysis I’ll look for recurring themes; their very recurrence usually signals crucial processes (e.g. discrimination, selection) out there, in the external social world. Thirdly I’ll look for hints, indices, clues about social processes out there; e.g. constraints, limits to action, social process by contrast. My search then is for initial cues for action, of action. Bertoaux states that a life story should be read and re-read many times while focusing - and trying to imagine - patterns of social relations ‘out there’ that shaped it. I agree, but I also pay much more attention to childhood. Indeed I believe (with Wordsworth, Nietzsche, Freud …) that the child – i.e. childhood - is the father of the adult. A given childhood includes many keys which, if unaveled, will prove very helpful in deciphering the grown-up adult’s inner workings. Another issue is about turning points in the course of life. As Hareven and Masaoka have shown, from happening out of nowhere through impact of some external event, turning points in life usually result from a slow maturation taking place in the inner space of psyche.

Are National Parks Inherently Unequal? the Reform to Parks and Its First Application in Metropolitan France

In France, many conflicts have marked the genesis of national parks enabled by the Law of 1960, right up to the blocking of their creation or had a lasting effect on their existence (Larrère 2009). In an attempt to overcome the local resistance that inevitably accompanies having a natural site classified as a national park, the French government passed a new Law (2006) which grants greater power to local elected representatives, explicitly recognizes the rights and knowledge of local users, and invites them to participate in actually defining the park project.

Our research into the creation of the new Calanques National Park, however, points up that the application of these new principles actually reinforces the environmental inequality that they were meant to reduce. How should we interpret this apparent paradox? The goal of this paper is to outline the interacting processes at work in the park's creation that exacerbated local environmental inequalities. We will look at both the weight of procedures and the more structural factors behind such inequality.

We will show how the consultation procedures adopted tend to reproduce the asymmetry of the public sphere (in the Habermasian sense) that developed throughout the 20th century around the protection of the Calanques. They as such helped institutionalize in the park project the dominant norms through whose lens certain uses seen as “worthy of a park”, whereas others are downgraded. In a related vein, the new National Park label has re-increased the environmental value of the surrounding neighbourhoods, further boosting their new appeal. This process has even affected the poorest areas and led to a relocation of the most economically distressed populations outside the site, meaning far from the natural amenities that had formed the bases of their living conditions.

A Panamazonian Project Facing the State? Particularities and Constraints of Indigenous REDD+ Proposal

As globalized economies develop new forms of intervention in the Amazon, various levels of governance to further their encroachment, halting the abatement of “indigenous space” (Chirif, 2006) seems both ever more urgent and highly implausible. Payments for ecosystem services (PES) expand as a paradigm for environmental management in the biome, REDD+ being one of its most ambitious experiments (Corbera 2012). PES schemes are contributing to change not only the framework that relates to natural resources but also the value of “natural” assets. These transformations lead to further changes in indigenous peoples’ recognition, legal rights and economic opportunities.

Indigenous peoples networks detain different praxis in order to protect themselves from disposessory process (Li, 2010). Facing the national-state has always been hard for their movements. One of their main strategies to gain influence was to change the scale of their intervention (Pieck, 2006). In 2009 a proposal for “holistic management of forests”, that seeks to adapt REDD+ objectives to indigenous worldviews, is presented by their umbrella organization, the Coordinator of Indigenous Organizations of the Amazon River Basin (COICA).

States engagement in the climate regime can be seen as a ‘denationalized state agenda’ (Sassen 2006), as they actively participate in new kinds of trans-governmental partnerships and highly specialized convergence in regulatory issues. Tropical countries are adopting new institutional arrangements aspiring to receiv climate financing in the form of cooperation and new business opportunities. How do Amazonian States currently read indigenous peoples’ proposals regarding territorial management? What can we learn from indigenous movement’s practices facing green economy? Based on fieldwork both in the UNFCCC and in Peru and Bolivia, this paper seeks to contribute to a reflection on the role imagined for and attained by communities with diverse approaches to the biophysical environment.

Indigenous Peoples Facing Climate Change Policies: The Struggle for Autonomy of « Forest Dependent » Communities

While globalization of both extractive capitalism and indigenous rights policies has deepened during the XXI century, contention over access and control of “environmental” and “natural” resources in indigenous territories is escalating around the world. Since the national becomes a more complex site for the global, the specific and deep histories of a country become more, rather than less, significant and hence produce distinctive negotiations with the new endogenous and external global forces (Sassen 2006). In this context, how do indigenous peoples struggles for their communities deploy at different levels of governance? Which social meanings can we find in the diverse political spaces where their movements intervene? In this presentation we would like to tackle these questions analyzing the Amazonian indigenous peoples participation in the global climate change policy debate.

On the climate change regime, one of the most ambitious international policy scheme is being negotiated under the acronym of REDD+ (reducing emissions of deforestation and forest degradation) (Corbera 2012, Berstein and Cashore 2010). In this framework indigenous peoples and “local” communities are presented as forest dependent people attaching issues regarding their rights and livelhoods to the conservation of forests. How do indigenous peoples movements see this process vis-à-vis their will for autonomy and demands of respect for their worldviews? This presentation is based on fieldwork with indigenous peoples organizations of the Amazon Basin both in the United Nations Framework Convention on climate change negotiations (UNFCCC) and at national and territorial level in Bolivia and Peru.

Biocultural Diversity and Agriculture: Reflections on Worlds in Movement

Since the 1990’s, we have experienced an increased amount of literature presenting case studies that explore de relationship between human beings and nature from the point of view of biocultural diversity and agricultural practices. There is also a recent academic literature on global projects defining alternative worlds to the dominant model called “Western-liberal-modernist ontology”. That literature labels those projects as “political ontologies” or “worlds in motion”.

South-South Statistical Cooperation

This presentation proposes to examine on the current state of South-South cooperation in the production of statistics in matters related to development. Based in part on the author's fieldwork in Africa, Central America and South East Asia as well as a literature review, this presentation would like to reflect on some current and upcoming challenges in technical cooperation. Taking the stance of a political sociology of the state in so-called developing countries and of a critical study of the international system, this presentation will examine issues related to bilateral and multilateral cooperation between countries in the "South".

Surveys and census are an area generally acknowledged to be still mainly dominated by "Northern expertise". However, current research show that South-South cooperation in statistics is emerging terms in both of knowledge and technology. The paper argues that South-South cooperation in statistics not only offers potential for the development of a new kind of knowledge, but also for the development of a new kind of technology. The paper also argues that South-South cooperation in statistics is not exempt from possible issues (such as the reproduction of schemes of dependence) which this contribution will reflect on.

Killin without Hatred? the Social Construction of the Consent to Kill in Modern Warfare

Killing other people is not something trivial. Therefore, the military organizations spend a great deal of energy in order to prepare the soldiers to this prospect. As J. Butler recently put it, they do so by constructing "frames of war", i.e. meaning structures that regulate the military "economy of compassion". This paper aims at identifying the frames of war at work in the new Western way of war. The literature on this issue suggests that the Western modern frames of war are subject to two contradictory dynamic. On the one hand, modern warfare seems to be deeply engaged in the path of rationalization of violence and reification of the enemy. On the other hand, a discourse is (re)emerging which frames the Western wars as "humanitarian". The paper tries to understand whether and how the latter affects the former. It does so by focusing on a particular case study: the frames of the French soldiers who participated to the war in Libya in 2011. The research relies on forty semi-structured interviews with military leaders and fighter plane pilots. The analysis reveals a dominant frame which shows great sympathy for the population as this is not the object of the military mission. It also shows that the soldiers are deeply engaged in the path of rationalization of violence and reification of the enemy.

Le « Clone » Dans Les Romans De Science-Fiction, Support De
Le handicap psychique » donne lieu actuellement en France, après des expériences similaires aux Etats Unis, au Québec, et en Hollande, à une expérimentation qui remet en cause bien des habitudes dans les services psychiatriques : il s'agit de la création de fonction de « médiateurs de santé pairs » en santé mentale, « pairs – aidant » professionnels, c'est-à-dire anciens malades, en cours de rétablissement, chargés de travailler au côté des soignants des hôpitaux ou des services psychiatriques ambulatoires pour aider les patients.

L'expérimentation est sans nulle doute portée par une utopie : déstigmatiser la maladie mentale, montrer l'utilité des savoirs et points de vue profanes dans le processus du soin, créer un nouveau métier sur la base de l'expérience de la maladie et du rétablissement. La reconnaissance et la mise en œuvre d'un type inédit d'compétence remettent en cause nombre d'apriori symboliques et économique de la relation de soin. L'évaluation de ce dispositif est en cours, mais on peut déjà analyser les difficultés idéologiques et pratiques qu'il révèle en s'y confrontant et parfois surmonte.

Children As a New Witness of Disasters: Drawing the Experiences of Van Earthquake 2011 Turkey

For a few decades the experiences of children have been gained more attention by social sciences scholars. From the social constructionist point of view, it is asserted that their everyday experiences shape their sense of self and their views of others, events around them and the society as a whole. However it must be added that the culture and region are also important factors that affect the world view and the other things listed above. In this presentation it is aimed to explore the children's view of disaster by depending on both their drawings and expressions in the case of 2011 Van Earthquake in Turkey. This earthquake has some specific features in some senses. This City is located at the Eastern Anatolia and the density of Kurdish ethnic group is higher. Since then it can be assumed that the culture and region are also important factors that affect the world view and the other things listed above.
The Politics of Religion in Turkey

According to the World Values Survey, the percentage of Turkish citizens who consider religion to be important in their lives increased from 61 percent in 1990 to 81 percent in 2001. This data indicates that Turkish people have become more religious than they were ten years ago. Although founders of sociology, including Emile Durkheim and Max Weber, have argued that religious beliefs and practices would decline because of modernization, why was this not the case? What happened during this period of time? In the face of rapid modernization, why did Turkish people become more religious?

The country of Turkey serves as a sociologically and culturally illuminating, theoretically inspiring, and historically timely case study for an analysis of the relationship between modernization and secularization. Turkey is a modern republic moving towards becoming member of the European Union.

In addition to all these unique characteristics, Turkish history is a compelling test case for the relationship between the politics of religion and collective memories of religious and secular past as well. Late Ottoman Empire (1876-9123) tried to construct an Islamic identity. The Modern Turkish republic was immensely devoted to educational and social efforts to secularize Turkish society by creating a secular national identity from its foundation in 1923 until 1950. Although these efforts were reduced after 1950 because of democratic elections, they would keep continuing in a diminished capacity until 1980. After the political and social liberalization of the 1980s, Turkish Republic tried to construct a Turkish-Islamic synthesis emphasizing collective religious memories of Late Ottoman Empire.

After 1980's, reactivating collective religious memories has provided an opportunity for religious movements to emerge in Turkey. My paper examines this emergence by analyzing the relationships between the politics of religion and collective religious memories.

Women's Lives behind a Migration Story

The main aim of this study is to understand how women's lives change in terms of authority, power and gender roles after their husbands' migration from Fatsa (Turkey) to Nagoya (Japan) since the beginning of 1990s. In this regard, the research question of this study is how women's lives change in terms of authority, daily life practices and gender roles after the migration of their husbands. Otherwise stated, this study inquires whether male migration empowers women's lives; especially the control of the household in terms of decision-making processes in the family issues and if yes to what extent it takes place. This research question also provides an opportunity to shed a light on a further point to grasp the meaning of the whole picture of women's lives. Although, male migration has similar impacts on women's lives in different parts of the world, how do women develop different strategies from the other cases to handle with the absence of men in Fatsa? In other words, what makes this study different from the others? How do women experience the process of migration from Fatsa to Japan? Perception of the migration process by the women is essential to focus on as it can be argued that this process is the point where everything starts to changes in women's lives.

The process of taking the decision of migration to Japan, specifically the city of Nagoya, and women's strategies to handle with this decision and process will be discussed from the perspective around this point.

Narrations of the Shooting Death of Trayvon Martin and the Trial of George Zimmerman as Intersectional Challenge to the School-to-Prison Pipeline in the United States

Reactions to the shooting death of unarmed seventeen year-old Trayvon Martin in February 2012 and the not guilty verdict in the trial of George Zimmerman in July 2013 could be heard throughout the United States and around the world. In Al Jazeera, Susan Abuflah, a Palestinian writer, wrote: "Japan is awpiercice the dis- gards and the disrespect for the black body runs through this whole case. It runs through this country and transforms itself to adapt to the times."

On August 12, 2013, U.S. Attorney General Eric Holder announced that the Justice Department, with the Department of Education, "to confront the 'school-to-prison pipeline' and those zero-tolerance school discipline policies that do not promote safety..."but instead lead to the criminal justice system. Reactions to the death of Martin and the announcement of a new approach to the disciplining of youth are acknowledgements of the systemic use of violence to control people of color in the United States.

While many accounts of the Martin/Zimmerman case have focused on race as a central theme, some have pointed to race as it intersects with gender and/or age. A narration is constructed so that it resonates with an audience, thereby providing a kind of truth. Intersectional analysis complicates a narrative, but it also provides a nuanced view of societal violence/power as well as a vantage point from which to exercise agency and bridge the research/practice gap.

Using content analysis of media from around the world, we identify multiple ways in which the Martin/Zimmerman case has been narrated, focusing on intersectionally-framed accounts that along with race point to gender--masculinities deployed--and/or age—youth/adult to make sense of the violence. Statistical data on incarceration in the United States will be used to show the relevance of the narrations to the school-to-prison pipeline.

DEMPSEY, DEBORAH* (Swinburne University, DDempsey@swin.edu.au)

Global Relational Dilemmas and Commercial Surrogacy

Commercial surrogacy continues to be illegal in a number of developed Western countries such as the UK and Australia due to concerns about the exploitation of women and children. At the same time, commercial ART clinics patronized largely by Western clients (many from Australia and the UK) have flourished in developing countries such as India and Thailand due to the more lenient regulatory frameworks and the lower costs of services for intended parents.

This transnational commercial use of reproductive technologies is generating a range of what I call 'global relational dilemmas'. These include the creation of stateless and parentless children when mismatches occur in countries' laws, implications for children born of these processes, the heavy, yet undefined distinction between 'commercial' and 'altruistic' surrogacy in some Western countries such as Australia hampers thinking through creative solutions to the global relational dilemmas generated by international surrogacy. Based on empirical social research into surrogacy use by Australian gay men, along with analysis of internet-based sources such as surrogacy blogs and websites, I explore the relational and kinship work performed by clients, managers and clinicians in commercial surrogacy settings. This is with a view to thinking through what might constitute sustainable transnational practices in family formation through commercial surrogacy that respect the human dignity of the children born, surrogates, gamete donors and intended parents.

Expanding Labour Market Effect Measures: Measuring Distance to the Labour Market As Increase or Decrease in Barriers Hinder Access to the Labour Market for the Unemployed

Do Active Labour Market Programmes (ALMP) reduce the number of barriers hindering unemployed persons entering the labour market? Studies show that ALMPs have little, non-existent or negative effect on unemployed persons who have been assessed by their case worker to have problems besides unemployment. These studies typically use subsequent employment or reduced welfare benefit dependency as effect measures.

There are no validated effect measures that include steps before actual entry to the labour market; steps in which the unemployed may come to feel healthier, happier, more confident etc. Therefore I develop and test a graduated measure of unobserved labour market status. The measure explicitly factors in a complex set of barriers assumed hindering entrance to the labour market for unemployed individuals. The measure consists of internationally recognized measures of and questions on well-being, health, and happiness supplemented by questions on e.g. subjective feeling of readiness for work. Indeed, among the group in question, issues in these areas of life are widespread, and so focusing on these aspects may show other results regarding the effects of ALMPs than previous research.

I test the measure as an indicator of distance to the labour market in three ways: I: 1) analyze data from a panel survey on a sample of 4,400 unemployed from Copenhagen, Denmark, with waves in 2013 and 2014; 2) assess whether the measure is a good proxy for future employment using detailed data from administrative registers, and 3) compare the measure to findings from qualitative interviews with case workers and unemployed.

In developing the measure, I draw on marginalisation theories in viewing unemployment as degrees of marginalisation from, at the one end, social exclusion from the labour market and, at the other, social inclusion in the labour market, where health and related problems act as a barriers against inclusion.

A Home-Based Dietary Intervention for Chinese-American Cancer Survivors

Cancer is the leading cause of all deaths among Asian American populations in the United States (CDC, 2013). Asian American cancer patients and survivors are more likely to develop aggressive, recurrent, secondary cancers, cardiovascular disease, and other chronic diseases compared to non-Hispanic Whites. Consequently, more Asian American cancer survivors will experience cancer diagnosis and live a longer life after treatment. Studies also confirmed that cancer survivors generally are more likely to develop progressive, recurrent, secondary cancers, cardiovascular disease, and other chronic diseases compared to non-Hispanic Whites. Consequently, more Asian American cancer survivors will experience cancer diagnosis and live a longer life after treatment.

Studies also confirmed that cancer survivors generally are more likely to develop progressive, recurrent, secondary cancers, cardiovascular disease, and other chronic diseases compared to non-Hispanic Whites. Consequently, more Asian American cancer survivors will experience cancer diagnosis and live a longer life after treatment.
insecurity, especially when it impacts the community's most precious resource - children. We find that community environments matter over and above characteristics of individual families and that family and neighborhood traits combine in ways consistent with the poverty paradox. Our next steps include gaining a better understanding of the mechanisms underlying our findings as it will aid in our understanding of how community resources in disadvantaged areas can be leveraged to alleviate food insecurity and thus improve the health and achievement of children.

Health Insights Across the Life Course of Oglala Lakota Elders: From Wellness to Illness

In my research with 25 Oglala Lakota Elders (22 women and 3 men between the ages of 55 and 98 years of age) living on the Pine Ridge Indian Reservation in South Dakota in the United States, I employed an qualitative Indigenous methodology called the Conversational Method. The recorded conversations ranged between 1.5 hours and 9 hours in length. Elders were directly approached and recruited from nine elder meal sites throughout the reservation, through snowball methods with friends and family members of the elders and from cultural community events. The narratives were analyzed using thematic analysis. These American Indian elders faced great adversity over their life course in terms of social conditions and weathering the federal assimilation strategies asserted on their communities throughout the 20th Century. The elders reveal the modes of food production (Europe and Americas), living in the childhood years, they reside on family homesteads where they raised farm animals and grew their own vegetables. This self-sufficiency gave way to federal food programs in their adult years leading to increased experiences of chronic diseases. Modern life on the reservation has moved away from communal living and caused a great deal of strain on health of the elders. Many of the elders lived alone and struggled to acquire adequate healthy foods, which negatively impact their physical health. Additionally, the elders had limited access to formal health care for much of their lives and they traced the early years of being nurtured by their grandmothers with traditional medicine to the shift to western medical care. The elders struggled to navigate western medicine and shared the confusion of living with chronic diseases in a resource poor environment. Tracking these changes across the life course reveals sites for intervention to positively impact the health of Lakota elders.

Medicine, Hybrids and Management in European Hospitals

Abstract
This paper examines the changing character of hospital doctors and management across Europe and explores the concept of professional ‘hybrid’. The relation between physicians and managers has undergone changes over recent decades, in the wake of the now well entrenched new public management reforms and newer governance arrangements. We are seeing in many countries what has been termed the ‘hybridisation’ of medical roles with doctors increasingly taking on managerial responsibilities (Dent, Kirkpatrick and Neogy 2012). This development, however, is one that is variegated as between countries. In this paper we examine the cases of Denmark, Germany, France and England and explore some of the reasons for the similarities and differences. The paper draws largely on research collected within the European COST Medicine in Management (IS0903) network.

Rice-Fish Coculture for Environmental, Economic, and Cultural Well-Being

Rice is one of the staple grains that feeds the modern world, and as such holds a very important place in agricultural systems internationally. Because rice is such an important dietary element, particularly in Asian countries, it has also become a foundational cultural component. As populations across the globe expand, however, the demand for rice has increased drastically, and while technology and modern farming methods have resulted in higher yields of rice, this comes at a severe environmental and sociocultural costs.

Rice paddies are a significant source of several environmental pollutants, including pesticides and fertilizers. Industrialized methods of growing rice have compounded this problem by pushing out more traditional, sustainable practices. Interestingly, some of these ‘old’ ways of growing rice can have similar yields to modern cropping systems while utilizing far fewer externally sourced inputs, resulting in less pollutants exiting the system and becoming problematic in the surrounding environment (Xie et. al, 2010). This could be extremely useful information given current environmental concerns, as well as providing an avenue for cultural retention of traditional systems.

Specifically, a form of time-honored rice cultivation known as ‘rice-fish coculture’ has been studied as a way of reducing the environmental impact of rice paddy cultivation while maintaining high yields in order to provide economic security. Additionally, the reintroduction of rice-fish cocultures offers the opportunity for cultural revival and diet diversification. For example, rice-fish coculture was practiced in China for thousands of years and was recently designated as a Globally Important Agricultural Heritage System (GIAHS) praised for its ecological, economic, and social functions. (Koohafkan, P. & dela Cruz, n.d). This system provides an excellent opportunity to combine traditional knowledge and practices in a way that will increase the sustainability and viability of small, rural rice paddy operations.

‘Aesthetic Labour’ in the Emerging Labour Market

Since the onslaught of globalization, the emergence of new service industries have attracted ‘single women migrants’ towards sectors such as retail services, hospitality, beauty parlors etc. These newly emerging service sectors have become one of the major employment areas of women that accelerate the process of single female migration to urban centers. Thus, globalization has blurred down the stereotypical gender roles and reconstituting itself by inventing a new category called ‘aesthetic labour’ which is in fair demand in the labour market.

The aesthetic labour force in Indian cities is largely populated by the female migrants from the North Eastern regions of India, who now are creating a niche in certain labour markets in the metropolitan cities. Their nature of being flexible, fair skinned and the fact that they are ready to migrate from the economically poorer regions of India easily qualify them as an ideal workforce for services like retail selling and hospitality. A new dynamics of inequality is framed through this processes of globalisation that prioritises soft skills (the attitude and appearance of employees) when it comes to selection and performance evaluation in their respective fields. The ‘Pan Asian’ physical appearance is a central character that normalizes interactions with the members of host community and they are subjected to different kinds of social evaluations and treatments from the host.

This paper would examine the process of migration of single female migrants from the North Eastern states of India to the Chennai city to see how the aesthetic labour market functions these women migrants negotiate and reconstruct their gender roles and identities.

**AUTOBIOGRAPHICAL NARRATION IN TURKISH WOMEN WEBLOGS**

Last decades have witnessed a shift in the textual genre of life narratives from conventional biography to autobiography. Both the feminist qualitative researches and the quantitative data on the profiles of weblog users reveal that this shift from biography to autobiography also led to a remarkable transition from a male domain towards the female one in life narratives. Moreover, in the era of digital media, new communication technologies also created significant changes in the form and content of “writing about oneself”. They have enriched the forms of expressions through new textual and audio-visual supports. Besides, the intellectual and emotional mood of the autobiographic texts has also changed in a considerable way. Autobiographic texts of today, which are framing a new kind of life narratives versus the past, fictional versus factual/real, life versus death, whole versus partial, Erlebnis versus Erfahrung (in terms of Benjamin’s conceptualization) has been studied and intimacy/objectivity versus subjective/objective distance.

Moreover, today not only the celebrity/famous people but also ordinary people can share their autobiography through the internet. Hence, it is possible to speak about a kind of democratization through the new media also in terms of acting as autobiographical narrators and the “construction of the self and identity” with regard to the controversial discussions on empowerment through new media.

Food Supply Chains, Refrigeration and Performativity

This paper explores food supply chains through the lens of refrigeration technologies and examines how they have influenced approaches to food. The investigation of how a household refrigerator was introduced in the 1920s and the refrigeration of food is now so pervasive that it influences what we eat and how it has shaped understandings of “fresh”. Callon's notion of performativity (1998) is useful in making sense of how refrigeration has shaped our practices and understandings. The discourse around refrigeration and fresh food is both outside the reality that it describes and at the same time a part of the construction of the reality of an object by acting on it (Callon 2006). The increasing length of food chains and reliance on fossil fuelled systems of handling, storage and transport of food reinforces feelings of increasing time space compression (Harvey 1999) and peoples' remoteness from their food supply. This separation from food also is also connected with increasing reliance on food packaging and pre-preparation techniques which are an inherent part of global food supply systems. The types of foods that are available and transported globally, have implications for greenhouse gas emissions; food waste; food security and nutrition and health among others. In a world where food availability and price is heavily determined by agro-industrial corporations, an examination of the social implications of further economic concentration in our food supply sector is needed.

Language Codes and Production of Meanings in Emergency Calls of Domestic Violence

Violence against women is a world spread phenomenon. Even in modern Western societies domestic violence is transversely present and affects not only lower classes, as it could be believed, but also women of upper-middle classes, different culture backgrounds and origins. The emergency call is a crucial mechanism to assist women when there is an aggression. For instance, these calls have been centralized in call centres (112) in Catalonia since 2007. Professionals of this service have structured violence situations into codes with institutional meaning. We are wondering how this service is implemented, the different actors involved, which is the appropriate way to decide what is the relevant category of violence and to what extent and in what ways does this code implies to produce meaning for the different agencies involved (police, health services, woman agencies...). i.e. how codes should be used to measure and the efficiency of the service, in terms of the response to the emergency and its quality. Even though Catalonia is one of the regions which has increased the most the number of denounces (Informe anual del observatorio estatal de violences, 2007), there is still a debate among professionals about whether is better denounced or not. That is due to the fact that it implies a double victimization for the woman. Therefore, it is important to denounce in the following hours or day after the aggression, in which case this service has an important role in the process and achievement of the goal: the security of women.

Social Movements in Kenya: Navigating Between Individual Motivations, Visions of Social Movements Organizations and Targets of Collective Action

Are social movements’ necessarily political actors that exist for a certain period of time before they disperse or transform themselves in institutionalized organizations? How does the organizational structure changes, and how do different individual purposes and organizations visions correlate and shaping social movements’ claims?

Transformation processes as well as their trajectories will be described and analyzed in the paper proposed. In order to explain the relation between organizations and movements it is important to consider the contradiction between individual behavior of activists, organizational missions and social movements claims as well as their specific historical and political context. We use empirical data to analyze the meaning and modality of student’s and women’s movements in Kenya. The movements transformed themselves over certain periods of time and due to their specific political, societal, cultural and historical settings.

In the case of the student movements the students changed themselves from a de facto opposition to the one party system in the 1980s to a current organization which is influenced by and connected to national politics. Current student leaders in Nairobi, for instance, are sponsored by national politicians and are integrated in clientelistic structures of Kenyan politics. Individual purposes of students seem at least partly in contradiction to organizations aims.

The example of women’s movements in Kenya shows how activists negotiate social movement claims in a contradicting field of international norms of women’s rights, the guidelines of donors and individual targets. A reasonable chance of social movement’s success decides about the strategy of action and to what extent they seize up an issue.

DEUTSCHMANN, ANNA* (University of Vienna, onna.deutschmann@univie.ac.at)

Student’s and Women’s Movements in Kenya Transforming the Political Landscape

Social movements are an important part of the political landscape in Kenya. For instance, social movements have been strong forces during the struggle against the authoritarian rule in the 1980s, while they remained co-opted before. Social movements transformed themselves over certain periods of time and due to their specific political, societal, cultural and historical settings. The particular historical relation between social movements and the state shapes the impact of the activism and limit their contribution to the democratization process.

In order to explain the state-society relations we draw attention to the political environment social movements and in particular social movement organizations (SMOs) face in Kenya: First, SMOs fill political gaps left open by the state, such as the provision of extensive social services in fields where the state is not sufficiently active. With support of international donors, SMOs provide social services beyond state responsibility. Thereby, they de-legitimize the state and the ownership for development processes. Due to the fact that social movements highly depend on the support of the donor community, SMOs ensure accountability towards the donors rather than towards the state or the citizens. Furthermore, SMOs undertake the political recruitment for parties. SMOs are important vehicles in order to develop the profile of political aspirants and to gather political loyalties by adopting SMOs visions or using existing recruiting networks of social movements.

Based on field studies in Kenya, two case studies - the student’s and the women’s movements show the structure and impact of social movements in Kenya. In order to explain to what extent social movements shape the democratic processes we analyse the particular relation and interaction between social movements and the state.

Managing Communication Access in Health Care: Who’s in Charge?

Disability rights activists have made substantial progress in securing the rights of citizens with disabilities. In the United States, the landmark Americans with Disabilities Act, passed in 1990, stands as both a signal achievement of that movement and also the foundation for future efforts. As with any legislation, however, achievement of the intent of the ADA—full social inclusion for people with disabilities—will depend on the implementation of the legislation, a fundamentally social process. This paper focuses on deaf patients’ experiences of health care in the United States, and on the responses of health-care professionals and facilities to the ADA mandate to provide access. Drawing on interviews with professionals in different positions within the health-care hierarchy, I examine policies and practices. The results suggest that managers and front-line professionals must navigate a web of competing mandates as they confront communication differences, and that well-intentioned policies may sometimes give the appearance of access while significant problems remain.

Disaster Exercises and the Shape of Organisations

What is the relationship between disasters and organisations? Does it matter, whether a disaster preparedness organisations prepares for floods or for earthquakes? Does the organisation itself conceive itself in the light of particular disasters? Or did so-called all hazards approaches solve the problem of organisational diversity matched to particular disasters? The problem we have to confront here is two-sided: From the viewpoint of disaster studies, the question is simply which organisations are best suited to tackle disasters. Yet from an organisational perspective, it is clear that from a comparative and historical viewpoint, disaster organisations evolve according to their own logic, tied as much to particular (local) organisational models. Moreover, particular organisations may have evolved for one type of disaster and may not generalise with others. A particular problem here, which distinguishes disaster organisations from other organisations, is that most disaster organisations need to operate usually...
in the absence of their main object, i.e. actual disasters. Most of the operations take place with stand ins for this object, as in exercises. The problem then becomes how enactments and representations of disasters in exercises shape organisations.

In our presentation we compare disaster preparedness organisations in the UK, Switzerland and India and analyze how their organisational structures reflect varying disasters through the lens of exercises. We report from ethnographical studies among state disaster organizations in these countries. We pay particular emphasis on how exercises are adapted to particular disasters and how these disasters structure operational routines, but also how disasters are viewed through the lens of the feasibility of exercises.

DEVLIN, MAURICE* (National University of Ireland, Maynooth, maurice.devlin@nuim.ie)

Young People, Youth Work and Inequality in Austerity Ireland

At the outset of the 21st century Ireland experienced the unprecedented economic boom of the short-lived 'Celtic Tiger' followed by a precipitous collapse and a protracted period of austerity, disproportionately impacting young people. Meanwhile the youth population, unlike much of Europe, is projected to increase by more than one third in the coming decade. However, there is a return of net outward migration, the highest among the most qualified young people. For the least qualified, options of all kinds are severely limited and unemployment the highest in living memory. Rather than celebrating the country's 'demographic dividend', media commentary and political discourse portrays the dangers of a 'lost generation'.

We explore the circumstances of diverse young people in Ireland and how long-established inequalities are persisting while new ones are emerging. Case studies of youth work responses to class, gender, 'race' and ethnicity, disability and sexuality show contrasting levels of attention to, and action on, different forms of inequality. A focus on LGBT issues has increased greatly while gender rarely features prominently either in policy and practice fora. Despite examples of excellent work with ethnic minorities, a comprehensive intercultural strategy for youth has never been adopted at national level. Action relating to disability remains patchy and incoherent within generic youth work organisations; and class inequality continues to be addressed (if at all) primarily through the prism of 'disadvantaged youth'. On the other hand, recent policy statements relating to youth place a greatly increased emphasis on human rights, equality and diversity as compared with those of the 1980s and '90s. A forthcoming national youth policy framework and a number of developments in Europe, if combined with appropriate initiatives both in youth work practice and worker training and education, hold out the possibility of a more concerted and coherent youth work response to inequality.

DEVLIN, MAURICE* (National University of Ireland, Maynooth, maurice.devlin@nuim.ie)

Youth Workers As 'Knowledge Professionals': The Irish Experience in International Context

While youth work (non-formal and informal educational work with young people) has a long history, going back at least to the 19th century, it is taking on a new form and facing new challenges and opportunities today. It has always been 'knowledge-based' in that it is centrally concerned with the generation, facilitation and even 'manipulation' of both information and ideas among young people: information and ideas about self and society and the relationship between the two. It has therefore always had an inescapably ideological dimension. Recent and current social and economic change is influencing both the types of knowledge with which youth workers are concerned and the ways in which they, and the young people they work with, relate to it. It is also influencing youth work's relationship with other occupational and professional areas such as formal education, employment and training services, commercial leisure and the media. This paper will provide a case study of the 'state of play' regarding professionalism and professionalisation in Irish youth work, making reference also to some relevant developments elsewhere in Europe and further afield. It will explore the tensions and apparent contradictions between an increasing policy focus on quality standards and professionalism among workers and an austerity-driven climate in which workers themselves are increasingly often in precarious job situations and the young people they work with are disproportionately affected by the economic crisis and its impact on jobs and public services. It will also consider the legacy of youth work's history as a social movement as well as a Professionalising occupation, and the 'problems' as well as possibilities that lie in relationships between volunteers and paid workers. Finally it will refer to recent efforts (often through the use of new media) to develop a stronger collective purpose and voice among youth workers and young people.

DHAOUADI, MAHMoud* (Univ.of Tunis, m.thawad@yahoo.co)

Sociopsychological Map of Tunisian Bilingualism

The Tunisian society uses two languages: Arabic its native/national language and French as its colonial language. Written and oral presences of these two languages in Tunisia create two types of bilingualism: 1- a bilingualism which does not blame the use of French instead of Arabic among Tunisians. This bilingualism is the most widespread. 2- a bilingualism that avoids the use of French between Tunisians. Only a very tiny group of Tunisians stands for this. The two bilingualisms are also associated with two forms of ‘Arabization’. Sociopsychological analysis shows that bilingualism 1 continuing prominence in Tunisia is the outcome of: a - the spread of French in Tunisian society during the French colonisation (1881-1956), b- Many Tunisians went to schools in Tunisia where French language and its culture were dominant. Furthermore, some Tunisians had attended French universities. c- The Tunisian graduates of secondary schools and universities have taken power to rule the country after independence. In Boudieu’s terms, these French educated Tunisians have re-produced themselves in Tunisian society by giving great importance the presence and the use of French and its culture in independent Tunisia.

Gender Based Violence (A case study of Gujarat Stree Kelavani Mandal)

Gender based violence is violence against women based on women's subordinate status in society. Gender based violence includes physical, sexual and psychological violence. It occurs in both the public and private spheres.

This research paper is an empirical and secondary data based paper. The data is collected from Gujarat Stree Kelavani Mandal, a well known prestigious NGO of Ahmedabad.

The main objective of this study is to know the types of gender based violence, causes and role of Gujarat Stree Kelavani Mandal for removal of domestic violence.

The second part of the study makes a number of recommendations for action.

This paper is divided into four parts. The first part shows aspects of gender based violence. The second part shows socio-economic profile of respondents. The third part shows the main causes of gender based violence and the role of Gujarat Stree Kelavani Mandal. The last part contains concluding remarks and recommendations.

What Drives National Differences in Intensive Grandparental Childcare in Europe?

Grandparents play an important role in looking after grandchildren. The provision of intensive grandparental childcare varies considerably across Europe, with figures ranging from less than 4% in Sweden and Denmark, to almost one quarter in Greece. This paper investigates whether contextual-structural factors (such as formal childcare and labour market structures) and family cultures influence the level of informal childcare support from older parents to their adult children, using data from the Survey of Health, Ageing and Retirement in Europe. Multilevel analyses suggest that grandparental childcare variations are mainly driven by macro-level factors. Both parent and grandparent socio-demographic and economic characteristics were associated with intensive childcare and were consistent with existing literature. However, even accounting for socio-economic and demographic differences between national populations, country-level variations

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
in the level of provision of intensive grandparental childcare remain. Most of such variation can be explained by structural and cultural factors. In particular, in those countries where both parents and grandparents are expected to work, formal childcare is generally well provided and appears to be the norm; thus, there is a lower level of grandparental childcare. In contrast, in countries where there is a high percentage of women who are not in paid employment, maternal care for pre-school children appears to be the preferred norm. In such countries, provision of formal childcare is limited as care is expected to be provided by family members, and mothers in particular rather than grandmothers. If, however, a mother is unemployed, which is a good proxy for unmeasured employment and dismissals due to the frequent downsizing and outsourcing processes. As result of these trends, a growing number of individuals is more and more “vulnerable”, while trade unions have many difficulties to represent a large part of workers in this changing world of work. Nevertheless, inside and outside the institutional trade union organizations, individuals try to create collective actions with the aim to affirm their workers’ rights and to improve their quality of work and life.

This paper analyzes the collective actions of “vulnerable” workers, considering individuals with a temporary job, without a job, or at risk to lose their job. We analyze the actions promoted by the unions as well as by the workers’ “self-organized networks”, with a focus on the Italian context and an analysis of the European perspective (20 interviews in Italy and 10 interviews at European level). Objectives of this paper are: a) understanding the meaning of action (Touaine) of the individuals involved in these social movements; b) understanding the relationships between “institutional” trade unions and “self-organized networks”; c) understanding the impact of these collective actions on the public sphere, especially considering the relationship between workers’ movements and democracy in the present age.

The paper will examine the Russian state initiatives to promote an Islamic education in Tatarstan and the North Caucasus. It will ask the question of what forms of Islamic education have been promoted and what is understood as “moderate Islam”. The question of the form of Islam promoted by the Russian state highlights how certain boundaries are being drawn between a secularised, traditional and “Soviet” Islam that is represented by the Sufi branch of Islam and alternative forms of Islam such as a Sahafi inspired Islam that are portrayed as being alien and not compatible with Russian secularism. References to collective memories linked to the Sufi tradition are thus emphasised in Tatarstan, even if the region also proclaims to represent a modernist trend in Islam in the form of Sufism, in order to draw a boundary with Sahafi inspired movements. Furthermore, Tatarstan emphasises the importance of global efforts aimed at promoting a moderate Islam, for example in Western countries.

At the same time, such boundaries shed a new light on the way in which concepts of “modernity” and “tradition” can be associated to notions of “secularity” and “religion”. Indeed, the Russian state is perceived as supporting the traditional Sufi establishment that is described as being “non-democratic” and lacking in religious knowledge and authority by alternative Islamic movements such as the Sahafs, in particular in the North Caucasus. Further, the Russian state has tended to isolate the North Caucasus from transnational networks of Islamic knowledge. The Sufi establishment, also represented in the region of Tatarstan, has been delegitimized as a religious source of authority due to its perceived cooptation with Soviet structures and with federal authorities after the end of the Soviet Union.
on issues such as, product quality, the legitimacy of contractual arrangements, labor relations and work routines, among others. These rationales were employed by the actors in concrete business relationships.

The CEDAW: How a Cold War Product Could Become a Key Instrument for Women’s Rights in the Global Society

Women’s rights were controversial in the international arena at the early 20th century. Nowadays, women’s human rights and women’s empowerment have spread over the world. This process has been supported by the United Nations agenda for gender equality, the global women’s movements, the international public opinion, and Western powerful democratic countries. The CEDAW, and its Optional Protocol, is the most relevant legal instrument in this global trend. The CEDAW itself has a global dimension, since just a few countries have not already signed the document. Feminist movements all over the world use the CEDAW in order to put pressure on nation-states for the recognition of women’s rights.

In this paper we will analyze three aspects of the CEDAW from a global society perspective that can be useful to think about current and future strategies to face gender inequality in the 21st century. First, we will try to find out global and regional trends in the expansion of the CEDAW and its Optional Protocol in order to identify contagion effects, reference groups and followers. Second, we will focus on the role of the inter- and transnational women’s movements regarding the success of the CEDAW ratifications. Diverse considerations and uses of this document need to be seen in relation to the different “waves” of the transnational women’s movement and its ideological debates. And third, we will address the content and limits of this document since its approval in 1979. We will take into account the Cold War context – with emphasis in the shocking US refusal to sign the CEDAW – that shaped the document and we will set out current transnational women’s movements proposals to update our “international bill of rights”

Profesores De Posgrados De Calidad. Ética Profesional y Requerimientos Institucionales

Los programas de posgrado se clasifican de acuerdo con su orientación en los siguientes dos tipos: de profesionalización y de investigación (Conacyt, 2013). Recientemente en México se observa que, en el mayor número de casos, las instituciones de educación superior privadas ofrecen estudios de posgrado orientados a la profesionalización (actualizar a los profesionistas de diversas áreas de conocimiento), mientras que las universidades públicas incluyen ambas orientaciones (con énfasis en los procesos de generación de conocimientos).

El reconocimiento y acreditación de los programas de posgrado en este país obligan a cubrir un conjunto de requisitos entre los que destaca el contar con una planta académica de tiempo completo con altos grados de habilitación y experiencia en la docencia e investigación. Para esto los profesores de tiempo completo se someten también a proceso de acreditación y evaluación ante diversas instancias (por ejemplo el Programa de Mejoramiento del Profesorado o el Sistema Nacional de Investigación).

En la poneza se retoman experiencias de profesores de tiempo completo de la Maestría en Estudios Culturales y el Doctorado en Estudios Regionales que han colaborado en el diseño y conducción de estos programas que actualmente se encuentran inscritos en el Padrón de Posgrados de Calidad del Consejo Nacional de Ciencia y Tecnología. Estas experiencias se recuperan a manera de dilemas en los que se les cuestiona sobre los beneficios e inconvenientes que conlleva el reconocimiento y mantenimiento de los programas de posgrado en este padrón de calidad, aludiendo a los principios de ética profesional en los que fundamentan su práctica.

Cooperation Of Various Stakeholders In Providing Youth Services In Estonia

Youth policy is a relatively new challenging phenomenon studied under various contexts. In the context of EU studies, the youth policy is seen as system of the complex interactions between domestic, transnational, and supranational actors in the youth field. The young people require a new attitude, that means seeing youth policy across traditional sector boundaries and from youth perspectives. Currently, the main issue of youth policy implementation is the problem to organize an efficient interaction between different institutions and stakeholders across levels and sectors.

The important task of the paper is to present Estonian experience of the implementation cross sector integrated model of youth policy. The objectives of the paper:

- to explore how the main actors of youth policy identify cross sector integrated youth policy, their attitudes, views about it;
- to analyze how is youth policy playing out across vertical levels or horizontal levels of governance. If it is not working well and if so why? Consideration of and barriers to better implementation of integrated youth policy;
- to share good existing practices of cooperation between various stakeholders in the youth field and to introduce the key tools for good cooperation and participation in youth policy.

The main theoretical conceptions that are used in work:

- Simona Piattoni multilevel governance framework to study vertical and horizontal dimension of cooperation in Estonian youth policy.
- Howard Williamson theoretical approach “the five Cs” to characterize Estonian youth policy.

The analysis is based on the results of semi-structured interviews and 1 focus group with experts from youth field in Estonia. The survey examined the following issues:

- Knowledge about integrated youth policy across various stakeholders,
- Contribution of main stakeholders in developing Estonian youth policy
- Cooperation between stakeholders.

DIBOU, TANJÀ* (Tallinn University, PhD student, dibouta@hotmail.com)

Youth As Youth Policy Actors: Options Of Youth Participation In Estonian Youth Policy

Youth as youth policy actors: options of youth participation in Estonian youth policy

Raising youth active participation in decision making process is the one’s of main priority of many international and national agendas on youth. For instance, one of two overall objectives of the European Union Youth Strategy (2010-2018) is to encourage young people to be active citizens and participate in society.

Comprehensive analysis of the present existing options of youth participation in youth policy offers a more effective way to understand youth ability to influence their own lives. A focus on the youth involvement in civil society brings to discuss about various forms from ‘true’ to ‘false’ forms of activism. Scholars in youth field identify that not every action of young people in society should be seen as the full of value.

The objectives of the paper is to explore how and whether the state provide opportunities to youth participate in decision-making process of youth policy and how this process is organized in Estonia. Author have chosen for analysis Estonia, as example of Baltic states, where in youth policy it is possible to find at the same time EU approaches and post Soviet experience.

The youth participation will be analyzed through a review of theoretical literature with providing some practical examples and empirical data from youth sector, using the Estonia states’ documents, statistics, surveys and data from institutional research (10 interviews and 1 focus group with experts from youth field)

The main question for author is to explore whether youth opinions are taken into consideration by politicians.

South Africa’s Public Rdp Programme in the Light of Temporary Migrants’ Housing Needs: A Critical Reflection

In spite of moderate immigration rates in the last decade, South Africa’s large cities have been experiencing an unbalanced growth of informal settlements. This, so the present paper argues, is a consequence of the ‘missing link’ between public housing schemes and the housing needs of temporary migrants. Drawing upon primary and secondary data collected during three short field visits to South Africa in 2012 and 2013 the authors explore the background of the mismatch and outline possible solutions for a pro-poor led National Housing Policy considering temporary migrants’ housing needs.

South Africa’s Government Housing Policy has experienced various programmatic turns in recent decades. The first and possibly most important one is related to the end of Apartheid in 1994. In order to counter the huge housing backlog of the time, a massive, policy driven public housing program for low income households in the context of the Reconstruction and Development Programme, RDP,
was put in place: since 1994, approximately 3 million housing units were built. In 2004, with the start of the "Breaking New Grounds" initiative, the importance of in situ upgrading of informal settlements for the affordable housing provision of the urban poor, was acknowledged and becoming part of policy agendas.

At the same time South African society has profoundly changed in many ways. The evolving "postfordist" labor market has become much more flexible than during Apartheid years, pushing people to move behind informal job opportunities, thereby changing the 'spatially' of cities. In this context it is argued that, due to a combination of job-related constraints and socio-cultural connections with regions or countries elsewhere, highly mobile temporary migrants have different housing needs than permanent migrants. They even tend to be systematically disadvantaged by the RDP programme, which pursues the number-driven objective of converting 'informal' into 'formal' dwellers.

### The Challenges in a Fragmented World of Achieving a Holistic Approach to Urban Planning for a Sustainable Future

In our 'complex, fragmented urban world' (Stoker) 'global problems are generated at the local scale and should be solved there too' (Condon). Yet, neither government nor local planning gives much response to the collective problems, while political systems focus on short-term rather than long-term benefits.

Held emphasises 'the need for a strong public sector, and the requirement for multilateral governance', while acknowledging conflicts between economic development and the strengthening of civil society. McIntyre-Mills argues, 'policy and practice needs to consider social, economic and environmental implications for all life'.

The field of urban planning exemplifies this. Key issues of democracy and participation in public policy making at local and regional level, the role of the private sector and the balance of markets, government and civil society, and a containerized approach by government, results in much urban planning failing to recognize future consequences of current choices.

Any approach to resolve this complex mess and balance the state, market and society requires, as McIntyre-Mills says, 'a democracy/governance cycle that spans central, spatial and temporal boundaries'. At the same time democracy needs to change to meet the convergent social, economic and environmental challenges. McIntyre-Mills recommends 'both centralized controls to protect the global commons and decentralized engagement to test out our ideas'.

Urban planning can also only succeed when there exists more room for engagement and where it recognizes that we need to be the subjects not the objects of other people's designs (McIntyre-Mills). However, participatory design is complex and difficult and, while digital communication can potentially include more voices, like any engagement it works best when complementing other processes and not solely focused around the needs, goals, and concerns of the potentially engaged' (Leighninger).

Sarkissian therefore argues that urban planning needs to take a holistic approach, 'taking into account multiple layers and components of social systems' and to be long term focused.

### Creating Hackney As Home: Youth Perspectives on Gentrification in London

This paper focuses on how studies of and with young people contribute to our understanding of contemporary urban redevelopment including processes of gentrification. Within urban centres, demands from competing stakeholders have led to juxtaposing expectations of space use and a concomitant potential for everyday conflict between residents, local authorities and developers. These processes of change are being documented through various approaches but there remains a need for more work on how young people experience this urban transformation and what this means for urban theory and practices of redevelopment.

The Creating Hackney As Home project, working with five peer researchers, has used participatory visual methods to document young people's experience of gentrification in the London Borough of Hackney. This area has been marked by rapid transformation given its location close to the financial and cultural centres of the city and the Olympic site. The project found that young people maintain an ambivalent relationship with this locality, recognising that changes can be beneficial but ‘not always for them’. Feelings of exclusion from planning processes and displacement from their neighbourhoods were matched by expressions of comfort in new public spaces and shops. Participants noted the uneasiness generated by changing demographics, such as the movement of creative industries and young urban professionals into the borough, as well as the skills necessary to adapt to these new circumstances. In conclusion, the paper highlights the complex, ambiguous processes of growing up in post-industrial cities.

Project information and the films can be found at: www.hackneyashome.co.uk

### The Role of Governments in Education for Sustainable Consumption (ESC): Capacity for the Effective Implementation in Asia-Pacific Region

Sustainable consumption is an integral element of sustainable development and an issue of paramount importance to the United Nations. At the UN Conference on Sustainable Development (Rio+20) in 2012, the Heads of State reaffirmed that promoting Sustainable Consumption and Production (SCP) is an essential requirement for sustainable development and the outcome of the Future We Want adopted the 10-Year Framework of Programme on SCP. The importance of education in facilitating a shift towards sustainable development and in promoting sustainable lifestyles has also been internationally reaffirmed in the UN’s decision to launch a UN Decade of Education for Sustainable Development 2005-2014. Hence, Education for Sustainable Consumption (ESC) is understood as the way to promote responsible environmental citizenship and national policy for ESC is a powerful instrument to influence sustainable consumption behaviour.

This paper addresses how to improve the capacity of governments in implementing effective ESC. The research was conducted through primary interviews with relevant government officers, survey/ questionnaires, and analysis of policy documents in Asia-Pacific Region: East Asia cases from P.R.China, Japan, R.O.Korea in 2010-2011 and Southeast Asia cases from Malaysia, Philippines, Thailand in 2013-2014. This research targeted governmental capacity for implementing effective ESC as an important opportunity for strengthening the meta-level structures through which transformative change can be encouraged.

The findings identify key aspects of current governmental context for promoting sustainable consumption. The six country cases are analysed in a comparative assessment based on the four levers of change identified in UN-SDPs capacity development framework: institutional arrangements, leadership, knowledge, and accountability. The recommendations aim to strengthen policy and institutional frameworks for ESC and to link with wider policies for SCP and Education for Sustainable Development.

### Mngreera A Way Forward to Development: A Case Study of a Tribal Village in Madhya Pradesh

The National Rural Employment Guarantee Act currently provides right of employment to the rural poor of the country. The Act provides employment guarantee to every rural household for 100 days in a year. This is perhaps the first time that the
Panchayats have been provided with the freedom to plan and execute works and is backed by substantial resources, which are at their own disposal. Ideally, the Act and the programme design reflect to bring about a radical change in the rural areas as far as employment generation and creation of sustainable assets for the villages is concerned. The MNREGA programme’s efficacy is based on the logic of using the productive capacity to build, create productive and nonproductive asset, while simultaneously alleviating the problem of chronic unemployment and poverty. This paper is based on the study Eradication of Poverty and MNREGA conducted recently in Harda district of Madhya Pradesh. Madhya Pradesh accounts for 23 percent of the total tribal population in the country. In spite of favorable resource conditions, tribal regions perform poorly in terms of infrastructure, returns from agriculture and almost all human development indicators. As compared to other sections of the Indian society, the tribal population has the lowest Human Development Index (HDI). Among the social groups, scheduled tribes (STs) have the highest proportion of the population. The combined STs and Other Backward Classes (OBCs) account for 27 percent of the total population. This paper begins by examining the implementation of MNREGA in Bori village of Harda district in terms of development. It will explore the impact of MNREGA on the lives tribes of Bori village and also present the ground realities related to the MNREGA.

Turkey Case Study: Occupy Gezi Public Protests

This presentation focuses on Istanbul's Occupy Gezi protests that started on May 28 2013 spread via Facebook, Twitter, Friendfeed etc. The purpose of this research is to find out how and to what extent social media activism is changing the role of social actors - online and offline -. Some of the research questions to be answered are:

- Are communities more active because of the opportunities offered by digital tools?
- Have communities engagement and participation improved because of digital transformation?
- What cultural and media practices of communities affected by digital transformation?
- Who are leading on increasing the use of digital tools in communities?

The protest which started on May 28, 2013 in Istanbul was against the destruction of Gezi Park, the only big green park left in the centre of Istanbul, and construction of a shopping mall instead. Protesters spread the word via social media Facebook, Twitter and Friendfeed and using the following hashtags: #ayakalk #geziparki #occupygezi. In short time the protest became an international news issue. Within hours their page was liked by hundreds of thousands. #ayakalk #geziparki #occupygezi. In short time the protest became an international news issue. Within hours their page was liked by hundreds of thousands.

DIMMER, CHRISTIAN* (The University of Tokyo, Chr.Dimmer@gmail.com)

Relational Place-Making, Actor-Networks and the Emergence of Tokyo’s Sub-Centre Shibuya

Much has been written about global(ising) Tokyo. While some have identified familiar neoliberal, entrepreneurial forms of governance as response to pressures of global competition, with big corporations playing a major role in urban restructuring, national government, cheer-leading and local governments increasingly marginalised (Sorensen 2003, Jacobs 2005, Waley 2007), others have emphasised Tokyo’s rootedness in local policy frameworks and a distinct development state that evade universalistic narratives (Saito 2003, Fujita 2011, Tsukamoto 2011). This paper seeks to contribute to these discourses. While existing studies tended to be macroscopic and quantitative, this research focuses on the making of one major place in Tokyo—the Shibuya Sub-centre—in the longue durée. It traces systematically how contestation and collaboration between different actor-networks over time led to the formation of a shopping mall instead.

(Re)Assembling Public Space! Creating New Urban Commons: Evolving Geographies of Contestation, Celebration, and Collaboration in Contemporary Tokyo

When Walter Lippmann (1925) famously called the public a phantom, he meant to stress its fragile, provisional nature —ceasing to exist, once no longer upheld, re-assembled, performed. Clive Barnett suggests that publics do not simply exist a priori, but must be convened in open-ended, contingent processes without the certainty of success (2008). Nancy Fraser emphasises the presence of many “subaltern Counterpublics,” where marginalised groups congregate to discuss matters of concern to them (2010). Bruno Latour rejects the idea of one unitary public sphere, where only the quality of the best argument matters but not the identities of those presenting it — suggesting that the public and the political are constantly (re)assembled through devices, procedures, and mediums; crystallising around specific issues, or topoi. Highlighted are the processes of how publics are created, and the many small, mundane acts and things that support these. ‘True’ public space has therefore a performative and ephemeral quality, that only exists in an instance when a public space is temporarily supported, or even convened into being by a physical setting. In such a moment a public space turns into more than just a state-owned venue of accidental, amorphous sociability and begins to take on a broader collective, often political, relevance. This paper is interested in the transformative potential of such public spaces and examines the myriad of new commons in Tokyo, having recently sprung up in the form of collective houses, artists communities and others places. Here people are testing new modes of sharing time, goods, skills and spaces beyond state and market — prefiguring new models of post-consumerist society in privately owned settings. Although neither explicitly political, nor fully public, arrangements like these create new affordances, and social capital that may later become pertinent; transforming society in many small, quotidian, pragmatic steps.

‘Decolonial Marxism’ and Neozapataismo: Bridging Counterhegemonic Struggles in the Global North and South

How can we understand the diversity of forms of radical counter hegemonic resistances within current processes of accumulation of capital, from a non-Eurocentric perspective? In this paper, I anticipate a conversation between two approaches to resistance: Decolonial School and Open Marxisms. By constructing the imaginary dialogue between these two perspectives I identify their theoretical strategies, limitations and mutual recognitions that prevent fruitful cross fertilisation, in order to delineate a new direction in the study of counterhegemonic politics and social emancipation. To DS it is indispensable not only to recognise particular trajectories of experience of power, oppression and domination but also to overcome both Eurocentric and Third World “fundamentalisms” (Grosfoguel 2008). Marxists and political economists reproduce the ‘coloniality of power’ that movements in the South are struggling against. However, a DS fails to consider the material processes of emergence of counterhegemonic pluriversal resistance within and against new forms of accumulation of global capital. (Open) Marxists and radical political economists offer an adequate critique of global capitalism. They explain how current forms of ‘accumulation by dispossession’ (Harvey 2003) and ‘crisis’ have changed the experience of oppression, exploitation and resistance within and against new forms of accumulation of global capital. Danish Exceptionalism: Explaining the Unique Increase in Social Trust over the Past 30 Years

Contrary to the general trend in most countries, social trust has been rising steadily in Denmark for the past three decades. The purpose of this paper is to understand this development. Our analyses show that the rise in trust can partly

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
be attributed to generational differences, a rise in education, an improvement in the quality of state institutions, and the trust in these institutions among citizens. The analyses build on data from a number of Danish surveys, including both a cross-sectional and a panel survey.

In this paper we argue that residential exposure to ethnic diversity reduces social trust. Previous within-country analyses of the relationship between contextual ethnic diversity and social trust have been conducted at higher levels of aggregation, concealing substantial variation in actual exposure to ethnic diversity. In contrast, we analyze how ethnic diversity of the immediate micro-context—where interethnic exposure is inevitable—affects trust. We do this using Danish survey data linked with register-based data, which enables us to obtain precise measures of the ethnic diversity of each individual’s residential surroundings. We focus on contextual diversity within a radius of 80 meters of a given individual, but compare the effect in the micro-context to the impact of diversity in more aggregate contexts. The results show that ethnic diversity in the micro-context affects trust negatively, while the effect vanishes in larger contextual units. This supports the idea that interethnic exposure underlies the relationship.

In the globalization of modern sports, celebrity sports athletes have acquired a stardom equal to that of entertainment icons. Celebrity athletes serve the role of national representatives and shoulder the responsibility to win glory for the nation. This acquired identity has put elite athletes under the media limelight, and celebrity athletes are constantly subjected to media scrutiny and framing, especially when they fail to live up to national expectations. Discourses of the elite sporting bodies are “characters within a set of narratives” (Laclau, 1992, quoted in Whannel, 1992: 121), and the formation of sporting celebrity is “intrinsically tied to the rise of the modern nation-state, yet in both realms the nation-state has increasingly come under pressure as the dominant frame for the organization of political and sporting discourses alike” (Sandvoss, Real & Bernstein, 2012: 11-12).

This paper maps the media discourses surrounding Chinese 110m hurdler Liu Xiang (2008) from his record-breaking success in 2004 to his two-times withdrawal from both 2008 Beijing and 2012 London Olympics. Data were collected from two major Chinese newspapers: People’s Daily and Titan Sports. Analysis also draws from data of semi-constructed interviews with 13 Chinese sports journalists regarding the myth surrounding Liu Xiang. Through in-depth research, it provides: 1) a comparative content analysis of the attributes to his body before and after regarding the myth surrounding Liu Xiang. Through in-depth research, it provides: 1) a comparative content analysis of the attributes to his body before and after.

However, they allow France to show a diversity and equal opportunities façade. This paper is based on biographical interviews, an intersectional methodology and a feminist and post-colonial approach. It draws on studies conducted in the Netherlands and the USA with highly qualified bicultural Black women (Essed 1984, 1991 2004) to analyze the aspects of labour cross cultural relationships in France. It asks questions of leadership style and values related to diversity, gender, age, disabilities, etc. It tests pseudo success stories of women who are faced with the role reversal in the home and workplace and in the social order of invisibility.}

How does language (biographical empirical data) account for the social relations and their context? My research on untold experiences of suffering in the social space of work is the result of my own immersion in the social relations that I am studying. It is embodied in the French debates on gendered equality at work and post-coloniality. The French scientific knowledge produces and promotes distance vis-à-vis the object. Nevertheless, I highlight the heuristic value of the standpoint epistemology (Mathieu 1971; 1991; Juteau, 1981, Haraway, 1988). My epistemic advantage (Hartsock, 1998, Harding, 1990; 2003) is central and my work is likely to be returned to journalism, fiction and socio-political subversion, and excluded from academic recognition (Bourdieu, Morrison, 2000). This epistemology denies the rift between commitment and sociological knowledge (Guillaumin, 1981; 1992; Delphy, 1998; 2001) and raises the issue of race and gender diversity in academia (Essed, 1997, 1999). Considered “unscientific” by “the White middle Western male bourgeoisie”, this approach questions both the producer of academic knowledge and his object. In French sociology, it is considered harmful (Boudon, 2001) and auto-theorization remains marginal. The issue is: How am I represented, and how do I self-represent myself outside the usual frameworks, based on a theory of personal experience (De Lauretis, 1987)? I aim to produce an academic knowledge from practical and subjective discursive truths, in a process of translation of subjectivities. As an Afro-Caribbean researcher in “a sexualized and racialized world” (Morrison, Din 1994), I use my epistemic advantage, in order to produce a counter-hegemonic knowledge of the social relations of gender, race, etc. inside the academy (hooks, 2000; Hill Collins, 1989) in France.

The role of social protection policies in the food security of farmers and agricultural labourers

The role of social protection policies in the food security of farmers and agricultural labourers

Black and Executives in France: Straw Women?

In France, the managers assume autonomy, weak hierarchical constraints and progression within the organization (Flocco, 2006). Paradoxically they are both filled and devoid of these attributes. They have a power which is not real. They can act with a limited and confusing scope. Their initiatives remain uncertain (Cousin, 2008). A current qualitative survey with Black women graduates in public and private French companies provides some answers to the following questions: Do they actually chose their own rules of action? Their potential autonomy is it effective and proven? What are the forms of objective and subjective requirements which they face? Are they the actresses of their own careers? (Flocco, 2006). In labor relations, the “ethnic imbalance”, issues of sex, class and race, lead some employees to refuse the authority of people that they perceive as dominated (De Rudder, 2000). Than, Black women graduates often occupy functional jobs with no command and/or financial responsibility, when they are not isolated from collective work and management. If these executives were “straw women”, who do not really have the power, but a limited scope and uncertain initiatives. However they allow France to show a diversity and equal opportunities façade. This paper is based on biographical interviews, an intersectional methodology and a feminist and post-colonial approach. It draws on studies conducted in the Netherlands and the USA with highly qualified bicultural Black women.
Senior Fellow, National Centre for Epidemiology and Population Health, Australian National University.

Cheap fresh food provokes a conundrum: it can provide higher levels of nutrition than if the food was more expensive but it can also lead to inadequate and unsustainably low farmer livelihoods. What is good for consumer health, in terms of fresh food availability and affordability, is not necessarily good for agricultural sector worker incomes or health. Farmers now constitute a growing proportion of the world’s poor. It is in this context that numerous international agencies argue that food security is first and foremost a matter of human security (including income/social protection and universal health coverage). This paper outlines arguments linking food and human security and social protection being made by the World Health Organisation and the Special Rapporteurs on the right to food and on extreme poverty and human rights. It also describes the wider applicability of The WorldFish Centre’s recommendation that poverty and food security go hand in hand, as well as the way in which they are interlinked. This paper also considers that operationalising the links between human security and food security within all agricultural sectors is the best way to ensure the long term survival of agriculture.

Mentally Disordered Offenders’ Perspectives on Their Level of Risk to Others

Mentally disordered offenders subject to section 37/41 of the Mental Health Act 1983 (England and Wales) are subject to conditions and restrictions operated by the Ministry of Justice. The legal basis for such an order is that it is ‘necessary for the protection of the public from serious harm’ and mental health services are tasked with identifying, monitoring and minimising mental health risks in order to maximise public safety. Relatively little has been written about the way in which this group of offenders understands and makes sense of their own level of risk. This paper presents original research with mentally disordered offenders subject to this order and demonstrates the way in which they sought to dignify and explain behaviours that had been identified as risky by others. It is argued that offenders gave accounts relying heavily on notions of identity in order to justify their actions. I begin by examining those who explained their offending as having occurred as a consequence of being ill. I then turn to those who rejected illness explanations and examine techniques which they used to present themselves. Not all research participants fell neatly into groups of people accepting or rejecting notions of mental illness. A large proportion gave complex and sometimes contradictory accounts. Within these accounts, risk and safety were framed in a variety of ways in order to emphasise the moral aspects of service users’ identities. Attention will be given to the wide range of strategies used to achieve this. I will explore differing ways in which participants described mental disorder, notions of risk as fate, hierarchies of risk and the use of jokes. Finally I draw a number of conclusions in relation to what this tells us about service users’ understanding of their identities.

Becoming Chinese in Indonesia: A Study on Ethnic & Nation Identities in Tangerang, Banten

Studies of ethnic Chinese in Indonesia tend to look at in an objective, general and static perspective. Imagining that all members have the same characteristics, they voluntarily acknowledge as a single community of Chinese people. The following study conducted over a number of people in South Tangerang, Banten, shows a different situation. There are many sub-groups in which collectively known as “Chinese people.” Each individual member has the freedom to identify her/himself as a member of the community. They initially refused to be known as “the Chinese,” preferred to identify themselves as “orang keturunan (descendants).” A term that draws her/him to the neighborhood of “orang priabumi (natives)” i.e., Betawi and Sundanese. With the physical and socio-cultural characteristics more like Indonesian people in general, what they do are just convert themselves from Confucianism and a to Buddhist to a Muslim, automatically they are recognized by the surrounding community as full members. But in its development, along with their identity to Jakarta, Chinese migration from other parts of Indonesia and settled in their traditional settlement, as well as the change of Indonesian government policies that tend to be more pro-Chinese, they do the necessary efforts ranging from religious conversion (converted to Christianity), learning languages (Hokkien dialects and Mandarin), change the mentality (trying to be more diligent at work), changing profession (from peasants to traders), to improve their economic statues (getting rich) and whiten skin color (from brown to a lighter one). All was done so that they can claim and recognize as “Orang Cina Udik (uphill Chinese)” and, even better, “Cina Benteng” (“Chinese of the fort” a term that people distinguish themselves with other Chinese people in Indonesia (Chinese of Medan, Bangka, Pontianak etc.), but confirms them as one single community: “Chinese people”.

Japan’s Pre-War Jury Trials As Seen By the Journalists of Hōritsu Shinbun (Legal News)

In May 2009, the Act Concerning Participation of Lay Judges in Criminal Trials (“Lay Judge Act”) was enforced in Japan. This piece of legislation established a new mixed-circuit court (saiban’in) system where the verdict and sentencing in major crimes are decided by a panel comprising three professional judges and six laypersons.

The introduction of the saiban’in system is not the first experimentation with citizen participation in the criminal justice system in Japan. The two-lyayperson jury system functioned in early Shōwa Japan between 1928 and 1943. Just like the first saiban’in trials in contemporary Japan, the first jury trials in the pre-war period attracted a significant amount of attention from the general public, academics, and journalists.

This paper describes and analyzes the journalistic accounts of the first cases tried by jury in pre-war Japan that appeared in the Hōritsu Shinbun (Legal News). The Hōritsu Shinbun articles not only contain the objective description of the jury trial proceedings and the strategies of the defense and prosecution, but also include a subjective element—the personal impressions of their authors. The observations of the authors of the articles provide readers with important insights into how the jury system was perceived by the general public at the time.

Highlighting these insights is the first objective of this paper. Outlining the features of Japan’s pre-war jury system is another. Placing the details of the functioning of the saiban’in system in contemporary Japan into a historical context is the third goal.

DOCCENA, HERBERT* (University of California, Berkeley, herbertdocena@gmail.com)

A Climate for Change: The ‘Climate Justice Movement’ and the Rise of Green Capitalism

Since global warming first burst onto the global political agenda in the 1980s, a new global movement has also emerged: Environmentalists, indigenous peoples, women’s, labor, other social movements, working in uneasy, coalitions with governments from the South, have come to constitute a "global climate justice movement." Straddling and negotiating North-South, inter-state, and intra-state divisions, this movement has pushed for more radical globally-coordinated measures to address the ecological crises, pressed for far-reaching changes to how the international community is governed, and offered alternative visions for how the earth’s common elements should be shared. They have demanded not only drastic greenhouse-gas emission reductions from Northern states, they have also called for more punitive measures, such as penalties and reparations, to counter the industrialized states’ and corporations’ insistence on more voluntary, incentives-oriented market-based approaches to global environmental problems. Critical theories of nature-society relations which seek to explain the emergence of a neoliberalized "green capitalism" over the last two decades, however, have largely overlooked the significance of this movement or see its impact merely in terms of its effects on capitalisms "crisis of accumulation." Drawing from archival research on, and interviews with, the key participants in, the international climate change negotiations, I argue that this movement has mounted a counter-hegemonic challenge to the North and that the North’s attempts to contain or absorb this challenge can better account for capitalism’s turn to market-based environmentalism. In making this argument, I seek to contribute to rethinking theories of global politics and nature-society relations.

Educational Expansion and Social Exclusion

Education is the most crucial component of Human Development Index evolved world over and has been viewed as a potent means, mechanism and strategy of equity and empowerment of weaker sections particularly in the context of developing economies. Despite being aware of this, educational equity has still been a major concern of all the societies. In India education has been accorded highest priority in Five Year Plans since independence and Right to Education Act has been passed recently. But realisation of educational equity for empowerment in the sense of the term still appears to be a distant dream. Based on the analysis of data from Census, World Bank, UNDP, Government department reports, the paper seeks to identify the nature, extent and constraints of educational inequities with a view to provide empirical insights and inputs for future policy interventions. The analysis reveals that inequities in educational attainments vary significantly with religion, family occupation, parental education, residence and size of family and much against commonly held assumption, the role of gender and caste is on the decline owing to the massification of education. The analysis further reveals that expansion of education has had limited impact on inclusivity because there is still disparity in access to education that empowers which continues to be at the disposal of the advanced sections resulting in perpetuation and in some sectors, accentuation of inequalities. Equity in technical, professional and higher education appears to hold the key for inclusive development.

DIVISION OF MEN IN UNIFORM: FORMAL AND INFORMAL BASES

Police department is ideally assumed to represents a streamlined bureaucracy organized on the basis of rank, authority and responsibility, following strict principles of super ordination and subordination. Each rung in the hierarchy right from orderlies to the top brass is vertical differentiated while horizontally being homogeneous in status, powers and privileges. But such depiction of ideal hierarchy appears to be far from actually being in operation with different sections of the police force reveals that, horizontal inequities operate on the lines of trades like, law and order, traffic, crime, investigation, special tasks and vigilance assignments in other Government departments. Despite similar pay and privileges across similar ranks, there are differential preferences on the grounds of importance, public authority, immunity, autonomy, visibility and the like. These considerations appear to have given rise to an informal hierarchy of branches and trades within police, based on a sense of superiority and inferiority, which in turn appear to be the bases of satisfactions, deprivations and inequalities.

Language Shift in Progress: The Case of Iranian Languages

The paper presents an overview of a variety of situations typical to the Iranian languages that are located in a wide area of Eurasia, from westernmost Kurdish up to Wakhi language in China.

All minor Iranian languages are in various stages of endangerment: We analyse situations of minor Iranian languages and their status in such countries, as Iran, Afghanistan, Tajikistan, and Turkey, Russia, Armenia, Iraq, India/ Pakistan, China, etc. In this perspective we give analysis of environment of the Iranian languages that are or were historically situated out of the mainstream of Iranian languages. These situations are typical for spoken languages in various non-Persianate countries, such as marginal Kumzari in Oman, Saryqoli and Wakhi in China; in these cases the process of language shift is most intensive. This type of the sociolinguistic situation can be supplemented by the state of Ishkashimi in Afghanistan, where the process of language shift is in progress, and has come a long way in one part of the community and finalized in the other, as local communities do not speak mother tongue any longer.

In our paper we provide specifically detailed record of endangered East-Iranian languages spoken today in Pamir-Hindu Kush region – the Pamiri languages spread in Badakhshan and its vicinity – a single linguistic and cultural area divided by a political border between several countries. Furthermore, we examine situations of extinct East-Iranian languages in Afghanistan, Tajikistan, India/Pakistan and China. As such Khotan Saka, Bactrian and Soghdian. In addition, we offer an account of the stagnation of the Yaghnobi language – an offspring of one of the dialects of medieval Eastern Iranian Soghdian language.

In conclusion we propose approaches to the problems of endangered Iranian languages.
In 2009, all Australian states raised the minimum age for compulsory school- ing. Young people are now required to be ‘earning or learning’ until age 17. Where upper secondary schooling selected students into limited academic oppor- tunities, now the same institutions must accommodate different sorts of stu- dents. Alternatively, such students can attend pre-vocational programs offered in Technical and Further Education (TAFE) colleges which are more oriented towards industry, credentialing and employment. The policy change has effectively crafted classrooms of a different ilk into two institutional templates. The paper will draw on a project designed to explore what kind of moral order these two institutional settings invoke when it comes to managing such students. Originally designed as classroom ethnography, the project involved extended observations and ongoing semi-structured interviews of teachers and students in three TAFE settings and two high school sites in towns experiencing high youth unemployment. Three to four weeks were spent observing the same core English and Maths classes for sixteen year olds in each classroom. The project was motiv- ated by the wish to support teachers to work productively in such classrooms with such students, under the assumption that teachers orchestrate classroom interactions. However, it became clear events in these classrooms were forcibly shaped by relations and parties above and beyond the classroom, as much as by those present. Teachers and students were observed to both comply with, and push against, the layers of policy and institutional processes regulating their behaviours. This paper re-thinks the project through the gaze and resources of institutional ethnography, to reveal layers of policy texts, accountabilities and documentation practices that impacted on routine behaviours. By mapping the multi-nodal webs of ‘ruling relations’, it shows how both teachers and students could make trouble, and then be held accountable for this trouble.

The Constraints Of Relevance On Curricular Knowledge

Under the Council of Australian Government’s ‘Compact with Young Austral- ians’ in 2009, all Australian states raised the minimum age for leaving school with the expectation that young people will be ‘earning or learning’ until age 17. Where upper secondary schooling has historically focused on selecting students into further academic opportunities through disciplinary studies, it must now cater for students who do not identify with the traditional academic pathway. The presence of this new group of ‘retained’ students has institutionalised a second layer of school curriculum premised on, and legitimated by, its claim of relevance to the students’ lifeworld. This paper will draw on an ethnographic study of five classrooms catering for such students in high schools and Technical and Further Education (TAFE) colleges in towns experiencing high youth unemployment. It will typify the curriculum and modes of assessment offered to students in these non-academic pathways, highlighting both the similarities and differences across institutional settings. While the curriculum offered to these students aspired to be prospective, orienting to future work and life scenarios, the students often, in volatile classroom discussions, demanded that the curriculum be grounded in their present, that is, as knowledge for immediate consumption, given their limited prospects to imagine skilled futures. In addition, teachers in their efforts to foster and recon-textualise such relevance, stripped the curriculum of any vertical discourse. This in effect reduced any mileage the students might make from the knowledge acquired. Using an analytical language from Bernstein’s distinction between vertical and horizontal discourses and knowledge structures, the conclu- sion reflects on what is gained and what is lost when relevance serves as the only principle for curricular selection.

Political Protest and Social Integration, the Role of Online Brokerage and Offline Activity in the Formation of Facebook Friendship Ties: The Case of Russia 2011

Despite their different political agendas, recent protest movements in the Arab World, Europe as well as North and South America share a strong reliance on social media. The use of Facebook or Twitter for recruitment, information dissem- ination and coordination has, for example, been one of the key factors in the Russian parliamentary elections in 2011. A striking feature of these protests is that a large group of citizens from competing political camps endorsed the oppo- sition’s general agenda. We suggest that political protest increased social integra- tion among participants by fostering friendship ties between political opponents. We elaborate on the mechanisms of the link between political protest and the formation and stability of friendship ties: “offline activity” during protest events (e.g. demonstrations) and “online brokers” (individuals with many online contacts) facilitating the creation of friendship ties between political opponents. The effect of offline activity is inferred indirectly, by comparing structural changes in the online group during demonstration periods and demonstration free peri- ods. The effect of online brokers is inferred directly as the tendency towards closing structural holes in the contact network. Longitudinal data extracted from one of the largest Russian protest groups on Facebook is used to test both hy- potheses. The dataset consists of about 3000 participants and more than 35000 links, measured at four time points. Two types of data were collect- ed. First, attribute data (e.g. gender, place of living) and friendship choices were drawn from Facebook pages. Second, political opinions (socialist, liberal) were determined based on content and discourse analysis of users’ pages. Stochastic actor-oriented modeling is applied for testing the hypotheses.

The Individual Child, the Future, and the Duty to Protect: Individualization and Changing Standards of Care Towards Children in Ireland

Following a figurational sociological theoretical framework, and empirically drawing upon changes in teachers’ manuals, educational handbooks, curricula, and newspaper reports, this paper examines the escalating notions of innocence and individualization attached to childhood in Ireland since the nineteenth centu- ry. The conceptual identity of, and emotional identification with, the child changes in this process over a long time frame. At various historical periods, there were oppositional views of the nature of childhood and consequent practices of appropriate intervention. Broadly speaking, the earlier concern of building the character of children to serve the needs of the adult world and social expecta- tions was overtaken by the adult responsibility to nurture and reveal the individu- al personality of each child and encourage his or her self-esteem. This indicates, as Elias argues, the widening distance between adults and children in terms of the individualizing process; the standards of emotional self-control expected of adults and children widen. But in another respect the cultural distance between these social categories diminishes in that children are increasingly afforded rights to express themselves and exert agency. The prohibition on personal violence between adults is extended to relations between adults and children, especially in schools where corporal punishment is eventually banned in Ireland in 1822. These changing adult-child relations are connected to broader processes such as state formation in Ireland and when state and nation builders after the disintegra- tion of the United Kingdom of Great Britain and Ireland looked to the collective past for sources of tradition and national distinction. This tilted the We-I balance towards the ‘we’. The increasing openness of Irish people towards global others from the 1950s encouraged a greater future-orientation. Increasing social differen- tiation and mobility meant children were not destined to follow in their parents’ footsteps and each child was increasingly expected to ‘choose’ a path in life.

New Urban Movement As an Emerging Field in Poland

Since 2008 we observe the intensification of grassroots neighbourhood activ- ism in Polish cities along with popularization of the Lefebvre’s idea of the “right to the city” among urban activists (Lefebvre 1968, Harvey 2012). With a number of international actors on global level promoting the idea of “placemaking”, Po- land becomes a country where a dynamic neighbourhood movement emerges, inspired by specific local problems fused with external influence (coming mostly from so-called “norm entrepreneurs”, Finnemore & Sikkink 1998). The main focus of this paper is to understand the dynamics of this emerging phenomenon and its development in Poland. We argue that the visibility of ideas and actors of this new movement is a result of growing severity of urban problems as well as raising awareness of cities’ inhabitants, willing to participate in the city governance and striving to become an important actor at the “urban scene”. Although very diverse in nature, we claim that this process and the involved actors can be described and explained using framework of field theory (Fligstein & McAdam 2012).

We use qualitative data from in-depth interviews with both local and inter- national key urban activists as well as with experts in the field to examine the processes that shape the new urban movement and its development in Poland. We postulate that urban renewal can be viewed as a distinct field, as defined by Fligstein & McAdam (2012), in-between the tension of a number of earlier and more established fields and that in the particular case of Poland we can also ob- serve the process of “field-maturing”, with already well established main actors in the field and the field processes of the formation of the new urban movement is still de- veloping, which creates tensions between different parts and actors of this rather heterogeneous movement and raises questions about its future.
This research focuses on associations to be quasi-public bodies to maintain and manage public lands in Japan. Public lands are generally maintained and managed by governments because the governments have owned them. However, the governments often lease their public lands which are used especially as community farming and growing to associations after they made lease agreements in the USA and the UK. These cases, associations can show their ideas to maintain and manage the public lands. On the other hands, the governments had only maintained and managed the public lands in Japan. Therefore, associations had not had chances to show their idea to manage and maintain the public lands. However, the Office of Nerima Ward of Tokyo enacted the Ordinance for Liveable Development in 2002. The ordinance has the definition of the community engagement on the public lands. In the Nerima Ward, associations can suggest their idea to manage and maintain public lands to the ward office. Moreover, the ward office authorises the associations as the bodies to manage and maintain the public lands. There is one case authorized by the ward office at present. In this case, there is a finding that the associations are needed to get approval from neighbouring landlords and users to be authorised by the ward office. This is considered that the associations are not just “Not for Profit Organizations” but “quasi-public bodies”.

This research suggests a question why the ward office should authorise associations as the objective to manage and maintain the public land in the Nerima Ward of Tokyo, though local governments make lease agreements with associations in the USA and the UK. Through to resolve this question, this research will clarify the meaning of the association which maintain and manage public lands and the public matter on the Japanese context.

La participación dentro de una comunidad es tan visible por el lugar donde impacta las decisiones que se toman, pero muchas veces esta expresión de los integrantes de una comunidad no se da en las cantidades que podrían beneficiar a la misma comunidad. Este fenómeno para para muchos pudiera ser “normal”. En realidad puede tener diferentes razones, desde un contexto personal, dado por diferencias entre los vecinos, hasta un contexto dado por las insuficiencias del mercado y las barreras como la distancia y diferencias sociales y culturales en los vecinos en los eventos que se suscitan. Entonces, estos contextos que por su naturaleza, presentan características, da la pauta que exigen un nuevo medio por el cual la participación presente su mayor cualidad: beneficiar a los vecinos y la comunidad. Todos los vecinos juegan un mismo papel como integrantes de la comunidad, y para generar la participación se necesitan alguien que emerja en un nivel que le dé un carácter como organizador, que establezca los principios que promueve la participación. Sin embargo, hoy en día, ya no se necesita un actor que solamente organicen, sino que vaya más allá. El nuevo perfil debe entenderse como un conjunto de vecinos que si promueven y organicen las participaciones, pero también, una herramienta que pueda cubrir las carencias de los medios de comunicación típicos de la comunidad y establezca las bases de una base sólida para generar conocimiento.

This paper examines elder care from the viewpoint of the caregivers in the context of India where legal, social, cultural and economic values emphasize the role of family in elder care. While there is research on the situation of the elderly in India, literature on the type and magnitude of care provided by the family and the impact of such care on the well-being of the caregivers is very limited. Using data from the WHO Study on Global Ageing and Adult Health (SAGE) survey conducted in 2007, which interviewed about 11000 respondents in six states in India and has a section on impact of caregiving, I’ll examine following key questions. First, I’ll examine the characteristics of the caregivers (age, gender and relationship to the care receiver), and the type of care provided (physical, emotional, financial and health care) by them. Second, the analysis will examine the subjective and objective well-being, and quality of life of the caregivers. Especially the analysis will investigate the role of gender, education and relationship of the caregiver and receiver on the well-being of the caregivers. The findings will be situated within the broader family, social and cultural context of India.

Comunidad Virtual

La comunicación en una comunidad se manifiesta como un evento independiente de las tecnologías de información, una tendencia que se ha mantenido durante siglos. Por otro lado, las tendencias de las redes sociales han incrementado, y cada vez más personas alrededor del mundo se unen a estos grupos virtuales, esto dado, a que las barreras como la distancia y diferencias sociales no existen. La construcción de una comunidad virtual para un territorio supone un nuevo paradigma que representa una infraestructura social e innovadora en la cual los habitantes de una comunidad podrían interactuar y colaborar el uno con el otro. Los puntos relevantes de este trabajo son la identidad de las necesidades básicas que expone la comunidad como requerimientos directos para generar comunicación y que puedan transmitirse en la comunidad virtual. El reto final es encontrar los competidores genéricos que permitan proponer esta infraestructura a diferentes entidades y establecer estos nuevos paradigmas, y cómo serán activos de una comunidad. El contexto base de este tema es el puente que hoy existe en las comunidades de un país y el uso de tecnologías de información, conocimiento y comunicación que permita el surgimiento de terrenos inteligentes.
The analyses will pay particular attention to differences by gender, education and ethnicity (all three have shown to have important influence on other demographic behaviours). The findings will be contextualized within the socio-economic and political changes in Kyrgyzstan such as the revival of Islam and “traditional” practices, ideational changes, lack of significant economic growth, ethnic tensions and migration. The changes and variations will also be interpreted by drawing on the rich social and demographic literature on marriage and divorce from developing countries.

Perceptions and Experiences of the Frail Elderly: Definitions of Family, Home and Independence

Projections anticipate that the frail elderly, individuals who are 85 years old and older, are the fastest growing sector in all developing nations and in particular in the United States. Majority of the elderly live in non-institutional settings, however, more than 15% of them require services and some accommodations to support their current lifestyle. The number of elderly of individuals requiring institutional support and or assistance with daily living is rising. The services available to this age group can include two types of support within the home: instrumental support for activities of daily living such as shopping and cleaning and personal care support with activities of daily living such as eating, dressing and moving within the home. Additional services are offered through institutions and may range from adult daycare services, graduated assisted living experiences, nursing home care and hospice care. Extended family and friends may provide some of the social and instrumental support needed as many of this age group are single and/or widowed. By this point in their lives, the frail elderly have often responded to life changes that have influenced family structure, the physical home and the perception of need and acceptance of assistance. Modifications in the community that have addressed access for individuals with disabilities are now benefitting those with difficulties due to age. This mixed methods study explored the experiences of the frail elderly in the mid-Atlantic region of the United States. Data collection included individual interviews with open ended questions and a short quantitative survey. Perceptions of independence, definitions of home and family, and knowledge and use of services and accommodations were explored. Implications for policy and service provision will be discussed.

Risk, Victimization and Vulnerability

In this paper, I intend to make a principal original contribution to the risk-based criminological literature by concentrating on risk in the context of victims. Although there now exists a significant body of scholarly work examining the impact and complexity of clinical and actuarial risk assessment methods on criminal justice decisions (see, e.g. Feeley and Simón 1992; 1994; Hudson 2004; Kemshall 1998; 2003; Hannah-Moffat 2005), efforts to construct a strategic knowledge of risk are yet to provide a coherent set of theoretical and conceptual tools that can be used to explain the dynamics of risk both in terms of the ‘risky’ individual, as well as the ‘at-risk’ victim. While the argument developed in this paper relates to empirical developments in England and Wales, the theorizing of victim-oriented approaches to risk management is both innovative and more generally applicable beyond the jurisdiction examined herein.

The theoretical contribution to the risk-based literature that is offered in this paper should be understood as both aligned to, but distinct from, O’Malley’s conceptualization of the potential and limits of risk. For O’Malley (2008; 2010), the promise of risk-based techniques often lies in discovering the disparate possibilities for experimentation, and identifying those sites of resistance that exist within the ‘culture of control’ (Gañán 2001). While O’Malley’s account offers particularly interesting insight into how risk functions through proxies of experimentation and resistance, this paper instead focuses on the central importance of a risk-based paradigm in facilitating the ascendance of victims in constructing notions of victimhood, vulnerability, resilience and in contributing to the development of responses/outcomes and professional praxis.

Aged Care Challenges and Solutions In Australia

This paper will examine some of the issues relating to the provision of community aged care in Australia. It will outline the population trends and major issues that impact on the delivery of community aged care services. The second part of the paper will assess some of the challenges raised by the Productivity Commission report (2011) into Aged Care. Finally it will put forward some solutions that were not fully considered by the Productivity Commission report as a way forward to making the provision of community aged care more sustainable in Australia.

Community aged care services in Australia will undergo significant change in the next four years. In 2012 the Australian government took over the funding and administration of Aged Care services and programs from the State governments. It is anticipated that there will be major changes in the way that services are funded with an expected move to more consumer directed services and individual funding by July 2015.

Many community organisations that provide Community aged care services will need to adjust the way in which they provide services and how they market services to the older population. In the last 20 years attitudes to residential care have also changed. More older people are expected to choose to reside for longer within their own home and local community. Australian Governments have recognised and encouraged the trend to remain at home. Governments have supported it with increased funding for community based services and community aged care packages. However, there remain significant challenges facing the Australian aged care system.
Inégalités Sociales Et Capital Numérique
Le développement des réseaux socionumériques a permis de renouveler les questions concernant la notion de position sociale qui est déterminée par le contexte politique. Ces comptes ont été systématiquement analysés et identifiés deux logiques d'accumulation du capital numérique. La première repose sur une accumulation progressive de la part d'agents n'occupant pas de positions dominantes en dehors de l'espace numérique. Dans ce cas, il n'existe pas de conversion de capitaux du offline vers le online. A l'opposé, nous avons identifié un second mode d'accumulation reposant sur la conversion de capitaux de la part d'agents disposant d'importantes ressources offline. Ce second type d'agents, l'espace numérique prolonge et renforce des positions d'influence de part d'agents disposant d'importantes ressources offline. Pose pour ce second type d'agents, l'espace numérique prolonge et renforce des positions d'influence préexistantes.

À partir d'une sélection de tweets émis pendant la campagne présidentielle 2012, nous avons identifié deux logiques d'accumulation du capital numérique. La première repose sur une accumulation progressive de la part d'agents n'occupant pas de positions dominantes en dehors de l'espace numérique. Dans ce cas, il n'existe pas de conversion de capitaux du offline vers le online. A l'opposé, nous avons identifié un second mode d'accumulation reposant sur la conversion de capitaux de la part d'agents disposant d'importantes ressources offline. Pour ce second type d'agents, l'espace numérique prolonge et renforce des positions d'influence préexistantes.

Panel Random and Digital Networks

The great majority of research studies on social digital networks focuses on interindividual relationships (friendship) or "followers" networks. In the "twitterosphere", let us to reconcile these two exigencies. Analyzing reasonable reason, panelisation allow to qualify Twitter accounts manually (sociodemographical attributes or audience data, etc.) and allows to explore message contents on the long way.

In these conditions, the question is: according to what logic can we sample Twitter? Is a panel randomly selected really representative of the network? Does Law of large Numbers apply to a socio digital network where every individual doesn't have the same weight neither the same visibility? Actually, on Twitter, accounts don't have the same visibility neither the same influence. How taking account of these inequalities?

We experiment two sampling logics. The first with a random sample: every account has the same weight, whatever its activity or its influence. From an exhaustive list of the population, we randomly select a panel of 2000 accounts. The second logic takes account of the hierarchical structure of Twitter. The "influence panel" is obtained from a list of accounts classified according an index of influence. We select the 1000 first accounts of the list.
And what are the practical and theoretical implications of discarding or changing this concept?

Organizational Planning for Future Droughts: The Instructive Case of the Edwards Aquifer Authority in Central Texas

For over a decade we have been studying the construction and implementation of rules and regulations of the Edwards Aquifer Authority (EAA). The EAA was created to conserve the waters of the Edwards Aquifer. In 2001 a severe drought engulfed Texas. This prolonged drought represented the first major test of the rules passed by the Authority since it assumed responsibility for managing the aquifer in 1998. Our objective is to highlight the theoretical implications of the activities of the EAA. We ground our framework in the ongoing activities of the EAA; we are influenced by the works of Beck, Giddens, Firey, Ostrom, Mol and Spaargaren, and Famiglietti – whom we take into new directions.

We outline some of the fundamental sociological issues that have emerged from our empirical investigations of water planning. We begin with the composition of the EAA Board. This elected board represents key sectors of the Aquifer. By design the largest stakeholder, San Antonio, has a dominant voice on the board but not an exclusive one. In order to enact strategic legislation San Antonio board members must forge alliances with members representing other jurisdictions. The Board has also shown flexibility in its governance. While the Board created rules for all groups who live in the region, due to aquifer variations, these rules cannot always be applied in a standardized manner.

We believe that Ostrom's notion of commons property to be central to planning for water and the future. We also focus on the growing importance of conservation planning. Conservation planning extends beyond the aquifer itself as the aquifer is dependent on the recharge zone. As a karst aquifer, the Edwards is self-replenishing. However, to replenish takes rain - a resource in short supply in this part of Texas. This abstract highlights a few problems we consider in more detail in the paper.

Societal Control of the Armed Forces - New Criteria for an Old Framework

Although the primacy of the political has incontestable manifested itself in established democracies, the question of the control or oversight of the military by civilian actors proves to be as relevant as ever before. However, the executive power of reference in a miliary self-referential civil-military debate is of limited explanatory value today. Holding not only national security structures, but also the “guardians of the guardians”, accountable is the task of an emancipated civilian side that encompasses a broader than usual understanding of civilian expertise. This submission seeks to deconstruct the limitations of prevailing civil-military relations concepts based on new criteria and a methodology that widens the focus of inquiry by drawing on a cognitive-interpretative approach (exploiting data from problem-centred interviews with grassroots actors). The aim is to show how actors have changed or been integrated into the debate on security and defense in response to altering institutional frameworks.

Presuming hegemony, critical theory has not problematized this mutation. Here, I want to stay a little longer with praxis itself as it takes shape in moments of encounters between global power and its opposite, when world order can still be problematized as if it was at stake.

In the first section, I look into three distinct episodes when 'global crowds' gathered: the so-called 'bread riots' in Egypt (January 1977); the general strike in Barcelona (March 2012), and the 'V for vinegar' protests in Brazil (June 2013). From a political point of view, global crowds are never more than mobs. Their myopic rebellions of the belly beg for a new prince to draw them out of themselves. Seen less condescendingly, global crowds reveal common legitimizing notions: a moral (or sociological) economy at work. In contrast to the 'steady-state' morality of peasants, the moral economy of global crowds is more properly thought of as a morality of situation. It not about subjectivity placed and embodied, but, more radically, about the possibility of presence in the world.

In the second section of the text, I argue for the relative coherence of resistances as part of a 'moral and ethical order', against which capitalist world ordering, for all its hegemonic swagger, remains fragmented and reactive, still excluded from actually-existing social relations.

That we may still be in a time when it appears unnatural for power to be defined outside concrete, historical situations when presence is possible suggests that domination, not hegemony, should serve as our reference point for thinking about world order and resistance.

The Matthew Effects of the Canada Research Chairs Program: Do Women Enjoy the Same Benefits As Men?

In a classic 1968 paper Merton described the "Matthew Effect" as the tendency among elite scientists to accumulate advantage. Alongside Merton's analyses, Zuckerman documented the experiences of 1000 women scientists and found women's productivity was routinely eclipsed by men's. This, they argued, accounted for the propensity for men to reap disproportionate rewards over their careers. In the years since, the gendered nature of academic work has been the focus of significant attention around the world. Recently, the Council of the Canadian Research Chair Expert Panel on Women, on the (2012) found that women continue to face obstacles in their appointment to faculty positions and their progress through the ranks. Structural and individual discrimination continue to have adverse effects on women academics.

In 2003, the Canada Research Chairs program was established to attract and retain research leaders across all disciplines. Initially, most chairs were awarded to men. More than a decade after the program was established, only 26.2% of CRCs are held by women. In this paper, we are interested in the way in which the Matthew Effect plays out for women and men CRCs. We have previously argued that on many dimensions of professional achievement, status, and rewards, women and men CRCs enjoy similar experiences (Grant and Drakich, 2011). Yet, critical differences do exist and these centre around the gendered nature of academic work and workplaces. In this paper, we focus on measures of research productivity (specifically, research grants and publications), career advancement, and awareness and recognition. As well, we examine how the dynamics of accumulated advantage vary by discipline. Findings based on 60 qualitative interviews show that men are more likely to enjoy greater benefits. We explore the reasons for the enduring pattern of inequitable distribution of rewards amongst women and men.

Construction and Constitution of Community – Epistemological and Cultural Comparative Reflections

The community concept gives rise to cultural comparative reflections since diverse notions of community are represented when going back to the roots of the sociological discipline contrasting the Anglosaxons and the German tradition. Opening up the comparison to the American, Asian and other contexts, combining a social science with a phenomenological perspective, I will analyze the construction and constitution of the community phenomenon. On the one hand, from a social science viewpoint, it will be investigated in which expressions in diverse socio-historical conditions the idea of community was constructed. On the other hand and from a phenomenological perspective, it is highly significant that communities or communal relationships are constituted on the basis of general structures of experience in activities of consciousness. The phenomenological perspective allows describing the structures of the life-world as "mathesis universalis" which is considered to be the a priori of the social sciences. It opens up the ground for historical and cultural comparison of diverse expressions of community in contrast to cultural and theoretical conceptions that do not consider the individual as the primary unit of consciousness, but the belongingness to a social relation.

Construction and Constitution of Individuality – a Parallel Action Between Social Science and Phenomenology

The present study investigates the concept and social phenomenon of "individuality" from two different perspectives. From a social science viewpoint, I will concentrate on socio-historic expressions of concrete forms of individuality or the individual which appears in different cultural contexts. The second focus applies phenomenological reflections which describe constitutive processes of the "individual" from an egological perspective. My analysis starts from the assumption that phenomenology and the social sciences have to be seen as two disciplines with differing research methods which complement one another. Therefore I will present a "parallel action" of phenomenology and the social sciences which is used to study the constitution and construction of the phenomenon of "individuality" from the life-worlds of different cultures. The comparison serves as "mathesis universalis" which is considered to be the a priori of the social world. It opens up the ground for historical and cultural comparison of diverse expressions of individuality in contrast to cultural and theoretical conceptions that do not consider the individual as the primary unit of consciousness.

After the Meltdown: Energy Regime Crisis and Environmental Conflicts in Post-Fukushima Japan

Since the Kyoto Protocols, Japanese environmentalism largely avoided a critique of the hazards of the nuclear industry with the energy demands of the country. Instead, small and marginal anti-nuclear movement organizations remained focused on this issue. Then, in 2011, the Fukushima nuclear disaster and humanitarian crisis caused by the Tohoku earthquake and tsunami called the entire nuclear industry into question. However, the silence among established environmental organizations continued. Based on an extensive study of Japanese environmental organizations, we investigate why the Japanese environmental movement was relatively silent on the largest environmental crisis in the country's history. Why were environmental organizations not in the lead of the mass protests demanding an end to nuclear energy in earthquake and tsunami prone Japan? We address this question historically and quantitatively, incorporating survey data on the Japanese environmental movement as well as extensive network data. This research is the first to quantitatively operationalize power structures in Japan and test their impact on the behavior of a large sample of environmental organizations. Among other factors, the statistical analyses identify significant negative associations of government and corporate ties on environmental organizations. Our network data trace ties between the private electric utility companies (nuclear) and their key industry partners in finance, insurance, and the media to key government agencies in Japan. These industry, government and media connections are then traced to board memberships of a large sample of environmental organizations. Among other factors, the statistical analyses identify significant negative associations of government and corporate ties on environmental groups' adoption of a reflexive and critical position on nuclear energy following the Fukushima meltdown.

An Energy Industrial Complex in Post-Fukushima Japan: A Network Analysis of the Nuclear Power Industry, the State and the Media

Despite suffering the force of a nuclear meltdown amid a natural disaster, national political leaders have re-committed Japan to a heavy reliance on nuclear energy. By examining the network connections between 400 energy corporations, government agencies, and other large corporations in post-Fukushima Japan, we reconstructing the specificity of the respective community concept within a particular cultural background. It permits e.g. to analyze the distinctiveness of Max Weber's idea of the communal relationship, in which the orientation of social action is based on the subjective affectual and traditional feeling of the parties of belonging together.

Construction and Constitution of Individuality – a Parallel Action Between Social Science and Phenomenology

The present study investigates the concept and social phenomenon of "individuality" from two different perspectives. From a social science viewpoint, I will concentrate on socio-historic expressions of concrete forms of individuality or the individual which appears in different cultural contexts. The second focus applies phenomenological reflections which describe constitutive processes of the "individual" from an egological perspective. My analysis starts from the assumption that phenomenology and the social sciences have to be seen as two disciplines with differing research methods which complement one another. Therefore I will present a "parallel action" of phenomenology and the social sciences which is used to study the constitution and construction of the phenomenon of "individuality" from the life-worlds of different cultures. The comparison serves as "mathesis universalis" which is considered to be the a priori of the social world. It opens up the ground for historical and cultural comparison of diverse expressions of individuality in contrast to cultural and theoretical conceptions that do not consider the individual as the primary unit of consciousness, but the belongingness to a social relation.

The Matthew Effects of the Canada Research Chairs Program: Do Women Enjoy the Same Benefits As Men?

In a classic 1968 paper Merton described the "Matthew Effect" as the tendency among elite scientists to accumulate advantage. Alongside Merton's analyses, Zuckerman documented the experiences of women scientists and found women's productivity was routinely eclipsed by men's. This, they argued, accounted for the propensity for men to reap disproportionate rewards over their careers. In the years since, the gendered nature of academic work has been the focus of significant attention around the world. Recently, the Council of the Canadian Research Chair Expert Panel on Women, on the (2012) found that women continue to face obstacles in their appointment to faculty positions and their progress through the ranks. Structural and individual discrimination continue to have adverse effects on women academics.

In 2003, the Canada Research Chairs program was established to attract and retain research leaders across all disciplines. Initially, most chairs were awarded to men. More than a decade after the program was established, only 26.2% of CRCs are held by women. In this paper, we are interested in the way in which the Matthew Effect plays out for women and men CRCs. We have previously argued that on many dimensions of professional achievement, status, and rewards, women and men CRCs enjoy similar experiences (Grant and Drakich, 2011). Yet, critical differences do exist and these centre around the gendered nature of academic work and workplaces. In this paper, we focus on measures of research productivity (specifically, research grants and publications), career advancement, and awareness and recognition. As well, we examine how the dynamics of accumulated advantage vary by discipline. Findings based on 60 qualitative interviews show that men are more likely to enjoy greater benefits. We explore the reasons for the enduring pattern of inequitable distribution of rewards amongst women and men.

Construction and Constitution of Community – Epistemological and Cultural Comparative Reflections

The community concept gives rise to cultural comparative reflections since diverse notions of community are represented when going back to the roots of the sociological discipline contrasting the Anglosaxons and the German tradition. Opening up the comparison to the American, Asian and other contexts, combining a social science with a phenomenological perspective, I will analyze the construction and constitution of the community phenomenon. On the one hand, from a social science viewpoint, it will be investigated in which expressions in diverse socio-historical conditions the idea of community was constructed. On the other hand and from a phenomenological perspective, it is highly significant that communities or communal relationships are constituted on the basis of general structures of experience in activities of consciousness. The phenomenological perspective allows describing the structures of the life-world as "mathesis universalis" which is seen as a priori of the social world. It opens up the ground for historical and cultural comparison of diverse ideas and empirical expressions of community, even though Ferdinand Tonnies considered it to be a general sociological concept. The 'parallel action' of phenomenology and social science allows
argue that a nuclear Energy Industrial Complex (EIC) uprooted attempts to criticize nuclear power and helped re-establish nuclear energy as a major priority for the country's energy mix. The network analyses of our original data depict this EIC as an institutionalized power structure that empowers corporate policy preferences and shapes public opinion in order to secure long-term energy development agendas suited to their particular profitability interests. We also observe how environmental organizations are embedded in some of the same networks with the state energy regulatory boards, energy companies, lawmakers and advertising corporations. The density of network overlap between the EIC and environmental organizations is interpreted as a highly constructed political environment fostering, limiting avenues for claims by environmental movement activists that strive to expose the risks of nuclear power. We conclude that national energy policy priorities are not determined by responses to disaster (human or environmental) but are instead propelled by the relative power of large scale corporate interests that forge Energy Industrial Complexes with government leaders and agencies.

Negotiating Independence: Housing Transitions of Younger People and Family Support in the UK and Japan

The restructuring of welfare states coupled with changes in housing systems across advanced economies have exposed deepening inequalities in the housing transitions of younger people. Japan and the UK are two countries in which ownership of housing has been avidly supported by governments and considered key to sustaining a welfare system based on individual responsibility. However, labor market changes and economic upheavals have challenged both these systems. Younger generations, entering the housing market in the last decade, have especially felt the effects. Family support has become a main factor determining housing transitions, as evidence suggests that inter-vivo transfers and in-kind support both specifically and postively influence the housing trajectories of younger people. Using data from qualitative interviews with young households who have achieved residential independence and members of their family networks who supported them, this paper will trace the housing trajectories of younger people, focusing on the negotiations of family support and the generational interdependencies that the giving and receiving of support create.

Organization As a Way of Life: On the Continuing Significance of 'the Classic Stance' in Organization Theory

Many of the concepts and concerns animating practitioners of what I term 'the classic stance' in Organization Theory are now seen as having little explanatory traction in the present. This paper explores the work of one significant, but now largely forgotten, exponent of 'the classic stance', the businessman, minister of state, and organizational theorist, Wilfred Brown. Through an exploration of Brown's analysis of 'bureaucracy', 'authority' and 'the judging of performance', I question the common assumption of the present having 'moved beyond' the sorts of concerns, and the organizational toolkit, developed by practitioners of 'the classic stance' in Organizational Theory. Perhaps contemporary matters of organizational concern are not so far removed from those animating the classics? And maybe, their conceptual toolkit is not quite so anachronistic as we might assume? Maybe their highly formulated knowledge of 'what makes up good organization' (Brown, 1965:32) has some possible traction for us, here and now?

Global Public Intellectual Personas: A Critical Engagement with Some Recent Contributions to Reconfiguring Social Theory Canons

This paper examines recent attempts at reconfiguring social theory canonicity with a specific, but not exclusive, focus on work that has sought to do so from the global "south" - see for example Connell; Comaroff & Comaroff; Burrawoy & Von Hold as well as multicultural readers and social theory introductions - see for example Lemert. Specifically, it examines the implications, possibilities and limitations posed by such endeavours, particularly where such interventions are explicitly or implicitly understood as responses to demands for representivity, recognition and repARATION, and explores the centrality of intellectual personas to this practice. It is argued that these interventions need to be understood against the background of what arguably is a much wider culture of celebrity and the associated phenomenon of contemporary global public intellectual personas, mediated by visual cultures, social media platforms, database-underpinned indexes, quotation circles and other social practices.

The Site of Recapitalizing the Spiritual Capital of the City: Welcoming the Stranger with Intention and Architectural Edifice

Violence during the protests in Tahrir Square, buses driving through London that leave undocumented foreigners with extradition, and xenophobic attacks in South Africa. These events divulge a spiritual capital bankruptcy in the city of our era. The dominant reaction to this spiritual bankruptcy is analysis, but the spiritual capital present in the city is not analytically-complicated, it is (counter intuitively-complex. Rather than an Analyst narrative, we need the Lacanian opposite, a Master narrative, which offers solusions to the spiritual bankruptcy. In our paper we offer a Master narrative of spiritual capital that moves beyond the Analyst narrative. This we do by combining our two fields of study: Spirituality and Architecture. The Master narrative of spiritual capital comes in the form of the Stranger, who passes through the city. The Stranger, as political neighbour, has the potential to recapitalize the city spiritually. Then, we move to conceptualise and visualise an architectural edifice that can facilitate the spiritual recapitalization of the city in the Stranger’s movement in and through the city. This architectural edifice will aim to recover a historical aspect of spiritual architecture that has not been recorded. Architectural edifices as build expressions of kindness extended in acceptance to the Stranger. From the intricate systems of asylum offered by medieval churches, to the social functions embodied in the Ottoman Külliye, spiritual tradition has traditionally uphold the way of life of the place, while being open to the influence of the Stranger. The above-mentioned edifice will be conceived as an Analyst narrative, which offers solusions to the spiritual bankruptcy. An expression of the art of care, the architectural edifice extends kindness to the Stranger and provide a location for the spiritual recapitalization of the city.

Contextualising Right to Education Act (2009) in Globalising India: A Sociological Introspection of Marginalised Communities

This paper attempts to contextualize Right to Education Act (2009) in neo-liberal India where the state has been declining from welfare activities and social responsibilities. Institutional reforms followed by structural adjustment programme concomitant with second generation reforms have forcefully advocated privatisation at every level of schooling. Unfortunately, this notion of unprecedented privatisation of education system has not been much supportive for children hailing from socio-economic and educationally marginalised communities like Scheduled Castes and Scheduled Tribes. India is one of 135 countries to implement RTE as one of the fundamental rights but data from Ministry of Human Resource Development indicates that more than 20 million children in the school going age are not enrolled anywhere. Though government caters to the educational needs of an aggregate percent of children, research studies illustrate that the schooling system has responded poorly on the benchmark of Retention and Quality. The overall situation appears pathological when broad indicators like NIR, GER, dropout rate, retention rate, gender gap are considered. Majority of ‘sarkari’ schools are facing challenges like poor infrastructure, acute shortage of trained teachers (particularly) in science subjects, adverse Teacher Pupil Ratio (1:59 in Bihar), and poor cognitive outcomes. Educational history of India shows that after independence in 1947, it adopted a policy of Protective Discrimination by reserving twenty two and half percent seats for SCs and STs in government education system but the objective is yet to be achieved. Again making and implementing a new act like RTE with provisions to provide 25% reservation for disadvantaged children in private schools appears to be quite exigent in the era of globalisation where profit making by private school managements have emerged as stronger and more powerful in manipulating norms and not confirming with provisions laid down in RTE Act by the Indian Government.

Pathways and Transition to Work in New Economies: A Study of Young People in Lucknow City, India

Two decades of economic reforms has brought about far reaching changes in the nature of Indian economy. The nature of employment and industrial organisation is also undergoing change. Highly flexible labour market, located in global
market economy, has emerged. This is best described by the term post-Fordism. The workforce is required to be multi-skilled and flexible in new economies. Further, the growing economic instability and rapidly changing technoscapes pose a big challenge for making smooth transition to work life. Post-Fordism brings an accentuated division between core and periphery workers. The workers in the core are relatively well paid and have secure jobs. But the workers in the periphery lack job security. It is further argued that career decision making are mainly about ‘opportunity structures’ which in turn is strongly influenced by social class and associated social and cultural resources of young people. This paper answers three research questions. Does core employment in current labour market is restricted to well-educated and trained youth? How the location of young people in hierarchical career structure of market economy is influenced by their cultural resources? What pathways are followed by young people belonging to different class position? The study reveals that both core and periphery workers in market economy need high level of education with constant re-skilling to adapt themselves continually to new and more demanding work opportunities. The adaption of young people in workforce is in turn affected by the cultural resources at their disposition. The young people in Lucknow are not a homogeneous group; they belong to different class positions and hence face different challenges in their transition to work life. Career decision making of young people and their pathways of transition to work is largely determined by social structure and cultural resources and partly determined by ‘flexibility of the self’.

La Téléassistance à l’Épreuve des Savoirs Profanes

Résumé de la proposition : Le principe d’une fracture numérique recèle très souvent un implicite, à savoir que l’évolution des sociétés humaines suivrait une seule voie. Le libre accès ou l’utilisation numérique (ou plus précisément le numérique) serait le modèle. Mais ce que mettent en relief les inégalités d’accès ou d’usage à ces technologies est, d’une part, qu’il existe différents modes de communications dont certains sont réifiés à la numérisation (et faudra s’interroger sur les savoirs alternatifs sous-jacents à ces « résistances »), d’autre part que l’accessibilité des autres modalités de connaissance et de savoir suppose d’autres trajectoires technologiques que celles qui sont actuellement proposées ou imposées. Tout l’intérêt de l’examen de ces pratiques de braconnage ou de résistances consiste justement à mettre en lumière, et à réactiver la pluralité des formes d’universalisation d’un savoir numérique dans des contextes locaux. Par comparaison cela nous invite également à interroger les changements en profondeurs induits par l’extensivité du paradigme numérique sur les cadres de l’expérience commune. C’est ce que nous proposerons de faire en partant de l’exemple de la téléassistance. Nous montrerons en particulier que les difficultés formulées dans un langage avant tout technique (celui de l’ingénierie informatique) reflètent en même temps qu’elles recouvrent des réalités incommensurables avec les procédures de modélisation algorithmiques actuelles (savoirs profanes, amateurs, à base historique avec une prééminence des situations particulières, des cas individuels, des éléments biographiques…). Nous illustrerons ce point à partir de la relation d’une personne avec une déficience visuelle et la robotique personnalisée dans le cadre de l’assistance aux personnes (robotique personnelle ou cobotique pour robotique collaborative), mais également des usages des smart technologies et des réseaux sociaux dans le domaine de l’autonomie et de la santé.

Rapid Social Change and New Religious Movements in Post-Independent India

The changing texture of religion is considered to be an important part of the structural transformation in post-independent India and one worthy of closer analysis. As we know, theorist of modernity had written off religion in the 1950’s and 1960’s. It is now accepted, if a little late in the day, that religious identity rarely disappears with modernity. Rather, modernity refashions religious identities in various ways. It is manifested in the global religious resurgence of ‘New Religious Movements’ (NRMs). However, the workers in the periphery are rather strikingly in modern western societies undergoing rapid social change and experiencing diverse anxieties and ambiguities inherent in a hyper-modern and technological civilization. Yet, what gives meaning to the proposed paper is that it sees beyond the west, and examines how new religiosity is increasingly visible even in a society like ours.

As our society is undergoing rapid transformation and a new middle class with new aspirations is emerging, we witness the steady growth of religious channels on television, phenomenal growth of new gurus and cults, and new preoccupation with yoga, ayurveda, health and alternative life practices. This research paper aims to highlight Rapid Social Change which necessitated and facilitated rise and growth of new religious movements in Post-Independent India. It focuses on a fast-growing and high-profile contemporary Guru faith originating in India and attracting a transnational following. By drawing upon multi-sited fieldwork among the Sri Mataji Nirmala Devi primarily urban, educated ‘middle-class’ Indian devotees, the researcher provides crucial insights into new trends in popular Hinduisms in a post-Independent and rapidly modernizing Indian setting. It attempts to locate the macro structural sources of New Religious Movements in post-Independent India; to highlight the micro structural availability of people in a particular New Religious Movement.

Analyse Des Processus D’Emergences D’Une Politique Publique Au Croisement De La Santé Publique, De La Cohésion Sociale Et De L’agriculture

Cette communication est issue d’une recherche interventionnelle ECOALES (Empowerment, Comportement Alimentaire et Economie Solidaire). Cette dernière, vise à évaluer l’intervention UNITERRES portée par l’A.N.D.E.S, un réseau d’associations sociales et solidaires. L’intervention UNITERRES repose sur le possible lien entre le développement de systèmes durables de production et de distribution de l’alimentation et une amélioration des comportements nutritionnels.

En se basant empiriquement sur l’intervention UNITERRES, cette communication souhaite interroger les processus institutionnels et politiques à l’œuvre dans l’émergence d’une nouvelle relation du lien entre santé publique, cohésion sociale et agriculture. Comment des conceptions issues de la consommation critique se diffusent-ils ou sont incorporées au sein d’institutions parties prenante de ce programme ? Peut-on parler d’un phénomène d’empowerment, dans le sens où des associations issues de l’économie sociale et solidaire imposeraient cette nouvelle vision dans l’agenda politique et administratif ? Il s’agira d’explorer les processus sociopolitiques qui sont à l’œuvre autour de cette intervention. Quels processus ont permis la mise sur agenda de ces questions ? Comment analyser les jeux d’échelle et les relations entre les niveaux local, national et européen ?

Si la vision sous-tendue par ce programme est loin d’être adoptée comme un modèle nouveau, il est intéressant de comprendre comment elle a réussi à occuper une place non négligeable dans l’agenda politique. Nous avons mis au jour deux facteurs qui nous semblent centraux dans ce processus. Le premier est que, loin d’être uniquement le fruit du secteur associatif (qui l’aurait « imposé »), ce projet est d’abord et d’autrefois une co-construction entre les administrations centrales et les associations. Le second facteur concerne les jeux d’échelles entre le niveau local, national et européen. Nous avons pu observer un processus d’imbrication entre différents niveaux d’échelles qui ont contribué à renforcer la visibilité et l’émergence de ce projet.

Why Environmental Standards Do Not Guide Food Practices: The Role of Certified and Rewarding Dimensions of Standards in Understanding the Sustainable Consumption of French Households

Several researches have been emphasizing how much food practices are inert and not so easy to convert. Indeed, they are embedded in cognitive, symbolic and material devices that constrain them by producing routinized path of consumption. However, households are submitted to a variety of standards that may refer to in different manners. In France, they have been regularly exposed to different public messages on how to consume eco-friendly food. However, environmental standards are often competing poorly with other kind of standards, especially nutritional standards. They may either be ignored or disqualified by individuals. Why environmental prescriptions are not more efficient in orienting food practices in France?

By relying on an in-depth ethnographic study conducted among 30 households in France, we identify the conditions of use of nutritional and environmental standards by households in their food practices (planning, shopping, cooking, eating). Our results are twofold. First, we state that individuals rely on standards they consider as stabilized knowledge, even though they may use it in a very idiosyncratic way. Since they may consider environmental standards as relying on negotiable belief rather than certified knowledge, they are less prone to implement them. Secondly, standards are not only guiding practices, individuals also use them to get rewards. Considering the case of food practices, following proper nutritional standards for a mother is a way of receiving rewards from peers and family for being a good mother. This is not the case for the environmental standards, for which the peer group does not generally play this role, and, moreover could deny the existence of such a standard. These insights could be of help for understanding the unsustainable features of some food consumption practices.

*Public Communication in the Processes of Transparency and Accountability in the Era of Open Data*

Transparency and accountability in the public sector are currently at the center of the communication policies by public administrations in different institutional contexts. With the development of ICT and the prospective of open data and open government that invests in recent years the renewal of the public system in various countries and supranational realities (such as Europe), accountability seems to find new impulse. Public institutions tend to make available to the public information concerning the processes of administration, the manner of use of public goods and resources.

At the same time, in the Network Society (Castells 2008, Jenkins 2006) each institution is called upon to deal with the demand for transparency and participation of citizens, which use for this purpose increasingly the internet and social media (new forms of civic engagement) (Castells 2010 to 2012, Dahlgren 2010).

Observing the ways in which public authorities are transitioning towards open data (through the analysis of significant cases at the level of local and national governments) emerge strengths and weaknesses, including a problem of attribution of sense to produced data, at the macro level (institutions) and the micro level (individual and associated citizens).

Public communication plays a crucial role because it can accompany open government, through a contextualization and adequate communication of the data that goes beyond the mere publication.

This effort, associated with the ability of individual and associated citizens to practice a selection of data, is possible the emergence of the construction of sense that it favors the desired micro-macro link (Ardoi 1998, Mazzoli 2001, 2012), the possible compatibilization between macro-systems and environment, life-worlds.

*The New Global Life of Cosmopolitanism in Social Science*

Cosmopolitanism as an idea is not a new one. Its use within the realm of social sciences and humanities has yet dramatically increased since the early 1990s, even becoming part of various labels – Ulrich Beck’s “cosmopolitan sociology”, Laurence Rouleau-Berger’s “cosmopolitisme méthodologique”, Adam Kuper’s “cosmopolitan anthropology” to name a few – and concepts – Daniele Archibugi’s “cosmopolitician” or “cosmopolitan democracy”, David Held’s “cosmopolitical governance”. The objective of this paper is first to investigate the link between the early Cold War and this resurrection of cosmopolitanism in the academy; second to provide an historical analysis of the re-emergence of this perspective and of its use; and third to study how this “cosmopolitization” of global social science and humanities addresses the issue of the “spatialization” of the world.

*Performative Turn and Epistemological Reconfiguration of Social Knowledge*

This report discusses the process of epistemological reconfiguration of social knowledge from representation to performativity, which can be observed in the context of performative turn in social sciences and outlines some features of performativist epistemology.

For the last decades, sociological knowledge has changed but epistemological concepts are still based on representative idiom. Representational epistemology is the epistemology of observation. Social knowledge is estimated by the criteria of observation and other dimensions of social cognition are overlooked.

Performative turn is redefining basic elements of research. In the context of performativist epistemology the epistemic subject (knower) should be considered not as a person or a scientific community, but as a dispersed knower embedded in complex machineries of different devices, networks and social conventions. Scientific facts and observations are effects of agency. Fact is not something that should be discovered, rather it should be produced or performed. Performative social theory takes part in enacting reality which it describes and it could not be evaluated in accordance with the representational criteria. The criteria of accurate representation should be replaced by the criteria of reconfiguration of reality. New scientific objectivity implies that the main criterion for evaluation of sociological knowledge is not the accuracy of representation, but the degree of reconfiguration of social reality.

Shift from representation to performativity provides a new prospective for social science. If social sciences take part in enacting reality, struggle between different scientific models and theories implies the struggle between realities, enacted by these models and theories. If sociologists want to make sociology more credible they need not only about how to represent reality, but how to promote sociological version of reality.

*How to be a Good Financial Advisor in the M&A Sector?*

This communication presents research evidences about peculiar Knowledge Workers: professionals who work in mergers and acquisitions Financial Services (M&A) as employees in consulting or financial firms. This professional group is structured by a “up or out” rule, with high turn-over and sharp selection. In order to keep their job or to be promoted, workers have to think and act in line with a peculiar way of representing their firms to sell and buy. Hence, we investigate the set of images, frameworks, language and meanings which is shared by this group of workers. We examine it as a social construction which inspontaneous, and at the same time, is institutionalized (Berger and Luckmann, 1997).

The communication is based on a large sociological qualitative inquiry, conducted since 2011 (observations of work and more than 70 interviews with M&A French practitioners) and an analysis of curricula vitae of professionals of financial services. Theoretical frame is mainly borrowed from sociology of professions and sociology of work and particularly French activities' analysis.

We will briefly introduce the professional milieu and its occupants. We'll then demonstrate that they construct a specific representation of the companies they deal with. We argue that this mechanism of subjectivation derives from 3 main social processes: daily activities (characterized by obedience and extra work), the piloting of employees. We observe that it also allows to answer the question of whether trust is higher a) among people that share the same characteristics and b) in denominational comparatively more mixed Cologne than in denominational rather homogenous Bilbao.

*Decomposing the Determinants of (Dis)Trust in Outgroups in Germany and Spain: Results from an Experimental Design Using the Factorial Survey*

Social trust is understood in social sciences as a key component for social cohesion, economic growth and political development of a society, as it is the ‘glue of social life’. Immigration caused by the economic miracles after World War II and by refugees from crisis areas generated a growing religious an ethnic diversification in Western societies. The plurality of origins, denominations and cultures that increasingly form part of our society is frequently assumed to undermine social trust in current modern societies (Putnam). The purpose of this paper is to decompose for the first time empirically the impact of different factors that are assumed to be determinants of trust and distrust by using a factorial survey. This experimental design carried out among students from Bilbao and Cologne consists in judging varying descriptions (vignettes) of fictitious persons acting in an interview by the researcher in advance defined situation. By using mulilevel analyses the impact of the described characters of the fictitious persons as well as the impact of respondent characteristics on trust can be estimated simultaneously. Besides the model also allows to answer the question of whether trust is higher a) among people that share the same characteristics and b) in denominational comparatively more mixed Cologne than in denominational rather homogenous Bilbao.

*L'évaluation Du New Public Management Par Les Travailleurs. Ou Comment Joindre L’inutile Au Désagréable*

Le New Public Management s’est imposé dans les administrations publiques européennes et américaines depuis un quart de siècle. Cette communication rend compte des résultats d’une analyse de cas clinique dans des organisations françaises (observations au poste de travail, entretiens individuels, analyse documentaire, mise à l’épreuve collective des hypothèses). Le cadre théorique est la sociologie clinique du travail.

Nous nous demandons combien l’évaluation que les travailleurs font de ce mode de gestion du travail. Nous présentons qu’à hauteur d’activité, le piloteage par les nombres sous contrainte de productivité, engendre quatre processus typiques.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
The International Institute for Applied Systems Analysis (IIASA) in Laxenburg near Vienna is a remarkable example of a transnational scientific organization due to the political circumstances of its foundation during the Cold War, its institutional setting as a meeting place for scientists with different national and political backgrounds, and its research into some of the most pressing issues of global change.

First proposed by US-President Lyndon B. Johnson in 1966 as part of his ‘bridge building’ initiatives between the USSR and the USA, the institute’s rationale was both political, in hoping to foster rapprochement between the blocs by organizing cooperative research into common problems of the industrialized nations and scientific, in that solutions to large-scale global problems shall be facilitated which cannot be achieved by either of the sides alone.

The IIASA-Charter was eventually signed by representatives from twelve member countries from East and West in October 1972, establishing IIASA as a non-governmental research institute, where scientists from all member states worked together in applied research projects. Within the methodological framework of systems analysis, research problems included questions of the environmental dangers of the modernization process, population growth, urban planning, energy production and water resources, thus being inherently interdisciplinary and global in scope.

The paper builds upon a thick contextualization of IIASA to explain the methodological changes, systems analysis has seen as a consequence of its internationalization. These changes are marked by a gradual, and in retrospect dramatic increase of ‘soft’ social science perspectives and an ever growing skepticism towards the formerly strong positivistic epistemology in systems analysis. Though primarily concerned with the case of IIASA; this effect of internationalization shall be underlined by drawing comparisons with earlier US-American versions of systems analysis as well as other international research contexts like that of area studies.
developed between actors (i) trust between those actor increased due to changes in interests, identities and norms; (ii) this in turn implied a benefit for local populations and those actors due to the many different projects developed to increase life conditions of local actors (iv) it will be extract theoretical issues in the area of social constructivism and implications for others scenarios will be extracted.

Involving People in the Mitigation of Electric Demand Peaks: Attitudes and Behaviours in a Peak Pricing and Load Shedding Experiment

As part of the current quest to reduce energy demand in buildings, people behaviors are increasingly seen as one of the main factors driving households consumption, making them potential levers for energy savings or peak shifting. Peak shifting is an increasing concern in a context where electricity demand grows while networks need massive investments and generation becomes less flexible in the presence of dispersed electrification. Among the different ways people can be driven to shift their electricity consumption from peak to off-peak time, we've studied load shedding remote signals and tariff incentives effects through a field trial. How do people perceive those interventions? How do they change their daily practices? What are the outcomes in terms of peak shifting and energy consumption? Our work relies on both qualitative and quantitative materials. In depth interviews and observations at home revealed the diversity of the changes and actions undertaken by people in reaction to the signal and/or incentive. A comprehensive analysis of the energy consumption main dimensions (usage, project, context) was carried out, from the motivations leading people to take part in the experiment to the underlying semantic fields and the antagonisms structuring them: individualism/community, comfort/moderation, transformation/preservation, efficiency/morality. Eventually those attitudes and behaviours could be related to the measured consumption shifts and load shedding acceptance, providing insights on how to enhance or mitigate existing dynamics in people practices impacting energy consumption.

The Vulnerable Organisation: Austerity and the Third Sector

The on-going economic recession in the UK has led to the introduction of austerity measures by the coalition government, which has been accompanied by feminist analyses of how the recession is disproportionately affecting women. Cuts in government budgets and public sector jobs have occurred alongside cuts in government support services, especially those set up to support women. At a time when these third sector, not-for-profit, organisations are most needed by the population, such cuts in public sector jobs, a reduced level of pay in the private sector, a public sector pay freeze and changes in the benefits system. On the other hand, such individuals may find themselves turning to alternative third sector organisations, such as foodbanks, set up to help individuals and families who face such difficult financial situations.

To what extent have third sector organisations, set up specifically to help women, been affected by austerity measures? How vulnerable are these organisations? How sustainable is the concept of the big society? What does all of this mean for the future of gender equality?

A Matter of Rights: Social Inclusion Among Refugee Children in Canada and Sweden

In 2010, Canada accepted approximately 25,000 refugees. Of these, 25% were children under the age of 15. Refugee children often have experienced trauma, exploitation and human rights violations, which can make it difficult for them to become fully included in the society they are entering. The United Nations Convention on the Rights of the Child (CRC) obligates States to ensure the social inclusion of all children, including refugees. While all but two countries have ratified the CRC, few have fully implemented it. In this paper, we explore the relationship between a country’s level of implementation of the CRC and its level of social inclusion of refugee children. We examined the policies of Canada, which has made relatively little progress in implementing the CRC, to those of Sweden, which has extensively advanced CRC implementation by incorporating it into legislation. We focused on five policy areas particularly relevant to children’s social inclusion: 1) family reunification; 2) health care accessibility; 3) housing accessibility; 4) education accessibility; and 5) economic security. To measure CRC implementation in each policy area, we developed five CRC Implementation Scales based on criteria recommended in UNICEF’s Implementation Handbook. Each country was scored on whether the implementation criteria were met in each policy area. To measure refugee children’s social inclusion, we identified comparable indicators in each country of family reunification; accessibility of health care, housing, and education; and economic security. As expected, Sweden’s CRC implementation scores were higher than Canada’s in all five policy areas, and these differences were reflected in a higher level of social inclusion among refugee children in Sweden than in Canada in each of the five areas. The findings suggest that the well-being of refugee children reflects a country’s level of commitment to upholding their rights.

Leaders and Laggards: Banning Corporal Punishment of Children in Scandinavia and the Anglo Nations

This paper will explore the unfolding of a global phenomenon – the legal prohibition of corporal punishment of children. Until 35 years ago, this near-universal practice was considered appropriate, necessary and a parental right. But a paradigm shift in conceptions of childhood has led to a global movement to redefine it as violence and as a violation of children’s rights. Today, 33 countries have prohibited it in all settings, including the home. This remarkable shift reflects profound cultural changes in thinking about children and their development, parent-child relationships, and the role of the state in family life. This movement began in Scandinavia, when Sweden became the first country to explicitly abolish all corporal punishment of children in 1979. Finland and Norway were the second and third countries to prohibit corporal punishment of children in 1983 and 1987, respectively. Interestingly, but perhaps not surprisingly, progress in the Anglo nations has virtually stalled. New Zealand became the first Anglo nation to pass a corporal punishment ban in 2007, but this did not happen everywhere. In all other Anglo nations (Australia, Canada, UK, US), legal defences continue to protect adults who corporally punish children.

In this paper, we will examine the process of law reform in the three Scandinavian "pioneer" countries and contrast it with the situation in the Anglo countries. We will address the following three questions: 1) Why did this particular law reform movement begin in Scandinavia? 2) What social, political and historical reasons account for Sweden, Finland and Norway being the first to reform their laws? 3) What accounts for the Anglo nations’ slow progress on this front?

Research University in Modern Russia: From Science to Innovation

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
Historically, science in Russia was concentrated at the academic and applied-research institutions. Nowadays, state science policy is aimed at the development of scientific researches in higher education institutions. As a result, some universities received the status of National Research University. Research universities become entrepreneurial, characterized by the managerial model similar to business. The consequences of such business-oriented strategies turned into unstable conditions of work for scientist, limitation of permanent contracts, public perception of scientist as ordinary worker.

The principles of research universities were imported into Russian educational system, which is included into particular socio-economic conditions: the state, not private sector, is a major customer in producing public goods. In this regard, it is important to understand the effectiveness of Research University in Russian reality.

This report will present the results of empirical study, conducted in 2013 at the laboratories under the supervision of leading scientists in St. Petersburg. These laboratories represent Biomedical and IT clusters. We have sent 50 questionnaires per e-mail to the young researchers. The questionnaire includes three parts: global situation in Russian science, situation at the university, own professional career. We obtained 9 interviews with leading scientists.

We have created rating scale with following items: the prospects of line of investigation, the potential for innovation, scientific productivity, efficiency of management, the training of young researchers and their academic advancement on investigation, the potential for innovation, scientific productivity, efficiency of managerial career. We obtained 9 interviews with leading scientists. These laboratories represent Biomedical and IT clusters. We have sent 50 questionnaires per e-mail to the young researchers. The questionnaire includes three parts: global situation in Russian science, situation at the university, own professional career. We obtained 9 interviews with leading scientists.

In Sen’s and Nussbaum’s capability theory, subjective wellbeing or suffering as usually measured is a functioning, i.e. a realization or state of being. This mental and emotional state is a result of different factors including the capabilities that each individual enjoyed to pursue his life projects. The chapter examines the factors associated with different indicators of suffering - negative affect, depressive symptom, scale of suffering and life dissatisfaction - using a unique Chilean survey conducted by UNDP to evaluate subjective well being in Chile. These factors include different variables considered in the literature such as sex, age, civil status, labor status, personality, recent negative or positive events, etc., as well as individual capabilities. By doing so, the paper provides a novel empirical assessment of the relationship between suffering and capability deprivation. The results suggest that some capabilities are more related to suffering than others.

Conditional cash transfer programs in Turkey since 2004, this research investigates the politics of CCT social assistance program examining how its design and its institutionalization were shaped by the vote seeking practices of the Justice and Development Party government (AKP) (Aytac, 2013; Yoruk, 2012). This research will aim to understand the "translation" (Campbell, 2004) or the "vernacularization" (Levitt and Merry, 2009) of ideas and policy instruments (Dobbin, 2013; Fiszbein and Schady, 2009) orients researchers to concentrate on the national stories of this adoption process to understand the variation in the program design across cases. By focusing on the institutionalization of conditional cash transfer programs in Turkey since 2004, this research investigates the politics of CCT social assistance program examining how its design and its institutionalization were shaped by the vote seeking practices of the Justice and Development Party government (Adalet ve Kalkınma Partisi-AKP) (Aytaç, 2013; Yoruk, 2012). This research will aim to understand the "translation" (Campbell, 2004) or the "vernacularization" (Levitt and Merry, 2009) of ideas and policy instruments. (Dobbin, Simmons and Garrett, 2007). There is an important role of domestic actors in the adaptation of policy ideas into domestic circumstances. Following the financial crisis in 2001, the CCT program was launched in Turkey within the scope of the Social Risk Mitigation Project initiated by the World Bank. Although the financial assistance provided by the World Bank has been exhausted in 2005, AKP government has institutionalized this social assistance instrument. How can we explain the institutionalization of the CCT by the AKP government as an anti-poverty scheme? What are the implications of the CCT for the welfare and citizenship regime in Turkey considering regional, ethnic and gender dimension of poverty in Turkey? This research suggests that CCT has been used to contain the Kurds in Southeastern regions of Turkey as well as to gather and increase votes in local elections by the AKP government.

Conditional cash transfer programs were promoted by International Organization as the most efficient policy instrument for poverty alleviation with its focus on human capital development of children addressing inter generational transfer of poverty (Handa and Davis, 2006). The growing scholarly interest on the diffusion of conditional cash transfer (CCT) programs (Ancelovici and Jenson, 2013; Fiszbein and Schady, 2009) orients researchers to concentrate on the national stories of this adoption process to understand the variation in the program design across cases. By focusing on the institutionalization of conditional cash transfer programs in Turkey since 2004, this research investigates the politics of CCT social assistance program examining how its design and its institutionalization were shaped by the vote seeking practices of the Justice and Development Party government (Adalet ve Kalkınma Partisi-AKP) (Aytaç, 2013; Yoruk, 2012). This research will aim to understand the "translation" (Campbell, 2004) or the "vernacularization" (Levitt and Merry, 2009) of ideas and policy instruments. (Dobbin, Simmons and Garrett, 2007). There is an important role of domestic actors in the adaptation of policy ideas into domestic circumstances. Following the financial crisis in 2001, the CCT program was launched in Turkey within the scope of the Social Risk Mitigation Project initiated by the World Bank. Although the financial assistance provided by the World Bank has been exhausted in 2005, AKP government has institutionalized this social assistance instrument. This research suggests that CCT has been used to contain the Kurds in Southeastern regions of Turkey as well as to gather and increase votes in local elections by the AKP government.
Humanity and Institutional Categorization of the Unemployed Poor in the Context of Czech Welfare System

When welfare professionals in the Czech Republic speak about unemployed, they specify different kind of humanity of the unemployed and qualify them as “deserving” or “undeserving” poor. Similar processes of moral differentiation among the poor are ethnographically described by sociologists and anthropologists such as Howe, Haney, Dubos etc., who in their analysis focus on changes of welfare systems in Europe. They focus specifically on the process of creation of categories and thus also moral communities according to which the unemployed were measured and evaluated as “undeserving”. In this paper I show how this process of evaluation is highly loaded with ethnicity – Gypsyness. Roma/Gypsy are the only visible “group”, that is publically assigned to the “undeserving” category.

The welfare professionals has to stand up to paradoxical situation: they mostly share the common-sense and understanding the Roma as “undeserving”, on the other hand they stress neutrality and standard criteria for distributing money to the poor and thus pretend the welfare system as not being ethnically loaded field. The paradox in their standpoint brings ambivalences also into everyday situations among professionals and claimants. These ambivalences open space for responses and for the negotiation of quality of humanity by professionals and by claimants themselves. In the paper (that comes up from participant observation at two Czech welfare offices that I did in 2012) I show, how this pretended neutral space is in Czech context morally loaded field that always come up from racial differentiation among different quality of humanity. In other words I show how these ambivalences are filled with specific meanings of humanity and how claimants stress their humanity in opposition to other claimants alongside the racial line.

Japan Redefining National Culture: Unintended Consequence of ‘Cool-Japan’

Since the word ‘Cool Japan’ was introduced by Douglas McGray in his article of Japan Gross National Cool in 2002, the word represents the global strong wave of Japan’s pop and youth culture; and the academic debates on it also focuses on these various cultural products that can be classified as the ‘Cool Japan’, consumed by people outside of Japan or foreigners in Japan. Among abundant academic findings on the subject, though conducted from various approach, ranging from media to economic studies, very few academic studies put forward arguments on the impact of ‘Cool Japan’ to the Japan as a nation and a state in term of redefinition of national culture. This study will elaborate how the ‘Cool Japan’ wave has led Japan to position and re-position herself in the global world, and as the unintended consequence of the repositioning, how Japan attempts to redefine the National Culture. Through a qualitative approach that includes close study on the content of media coverage on the ‘Cool Japan’ and interviews to key-person in the government and non-government institutions of Japan who are closely connected to the policy of Cool Japan, and by making comparison with other country’s experience, this study attempts to understand the process of re-definition of national culture for Japan, as a nation and a state.

Spatial Justice for Urban Informal Sector: The Case of Indonesia

Urbanization and urban development in Indonesian cities has resulted in co-existing formal and informal sector, despite the fact that restructuring of physical and economic activities had caused the core of the city to shift from a manufacturing center to a services and financial activities. Intensive and borderless flows of investment, goods, information and people contribute significantly to the co-existing formal and informal sector, creating spatial injustice. The condition was further enhanced by the Asian Economic Crisis at the end of 20th century, which for Indonesia was coupled by political crisis that led to the ending of the 33 years long centralized regime. The commencement of 21st century in Indonesia – known in Indonesia as the era of reformation – was marked with the implementation of a new decentralization law in 2001, which should have given more opportunities to city government in their attempt at creating spatial justice for the citizen including the informal sector. This study will elaborate the positionning-contestation-repositioning of the informal sector in two local cities in Indonesia whose city governments have adopted contrasting standpoint on informal sector. By applying qualitative approach on two local cities through on-site observation, coupled with several interviews of key person from the city governments and informal sectors, as well as other important actors, also through study on secondary data, conducted approximately one decade after the implementation of the new decentralization law in Indonesia, this study aims at understanding the underlying process of the production of spatial (in)justice.

Feasibility Of Social Capital and Leprosy Patients in India: A Quantitative Study

Feasibility of Social Capital and Leprosy patients in India: A Quantitative Study

Leprosy still evokes social stigma and prejudices in the society and it exer-cises constraints on the patients to live a socially excluded life. Low level of so-cial capital is one of the manifestations of social stigma associated to leprosy. In the present study an attempt has been made to understand the observance of effect on social capital in case of patients suffering from leprosy. A total of 120 leprosy sufferers were selected randomly from ‘The Leprosy Mission (TLM)’ hospital of Allahabad district of Uttar Pradesh (India). Both deformed (N=60) and non-deformed (N=60) patients were selected in the sample. Data were collected through interview – schedule in two time context; i.e. before the onset of ailment and after the onset of ailment. Interaction patterns of leprosy suffers with their family and community were also observed. In addition, a four point scale was also used to observe the intensity of social capital with the increased intensity of deformation. Analysis of data indicates that deformed leprosy patients have low social capital in terms of interpersonal trust, reciprocity, social support and social participation than non-deformed patients. ‘Sin of previous birth’, ‘punishment of God’, ‘fear of infection by germs’ and ‘visible signs of deformation’ lead to low social capital in case of leprosy patients. On the contrary ‘unawareness about the ailment’, ‘lack of physical deformation’, and ‘modern medical belief system’ are promoting their bonding with their family and community as much as before the onset of ailment. In that case patients have good stock of social capital.

Neoliberal School Accountability Policies and Gaming Practices By School Personnel: Consequences For Schools, Children, Teachers and Society

Professional ethics in public k-12 education requires that teachers and school administrators ethically perform the duties of their position within schools that are the learning and welfare of their students and prepare their students for future adult roles as citizens of their society. The traditional relationship between teachers and other school professionals has been based on organic trust (Bryk and Schneider 2002), in which teachers and other school professionals accept salaries that are lower than those earned by similarly-trained profession-als in the corporate world in exchange for job security. New generation is associated with globalization impose external accountability systems on schools and school-ing have altered that social contract, as they assume that school personnel will

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
not work for the welfare and learning of their students unless they are pressured to do so under the threat of draconian measures. Within Neoliberalism, the principal indicators of school effectiveness are scores on standardized tests. Low-performing schools face closure and the termination of staff. The current accountability systems adopted in several developed nations and increasingly considered in developing nations are thus based on hierarchy (Dworin and Tober 2012). Especially in high-poverty schools teachers and school administrators do not trust that their students will perform adequately enough on high-stakes, standardized tests to ensure their own job security. This leads many to “game the system” by teaching to the tests (that give the appearance of evident and stable learning gains when such gains are fraudulent). School teachers, administrators, and even government education agencies have been found to engage in such gaming, with the result that student learning deficiencies are not detected and students are deprived of the education they deserve. The systems of accountability and the need to game the system adversely affect the morale of school personnel.

In order to reduce the risks for the population, an integrated disaster risk reduction approach is needed. Apart from “green” infrastructural measures and relocation of the most vulnerable inhabitants, it is essential to implement “green” measures such as using ecosystem services to achieve a more feasible and cost-effective reduction of vulnerability.

An important precondition for the inclusion of all levels of society into risks reduction strategy is the assessment of social perception regarding options and constraints for actions. The focus of our study is the potential for the valorization of ecosystem services through the participation of the population via preservation and recuperation of nature.

The paper presents a case study in the municipality of Teresópolis where quantitative and qualitative data collection has been conducted in order to assess the perception of the local population of environmental risks and the potential for reducing vulnerability through the valorization of ecosystem services. This analysis is an essential basis for developing a sensitization strategy for ecosystem based measures for disaster risk reduction.

Especially the poorer strata of the population perceive a lack of possibilities and empowerment. Sensitization measures have to be adapted to the special needs of the target group in order to ensure their contribution on community level.

Emerging Society and Sociological Discourse in Brazil

Sociological research in Brazil pays little attention to the dynamics of economic and cultural globalization, and especially not to that with the BRICS. This paper proposes a sociology of the BRICS, based in symbolic interactionism and a classification which sees globalisation as occurring in three relatively autonomous spheres: political (economic and cultural type). Following upon Weber, I define the sociology of the BRICS as having at its centre the significant interactions that occur between citizens (and ‘objects’) that represent the BRICS countries. This research uses mixed methods, drawing upon observations, interviews and readings. A massive increase in Brazilian presence in China is observable over the past two decades, has been accompanied by a rising number of strains between Brazilians and Chinese. The results of recent field research in Southern China, especially with Brazilians who serve as cultural intermediaries, will be analysed. Some consequences drawn from this study for Brazil-China relations are detailed and some future research initiatives suggested. My hypothesis is that the objects of sociological discourse will adjust to meet the emerging needs in the society.

The Consumerist Aesthetics and the Spirit of Capitalism: New Forms of Inequality in the World and Modern Russia

From the 60th years of XX century the thesis of a fundamental change in the type of capitalist relations existing in developed countries became popular. It is, primarily, the transition from the classic puritan capitalism (that was described by Weber and Marx) to its hedonistic and consumerist type. Examining the “spirit of capitalism”, we naturally approach to its two main aspects - the ethic and aesthetic. And the role of aesthetics, that increases over time – is the main subject of our study. The special role of “aesthetic shift” was played in the development of capitalism, we naturally approach to its two main aspects – the ethic and aesthetic.

Connecting People and Nature: Challenges and Potentials for Reducing Vulnerability through an Ecosystem Based Approach

In January 2011 the population in the mountain region of Rio de Janeiro state, Brazil, suffered once again from an environmental disaster: excessive rainfall in a short time provoked landslides and floods which caused more than 900 fatalities and led to a major material damage. Generally, those events are natural because of the rugged topography and vulnerable geology and soils, but anthropogenic land degradation and informal housing contribute to disaster risk. Due to scarcely of inhabitable land, lack of public transport and social infrastructure poor people are increasingly forced to live in high risk areas.

In both the United States, and increasingly in the United Kingdom, consumerization and deprofessionalization have resulted in increasing demands for patient autonomy in health care decision-making (Dworkin and Tobe, 1973). Loss of physician authority and concerns over paternalistic practices shifted decision-making power towards patients at the expense of physician control over clinical decisions (Truog, 2012). Using the example of the Do Not Resuscitate (DNR) order at the end of life, I discuss how decisions made between physicians and patients reflect changing power dynamics, and how unlimited patient choice might threaten the physician’s ability to act in the best interest of their patient. In the US, DNR decisions are largely determined by patient choice whereas in the UK, physicians are permitted to make decisions unilaterally based on what they believe is in the patient’s best interest. Through semi-structured interviews in the US and UK, I explore how prioritization of choice and patient autonomy over clinical judgment result in contrasting outcomes.
flicts in DNR decision making and moral distress in American doctors in ways that do not occur in Britain.

Less experienced physicians in the US feel especially compelled to offer unlimited choice, as compared to more experienced physicians who feel more comfortable giving recommendations based on clinical judgment. Despite this, most American physicians acknowledge that patients often do not have sufficient information or the tools necessary to make informed decisions. Junior doctors tend to perceive recommendations as a violation of patient autonomy and are less willing to take on the burden of responsibility for clinical decision making due to lack of experience and confidence. These prioritizations of unrestricted choice forces physicians to perform futile therapies that they believe are harmful to the patient and ethically unacceptable.

This paper analyzes the ways in which Indigenous Peoples Organizations (IPOs) have negotiated their participation in intergovernmental policy that has been deliberated within the context of the United Nations Framework Convention on Climate Change (UNFCCC) and the United Nations Convention on Biological Diversity (CBD). In both bodies, Indigenous Peoples Organizations have been influential in shaping various aspects of the policy processes. The paper identifies some of the most salient issues that have arisen for Indigenous Peoples in the two policy processes, and analyzes some of the strategies that IPOs have used to influence the policy decisions. The broader legal framework of international law as it pertains to Indigenous Peoples has focused on self-determination and sovereignty. However, within the UN system, nation-states are given primacy, thus relegating IPOs to “non-governmental” status. The legacy of the nation-state system upon which the UN is predicated presents obstacles for IPOs who advocate for rights for people who are often marginalized or not recognized by UN-legitimized governments. However, competing processes, such as those taking place under the United Nations Permanent Forum on Indigenous Issues (IPFII), can serve to put pressure on parallel policy dialogues. Additionally, Indigenous Peoples’ participation has been institutionalized in both the CBD and the UNFCCC, with varying results for the efficacy of Indigenous participation. Informed by institutional ethnography, the primary data for this paper were collected through participant observation at UNFCCC, CBD, and IPFII meetings. Additionally, I have followed transformations in various policy texts as they have been influenced by IPO engagement with the policy processes.

This paper explores the dynamic interface between Bustos Alliance of Christian Churches and the Municipality of Bustos, Bulacan in the Good Governance and Transparency Advocacy. As a practitioner of community development, the mayor of Bustos, Bulacan has introduced participatory governance since he was elected in 2010. The partakers of this form of governance are representatives of various sectors such as the members of Bustos Alliance of Christian Churches who have been empowered to safeguard the budget and monitor the expenditures of the municipality. They actively participate in the planning, implementing, monitoring and evaluating the municipal development program. This alliance collaborates with the municipal government and in return, the latter allocates funds to their activities that address holistic development of the people of Bustos.

The researcher uses Pierre Bourdieu’s ‘practice theory’ and the theory on participatory governance as its framework in this research. It also utilizes in-depth interview of the key informants, participant observation and triangulation. Key informants include the mayor, the municipal councilors, the secretary to the mayor, the municipal department heads and the officers and members of Bustos Alliance of Christian Churches. Participant-observation is done during the actual municipal planning, implementation, monitoring and evaluation. Triangulation is done to validate the data gathered. Findings are analyzed using specifically the theory on participatory governance of Dr. Oscar P. Ferrer of the University of the Philippines followed by the conclusion and recommendation derived from the result of the study.

Gender segregation among occupations which can be traced back to gender specific vocational choice leads to gender inequality in the labor market. According to Gottfredson’s (1981) theory of vocational choice and role identity theory (Stryker & Burke, 2000) gender differences in occupational choice appear because gender is a significant part of the self-concept. Since adolescents attempt to fulfill
social expectations regarding gender roles they choose occupations in which per-
sons of their own sex are predominant. By doing this, we assume, young persons
try to receive social approval from significant others in order to develop and en-
hance their self-concept.
To test the hypothesis whereby gender specific vocational choice is driven by
the fundamental human need for social approval we used data from a representa-
tive survey of 4.621 applicants for vocational training in Germany in 2010. With-
in this survey participants were asked to anticipate the reaction of their social en-
vironment if they would choose a specific occupation. The adolescents assessed
16 different occupations varying with regard to status and sex ratio. Furthermore
the participants provided information about the occupations they had actually
applied for.
Using regression models, we firstly demonstrated that young persons antici-
pate social approval from significant others more likely if the assessed occupation
is appropriate to their sex. Secondly, we showed that the likelihood for applying
for a job is influenced by the adolescents’ expectation about how their social en-
vironment will react upon their occupational choice.
The results indicate that adolescents use vocational choice as a tool to gain
credit and avoid blame by showing gender appropriate behavior.

Global Financial Class and Precarious Work Societies

Global Financial Class and Precarious Work Societies
The purpose of this paper is to investigate whether the formation of a global fi-
nancial class is paralleled by the development of a global precarious work society.
Taking global developments into account, the paper will trace differentiating and
integrating aspects of global work relationships. While the formation of a global financial
class can be described as a new integrating and collectivising element in the
global economy, I argue that it comes with a shadow side. This shadow
side I describe as a global precarious work society. Wherever we can observe the
development of a global financial class, the development of a precarious layer of
work relationships is not far behind. The paper will map out which industries, which
population groups or economies play which role in the development of a
global precarious work society. The formation of a global financial class and the
development of a global precarious work society ultimately cannot be separated
and need to be looked at as social consequences of financialisation as a differenti-
arising and integrating process.

The Institutional Dynamics of Transnational Entrepreneurship:
Theoretical Considerations and Empirical Evidence
The phenomenon of transnational entrepreneurship refers to the transna-
tional operations of the start-up enterprises of migrant entrepreneurs. It may
be viewed as a complement to the networking dynamics of large transnational
companies, thus resembling a ‘globalisation from below’ (Portes). Transnation-
al entrepreneurs combine resource mobilization in their countries of origin and
destination, augmented by resources in third countries. The factor movements
of labor, capital and knowledge are framed by network relationships that com-
bine local and transnational components in terms of a ‘multiple embeddedness’
(Kloosterman and Rath). Against this background, the question arises in what
sense transnational entrepreneurship exhibits strategic qualities regarding the
utilisation of socio-cultural resources. This would imply that transnational entre-
preneurship gains an institutional logic of its own. Empirical evidence regarding
this matter has been gained from empirical research projects that have been
conducted by researchers in the field of transnational entrepreneurship in large
transnational enterprises during 2011 and 2012, primarily by making use of
interviews with entrepreneurial actors. Frankfurt/Rhine-Main is the eco-
nomically and socially most internationalised region in Germany with a share of
migrants in start-up enterprises that is set well above 40% since the mid-2000s.
Corresponding transnational segments of business operations involve not only
capabilities in mobility, multilingualism and intercultural interaction but increas-
ingly also human capital in terms of professional qualifications. In exploring the
multiple dimensions of embeddedness the projects confirm the hypothesis that
transnational entrepreneurship goes together with a strategic utilisation of so-
cio-cultural resources and identities.

Transformations of Industrial Policy in East Asian Capitalisms: The
Rise of the Entrepreneurial State
The role of industrial policy in the rapid economic growth of the East Asian
countries is subject to different discussions. A key issue in these debates is the
concept of the “developmental state”, which takes on the exposed role of
the governmental executive in political systems and its relative autonomy in the
relationship with the business sector. The state exercises industrial guidance in a
national effort of catch-up growth. In this manner, the concept of the develop-
mental state has been said to address key aspects of the East Asian miracle that
unfolded since the 1960s and lasted well into the 1990s, providing the empirical
basis for ongoing concerns with the institutional specificity of Asian capitalisms.
During the late 1990s, however, East Asian types of capitalism have been subject
to an ongoing transformation, including the set-up of the corresponding develop-
mental states. Political systems have been marked by a flexibility of govern-
ment-business relations with firms turning into global players while approaching
the technological frontier. Besides, the Asian financial crisis of 1997 contributed
to this process. The proposed paper explores the institutional transformation of
government-business relations by addressing the reorientation of industrial pol-
cies in East Asia, with a focus on Japan, Korea, Taiwan and Singapore. The key ar-
gument is that the developmental state is transforming into a post-developmental
corresponding institutional constellation that is in line with the pressures of globalisation and technological as well as structural change, well approached in terms of an entrepreneurial state.

Don’t Know Much about History? Methodological Insights and
Challenges in Examining the Archival Record to Understand
Gendered Linguistic Inequalities
In this paper, I share methodological challenges I have faced in trying to under-
stand the historical factors contributing to gendered inequalities that persist in
the use and symbolic meaning of the Basque language (“Euskera’). Mainstream
discourses currently define a Basque person who speaks the Basque language,
which is grammatically gendered and expresses the gender of the person who
uttered it. In addition to native speakers, the linguistic properties of the
language also make the identity seemingly available to female as male speakers
alike: Euskera has no grammatival gender (“el” or “la”) or natural gender (“she”
or “he”). The only place that gender is marked is in the second-person familiar
pronoun, “hi”; noka marks the addressee as female; tok mark the addresses
as male. However, my ethnographic research has shown that the prototypical
Basque is constructed as the native, male speaker who uses the familiar.
I have further shown that contemporary discourses consider noka as “semiotically infe-
rrior” to tok even as it is linguistically equal: its use is “looked badly” upon and
considered disrespectful, while toko is semiotically linked primarily to hegemonic
masculinity, which has both negative and positive associations. To better un-
derstand the differential symbolic weight attached to noka and toko, I have used
methods drawn from sociolinguistics and historical sociolinguistics – such as in-
tra-textual analysis – to examine the archival record, composed primarily of bib-
liographic texts, folksong, legends and myths. To my knowledge, however, few sociolo-
gists have examined historical documents such as these to understand gendered
use of linguistic variables in the present. In this paper, I will share some findings,
insights and challenges my methodological approach with regard to the Basque
case have yielded thus far.

The paper focuses on the transformation of communities and emerging new
qualities in an industrial town in Southern-Western Siberia, Russia.
The large-scale crisis of tree town-forming enterprises in mid-1990s, accompa-
nied by dispossession, large-scale poverty and massive unemployment, result-
ed in the erosion of communities due to disappearance of the organizing role
of work and labor; decline of the structured leisure, erosion of factory communities,
individualization and fragmentation of life paths accompanied with the feelings of
insecurity and uncertainty.
The economy and community life in town was almost “rebuilt from scratch”.
Currently the economic consequences of the crisis are mainly over, but not the
transformation of inequalities or emergence of new communities and subjectiv-

How the Rhetoric of Reaction Justifies the Legalization of Migrant Care Labour in Austria

Austria legalized the 24/7 care for older adults provided mainly by migrant carer from Eastern European countries. The debate around this legalization during the years 2006-2008 shows patterns similar to Albert Hirschman's Rhetoric of Reaction: The Jeopardy thesis claims that a legalization according to established labour law standards of domestic care personnel would lead to skyrocketing costs jeopardizing the sustainability of the welfare state. The Futility thesis denied that the existing legal system of elder care would be sufficient for severely care-dependent older adults, since home care is delivered in relatively short hours calls and hardly available on weekends or at night. The Perseverity thesis again imputed the paradox effect of a veritable care crisis to the legalization, because migrant care workers would fear retroactive punishment. The Rhetoric of reaction aims at diminishing social rights for people in need of the welfare state.

So the legalization subjected the mostly migrant care workers to much worse working conditions compared to domestic care personnel enjoying social security and the benefits of collective bargaining.

Translations of Concepts over Time: What Criteria Decide about the Appropriateness of a Translation?

About children's literature it has been amply discussed whether certain terms or plots of classics are to be changed in new editions in order to comply with a notion of political correctness. To what extent is something similar taking place in social science literature?

Translating Lewis Coser's Greedy Institutions (1974) into the 21st century provides an example for the difficulties of relating a theory to contemporary phenomena.

Between the 1950s and 1970s Coser discussed various forms of Greedy Institutions with their total claim on the individual. Greedy Institutions demand undivided time and loyalty from the individual who will voluntarily devote him/herself for exclusive benefits granted to loyal followers only. Although the ancient authorities have vanished – princes with their court Jews, masters with their servants, or religious and political missionaries – the concept is far from obsolete today. Management consultants, 24/7 old age carers from Eastern Europe and particularly the hive mind of the New Social Media show that a revival of Coser's theory can help understand power relations governing today's individuals. Consequently this justifies a German translation of Coser's work, particularly since it has hardly been received in the German speaking world.

Whether shifting the context from Coser's original examples of court Jews and eunuchs in Byzantium is accepted within the scientific community as appropriate, is not a question of mere plausibility. While e.g. the proposition that internet based Social Media act similar to religious or political sects received wide approval, depicting spin doctors or management consultants as present day equivalent of the court Jews is seen critical.

Thus, translation also requires an effort of cultural sensitivity to the political culture. This eventually determines how the scientific community is going to receive the translated work.

EGGS, JOHANNES* (Institute for Employment Research, johannes.eggs@iab.de)

The German Welfare Reforms and Individual Health

In order to improve the competitiveness of its labour market, major welfare reforms were implemented in Germany in the last decade. Old schemes of welfare and unemployment assistance were amalgated into a new type of welfare called unemployment benefit II (UB II). UB II was supposed to be the new basic social security scheme and as such supposed to provide the minimum resources necessary for an individual to meet his or her basic needs. The central aim of UB II was the reintegration of individuals back into the labour market, that had been detached from it. Eligible for UB II receipt are not only long-term unemployed and people that received welfare prior to 2005, but also individuals, where other forms of income are not enough to provide the sufficient resources to meet basic needs.

The aim of this study is, whether UB-II-receipt has a singular effect on health. A negative effect could be caused by the stigma attached to the new welfare program.
In order to analyze this possible association, longitudinal data from the panel study “Labour market and social security” is used. The sample consists out of 12000 respondents aged 18 to 65, who participated up to five years from 2006 to 2011. Subjective health measures are the outcomes of interest. Fixed Effect panel models are calculated to establish a possible association between subjective health, unemployment and UI-liability.

Ethnic/ Religious Insurgencies and Nation-Building in Nigeria

Over the last decade, the activities of ethnic/religious insurgencies have permeated the Nigerian nation, bringing into question the essence of survival of the Nigerian project. This ranges from the activities of the Movement for the Emancipation of the Niger Delta (MEND), the Niger Delta Volunteer Force, the indigene/settler crisis in many states, and the Boko Haram saga in the North-East region. Several factors ranging from economic, political and cultural marginalization, widening social inequalities, lack of basic infrastructure and exclusion have been cited as reasons for these insurgencies in order to attract attention from the national government and the international world, it is the contention of this paper that employing tactics of violence and killings against innocent individuals, communities and armed conflict with the state creates more long-term devastating consequences than the short-term goal of attracting attention to whatever genuine demands any group may hold. The paper further argued that insurgency creates conditions where the most vulnerable particularly women and children, are more at risk of hunger, malnutrition related illnesses and death. Furthermore, countries in conflict suffer disruptions in livelihoods, infrastructure, schools, markets, assets, nutrition, health and loss of resources required for food production and distribution. The end result is that instead of the nation building sustainable development, the perpetration of conflict and violence causes the country to suffer long-lasting losses, including losses to food production. The paper concludes with the recommendation that employing constructive non-violent dialogue and demanding accountability from the leadership in all spheres of life and authority without recourse to employing parochial ethnic and religious sentiments would go a long way in getting answers to the people’s socioeconomic grievances so that we can all galvanize our collective drive, energies and resources in generating more secure livelihoods for the population currently mired in poverty, hunger and insecurity.

NEO-Liberal Reforms and Health Disparities in the Global South: The Case of Nigeria

For over two decades since Nigeria’s adoption of the neo-liberal policy, its impact on standards of living of the citizenry has not been rather satisfactory as manifested by the unequal income distribution gap between the rich and the poor over the years. Besides, the health conditions of the people has experienced a decline as revealed by the increasing rate of child/infant mortality and maternal mortality which expresses the failure of government reform in adequately addressing goal 4, 5 and 6 of the United Nations Millennium Development Goals (MDGs) targets. Using secondary sources of data, and the elite and world system theoretical models, the paper argued that government implementation of the neoliberal policies of removal of subsidies on essential goods and services, reduction of capital expenditures in the provision of healthcare and educational services and infrastructure have contributed to growing inequality, poverty and unemployment which has adversely narrow opportunities for human development. Today, Nigeria’s position in the UNDP Human Development index (HDI) ranking over the past years have remained poor, reflecting a combination of intense poverty, low educational levels and limited life expectancy. The paper concludes with the position that what is required is to address the challenge of human development in the global south is a strong government commitment in looking inward to fashion out people oriented policies that channel the nation’s economic resources into promoting healthcare, education, infrastructure, sanitation, nutrition and welfare as well incorporating safe and viable indigenous methods of treating health issues that are easily accessible and affordable.

EHLERT, MARTIN* (WZB Berlin Social Science Center, ehlert@wzb.eu)

Household Influences on Employment Insecurity over the Life Course

Previous research on employment instability mainly focused on labor market related factors. I argue however, that employment instability over the life course is also influenced by the household a person lives in. Building on literature about the “marriage premium” and the “male breadwinner hypothesis” as well as difference in gender roles, men in male breadwinner households may have a preference for stable jobs. Mothers in couple households on the other hand, who more often have to reconcile paid work and housework are constrained in their job searches and therefore may have to take up less stable jobs. Finally, especially among men, being married may be seen as a positive signal for productivity by employers and therefore they more often obtain stable jobs. Moreover, employers may displace married men and women with children less often because they are considered more productive and also have to support a family. In sum, these considerations suggest higher employment instability among single adult households, mothers and especially single mothers. I test these expectations by comparing the risk of involuntary job loss between different household types using the German Socio Economic Panel (GSOEP). To control for selection into households, I apply discrete-time event history models. Preliminary results indicate a higher risk of job loss among single poor and single single mothers. This might be rather driven by employer discrimination than by self-selection into unstable jobs.

Just Another “Special Interest”: Collective Identities and Union Strength in the U.S. and Canada in the Twentieth Century

Why are labor unions weaker in the U.S. than in Canada, despite the two countries’ many similarities? This was not always the case: unionization rates only diverged in the mid-1960s, with consequences for inequality and social policy. Standard explanations emphasizing long-standing differences in national characteristics and policy results from different processes of political incorporation, which created different collective identities for labor in both countries. Labor was incorporated as an interest group in the U.S., and as a class representative in Canada. These collective identities enabled and constrained labor’s scope of action. U.S. labor’s interest group identity led it to focus on using inside influence and lobbying. As its influence within the Democratic Party weakened and employer attacks intensified in the 1970s, labor was unprepared to return to a more mobilizational strategy, its independent organizing capacity sapped by decades of behaving as a responsible independent interest group. By contrast, Canadian labor’s class representative identity allowed it to retain its independent organizational capacity. Labor fought for legislative reforms, while also mobilizing outside political pressure. This left Canadian labor better equipped to withstand increased employer and government actions on labor beginning in the 1970s and 80s.

EIDLIN, BARRY* (University of Wisconsin–Madison, eidlin@ssc.wisc.edu)

Why Is There No Labor Party in the United States? Political Articulation and the Canadian Comparison, 1932-1948

Why is there no labor party in the United States? This question has long stood at the heart of debates about the shape of American politics and social policy. Existing explanations use a “reflection” model of politics, whereby parties reflect pre-existing differences in political cultures, institutions, and cleavages. But an analysis comparing existing U.S. electoral data with newly compiled Canadian political parties and interest group reflection models: instead of difference, the data shows similarity prior to the 1930s, then divergence. Labor party support collapsed in the U.S., and took off in Canada. To explain this, I propose an “articulation” model of politics, which emphasizes the role of parties in assembling and naturalizing different class coalitions. I show how struggles surrounding working and agrarian class coalitions during the Great Depression reconfigured class alliances in both countries. In the U.S., FDR and the Democratic Party made the Great Depression a class issue, and used state policy to articulate a liberal-labor alliance that undermined labor party support. In Canada, mainstream parties excluded agrarian and labor constituencies, leaving them available for an independent left political coalition. This foreclosed the possibility of a liberal-labor alliance and allowed the Cooperative Commonwealth Federation (CCF) to take root as a farmer-labor party.
through interactions. Indeed all respondents happened to own a mobile phone and participate in operating in their own logic beyond institutional or political belongings and an in various ways which are highly specific to their social background and gender. Mobile media, it becomes apparent that the young actors handle certain situations on one hand facilitate new forms of pairing and bonding within peer groups, but on the other hand reveal and amplify processes of social exclusion. Finding them to what extent media (related) practices produce and reproduce social inequalities.

Teenagers’ Use Of Mobile Media As Practices Of Social Inequality

Mobile media have become a fundamental part of adolescents’ everyday lives. Serving as “permanent digital companions” and taken for granted by its users, mobile phones and internet capable smartphones are deeply embedded in peer interactions. Mobile media usage encompasses both mediatized interactions and face-to-face-interactions related to media, creating different technosocial situations in which specific social rules and interaction orders are generated.

In the context of qualitative research (group discussions, interviews and media diaries), 18 adolescents (aged 12-18) gave valuable insights about such situations, focusing on interactional routines and conflicts as well as social expectations towards media (related) interactions. When looking at new media sociologically it is firstly necessary to question the associated social norms being negotiated by users and its implications for interaction orders. Secondly, it is instructive to scrutinize to what extent media (related) practices produce and reproduce social inequalities. Deriving from the respondents’ narratives, it is argued that mobile media on one hand facilitate new forms of pairing and bonding within peer groups, but on the other hand reveal and amplify processes of social exclusion. Finding them faced with certain constraints, expectations and obligations with regard to mobile media, it becomes apparent that the young actors handle certain situations in various ways which are highly specific to their social background and gender. This is remarkable as teenage peers are often seen as rather inclusive collectives operating in a world beyond institutional or political belongings and an “unequal world” – especially when we look at studies on adolescent media usage. Indeed all respondents happened to own a mobile phone and participate in corresponding practices. Nevertheless their distinct use of mobile media mirrors social polarization within juvenile groups as they steadily (re)produce inequalities through interactions.

Life Trajectories of Three Swedish Sociologists

To contribute to our knowledge of the social production of sociology, this paper builds on three interviews. The interviewees are Swedish sociologists, two men and one woman, one of the men having a foreign background. They are born between 1935 and 1955 and represent the active group of the first two generations of professional sociologists in Sweden.

The first Swedish chair in sociology in 1903 (shared with economics) did not get any successor. Therefore the starting year of the next chair in sociology more often counts as the start of the discipline in Sweden, namely 1947. The discipline was built up during the first three decades and is now represented at 21 universities and colleges in Sweden.

The chosen three personalities are not “ordinary”, but they fit in based on the criterion ‘median academic rank’. One of them reached professorial status being 65 years old, and the other two are associate professors. The man with Swedish background and the youngest career with an interviewee, also with a Swedish background. The woman could have been a top professor had she been raised now, not in the patriarchal times when she made her doctoral thesis (the 1970s). The man with the foreign background is a political refugee from Latin America who has over come many obstacles in his way to get to his present university position. They are interviewed as historical witnesses under their real names. As familiarity with sociological concepts can be presumed, the interviews themselves are based on an interactive sociological analysis by interviewer and interviewee. The interviewer is a Swedish, female sociologist born in the 1940’s who started to study sociology in 1968.

The Meaning of Space for Civic and Political Participation of Immigrants

The topic of immigrant voluntary organizations and their importance for immigrant incorporation has gained more and more attention in recent years. However, so far we have a limited understanding of how the spatial distribution of voluntary organizations affects immigrant civic participation, although immigrant organizations cluster in certain cities and even in certain spaces in cities.

The presentation is empirically based on a multilevel-study which is currently conducted in 30 Berlin neighborhoods and focuses on inhabitants with a Turkish migration background (first data will be available at the end of this year). It examines especially if the residential context affects the likelihood that immigrants participate civically, mainly through the spatial availability of immigrant networks and the availability of immigrant networks are examined using data from a multilevel-survey currently conducted in 30 Berlin neighborhoods which focuses on people with a Turkish migration background.

In the first part of the presentation citizenship policies of the German state towards people with a Turkish migration will be examined (especially in regard to political rights). In a second step, it will be analysed how these citizenship practices impact on the ground with practices of immigrant social networks and civic organizations.

Immigrant women, particularly those from Africa, often confront devaluation of their foreign credentials and work experiences gained from their countries of origin. Some of the women who migrated to Canada under the family unification
program are often perceived as dependents of their husbands and, therefore, not destined for gainful employment. The fact remains however, that economic challenges often confront the women's families as husbands' fathers' incomes do not adequately meet the needs of family members especially where children are involved. Mothers who cannot find gainful employment and who have limited access to the labor market, often resort to setting up small-scale enterprises in the base-ments of their homes. Such enterprises generally involve hair-briding, tailoring, and sale of ethnic food and products which yield some much needed income for meeting some of the needs of family members. This paper will highlight what estab-lishing what and who does it cost to re(member) a violent past. Analysis draws on Anthony Moran’s (2002 1016) notion of non-Indigenous fantasies of Australia as empty space, which meant: settlers could build their own utopias without hindrances. Such discourses [represented] indigenous society... [as] not counting as historical societies with their own traditions and historically sedimented relationship with the land. There-fore nothing stood in the way of the establishment of those new utopian societies. It is this clearing of space – the elimination of Indigenous peoples through massacre, removal to reserves or ‘adoption’ as a cheap source of labour - that has been a key site of disruption to the ‘topian’ vision of peaceful Australia. The paper explores how the three modes of visualisation address different audiences, and how the sublys different logics that underpin each genre produce differ-ent affects for the intended non-Indigenous audiences, but also the Indigenous peoples who are the subject of the images. Making a distinction between a desire to right injustices and the needs for dominant groups to address their own prob-lem, this paper considers the effects of remembering.

Visualizing Dispossession As a Mode of Reconciliation: An Australian Case Study

In the late twentieth century non-Indigenous Australians came face to face with the violent past of settler colonialism. During a decade of Reconciliation (1991-2000) they engaged (voluntarily or otherwise) with materials that informed them about the often ignored atrocities and everyday violence that had been directed at Indigenous peoples for the past two centuries. Thinking about a series of imag-es of land and belonging, the paper addresses the question of violent representations and pedagogy. Using three different modes of the visualisation of violence directed towards Indigenous peoples – popular cultural (commercial television and film), documentary (public television), and government commissions (photo-ography) - produced in the period of reconciliation or its aftermath, it asks the question what and who does it cost to re(member) a violent past. Significantly Consequences of Subtle Insults

Significant Consequences of Subtle Insults

Culture of honor is a significant and fruitful field for examining the cultural characteristics of some areas of the world like Mediterranean region. It is certain that the Culture of Honor in social psychology requires more studies to expand and deepen this important and relatively new field, and the related studies in Tur-key have great potential to provide such findings. Regarding the honor cultures, insult is a significant issue, and violent response to insult is one of the decisive properties of the Culture of Honor. However, this conclusion mainly results from the fact that insult is very critical in honor cultures then it can also be detected in situations where insult is even subtle, and after perceiving the insult corresponding reac-tions are given. For that purpose, two real-life short videos of a popular interna-tional TV show (i.e., Turkish version of the show) depicting a small conversation between a performer and the judges of the show were watched by the partic-ipants of this study. After each video, participants were asked to answer some open-ended and closed-ended questions. It was revealed that even subtle insults (i.e., word choice: usage of informal “you” vs “sen” in Turkish- rather than formal “you” “siz”) in Turkish- by the performer towards each judge member) were gener-ally perceived as great insult and reacted by anger and the desire of retaliation by the majority of the participants. The findings also match with the related findings of the previous qualitative studies (i.e., field and focus group studies) conducted in Turkey by the same researcher, which will also be mentioned during the pre-presentation. The results of the study and suggestions for the future studies about the Culture of Honor will be discussed on the basis of the literature.

Elder-Vass, Dave* (Loughborough University, d.elder-vass@lboro.ac.uk)
Defining The Gift

There is increasing sociological interest in contemporary giving practices; the literature, however, continues to be strongly influenced by the Maussian tradition of economic anthropology, with its stress on reciprocity and conceptions of the gift as a form of deferred exchange. Implicitly, and sometimes even explicitly, this tradition defines giving and the gift as theory-laden terms of art, and the theo-ry with which they are laden is derived from the study of non-modern societies. The assumptions built into such definitions are thus potentially problematic: first, because they exclude many phenomena that are included in giving as it is under-stood in contemporary lay usage. Secondly, failure to recognise the disconnect between the concept of gift implicit in anthropological accounts and the everyday concept of gift leads to misguided attempts to argue as if actual gifts in contem-porary late-modern societies are or must be subject to the analytical conclusions reached by the anthropologists.

The sociology of contemporary giving, I will argue, must begin from a definition of gifts that is based in contemporary lay usage. The paper will consider the issues involved in defining empirical terms for use in social theory and take these into account in developing a definition of gifts. Each significant term in this definition itself raises a number of issues. Must the gift, for example, be voluntary? And if so, what sorts of influences on the decision to give are compatible with it being so? Does giving entail a transfer of property rights? Or can gifts be made that evade our conceptions of property? In examining such issues the paper will map out a range of types of giving that is significantly different from that implicit in work in the anthropological tradition.

Elder-Vass, Dave* (Loughborough University, d.elder-vass@lboro.ac.uk)
Retheorising The Concept Of Mode Of Production In Diverse Economies

Mode of production is a central concept in political economy, and one that has often been relatively uncontroversial. The prevailing usages, however, tend to frame modes of production as thoroughly dominant in their epochs, thus tend-ing to marginalise other forms of production as socially and economically insig-nificant. Yet even today, in capitalism's pomp, there are massive sections of the economy that are far from capitalist in form. Labour in the household, subsis-ter, agriculture, and the myriad different forms of gift and solidarity economy take a vast range of economic forms, few of them recognizably capitalist. And increasingly it is clear that alternatives to capitalism will not be imposed by taking control of the state but rather are developing all around us in the interstices of our already diverse economy. We cannot make sense of this diversity without discarding or radically revising the concept of modes of production.

This paper engages with some of the issues that arise when we do so, and in-troduces an alternative approach organised around the concept of appropriative practices. If we think of the economy as a mixed economy of appropriative prac-tices, which may be combined and recombined in a variety of economic forms, we can give ourselves the theoretical flexibility to make sense of a far wider and more open range of alternative futures – and indeed of the varied and complex range of actual contemporary economies. We may then begin to theorise the forms of interaction between these competing economic forms, the sometimes surprising ways in which they bolster and undermine each other, and develop a political economy that is no longer trapped by its own terms between an inexorable capital-ism and an impossible socialism.

Elisaesn, Sven* (Uppsala University, sven.elisaesn@uus.se)
Max Weber and modern Nation-Building

Max Weber and modern nation-building.

Max Weber is in several respects "mossgrown", since he dealt with contempo-rary problems of German nation-building and security policy more than a century ago. He has no immediate fresh response to problems of multi-level governance or globalization. He takes the state for granted as the natural unit of analysis and his international community is one of Hobbesian realism. He also overestimates the role of charisma.

He nevertheless remains both a source of inspiration and a sustainable sparring partner to many new approaches, only to mention multi-Modernity paradigm and post-secularism, both challenging Weber's basic vision of the roots of the dominance of Western rationality.
Weber, moreover, gains new relevance for problems of nation-building, especially among “late children of 1848” in the newly independent states East of the Elbe. Charisma is one concept which gets a second and prolonged life after the implosion of the Soviet Empire. Weber might be a part of cosmopolitan bourgeoisie but is basically a nationalist political economist and his problem agenda – renewal of forms of state, political sociology and political representation – has many parallels today.

It is high time for an inventory of Weber’s work from the vantage point of its relevance and utility in today’s world.

Using Arts to Generate Representations of Resistance to Hegemonic Understandings of ‘Deprived Communities’

This paper will explore how community representations produced through creative arts practices can be used to challenge and disrupt numerically based framings of health policy and practice. Policies for health improvement in the most deprived localities in the UK tend to focus either on the impact of poverty and deprivation – but with little historical or cultural differentiation of the meaning of deprivation – or, most commonly, on the prevalence of ‘unhealthy behaviours’, with limited attempts to connect these with meaningful ways of life under varying conditions of disadvantage. Whilst health inequalities continue to be a priority for the UK government, many of the policies designed to address ‘austerity’ have served further to stigmatise, blame and silence those who languish in the bottom population quintiles produced by standard indices of deprivation. This paper will draw on theoretical development and early data collected from a three year research project, working in five neighbourhoods in Wales, Scotland and England. In this project, academics from the social sciences and the arts and humanities together with creative artists and community members seek to use the arts to develop new modes of describing and representing who they are and where they live. This experiment starts from the conviction that the creative arts, along with modes of analysis and critique derived from the humanities, can play a transformative role in a process of improving communication, dialogue and knowledge exchange as well as providing the resources of hope for forms of collective social action and agitation. The paper will also discuss the implications for sociology of developing an epistemology that is nourished by the literary, visual, and performative arts, and how this might influence processes of knowledge exchange with policy makers.

Characteristics in the Personal Network and Mortality Risk in Older Adults

Research on aging has consistently demonstrated increased chance of survival for older adults who are integrated into rich networks of personal relationships. Theoretical explanations are that personal relationships offer direct behavioral and physiological pathways to longevity, as well as buffer stress and provide coping resources during critical life-events. These pathways often operate independently from age, sex, lifestyle, well-being, chronic diseases and functional limitations. Besides these insights, many studies fail to establish a strong link between social integration into personal networks and risk of mortality. We suggest that the life-prolonging effects may vary considerably across the different conceptualizations of integration into personal networks. Furthermore, research designs need to account for changes in the personal network during the aging process. The objective of this study is to model mortality risk depending on a variety of personal network characteristics, including for example network size, social support and diversity in relationships, e.g. with a variety of family members. We expect most protective effects for complex and multifunctional personal networks (e.g., diversity). Data are from the Longitudinal Aging Study Amsterdam (LASA) and include 2,900 Dutch participants aged 54 to 85 at baseline in 1992 and six follow-ups covering a time span of twenty years. Preliminary findings suggest differential impacts of the personal network characteristics, e.g. there is a reduction in mortality risk for individuals integrated into diverse personal networks.

Even the Most Marginalised Can and Do Exercise Collective Agency!: Case Study Empowerment Programme for Caregivers of Children with Disabilities in a South African Township

This case study examines the medium-term outcomes on collective agency contributed to by a Community-based Rehabilitation (CBR) empowerment programme for caregivers of children with multiple disabilities in a peri-urban South African township. CBR is the World Health Organisation-endorsed approach to promoting human rights and improving quality of life for people with disabilities in developing settings. The newest conceptualisation of CBR includes an empowerment component that encourages interventions to mobilise communities of people with disabilities; promote self-advocacy and effective communication; and develop peer-led self-help groups. This paper adds to a small body of evidence base for CBR using empowering, participatory qualitative methods to allow members of a CBR self-help group to participate as co-researchers in analyzing the outcomes of their participation in the programme. Concrete examples of their burgeoning civil engagement and collective agency illustrates how even the most marginalised in society can and do exercise agency.

Challenges for Farmers Field School in Sudan: Towards Participatory Synthesis of Traditional Practices and Modern Knowledge for Sustainable Farming and Livelihood

Farmers in Gadarif State, Sudan, are suffering from Striga, a parasitic weed also known as witchweed, which attacks sorghum, their staple food crop. Given the threat to food security, Farmers Field School (FFS) program, launched by Sudanese researchers with funding from Japan, works with local farmers to develop weed control techniques combining traditional practices with outcomes of modern research. This paper, based on interviews with the research team, examination of technical documents, and survey and interviews with farmers, presents our self-critical assessments of prospects and challenges of FFS striving to improve the food security and build sustainable livelihood. First, FFS attempts to revive, conserve, and validate traditional practices to control Striga, including crop rotation, deep plowing and soil flooding, which currently few farmers adopt. Assessing these methods with local farmers, FFS is expected to generate a feasible, effective, and hence sustainable weed control regime to improve the food security of the underprivileged farmers. Second, while the livelihood in rural Gadarif is likely to continue centering on agriculture, many farming household members now seek non-agricultural income opportunities, as informed by the livelihoods approach literature. The livelihood diversification may indicate that FFS’s scope should eventually be widen to respond to diverse needs of farmers, such as comprehensive farm household management, financial literacy education and entrepreneurship. FFS’s participatory approach therefore should dedicate its efforts to truly empowering the participants beyond the technical development. Third, despite its promising bid, FFS leaves an essential question unanswered as to why Striga has recently come to damage sorghum devastatingly. Answering this question may demand a scrutiny of changes in political-ecological conditions of the region. Whatever the true reason is behind the Striga epidemic, attention to wider social, political, economic and ecological conditions is vital to tackle the problem and build sustainable farming and livelihood in Gadarif.
