Uncontested Science and Boundary Work: The Conceptualization and Measurement of Poverty in Chile (1987-2013)

This paper addresses the social scientific construction of the poverty in Chile, whose measurement is coordinated from the State, being of great relevance for the design of social policies and programs, and to monitor government action. The currently applied theoretical and methodological construction remained uncontested from 1987 to 2012. Despite that long period in which the measurement was a tightly sealed black box, there were many aspects that could have been questioned. A theoretical and political project to decrease the disparities took place regarding this process. As a result, the Chilean government appointed a committee with the task of making changes in it. A first goal of the presentation is to study the factors that led to that great stability of the instrument, in spite of significant socioeconomic changes that long ago made changes advisable. Special attention is given to: (1) the origins of the measurement, in which the Economic Commission for Latin America (ECLAC) participates in an outstanding way and transferred a methodology developed for the whole region of Latin America; (2) the boundary work made by experts involved in the measurement; (3) the calculation of this epistemic construction between academic centers, state institutions and the public sphere, all of which strengthen its character of reality and hinder its questioning. A second objective is to analyze how the 2012 controversy was generated and developed. Attention is given to the intertwining of political and scientific concerns and to the rhetorical handlings associated to the boundary work done by rival factions. A third objective is to analyze the outcome of the controversy, in which the scientific demarcation is still used to hide political dilemmas and complex normative choices. The study gathers information through interviews and document reviews, and by following key players in their participation in the controversy.

Gender Inequality in Higher Education: A Study of Girl Students of Conventional Courses in Nasik, India

Keywords: Gender inequality, Higher education, Girl students, Nasik India

Gender discrimination in developing world is a crucial reality. In modern times women are performing exceptionally well in different spheres of activities. The problem of gender inequality still prevails in all spheres of life. Though Indian constitution has granted equality to women in principle, in reality majority of Indian women are facing the problem of inequality and discrimination.

The paper tries to focus on gender discrimination in higher education in India where the situation is paradoxical. On the one hand girl students are performing very well in all faculties of education, many of them are topping the merit lists, the percentage of passing is more than the boys, but at the same time according to 2011 Indian census, 35% women are illiterate. Out of the remaining 65% literate women the percentage of higher education is very low. Again there are educational disparities on the ground of rural-urban, poor-rich, higher-lower caste etc. Government has provided various facilities and concessions to facilitate education to women and decrease the disparities.

The paper tries to highlight the challenges in education before the girl students of the Department of Sociology, their ambitions, career choice and hurdles in their education, their experience about gender discrimination in the family, family back ground, use of facilities or concessions given by the government, etc. The data collected by the primary techniques like questionnaire and interview. The study will be limited to the students of conventional courses. It will be conducted in one of the leading women's college in Nasik city.

Abstract
As god is a creator of flora and fauna, a woman is a creator of family which leads to society and Nation. The Indian society considered women as weaker sex. Such sociological and cultural traditions have kept women dormant for quite a long time. Despite of all hurdles Indian women stand tall from the rest of the crowd and are applauded for their achievements in their respective field.

The aim of this study is to discuss the issues regarding women entrepreneurship in Kanpur. Different stakeholders are playing pivotal role in women’s economic development. This paper is mostly based on Primary secondary data and some observations as and when required. The paper talks about the status of women entrepreneurs and their competitive skills in world of business environment. Skill, knowledge and adaptability (SKAs) in business are the main reasons for women to emerge into business ventures. The paper also focuses on the problems in front of women during setting up a business enterprise and running in the competitive world. Some issues related to lack of financial support, availability of resources as well as support of stake holder etc. are major barrier in development of women entrepreneurs in India. It will also suggest the way of eliminating and reducing hurdles of the women entrepreneurship development in Context of Kanpur.

Keywords- Women Entrepreneur, Socio-economic, Small and Medium Scale Enterprises, Competency.

Improvisation Of Destination Awareness Through Festivals and Events: Special Reference To India

As travelers become more sophisticated, destinations need to become more originitive in capturing those tourists. A potential tourist destination needs to create a brand image to compete in the global tourism marketplace. India, a land of vast cultural and regional diversities, has multi-faceted festivals. One can immediately draw a long list of religious festivals associated with various gods and goddesses, regions and traditions like holi, diwali, christmas, id (ul-fitr; ul-zuha), GurPurab, etc. The study focuses to examine the awareness of Indian festivals and their intent to travel. However, here the purpose is not to discuss the common religious festivals. It is an initiative to scrutinize upon only those festivals which are the main centers of tourist attraction. This study based upon several theories as theory of Reasoned Action, Theory of Planned Behavior, and marketing theories related to Awareness – Interest – Desire – Action (AIDA) sequence. The research is positivistic, quantitative research paradigm in which consumer behavior approaches prevail. The study postulates there is significant relationship between promotions of festivals, events and awareness of destinations. The study reveals some promotional aspects which may help in transforming the attitude of tourist towards festivals and events in India.

‘festivals are the features of cultural diversity’

Globalisation and Indian Media: Certain Policy Implications

Media conglomerates and media corporatisation are phenomenon which have been studied by a number of scholars. The process of liberalisation, deregulation, globalisation and digitisation have transformed the media landscape. In India there has been a proliferation in the type of media. Simultaneously there has been growth in the quantity and quality of media content available for consumption. Like in other industries even in the media industry globalisation and diversification work hand in hand. Deregulation and convergence have also further affected the media industry. In the television industry there is segmentation and commodification of content. Programmes like “Who wants to be a millionaire” are adapted to the Indian scenario. Global content is transformed into local content by involving local actors. Internet is also fast becoming a segment of multi-media business. There has been a rise in the new form of communication known as mass-self communication (Manuel Castells). It is mass communication because it reaches potentially a global audience. It is self communication because individ-
The paper seeks to address health care, early marriage practice, reproductive health status, awareness about small family norm, housing conditions and health, role of media in health, awareness, utilization of medical facilities, habits and health etc. The paper explores that health of tribal women is affected by many inter-related socio-economic and cultural factors. The study reveals that women in general and tribal women in particular are the worst sufferers. Despite modernization, medicalization, globalization, marked improvement in global health and other ongoing developmental processes, the exposure of tribes in general and tribal women in particular, to modern system of medicine is not significant. The paper explores the paradoxes of continuity study and change in the tribal health care practices and interventions. This could also be observed as the contrast between ethnicity and modern-post modern changes. Thus different patterns and levels of health inequalities could be identified among Indian tribal women. The findings will be a contribution to Medical Sociology, Sociology of Gender Studies, Social Anthropology, and to the health of tribal women.

**Exploring the Environmental Consequences of Beef Production in Southern Africa**

The consequences of beef production for the environment have been a hot topic in recent years. The myriad of issues raised include: the copious amounts of methane released into the atmosphere by cattle, the large quantities of water and feed used to sustain cattle, and the amount of oil that is used throughout the commodity chain in order to produce such large quantities of beef. However, environmental discourses are often confined to industrial processing systems in industrialized countries. This paper shines a light on the unique environmental context of beef production in Southern Africa and the impact of conservation policies on producers in Southern Africa. Specifically, the paper will explore the unique interplay of cattle rearing within an arid and semi-arid environment, the environmental issues relevant to smallholder and pastoral systems of production, and the issues that emerge from the interaction of livestock and wild animals.

**Open Your Own Data - Creating Individual High Value for Little People from Big Data**

The Open Data movement signifies availability and access to data as a prerequisite for the exercise of individual democratic rights. Data are now Big Data with large numbers of attributes, transactions, relationships, complexities, and individuals. Government data are typically viewed as aggregate data. However, plenty of examples show that your individual data is required for the administration and planning of your tax, your pension, your health etc.

Individuals using electronic devices and applications leave electronic traces. When using the World Wide Web, your phone, or applications you leave traces. Data in the form of electronic traces are also fruitful for commercial companies because profiling based upon the detailed registration of individual behaviour can be used to target the right product or service to the right customer. Profiling can remarkably improve the success of invitations from a company to individuals. Seemingly, the individual also benefits by only being disturbed by offers containing more relevant information. The issue of privacy and confidentiality is discussed and high-level precautions are implemented in order not to disclose individual data to a third party. However, the individual data should be available to the individual. To open and own your own data should be the general rule in all areas.

Big Data implies an information asymmetry that disfavours the individual. When individual data are not available to the individual, the individual's decision making is based on insufficient data. As an example your phone company knows precisely your behaviour regarding phone conversations, text messages, and data traffic. If you had your individual data - "know yourself" - you could generate more individual value when approaching a new company. With full availability of individual data and development of capable software applications and agents the individual can gain the rightful ownership and effectively act in the individual's own interest.

**Thai Seasonal Migrants Working for the Finnish Wild Berry Industry**

In 2005 one Finnish wild berry company invited 92 Thai-workers to pick wild berries for them. Today, there is over 3000 Thai-workers during the wild berry season in Finland. Thai-pickers are not employed by the companies and therefore lack protection from labour legislation. High number of pickers need to take loans to cover the cost of travel and recruiting from Thailand. Their position is precarious, and a crop failure in Finland can mean debt after the season. The Thai temporary workers can pick berries based on Finnish right of public access to natural resources, like wild berries. Debated debate has taken place in Finland concerning the vulnerable position of the migrant pickers. The income difference between North-East Thailand and Finland is considerable, and therefore taking the risk of picking wild berries is tempting. For many successful pickers the temporary work in Finland has turned into circular migration. The presentation is based on multi-sited ethnography conducted in Finland and Thailand. Thai-migrants views and experiences are related within the wild berry industry's global production chain where berries are manufactured and added value is produced. The research material includes ca. 50 interviews of Thai-pickers and field work. Thai and Finnish civil servant interviews, company manager interviews and interviews of recruiting agencies that recruit pickers in Thailand and manage the berry camps in Finland. Body of media material has been collected since 2005. The ethnographic and other material include extensive information on workers and differences between workers are shown to exist. Thai temporary workers are not a homogenous group. There is considerable differences in wealth, and as a result possibilities of temporary migration vary. Pickers have less negotiating power towards other actors in the business, but recently there have been protests against their unequal position in the Finnish wild berry industry.

**Children`s and Preschool Teacher`s Photographs of New Preschool Architecture: Issues of Participation and Interpretation**

**Children’s and preschool teacher’s photographs and experiences of new preschool architecture**

Kim Rasmussen

In an ongoing project (2013-2014) about children’s and preschool teacher’s interactions with and experiences of new architecture/physical environment, young children between 2-5 years and their preschool teachers has photographed the preschool and social environment. A numbers of photo-elicited interviews with the preschool teachers had been held over the summer too. These actions have created increased awareness of the relationship between the physical and social environment and generated a lot of communication and interpretations among all involved. The project continues during the wintertime.

The aim of the project, inspired from action research, new childhood sociolo, (phenomenology) is to create knowledge (on basis of experiences, narratives, observations/field notes, photos/visual knowledge) about the preschool environment, which might qualify the discourse of kindergartens and the new architecture.

The architecture in new childcare-institutions breaks on several points with the former idea of “kindergarten” (small environments with an emphasis on domesticity, development and play). The new preschools in Denmark are bulky, contains many children (some more than 200 children), and are highly transparent (wide-span use of glass in both interior and exterior walls). The new architecture is based on (neoliberal) ideas of flexibility and puts the emphasis on early childhood learning. But one thing is the ideas of politicians, architects and builders, another...
is how the buildings are "lived" and coded/decoded (Bernstein) and experienced by the participants. The paper and presentation will focus on issues of interpretation visual data and dilemmas experienced during the process of cooperation with the preschool teachers and children. A key issue is the asymmetry between children and adults: preschool teachers play a key role in the interpretation of children's photos, while it is difficult to invite and involve children (2-5 years) to interpret their own photos and words.

Public Sociology and the Impact Agenda: A Case Study

This paper explores the interface between two areas of debate high on the agenda of contemporary sociology. On the one hand, there are concerns as to the relevance and significance of the discipline in the 21st century; on the other, the imperative of displaying 'impact' (in accord with the current neoliberal agenda demanding accountability and 'value for money'). The concepts 'public sociology' and 'impact' are interrogated briefly but the core concern of the paper is to illustrate the complexity of operationalizing impact in a research project that demands the deep, and unwavering, involvement and commitment of a sociologist and researcher driven by the imperative of progressive social change. Deploying as a case study the attempt to use public procurement as a vehicle for promoting the employment prospects of racialised minorities (and other marginalised groups), the paper explores the dialectical relationship between various forms of social agency and disparate structural factors at macro, meso and micro-levels. It concludes that 'the messiness' of the demonstrable 'impact' mirrors that of the research process itself, and the pursuit of a 'public sociology' in this context conflicts with dominant characterisations in the literature.

La Strada Network As an Example of Transnational Mobilization Against Trafficking in Women

My presentation will explore mobilization around trafficking in women for the purpose of sexual exploitation in the Central and Eastern Europe (CEE). I will focus especially on the La Strada Network (LS) that is a network of non-governmental organizations from CEE and Netherlands. La Strada was developed in the mid 1990s as a result of cooperation between Dutch, Polish and Czech activists and since then developed in a European network and is a recognized actor in anti-trafficking movements both at the national level as well as internationally.

This network because of its roots as a cooperation between activists from the Western Europe and from post-socialist countries is a fruitful example to explore the processes of transnational mobilization. Firstly, I will use the concept of transnational activism in order to examine the role of the exchange of information and knowledge as well as the patterns of cooperation between activists form Netherlands and CEE.

Secondly I will give a closer look to the framing of trafficking by the network as a whole and by particular members of LS. Trafficking is linked to migration policy, national and international security, politics of prostitution etc. Framing of trafficking by a NGO depends on the location fo the actor, the views on prostitution, the source of funding etc. Using the example of La Strada I will investigate of the way particular LS members manage to reconcile a moderate framing of trafficking with gaining audience and support in local contexts.

Poland will serve as a case study for the analysis of the interplay between framing of trafficking by activists and relations between NGOs and the state agencies.

Mapping the Consumption of Distance Across the Life-Course: Connecting Individuals' Mobility Milestones to the Histories of Mobility Practices

Life events and life-course transitions can dramatically impact on people's consumption practices. There is ample evidence that key life events (e.g. arrival of first child, relocation, transition from education to work, retirement) coincide with more or less radical changes in consumption patterns (cf. Schaefer, Jaeger-Erben and Bamberg 2012). Understanding the role and significance of such ' tipping points' in people's consumption biography has the potential to significantly advance our knowledge of current patterns of (uns)ustainable consumption and how to either encourage or transform them.

At the same time, individual consumption biographies reflect wider structural conditions in society, including prevailing ' systems of provision' (Evans 2011) that organise the delivery of goods and services and their subsequent consumption. Linking individual consumption biographies to the histories of particular practices can thus cast new light on the causes and consequences of (uns)ustainable consumption and pave the way for more promising policies that work with rather than against people's established socio-environmental practices.

This paper argues for the development of longitudinal theoretical and empirical approaches to the study of everyday physical mobility and the associated ' consumption of distance'. The ability to adequately capture important mobility milestones across the life-course, that is, moments of radical change in how (much) people travel, must be central to these efforts. These milestones must in turn be linked to the history of key mobility practices such as walking, cycling and car use. Drawing on documentary evidence, policy papers and qualitative interview data from the Republic of Ireland, the paper identifies key mobility milestones in individuals' lives and connects them to the development of the modern Irish transport system and its implications for different mobility practices.

Voluntary Risk-Taking As Habituated Action: How Can a Practice-Theoretical Approach Contribute to Risk Research?

Abstract
Within the sociology of risk, the last 25 years have witnessed a development from viewing risk as something to be avoided towards viewing risk-taking as part of one’s self-development. Researchers have argued that routinised everyday life compels us to make 'escape attempts' (Cohen & Taylor, 1992) in which we deliberately put ourselves at risk. Central to this line of theorizing is Stephen Lyng's notion of 'edgework' (Lyng, 1990; 2005): i.e. voluntary risk-taking which negotiates the 'edge' between control and loss-of-control (Lyng, 2005). The concept of 'edge-work' sheds light on important aspects of risk-taking – but it also leaves some aspects of risk-taking in the dark.

The empirical case under study in this paper is youth recreational drug use; a form of voluntary risk-taking that has often been viewed in terms of edgework. However, viewing recreational drug use as edgework also entails some limitations: First, not all practices defined as risk-taking are actually experienced as such by the people involved. Experienced recreational drug users do not necessarily view their own drug use as 'risky'. And second, the experience of edgework builds on an underlying assumption about reflexivity: that risk-taking is a deliberate and carefully considered act. However, risk-taking is perhaps not always as well-considered; it may be more spontaneous or it may be non-reflexive.

To try to take these limitations into account, the present paper will allow for other views on risk-taking by drawing on insights from practice-theory, in particular notions of habituated action and embodied knowledge originating from the work of Bourdieu and Wacquant. In the paper I demonstrate how a practice-theoretical approach can contribute to our understanding of youth drug use by focusing on the subjective perceptions of risk, and on the bodily and embodied practice of risk-taking.

Navigating the Myanmar–Thailand–Malaysia Border: The Escape Strategies of Burmese Refugees from Chin State, Myanmar, to Battle Creek, Michigan

Forced migrants who flee their home countries as part of a mass movement face significantly different realities than ‘refugees’, as conventionally understood and legally defined in the West. Forced migrants typically lack secure legal status and access to any form of welfare system. Additionally, because they lack social structures that support international migration, they often engage in ‘step-migration’. Before arriving at their final destination, they move to nearby countries where they can obtain assistance from other migrants, employers and smugglers who are absent in their native communities. Scholars who study forced migration and/or illegal migration focus especially on how migrants use resources at their points of origin or destination or both, but they always overlook the actual border-crossing experience of these vulnerable migrants.

Based on twenty-one biographical narrative interviews with Burmese refugees in Battle Creek, Michigan, in 2012–2013, this paper examines how illegal border crossing from Myanmar’s Chin State to Thailand and then to Malaysia (and later to the United States after migrants are accepted as refugees by the UNHCR in Malaysia) is a migration strategy rather than an ‘end state’ and, among other factors, is related to the enormous difficulties of migrating legally to Malaysia. The paper examines hazardous border crossing (which requires clandestine agents and smugglers), the migration process, and the need for citizenship by nation-state, this paper considers the agency of Burmese migrants and raises the question of whether their ability to migrate ‘irregularly’ can be regarded as a resource in the particular context of forced migration.
Negotiating Risk in Intimate Labor: Domestic Workers and Night Nurses in Urban India

A recent spate of violent sexual assaults in Indian metropolises shocked the conscience of the nation and sparked a conversation about women’s safety on the streets of urban India, further reinforcing the view above that women were safest at home. Indeed, one reason domestic labor remains a major occupational category for poor women is because it is done within the confines of a home. Yet, most types of intimate labor in the private sphere are unregulated and potentially unsafe, especially when women are young. This paper looks at how two types of workers who perform intimate labor—domestic workers and night nurses—seek to navigate physical and “moral” risks as they move between their homes and their place of work.

To Violate with Impunity: Legal Constructions of Marital Rape

Law is one of the important tools through which the state claims to ensure that women are treated as equal citizens. However, literature shows that though, women across India face myriad forms of gender based violence everyday, law has not provided a mechanism to protect such women from harm. Further, it is also well documented that not all violence is condemned by the law. One such violence is that of marital sexual assault. ‘The Protection of Women from Domestic Violence Act 2005’, does include sexual abuse within the definition of domestic violence, yet it does not clearly criminalize marital sexual assault. On the other hand legislations on “rape” including the new Criminal Law Amendment Act 2013 continues to uphold legal exemption of “marital rape”. This paper attempts to understand such exemption of “marital rape” from Indian legal lexicon.

Legal constructions of “marital rape” is traced through analysis of legislations on “rape”, observation of cases at two Mahila Police Stations (All Women’s Police Station) at Odisha and through in-depth interviews of legal personnel from Odisha. This paper brings forth how despite campaigns and sensitization by women’s groups patriarchal notions continue to influence legal understanding of “marital rape”. Patriarchal and parochial notions such as “wife as property”, “divine ordinance” and others are invoked to justify the exemption of “marital rape”. It is argued that, while certain legislation may provide scope for pro-women interpretations to include marital rape, yet given the history of legal interpretations of law in India, such attempts would be far away. There is therefore, a need to amend the existing laws on sexual assault and bring in a comprehensive legislation against “marital rape”.

Bulgaria Case Study: The Challenges of the 2013 Social Protests in Bulgaria

The contemporary technologically determined information and communication environment is not only facilitating users’ participation in the process of generation and dissemination of content, but is also creating new opportunities for democratic citizenship. A variety of texts on new communication characteristics (Carpentier, Castells, Deuze, Fidler, Friedman, Jakubowicz, Jensen, Lash, Patriarche, Todorov, etc.) offer multiplex approaches to this phenomenon, elucidating the interrelations between the audiences, the traditional and the social media.

The proposed text will discuss some major political and social implications of the new modes of communication and the new forms of the audiences viewed through the prism of the media activism in Bulgaria. It is based on comparison of two case-studies, focused on recent social events in the country that had significant political effects. The first one, triggered by the high electricity bills, is connected with disapproval of the living standards. Although it resulted in resignation of the acting government in February 2013, the cost of electricity has not changed. The second one has moral purpose – for sustaining the democratic standards. On June 14, about 10,000 people summoned spontaneously via the social networks to protest against the Parliament for the non-transparent appointment of a controversial media mogul as a head of the State Agency of National Security. Although the Parliament withdrew the appointment immediately, since then (nearly three months) hundreds of activists are every day out in the streets protesting against other controversial measures of the new government. Both events enjoyed extensive mainstream media coverage.

The aim of the proposed research is to answer the question in what ways the ongoing audience transformations challenge the contemporary media mix in Bulgaria.

**Becoming Each Other: Interculturalisms, Grassroots Resistance and Cultural Creativity in Post-Colonial Trinidad and Tobago**

In addition to the overarching context or grand narrative of ethnic competition and contestation over cultural space, resources and recognition in multi-ethnic Trinidad and Tobago, there is also a little tradition of working class and grassroots interculturalisms and structural convergences taking place at the same time. In this paper, I examine cases of subordinate level interculturalisms that occur below the surface, often with little conscious awareness by the majority of the society. These include the often unnoticed adoption /adaptation by all members of the society of common aspects of religious practice, language, food, music, styles of being, and celebration of special days. I argue that Trinbagonians construct and perform the narrative of plurality as well as that of hybridity or creolisation accepting the dissonance and contradictions as part of the everyday complexity of life. So while a grand narrative of difference and ethnic competition prevails, the two major competing collectivities - Afro and Indo-Trinidadians are becoming more and more like each other.

**Capitalizing on Nigeria's Demographic Dividend**

Nigeria is the most populous country in Africa and the eighth most populous country in the world, and thus whether or not it realizes its potential demographic dividend is critically important. 

Nigeria is entering a period of potentially rapid economic growth due to the increase in the working-age population—the so-called demographic dividend. At first glance, Nigeria’s age structure appears promising, with a large cohort of young people entering adulthood (and, presumably, the labor force) while fertility rates are presumably falling. The dependency ratio suggests that the working age population will support the dependents (children and elderly) of the population, and in fact produce a surplus. In order to do that, however, working-age adults must be employed. Unemployment has declined since 2003, but most of that decline is due in agricultural work, which is less productive, and ecologically sound. Unemployment rates remain high across nearly every region and every subgroup in the population, but with Nigeria’s resources and oil wealth there is potential to invest in some creative forms of education, training, and job creation to realize the potential demographic dividend. Moreover, Nigeria's mortality and health indicators continue to lag far behind other countries as well. Life expectancy lags severely, due to the HIV/AIDS epidemic as well as other infectious diseases, and suggests a need for investment in public health infrastructure. Without a healthy population of workers, Nigeria cannot attain the demographic dividend.

**Upper Classes, Wider Horizons? the Social Stratification of Travelling in Europe**

Social stratification research on leisure tends to focus on class differences in cultural consumption patterns. In this literature, seldom is travelling taken into account as a dependent variable, even if international journeys are exponential-ly rising worldwide. But how is the experience of travelling sorted across social strata? Do they increase linearly as we move up the social hierarchy, as a reflex of higher income and cultural capital? Or are they more than proportionally an elite prerogative, while the bulk of the population keeps nation-wide travel horizons? And are there societal differences in the association between social class and travelling? In addition, this paper investigates differences in meanings of travels. We thus expand the cultural-sociological debate on the social stratification of cultural tastes: to mobility behaviours. Is international travelling a form of ‘omnivorous’ consumption, to use the famous concept of Peterson, for the better off and most educated? Is it meant to incorporate holidays, business and sociability experienc-es among the upper class, while being more focused and limited in scope among lower classes? Do these differences help characterize class-specific cultural capitals? As fostering class is contraction?

We address both sets of questions – the social stratification of the quantity and quality of mobility experiences – by analysing the distribution of national and international travels across social strata with data from the EUCROSS survey, covering six EU countries, Germany, Italy, Romania, Spain and the UK. Preliminary results of a series of EUCROSS data suggest that SES is an important predictor of mobility experiences; however, there are differences in motives of travels. Higher SES is associated with more travel for both holidays and professional trips. Furthermore, travelling patterns vary significantly depending on the countries from which they originate.

**Race and Patriarchy: Gender and Migration in South Africa during and after Apartheid**

Apartheid was not only a racial project, but also a patriarchal project that encouraged family separation. By design, black men and women in South Africa had different experiences under the apartheid regime, although many times they did not follow the strict patriarchal and racial laws. There is not much good historical data about gender differences in migration in South Africa, so I use a unique data set (2000 South African Migration and Health Survey) that includes life histories for a nationally representative sample of the black population to investigate the impact of apartheid policies on both men’s and women’s past and present migration patterns. Overall, I find that both women and men became increasingly likely to move over time, both during after the apartheid years and that women were more likely to move with their families, contrary to conventional wisdom and unlike migration patterns in other contexts. Women may not have moved at the same rates as men, but this paper gives evidence that despite apartheid’s intended effects of family separation, both women and were moving as families. Gender and migration patterns are relatively understudied, especially for historical populations, so this paper has the potential to add to our understanding of both historical and current gendered migration patterns, particularly in South Africa.

Modernity Reconfigured, or, Empire and the End of Habermas Versus Foucault

Central to debates in social theory about the relationship between modernity and critique has been the opposition, variously construed, between Foucauldian and Habermasian perspectives. Particularly in the 1980s and 1990s, and into the 2000s, these iconic figures stood for differing positions on the nature and purpose of human rationality, the workings of power in modern (and perhaps postmodern) capitalist societies, and the meaning and purpose of “critical theory.” As many papers and advanced course syllabi show, the opposition itself became a tool for thinking about democracy, capitalism, violence, and so on. However, this opposition was underwritten by a surprisingly similar theoretical narrative of modernity informed by a comparative-historical sociology of national states and economies, and this narrative is in important ways incorrect and incomplete, for it excludes empire and colonization from its causal stories and cultural interpretations. A reading of the explicit and implicit historical sociologies of Foucault and of Habermas is presented, highlighting these absences. The paper then explores the recurrence of this absence in other theories of modernity or modernisms, including Wittrock and Eisenstadt.

What, then, is the alternative? Too often, alternatives are themselves presented in terms informed by “Habermas versus Foucault,” modern versus postmodern, etc. In an effort to resist this tendency, instead of proposing a new all-encompassing position, this paper examines how three concepts that are simultaneously analytically and normatively would shift in their meaning and use, if we were to incorporate the sociology of empire into our understanding of modernity and critique. First, the relationship of the concept of power to the concept of instrumentality or instrumental reason is reconsidered. Second, the concept of fantasy, and the possibility of a hermeneutics of modern fantasies, is explored. This leads to a final reflection on the concept of modernity itself.

Overcoming Institutional Barriers: The Relationship Between Basic Human Motivations and Immigrant Integration Across European Societies

Research on the incorporation of immigrants into host societies has paid particular attention to the question of why some people are more likely to integrate. In this study, we analyze integration at the micro-level by identifying what basic human motivations lead to greater socioeconomic success, cultural adoption and political participation. Social psychological research has identified four higher-order universal human values that are consistent with specific cultural adaptations and political participation. The authors examine the relationships between these values and integration in Europe by analyzing data from the 2002-2012 cumulative file of the European Social Survey, which includes the Schwartz’ Portrait Values Questionnaire in addition to a number of social and political attitudes and behavior.

Subjectivity and Social Change In Social Struggles In Mexico

Mexico is a key country to look at and analyze the forms of struggle and the projects of other sorts of life that are being put into practice in the Global South. The experience of Zapata autonomous communities (since 1994), and the re-imaginings of Atenco to Oaxaca in the 1990s, present the processes of self-defense of villages in Guerrero and Michoacan, and other numerous indigenous struggles, whether rural or urban that are taking place in Mexican territory have been configured as a point of reference for the development of a new social imaginary in both the Latin American continent and other places around the world. In addition, these struggles have contributed to a new path between the process of urbanization in Mexico and also in Latin America, mainly led by social subjects that have outweighed the North-centered analyses of collective action and also the traditional conception of social movements.

In this paper, we will present a proposal of analysis regarding social struggles taking place in current Mexico, from below and from the point of view of the leaders. Our starting point is the Latin American literature on social movements and the ethnographic work carried out by the authors in various social protests in the country in the last decade. From our perspective, we aim to analyze how these struggles people reinvent and re-code non-institutional forms of doing politics in relation to collective needs and desires.

With this paper we attempt to contribute to the construction of a dialogue between the experiences of struggle in the Global South and the Global North, where the starting point are not the theories far from social subjects nor their geographical location, but instead the everyday political practices of people.

Modernity Reconfigured, or, Empire and the End of Habermas Versus Foucault

In invoking the metaphor of the magnet, an oft-heard concern about the sustainability of the welfare state is that generous social welfare provisions serve as an important pull-factor in immigrants’ consideration of their preferred country of destination. With their accumulated social risks, immigrants are on average more likely to claim welfare benefits, fueling the idea that such generous provisions reverse migration flows. If this concern could be addressed, then the analysis of attitudes towards social welfare programs among immigrants would reflect such magnetism effect, namely that immigrants would exhibit stronger pro-welfare attitudes compared to the non-immigrant population, particularly in countries with higher per capita spending. To evaluate the extent to which immigrants reflect the idea of welfare magnetism, we analyze the 2008 ‘Welfare Attitudes’ module of the European Social Survey, fielded in more than 20 countries. This survey allows us to untangle the extent to which self-interest motivations determine welfare attitudes among immigrants equally as they do among non-immigrants. Further, we analyze if pro-welfare attitudes are a function of the size of the welfare state immigrants reside in. While our analysis indicates that immigrants are indeed slightly more pro-welfare than the autochthonous population, it also shows that their welfare attitudes are an imprint of the welfare opinions of the majority population of the country they are living in. We conclude our contribution with the implications for the future of the welfare state, the theory of welfare magnetism, and the consequences for public policy.

Welfare Magnetism within Public Opinion. Evaluating Welfare Opinions Among First and Second Generation Immigrants

In the context of a French “epidemic” of obesity, the question of social inequalities regarding the development of obesity and the implementation of nutritional recommendations coming from public health campaigns constitutes an important concern. Based on a statistical analysis of obesity prevalence (1), on a corpus of 85 semi-directive interviews (2), and on a wide corpus of texts related to the French epidemic (3), this contribution will analyze the inequalities regarding obesity in France related to social classes, gender and generations, and it will examine the several factors explaining this social gap, in particular the integration of recommendation related to diet and body along the social scale and the way obesity is taken in account in public health campaigns. Finally, the analysis will be placed on the ongoing existence of a strong social hierarchy in which well-to-do and low-income categories are at opposite ends of the scale, and the factors that determine the integration of dietary dictates are presented (economic factors ; mental representations of diet and body ; the symbolic of sickness and its relation to diet ; the collective mental representations and identities of each social class). The analysis also shows the social inequalities that exist in the development of norms and the complexity of the intermediate social groups, divided between submission to normative pressure regarding diet and corpulence, and a form of working class rejection.

Obesity and Social Inequalities : Public Health Campaigns and Their Implementation

In the context of a French “epidemic” of obesity, the question of social inequalities regarding the development of obesity and the implementation of nutritional recommendations coming from public health campaigns constitutes an important concern. Based on a statistical analysis of obesity prevalence (1), on a corpus of 85 semi-directive interviews (2), and on a wide corpus of texts related to the French epidemic (3), this contribution will analyze the inequalities regarding obesity in France related to social classes, gender and generations, and it will examine the several factors explaining this social gap, in particular the integration of recommendation related to diet and body along the social scale and the way obesity is taken in account in public health campaigns. 802  * denotes a presenting author. Abstracts are organized by first presenting author’s last name.
We will thus highlight that the French public health campaigns, claiming to be universal, seem destined to fail: in order to raise a strong mobilization when it comes to obesity, public health campaign have neglected social disparities. In consequence, they may have deepened social inequality further because they have ignored – at least until recently - the social dimension of dietary consumption.

Employment is one important aspect for societal participation as well as social well-being. Besides providing a living, employment gives access to benefit entitlements in case of unemployment or retirement, but it also provides social prestige and social recognition.

Vocational rehabilitation, as an instrument of the German social welfare state designed to support societal participation, aims at (re-)gaining employment for people with disabilities. Due to a lack of data, there is little empirical evidence on the degree and quality of labour market integration of vocational rehabilitation in Germany.

Based on a three-wave panel survey of the Institute for Employment Research on vocational rehabilitation and the life course, our research focuses on rehabilitants in the financial responsibility of the German Federal Employment Agency (FÄA), who require reintegration into the labour market. These people already have several years of working experience, but cannot continue their prior occupation due to health problems and thus, mainly participate in further training, retraining and/or integrational measures. We analyse employment transitions and respective determinants for the re-entry into the labour market and the sustainability of employment using event history analyses.

Results show that two thirds of the population obtains (mostly unsubsidised) employment only a few months after vocational rehabilitation and on average stays employed for almost three years. The transition in employment is highly determined by structural factors, but also by the type of measure attended during vocational rehabilitation. Integrational measures, like e.g. employment subsidies, are most successful for the placement in employment. Surprisingly, the type of disability does not play an important role in labour market integration, but the subjective well-being appears to be of high significance for both the transition in and the sustainability of employment. Those who report a (very) bad health condition have significantly worse employment chances and thus, reduced chances of social well-being.

La Crise Racontée Par La Télévision Française

Cette communication se présente en forme de décryptage et d’analyse, sur une période d’une année, des programmes de la télévision française (grandes chaînes historiques, TF1 et France Télévisions) concernant la représentation de la crise selon deux catégories d’émissions: fictions téleséuées d’une part, et émissions de débats politiques, d’autre part, illustrant et légitimant conjointement un discours de l’inégalité.

S’agissant des fictions télévisées (séries et téléfilms), sous réserve de quelques notables exceptions qui donneront lieu à un éclairage spécifique, le modèle régulièrement dupliqué ignore la crise, en ne représentant que des milieux sociaux qui y échappent. Les exclu’s, lorsqu’ils apparaissent font figure d’accidents individuels. La télévision publique n’apparaît pas, à cet égard, fondamentalement différente de la télévision privée. L’exemple emblématique, de la série quotidienne Plus belle la vie (France 3), alors même qu’elle a la vertu d’illustrer les grandes questions sociales du temps présent (racisme, homophobie, ex-menehém, problèmes familiaux…) ne parvient parfois à susciter que l’incurie, ou l’ignorance.

Des tendances comparables caractérisent, selon d’autres voies, les émissions de débats politiques, nombreuses sur les chaînes publiques: la première traduction d’inégalités concerne les experts et les intellectuels invités, quasiment toujours les mêmes, fondant la distinction entre une minorité “visible” et la majorité des “invisibles”. Et ces mêmes experts partagent le même discours néolibéral d’appréhension de la crise, imputée à l’inadaptation des salariés aux nouveaux principes du marché du travail.

Public Transport in Times of Individualization

Public transport is recognized by policy makers as a main tool in the combat against greenhouse gas emissions, and a key factor in sustainable urban develop- ment. Yet in Stockholm, the European Green Capital of 2010, systems for private transport are given a significant portion of space and funding in policy making and regional development plans. A recent prognosis shows that by 2050 Swedes will be far from reaching its zero-emission climate target for road traffic, given hitherto decided measures. This implies a gap between the rhetoric and set targets, and the physical plans made to reach these targets.

This paper is focused upon transport policy strategies for facing and responding to climate change in second modernity, and how modernization pressures are reconciled with sustainable development in policy for urban transport. As a major driver for policy changes, the second modernity has resulted in a step further towards individualization and a step back for the collective planning of the first modernity. How do the second modernity and sustainable development relate to each other and how do they affect urban transport policy? An assumption is that the mechanisms of the second modernity encourage “light” private, flexibility-enhancing solutions over those heavier collective solutions laden with distributive justice that the 1987 Brundtland Report promotes, making weak sustainability or ecological modernization more attractive as a policy direction.

I will relate Stockholm’s urban transport policy to the regional development plan, to consider how policy relates to modernization and how well the theory of second modernity can explain the gaps between targets and prognosis for emissions. My hypothesis is that ecological modernization is a way to reconcile modernization and sustainable development, and that a bias towards modernization pressures have ignored – at least until recently - the social dimension of dietary consumption.
Recently, major newspapers began developing participatory platforms such as Asahi Shimbun’s "BilliMedia". Newspaper reporters from the Asahi were also encouraged to open official Twitter accounts, converse with the audience and debate with their peers and competitors on-line.

Albeit limited, these actions are transforming the culture of news production, gathering and gatekeeping functions. Based on Japanese reporters interviews, my research focuses on these newly emerging participatory practices and the challenge they present to professional ethics and ideology. Employing concepts as user generated content, social curation or big data manipulation, Japanese reporters attempt to redefine journalism in order to reclaim their credibility and jurisdiction at a time of crisis and uncertainty.

Muslims Social Exclusion in Canada and France: Does National Context Matter?

This paper compares the experiences of Muslim minorities in three contexts: France, Quebec, and English Canada, and in so doing helps illuminate a number of issues of significance to current debates on immigration and multiculturalism, including the role of public attitudes, national integration 'models' and advantages of transnational 'nations of immigration' over recent European experience, and language and culture. The rise of an anti-Muslim sentiment in most of Western European societies, and especially in France, has not reached the same level in Canada, however Quebec's is clearly distinctive in this regard and more like France. How these differences among public opinions and in political discourses affect social integration prospects of Muslim minorities in the three settings? Both quantitative and qualitative data are used. On the quantitative side, for France the new government-mandated "Trajectories and Origins" (Teo) survey conducted in 2009 (over 21000 interviews) overcomes many limitations in existing statistics for identification of ethnic minorities. The comparable Canadian source is the "Ethnic Diversity Survey" conducted in 2002 by Statistics Canada (over 42000 interviews). The paper also draws from structured encounters between Muslims and non-Muslims conducted in Paris, Montreal and Toronto.

Transborder Disaster In The Progressive Era

What can disaster teach us about diaspora? What can diaspora teach us about disaster? This paper explores two early 20th-century disasters in the U.S.-Canada borderland. One, the Halifax Explosion of 1917, took place in a region that sent migrants south to the United States; the other, the Salem Fire of 1914, mostly affected French-Canadian immigrants to the U.S. and their descendants.

Each disaster illuminates experiences of migration and diaspora. The Salem Fire—which started at a rural patent-leather factory and spread through the tenement district, eventually rendering 18,000 homeless or jobless—shows the relative unimportance of the Franco-American diaspora to the lives of its members. Contrary to what the historiographical literature would have us expect, Franco-American survivors mostly stayed near Salem, going neither to other New England centers of the diaspora nor back to Quebec. Local and regional communal organizations did little fund-raising or relief work. In contrast, the Halifax Explosion—which began as a fire on a munitions ship, killed 2,000, and left about 25,000 homeless or jobless—shows the importance of the Nova Scotia diaspora. Nova Scotian migrants to the "Boston States" donated money for relief and through their donations built a transnational political community that sought to influence relief and recovery efforts.

Likewise, attention to diaspora and migration can help us better explain the experience of disaster. As Erikson (1976) and others have recognized, displacement is a key trauma of disaster. Prior "displacement"—that is, migration—means that the household activity and the related energy consumption patterns differ from western countries. In this paper, we analyze the impact of inter-generational coresidence on energy consumption. Taking electricity as an example, we find that there are significant differences between inter-generational coresidence within a single generation and single generation household. Electricity usage of single generation household is much higher than other inter-generational coresidence household. This paper attempts to present such differences based on pooled data from the Chinese Family Panel Studies (CFPS) and used OLS regression model to decompose "age effect", "retirement effect" and "scale economies effect". The decomposition model shows that the presence of "scale economies effect", which means that the household per person electricity usage declines not only when household members increase, but also when inter-generational household members live together; (2) "age effect" and "retirement effect" can be found that female over 50 years old live in a household can increase household per person electricity consumption, and all the other age-gender-specific group live in a household can reduce household per person electricity consumption, especially for male at the age of 30-40; male consume less electricity in household than female at all age group, except for age 10-20. Energy policy makers can benefit from better understanding of these effects.

The Statistical Construction of Alterity: Governing National Population By Numbers in France and Germany (1860-1900)

This paper is aimed to contribute to the history of statistics as science but also a history of methods (Foucault 2004). This abstract explores the role of official statistics in the nation building process in the second part of the 19th century in France and Germany. Following the analyses of Desrosières and Foucault the study asks how science produced "imagined communities" (Anderson 1983) by using and constructing statistical categories on migration. By doing that official statistics contributed to produce differences between national and foreign populations, which both aim to be governed differently.

In the first step I will argue that the historical development of official statistics in the 19th century in France and Germany led to its use in both countries as a governing tool to administrate population, but in different national ways. In the second step the paper recontextualizes and deconstructs the statistical categories of foreigners and citizens, to show how official statistics took part in the historical process of nation building.

Scientific journals (Journal de la Société de Statistique de Paris, Zeitschrift des königlich preussischen statistischen Archivs) between 1860 and 1900 form the empirical basis of the study. About 160 articles on migration statistics have been qualitatively analysed in order to sketch the statistical discourse about migration as well as the discursive construction of German and French nations by statisticians.

Behind the Label: Always Fairly Traded?

Since Fair Trade entered the mainstream market, a label symbolizing the quality of being "fairly traded" has mediated between the producers and the consumers instead of the more direct relationship existing when fair trade was an alternative trade organizations business. With the lengthening and a larger opacity of the commodity chain, the label is supposed to give information and a guarantee to the consumers about the conditions of trade offered to the producers. A system of standards and certification has been developed to deliver the label. This paper pretends to demonstrate how a single label, the Fair Trade International label, covers (or hides) very different and opposite realities on the side of production and supply: on one side, autonomous cooperatives of coffee peasants (or FLO), covers (or hides) very different and opposite realities on the side of production and supply: on one side, autonomous cooperatives of coffee peasants, that buy up their coffee from the consumers about the conditions of trade offered to the producers. With the lengthening and the larger opacity of the commodity chain, the label is supposed to give information and a guarantee to the consumers about the conditions of trade offered to the producers. A system of standards and certification has been developed to deliver the label. The author gratefully acknowledges the financial support of the Scientific Commission of the IEP Grenoble, the Doctoral School SHPT of the University of Grenoble and the Potsdam Graduate School.

L’idéité Entre Construction Et Renoncement. Réflexions De Ernesto De Martino Et Georges Devereux Sur La Sexualité Dans Une Dimension Transcultruelle

L’anthropologue italien Ernesto de Martino (1908-1965), dans sa vision historico-critique du rapport entre psychisme et société, considère le sujet humain comme un produit historique dont les origines plongent dans ce qu’il appelle le ‘‘monde magique’’. L’existence d’une frontière stable entre l’individu et le reste du monde est, pour de Martino, loin d’être un fait établi mais caractérisé le monde occidental, qui a dépassé le phénomène de la ‘‘labilité de la présence’’ et dont l’angoisse face à la dissolution (l’appelle conoimia) ces états psychiques d’‘‘idéité indifférenciée’’ (le ‘‘monde magique’’) est désormais circonscrite à des situations bien précises (l’acte sexuel, la mort).

Georges Devereux (1908-1985), éluve de Marcel Mauss et fondateur de la ethnopsychanalyse, étudie de son coté la constitution d’une ‘‘idéité intégrée’’ et théorise la possibilité d’une ‘‘renoncement à l’idéité’’, comme un stratagème volontaire d’autodéfense psychique.

Jeproposera une analyse comparative de la notion de construction de l’idéité chez de Martino et Devereux, et son corollaire, la perte de l’idéité pour le premier, versus la renoncement à l’idéité pour le second. J’essaierai d’éclairer en particulier les plages de l’acte triple ‘‘sex-race-caste’, ‘‘les états psychiques d’‘‘identité indifférenciée’’, et qui a dépassé le phénomène de la ‘‘labilité de la présence’’ et dont l’angoisse face à la dissolution (l’appelle conoimia) ces états psychiques d’‘‘idéité indifférenciée’’ (le ‘‘monde magique’’) est désormais circonscrite à des situations bien précises (l’acte sexuel, la mort).

Elites of São Paulo and Their Varied Relationships with Public Space

The paper examines specific areas in São Paulo where elites cohabit with poorer populations and investigates the different ways they mediate this physical proximity. Our findings indicate that the relationships emerging from these dynamics vary from complete appropriation of public space by the elites to negotiated coexistence with other cohabiting social groups.

Until the 1970s, São Paulo’s elites lived in the center of the city. Although they were one of the actors in the metropolis’ macro-segregation configuration, the local literature traditionally emphasized the formation of urban peripheries inhabited homogeneously by poor populations. Recently, however, both quantitative and qualitative research have eloquently pointed to heterogeneous living spaces in São Paulo, indicating that portions of the elite have scattered throughout the metropolis, while others have stayed in the center.

The elite’s varied choices of housing location since the 1980s led to different impacts on public space: some of the groups have closed streets with gates and walls; others have banned sidewalks, and so forth. At the same time, some of the groups that stayed in the center have not materially sealed off contact with other social groups. Therefore, our aim is to understand how elites view contact with other populations and which role public space plays in the establishment or avoidance of such contact.

We take three methodological steps: (a) using Geographic Information System, we select areas that are inhabited by the 10% richer extract of the population according to the 2010 Census data, provided that these areas also contain poorer populations; (b) conduct and analyze in-depth interviews with members of the elites and label them into groups according to shared lifestyles, as well as sexualities, which is treated in a perspective transculturable by these two contemporaries, and which is aborded according to the angles different. En reconstructing entre autres la reflexion sur la pudeur et le plaisir sexuel developpe par de Martino, celle sur la devise sexuelle chez Devereux, je voudrais souligner l’originalite et la complementarite de la contribution de ce deux theoriciens.

Mobility Policies in São Paulo: Redistributive Strategies Towards the Public Transport

The paper focuses on a redistributive strategy that attacks poverty on one of its aspects – the impaired access to urban resources, specifically to mobility. It investigates two locally-designed São Paulo policies aimed at redistributing road space towards the public transport to make bus users travel faster and at lower costs. While Brazil has been redistributing income towards the poor through a federal Conditional Cash Transfer policy, its poorer metropolitan inhabitants are still submitted to lesser-quality urban services, mobility being one of the most critical. Analyses of the 1987, 1997 and 2007 Origin/Destination survey conducted in the São Paulo Metropolitan Region show a positive and significant correlation between higher incomes and automobile use. According to the same data, travel time for public transport users has been, on average, double the time it takes for car riders to move in the city. Automobiles take up more than 80% of road space in rush hour in São Paulo.

Data indicate that the two policies investigated here have redistributed road space and travel speed towards buses. The Sistema Integrado (2001-2004 ad hoc) focused on the implementation of a BRT (bus rapid transit) network while introducing an integration system that allowed fixed-fare multiple-bus riding. The Dá Licença para o Ônibus (current administration) has implemented more than 200 kilometers of exclusive bus lanes and claims to have reduced travel time on these lanes by half. Both policies suffered from political and institutional setbacks, as the paper will detail.

The role of transportation in accessing other urban-life goods has been eloquently described as crucial by European literature. Research on the subject has been scarce in the Global South, however. With empirical data on mobility in São Paulo, this paper aims to make a contribution to the research agenda on strategies that go beyond the redistribution of income.

Information Sharing in Contemporary Operations: Lessons from Special Operation Forces

Due to the complexity of contemporary operations, efficient information sharing has been identified as one of the main challenges of multinational coalitions. Today’s operations are conducted by military personnel from a diverse background often operating in a foreign environment alongside host nation military and police forces. Drawing on the experiences of the special operations community in “counter-network operations” in Iraq and Afghanistan, some western military organizations are capturing the lessons of these units. By flattening their command structures, leveraging state-of-the-art technology and adopting a mindset of “need to share” instead of “need to know”, these organizations strive for a skinnier “sensor to decision time”. Military organizations, while experimenting with the new possibilities of information technology such as Secure Video Tele Conference (SVTC) and collaborative chat rooms, at the same time are re-learning the importance of the human dimension. The age-old lessons of mission command still apply. The commander giving broad guidance and trusting the judgment of his subordinates seems to be the only alternative. This paper examines these trends in information management in modern military command centers and puts them in a broader societal and cultural context.

How the Radical Right Manages Internal Democratization: A Case Study on the French National Front

The French radical right party “Front National” has proven responsive to new trends adopted by political parties such as the introduction of functional alternatives to party membership and the expansion of intra-party democracy. Our paper proposes to describe this phenomenon and to analyze its effects on the internal party economy.

The choice of an internal election to select a new president in 2011 was an absolutely new development in a party characterized by centralization, verticality and a great degree of control of the president and executive board. It generated visible conflicts at all party levels, from the executive board to the local federations and the grassroots members, resulting in a significant turnover of executives at different levels in the following elections.

Based on a methodology using archive research and interviews with both party members and executives, we show that despite the controversies that surround ed it, the introduction of this highly democratic process progressively emerged as an important tool enabling the new president, Marine Le Pen, to keep the organization under control. New faithful executives have been promoted at the national and local level.

The creation of new satellite organizations remaining independent from the party but named after its leader appears as an attempt to reach new non-member supporters while boosting party personalization and the president’s legitimacy. The organizational responses have been assimilated in the party’s legacy and remain coherent with the populist tradition promoting a direct relationship between the leader and the people, and characterized by a strong loyalty and dedication to the leader. Hence, this internal democratic process has not changed the party’s routine decision-making process in the least; on the opposite, it has arguably reinforced the typical organizational model of a radical right party dominated by its leader.

research could be a good benchmark for improving the quality of teachers that the country produces.

There were four important migration phenomena about Filipino Teachers that were explored in this paper. First, it surveyed the migration and employment profile of teachers who usually worked in abroad as teachers. Demographic and socioeconomic profiles were also dealt with in this paper. Second, it analyzed the experiences of teachers as regards their motivations in working abroad, finding and applying for teaching jobs, teaching experiences, and adaptations and adjustments in a foreign country. This part was highlighted by competitiveness level of teachers and their perceived losses and gains while teaching abroad. Teachers’ competitiveness was indicated by their salaries, promotions, incentives and other benefits received due to their services to the host institutions. Third, the standards and required competencies among teachers from home country and receiving country were analyzed. Lastly, this paper examined as well the competitiveness of Filipino teachers using gender lens.

On Weather Disasters and International Migration: Empirical Model and Worldwide Forecast to 2060 Under Business As Usual

Weather Disasters (WDs) have played a role in promoting internal and international migrations in a number of episodes, but it is unclear if they play a systematic or idiosyncratic role. Part of the problem is that the statistical literature on migration has essentially ignored these impacts. This research question is important, for the intensity and frequency of WDs are expected to grow due to global warming, and there are reasons to suspect that large waves of immigration may result from harsh environmental impacts related to large scale mining. A notorious resource used in struggle is to get Wirikuta inserted in the list of World Natural and Cultural Heritage Sites before Unesco. Local actors believe this action can stop the extractive projects. Due to global pressures Mexican government has initiated and supported a counter-proposal, which would lead Wirikuta to be enlisted under the Intangible Heritage scheme, putting aside the relevance of matter (nature) in conflict. This would give way to mining companies to drag the metals with any method, obviating particularities of territory and culture. By analyzing this case we aim to elaborate on: the role of institutional heritage in conflictive contexts, Unesco's role and limitations of heritage schemes, state trends in solving--or not--local conflicts and social innovations that actors perform in policy-culture realms in order to preserve the environments they live in.

Comparative Sociology As an Inquiry and As a Teaching Discipline: An Attempt of Comparative Analysis

Andrey V. Rezaev,
Chair, Comparative Sociology Department,
St. Petersburg State University,
rezaev@yandex.ru

Paper to be presented at the XVIII ISA World Congress, Research Committee on Comparative Sociology, RC 20

Session: Comparative Sociology: Present Status and Future Directions

The exponential growth in affirmation of or claims to comparative research has arisen to multiple discussions in recent years. The paper is an opportunity to analyze a very old yet really stimulating topic in scholarly production. It explores into understanding the ‘similarities’ and ‘differences’ between “comparative analysis”, “comparative method” in social sciences, “comparative sociological studies”, “comparative sociology”. It tries to show the real novelty of a ‘comparative sociology’ in a nowadays sociological business.

The paper examines the reality of comparative sociology in the classroom as a teaching discipline and its specifics as a scholarly enterprise.

The paper argues that a broad discourse on the role of comparative sociology for intellectual life has not yet occurred in academe, despite many valiant efforts to help it take place.

The paper has two foci: the first is theoretical and methodological; it tries to depict general theoretical frames, methodological orientations for the current debates on “comparative analysis/method/sociology” issues in nowadays sociology.

The second aim is to reposition comparative studies’ production within policy practices. The output of academia is no longer confined to a pure intellectual/theoretical debate but is increasingly part of a current policy activity, a part of a broader public domain.

The specific data and field research materials come from the longitudinal researches developed by the research teams and teaching instructors during last
seven years (2006–2013) at the International Center for Comparative and Institutional Research (InterComCenter) and Comparative Sociology Department of St. Petersburg State University, Russia.

Macro Conditions of Class and Micro Patterns of Social Interaction: The Problem of Studying Labor Migrants’ Discontent in the Time of Economic Instability

Paper to be presented at the XVII ISA World Congress, Research Committee on Sociology of Migration, RC 31

The paper aims to focus not only on the limited control over migrants’ external situation in host societies, cultural discrimination or accessibility to legal protection, but to examine the problem of migrants’ everyday life practices in their uncertain condition, specifically in the time of economic instability. We try to conceptualize this emerging experience within the framework of the sociology of emotions and everyday life settings, which is understood as a long-term tension, (a) determined by the structural conditions, (b) created by and transmitted through the everyday social interaction, and (c) capable to result into collective action. This analytical move allows us to study ‘discontent’ at both macro- and micro-levels without losing its specific content.

In terms of theoretical and methodological foundations the research is orientated toward ethnographic institutionalism. We try to provide theoretical groundings and empirical evidence to justify an approach that link the micro experiences with the macro institutional arrangements through the detailed studies of migrants’ everyday life practices.

The data come from the three longitudinal field research Projects jointly supported by Vietnamese state foundation (2008-2010), CARI - Greece (2010-2012), and Russian state foundation - RGBF (2013-2016). The field researches dealt with everyday life practices (including “alternate practices”) of transnational labor migrants in Athens, Greece and St. Petersburg, Russia.

REZVANI NARAGHI, ASHKAN* (University of Wisconsin Milwaukee, rezvani2@uw.edu)

Constructing the Virtual and Material Public Spaces: The Cases of “We Are All Khaled Said” Facebook Page and Tahrir Square during Egypt 2011 Revolution

Social movements use urban spaces for their representation. They demand a spatial setting for their full effectiveness. However, spatiality of social movements has entered into a new phase since the mid-1990s. The prevalence of the Internet as part of the daily lives of people has challenged traditional theories of social movement and political public space. Recent revolutions and social movements in the Middle East and North Africa (MENA) region and in Western Europe and the USA have raised a reaction to the economic crisis and austerity programs of governments in different parts of the globe have created a new phase of research on the relationship between online activism and social movements. Scholars focus more on the role of social networking sites (SNS) and try to articulate their contribution to social movements. This essay has argued that Hannah Arendt’s conception of public space can contribute to the definition of material and virtual public spaces in contemporary social movements. By investigating Tahrir Square as a material public space and ‘We Are All Khaled Said’ Facebook page as a virtual public space during the Egypt 2011 revolution, this essay has studied the relationship of these spaces and the events of the revolution. It has shown that Arendt’s concepts of action and speech can theorize the virtual and public spaces of the Egyptian revolution.

children is worth closer analysis as it may fall beyond the categorizations usually applied to adults. To this end, a mixed methods research project with 245 children attending different primary schools in Portugal – one private school targeted at upper class children and one state-sponsored school located in a working class area – was developed. The results revealed significant differences by school and household typology.

What Makes Low and High Income Families Apportion Their Children's Education and Care to Early Childhood Education?

Why do families apportion their children's education and care to Early Childhood Education? Are there motivational differences between low and high income families? Prompted by these questions, research was carried out on four families - being 2 low income families and 2 high income families, who enrolled their children in Early Childhood Education in Brasilia, Distrito Federal, Brazil in 2013. Two interviews were held with parents addressing both family and Early Childhood Education topics. Using the concept of family arrangement (FONSECA, 2005) as a basis - which apart from the nuclear family, encompasses several other family structures and the idea that Early Childhood Education in Brazil is not only for the children’s right but the child’s, one can observe tendencies towards change in the standard of education for children aged 0 to 3. Previously exclusive to the family environment, the tendency now considers environments beyond the domestic parameters without considering the family a bearer of any social pathology (ROSEMENG, 1995). The care and education process is neither natural nor exclusive to families. Given this scenario, it is possible to highlight some reasons for this change like alterations in peer relationships, modifications in the perception of children aged 0 to 3, universalisation of education in an institutional context - prior to mandatory formal education, co-responsabilisation of the State in care and education as well as socialisation processes beyond the family environment. This research discusses the reasons behind families apportioning their children's education and care to Early Childhood Education and seeks to pinpoint explanatory categories for the changes in the standard of education and care of young children. The final intention is to identify motivational convergences and divergences between low and high income families.

Religion As an Important Factor in the Composition of Ethnic Identity in Ex Yugoslav Countries

In many countries religion is one of the most important factors in the composition of ethnic identity. Balkan is one of the regions of the world where ethnic identity was made by religious belonging. That was obvious during 1990-ies breakup of the state when federation disintegrated by its religious and national borders. The religious border was especially important in case of relations between Serbia, Croatia and Bosnia and Herzegovina. The fact was obvious given that all three main religious groups speak the same language today and they have same origin. The most important difference among them was religious. Almost all Croats are Roman Catholics, all of them who declare themselves today as Bosniaks are Muslim and almost all Serbs are Orthodox.

RICCIIONI, ILARIA* (Free University of Bozen, Italy, Ilaria.Ricciioni@unibz.it)

Music As a Factor of Social Cohesion: At What Conditions?

Music as a factor of social cohesion: at what conditions?

Music is often considered a universal language. As the most abstract of all arts, music has a code belonging to a certain relation to language and text, but also music has a code belonging to a certain relation to language and text, but also music has a code belonging to a certain relation to language and text, but also music has a code belonging to a certain relation to language and text. Each social context has a unique relation with imagination and the role of the arts in such context is the outcome of such peculiar relationship. Besides cultural and aesthetic values, every artistic expression has a potential social function: art and music can create a sense of belonging improving social cohesion as well as its content, an art can also contribute either to the change of cultural taste opening the way to new social order conceptions, or confirming traditions and identities. Moreover, music as culture can play a crucial role in the process of understanding cultural dynamics acting in a given place. According to the results of a field research carried out in a trilingual land: “Music culture and social function of music in Alto Adige”, this paper will go through a possible typology of the social role of the music, as well as the relation between language and music starting from the different repertoires, traditions and pedagogies in the three different languages (Italian, German and Ladin). Is it possible to trace a social relation to music according to the different traditions and values? Is it possible to understand the culture of a place also trough its music tastes? Is music a generation factor of cohesion or a culture factor of cohesion? Can music preferences be influenced by the dimension of a society/community and its dominant language?
The results of the wave one data revealed that senior on-liners were very well socially included and had a high level of mental well-being. However, in the longitudinal analyses, Internet and social media related variables did not predict mental well-being and social networks. It was concluded that going on-line and joining on-line communities may, at best, help to maintain quality of life and social networks rather than enhancing seniors’ psychosocial conditions.

Verbal Aggression Against Health Care Staff – Mixed Methods Study

Clinical staff in various settings has to cope with aggressive behavior from patients and visitors. In recent years, physical aggression has received a lot of attention and many prevention programs are available throughout Western societies. However, verbal aggression against health care staff is much more prevalent than physical aggression.

This paper reports on a mixed methods study which was conducted in the following settings in Germany: mental hospitals, forensic hospitals, acute care hospitals, nursing homes and residential homes for mentally ill residents. Eight focus group interviews were conducted with a total of 74 staff members (nurses, physicians, psychologists and nursing assistants). The interview guide contained questions about any kind of verbal aggression which had been experienced, about the differences between physical and verbal aggression and about the coping strategies of health care staff. Subsequently, 1,053 staff members from the various participating in a survey which focused on the frequency of verbal aggression and on the severity of aggressive acts.

The results revealed that verbal aggression is a very common phenomenon among health care staff. The following types of verbal aggression were identified: threats, verbal abuse, use of rude/sexual language, continual loud vocalizations (e.g., shouting, questionings), remarks which questioned the competency of the staff, refusal of cooperation and the ridiculing of staff. 16 percent of staff reported having experienced verbal aggression on a daily basis during the six months prior to the survey data collection date. Threats were experienced as being the most severe form of verbal aggression, followed by refusal of cooperation. On average, verbal aggression is rated to be more severe than physical aggression.

Currently, prevention programs in healthcare institutions are focusing mainly on physical aggression. This focus needs to be altered by teaching staff how to cope better with verbal aggression.

GARELLI, FRANCO (University of Torino, roberta.ricucci@unito.it)

Religion in the Public Arena in Southern Europe: Comparing/Contrasting Italy, Spain and Portugal

Observers of religious phenomena often tend to lump together Latin countries with Catholic roots – Italy, Spain and Portugal – excepting France, usually considered a separate case, a model of the secular State and of the society which characterizes it. Perhaps this is because there was in their past an epoch in which Catholicism exercised a hegemonic role in society, based on a quite normative ecclesiastical magisterium, over a widespread national network of parishes and a population totally exposed to clerical influence, after the pattern of militant com- mitment capable of getting a grip on the most dynamic and vital social sectors. Indeed, the these countries – in which Catholic culture is still prevalent – follow different paths through advanced modernity, and these can be seen in the forms assumed by the relationship between religion and civil society. In Italy, that relationship has in recent decades undergone three key moments which have para-
doxy restored the Catholic church and its world to the centre of the public stage. This development was by no means inevitable, as is evidenced by the examples of Spain and Portugal who – although sharing analogous dynamics – have reached outcomes different from those of Italy. Drawing on evidence from an data investigation in the framework of the GERCR (Groupe Européen de Recherche Interdisciplinaire sur le Changement Religieux) project, the paper compares (and contrasts) three Southern European countries by analysing the evolution of the relations between religion and public sphere.

AUTH-985.1

RIDGEWAY, CECILIA* (Stanford University, ridgeway@stanford.edu)

Cecilia Ridgeway: Framed by Gender: How Gender Persists in the Modern World

In an advanced industrial society like the United States, where an array of processes against gender inequality, how does this inequality persist? Integrating research from sociology, social cognition and psychology, and organizational behavior, Framed by Gender identifies the general processes through which gender as a principle of inequality rewrites itself into new forms of social and economic organization. The book argues that people confront uncertain circumstances with gender beliefs that are more traditional than those circumstances. They implicitly draw on the too-convenient cultural frame of gender to help organize new ways of doing things, thereby re-inscribing trailing gender stereotypes into the new activities, procedures, and forms of organization. This dynamic does not make equality unattainable, but suggests a constant struggle with uneven results. Demonstrating how personal interactions translate into larger structures of inequality, the book offers a distinctive analysis of the troubling endurance of gender inequality.

RIEBLING, JAN* (Otto-Friedrich University Bamberg, jan.riebling@uni-bamberg.de)

Structural Coupling of Financial Markets and Media Coverage - the Case of the State Debt Crisis

In our project we focus on interdependent processes between financial markets and media coverage during times of financial turmoil. The main goal is to identify explanations for price movements on financial markets that are beyond the comprehension of crisis as a problem between the state and the market. Thus, it is not the question whether there is too much or too little market regulation, instead we emphasize the importance of information processing on financial markets and the subsequent entanglement of financial markets with mass media. From a systems perspective, these processes are part of the structural coupling of two social systems, which perceive and implement new information, but only through their own systemic logic.

By examining the structural coupling we reveal patterns and causalities that are crucial for the understanding of financial market coordination through mass media products and vice versa. Especially the so called “state debt crisis” and its media coverage can be empirically viewed as the cause for major changes in the configuration of the financial markets. During that process state bonds get more and more volatile, deviating from the century old long-term investment cycles. No longer are interest payments the only way to gain profits with bonds, instead, short-term speculation becomes possible due to the heavily pending bond prices of crisis states like Greece, Portugal or Spain. The starting point for those fluctuations strongly correlates with the international media coverage about the possibility that states can actually fail financially. As a consequence, traditional evidence of financial stability like macroeconomic indicators or debt ratings have no measurable impact after the crisis on the increasing bond volatility. The process underlying this development is that media publications are much faster and already incorporated in the market prices when the reactions of states or rating agencies get published.

RIEDE, FELIX* (Aarhus University, friede@cas.au.dk)

Towards a Science of Past Disasters

Extreme climatic events are forecast to become more frequent in the future. This contribution argues that the past may hold clues to efficient, cost-effective, and culturally sensitive adaptations to and relief measures following such events. It is widely recognised that disasters emerge in the interplay between extreme events and the human communities affected by them. Whilst detailed knowledge of a given event is critical in understanding its impacts, an equally thorough understanding of the affected communities, their economies, ecologies, religious structures, and how all of these have developed over time is as important. Many extreme events leave methodologically convenient traces in the geological and archaeological records. This contribution focuses on two volcanic eruptions that have significantly affected Europe – the eruption of the Laacher See volcano (Germany) in the 13th millennium BCE, the eruption of Thera (Greece) volcano in the early 17th century BCE and the eruption of Vulcán Ilopango (El Salvador) in the 6th century CE – to illustrate the power of a quasi-case-control compara-
tive method for examining vulnerability and impacts in the near- and far-fields of these eruptions. Although issues of data resolution often plague the study of past disasters, these limitations are counterbalanced by the access to unique long-term information on societies and their material expressions of livelihood, as well as a similarly long-term perspective on the critical magnitude-frequency relation-
ship of the geophysical trigger(s) in question. By drawing together aspects of di-
sasters science, archaeology, volcanology and historical sociology, this contribu-
tion offers a programmatic statement and methodological roadmap for a science of past disasters that can make historically informed, evidence-based statements on general processes of cultural adaptations to climatic processes and events, and on contemporary vulnerability and impact from a deep time (historical and prehistoric) perspective.

RIEDEL, SASCHA* (University of Cologne, riedel@wiso.uni-koeln.de)

Drawing a Line Between Immigrants and Transmigrants

The changes of international mobility are apparently visible in all immigration countries of the world. Today’s migratory movements challenge classical concepts of labour- or forced migration theories. The pattern of permanent immigration lost its long lasting predominance in describing individual changes of location between countries. One of the most influential competing concepts in migration literature constitutes the idea of transnationalism. In this approach, individuals engage in lives, cultures, and activities in more than one country to the same extent. Although Germany is one of the main immigration countries of Europe, quantitative studies seizing the relevance of this conceptually new phenomenon are scarce. This is mostly due to the lack of data as the appropriate identification of transnationals requires multi-sited, mixed methods approaches with specific, often non-randomized, sampling procedures. But what can be done if there is no such data at hand? This study tries to answer this question by presenting and discussing strategies of quantitatively operationalizing transnationalism with existing, secondary survey data.

In this respect, the primary objective of this paper is to discuss the strengths and limitations of a strict distinction between transmigrants and immigrants in contrast to a more continuous definition of transnational lifestyles. To this end, the research is arranged in three stages: In a first step a multi-item measurement is developed in order to distinguish between immigrants and transmigrants in the most unambiguous manner possible. In contrast, the second step aims at accounting for gradual differences in the individuals’ ways of living. To this end, a transnationalism index is constructed. Finally, results of bi- and multivariate analyses on the adaption of immigrants and transmigrants in Germany are presented. The paper closes with prospects for the future research of transnationalism.

RIEDERER, BERNHARD* (University of Vienna, bernhard.riederer@univie.ac.at)

Children: Pleasure or Pain? Effects of Parenthood on Subjective Well-Being

Against the background of numerous public and academic debates on de-
clining birth-rates and problems of reconciling professional work and family life, the present research addresses the association between children and subjective well-being. Most people believe that parenthood should make us happy. Notwith-
standing, happiness research suggests that children are not important for the well-being of people living in contemporary western societies: Children might at most have a slight positive effect on parental well-being; However, a closer look at existing research reveals that some studies report positive effects of parenthood on subjective well-being while other studies report negative effects.

The present research aims at contributing to the explanation of this variation in children’s effects. Therefore, in line with social ecological theory, we identify sev-
eral factors on individual level, couple or family level, and societal level that might affect the association between children and subjective well-being. The respective hypotheses are proved by means of multilevel modeling and structural equation modeling using individual data from 30 countries participating in the European Value Study 2008/2009 and couple data from a project covering three countries (Austria, Germany, Switzerland).

Results illustrate that both, factors on individual level as well as factors on so-
cietal level moderate the association between children and subjective well-being. On individual level, among other factors, the stage in one’s life (age) proved to be relevant. On societal level, the welfare state based childcare system and dominant family values seem to be most important. In addition, individual level factors and processes on couple level mediate the association between children and subjective well-being. For example, the strain resulting from childcare that women feel indirectly affects men’s subjective well-being via relationship conflict perceived by men. Findings are relevant to potential future parents (timing of first birth, divi-
sion of work) and welfare states (childcare policy, existing norms).

RC42-712.6

RIEDERER, BERNHARD* (University of Vienna, bernhard.riederer@univie.ac.at)

 Parenthood and Subjective Well-Being within Couples: The Division of Work, the Relevance of Mutual Appreciation, and the Role of Partner Effects

Sociological and psychological theories point to parenthood as means to person-
dal development and social embeddedness, discuss its function for societal integration and highlight its meaning in structuring people’s lives and providing purposes in life. But the widespread belief that parenthood promotes happiness and satisfaction with life seems to be contradicted by a bulk of research discussing problems of reconciling professional work and family life. Quantitative studies primarily report negative effects of children upon parental well-being and qual-
itative research often highlights that especially women are confronted with an additional burden and the second shift at home.

Current research argues that children have both, positive and negative effects on parental well-being. Analyses conducted by the author with data of the Euro-
pean Value Study 2008/2009 reveal that individual factors (e.g., the stage in one’s life), life conditions (welfare state policy, dominant norms and values) contribute to variation in children’s effects. But consequences from paren-
thood directly affect the couple and the relationship between spouses. Therefore, effects of children on well-being and life satisfaction should also be dependent on the spouses capability of mutual perspective taking, and their support for each other.

The present research uses data from dual earner couples with young chil-
dren to analyze the mediating role of (a) the division of household work, child-
care tasks, and professional work, (b) positive and negative spillover from work to household and vice versa, (c) the appreciation spouses receive from each other, and (d) relationship conflict. In addition to actor effects, partner effects are also considered. Results are in line with the qualitative research that points to the im-
importance of giving and receiving gratitude. Furthermore, the quantitative findings support what A.R. Hochschild wrote: “If men share the second shift it affects them directly. If they don’t share, it affects them through their wives.”

Life Strategies of Families in Marginalised Urban Neighbourhoods: Dealing with Social and Educational Inequalities

Migration families often face challenges in Europe: unemployment issues, low income and the threat of poverty as well as an unequal education system, where children and young people are disadvantaged and consequently, their access to higher education and job perspectives is limited, hindering their chances and op-
opportunities with regard to participation in society. These families frequently live in urban areas strongly influenced by migration movements and faced with pro-
cesses of marginalization.

In our research project (within the framework of a larger, European research project), we focus on life strategies of families in marginalized urban neighbour-
hoods in Germany. Migration families frequently form a family project, and family an important resource in dealing with educational, job-related and social challenges. In our theoretical approach, family members are seen as actively dealing and negoti-
ating with societal circumstances and social meanings (Wacquant 2006). Their strat-
egies are analyzed, taking relevant explanation contexts into consideration, which shape each person’s scope of possibilities (Holzkamp 1983). Our research project aims to transcend beyond the deficit-oriented perspective without neglecting the social and societal challenges families have to deal with (Riegel/Yildiz 2011).

In this paper we will present analyses from biographical interviews, group dis-
cussions, and ethnographic data, on how family members describe and interpret educational pathways and which life strategies can be observed. We analyze bi-
ographical meanings and dynamics within a family and with regard to experien-
ces centered on education, an area accentuated by the intersections of migration, class, gender and generation. First findings show that family members develop strategies and creative pathways to deal with challenges posed by everyday rac-
ism and the education system, using unconventional ways to negotiate solutions for structural challenges, demanding participation and inclusion. The ambivalenc-
es of these strategies - dealing with processes of inclusion and exclusion – within circumstances of social inequality will be discussed.

RIEGEL, VIVIANE* (Goldsmiths University of London, viviane.riegel@terra.com.br)

A Reflection on the Main Challenges of Comparative Research on Global Consumption Studies

We face several methodological challenges once we are involved with compar-
itive research. The scope of study to its phenomena demands a dialogue with writers from different nationalities, theoretical and methodological affiliations,
whose interests converge to collaborate in the comparison of different contexts. Specifically, the main discussion when comparing different contexts is whether to discover an underlying grammar to social life which is applicable globally, or to pay attention to the detail of local differences.

The complexity of social research on global consumption studies can be understood as the idea of a complex system that combines both issues related to the idea of a global culture, as well as specific characteristics concerning local contexts. Following Law and Mol (2002) ideas over complexities in social studies, it is necessary to face multiple domains and the complexity related to consumption practices that are research objects for sociologists today.

Comparative research on global consumption studies faces a changing significance of empirical research, as it happens with contemporary social studies. This means that traditional methods, and the most conventional ones are increasingly dated research methods, which are unlikely to provide a robust base for empirical sociological research. In the future, it is why it is important for sociologists to get involved with a ‘politics of method’, renewing their interests in methodological innovation, mixing methods and renewing critical reflection (Savage and Burrows, 2007).

Following this methodological discussion, the goal of this study is to discuss the main challenges of comparative research on global consumption studies, considering both the hypothesis of a global consumer culture (Ritzer, 2004) and of localization/heterogeneity of consumption practices (Featherstone, 1991). In order to present these challenges, I am going to analyze three different research projects focused on global consumption practices that aim to compare the reality of these practices in different countries.

RC14-245.6
Riegel, Viviane* (Goldsmiths University of London, viviane.riegel@terra.com.br)

Global Consumer Culture: A Theoretical Discussion Between The Centrality Of Consumption In The Contemporary Society and Its Possible Localizations As A Result Of Cultural Differences

How can we understand the theoretical discussion concerning global consumer culture? Is it possible to affirm that such culture exists as global representation, central to contemporary society? Or should we consider possible localizations of consumption practices as a result of cultural differences from different individuals? Early in modern social theory, consumption has been object of discussion and, with the advent of postmodernist theory, its centrality has become a topic in social analysis. Further, contemporary studies presented mainly two different perspectives: the centrality of consumption in society or localizations of this practice according to cultural differences. In order to understand global consumer culture, this paper proposes a theoretical discussion between both perspectives.

In the first perspective, there is a rationale that begins with modern social theorists, and their focus on production systems (Marx, Weber, Smith), and that moves to the study of consumption (Simmel, Veblen, De Certeau), whether celebrating or demonizing this practice. Post-modernists have detailed this critique in understanding the structure of the consumer society (Baudrillard, Bauman, Lipovetsky), with consumption as the central practice of contemporary life. This centrality would also explain earlier studies that demonstrate the capillarity of consumption, not disjointed from the production system, but as a continuum that can be translated as prosumption (Ritzer).

The second perspective, present in most contemporary studies of consumption (Bourdieu, Campbell, Featherstone, Miller) has tried to steer a middle course that reconciles pessimistic classical theories with a recognition of the fact that consumption is not only indispensable, but also a domain in which people can express themselves positively in our society. They develop the notion of a consumer culture that refers to norms, values, and meanings associated with a society dominated by consumption. In this culture, there is possibility to localizations and the development of individuals with their respective differences.

Internet Usage and Socio-Cultural Change in Nairobi/Kenya

Through technical improvements and cheaper access the Internet in Kenya is becoming more and more important. For many years mainly Internet cafés have been the most important source for Internet access. Nowadays there are more and more people who own a private Computer/Laptop or use their working place to access the Internet in Kenya. The most important change is the rapid spread of mobile use of the Internet in Kenya.

The Kenyan Internet- and Mobile phone market is growing fast and it cannot be ignored that the Kenyan society is changing. On the streets of Nairobi you can find Internet cafés nearly everywhere and you can pay nearly everywhere with M-Pesa. Mobile phone shops, repair services for computer and mobile phones and private computer colleges are an integral part of the road infrastructure. Nearly all Kenyans have a mobile phone; for younger people it is very important to have a Facebook account.

In my research I wanted to find out what people do with on the Internet and how this is changing the life of the users. I visited three different cybercafés in different areas in Nairobi. One cybercafé was in a big shopping mall, the second in the city centre and the third in the so-called slum area Mathare. The inequalities were obvious but it was also very surprising how widespread the Internet already was and how different the people used it.

Another aspect of the presentation will be the function of Facebook before, during and after the election in March 2013. During the post election violence in 2007/2008 over 1100 people were killed. Everybody was watching the election 2013 with worries and tension. After the results were announced everything remained more or less peaceful on the streets but on Facebook there started an ethnic war with words.

Abstract

The social hegemonization of the biomedical perspective in the beginning of the 21st century has been heavily criticized. But as pointed out by Kuhn (1962), criticism alone has never brought about major paradigm shifts (Kuhn 1962). Paradigm changes require a realistic, viable, research able alternative - a paradigm candidate, as Brante phrases it (2005). Therefore, one obvious question is, what the most feasible alternative to the existing neuropsychiatric modes of explanation is, and what challenges must be faced in trying to establish a viable and qualified alternative.

The dominance of certain forms of knowledge does not exist within an institutional and societal vacuum. It is produced and reproduced through political, managerial and economic discourses, institutional solutions and organizations, which should be taken into account to gain a complex understanding of the curdigm changes require a realistic, viable, research able alternative - a paradigm candidate, as Brante phrases it (2005). Therefore, one obvious question is, what the most feasible alternative to the existing neuropsychiatric modes of explanation is, and what challenges must be faced in trying to establish a viable and qualified alternative.

The dominance of certain forms of knowledge does not exist within an institutional and societal vacuum. It is produced and reproduced through political, managerial and economic discourses, institutional solutions and organizations, which should be taken into account to gain a complex understanding of the curdigm changes require a realistic, viable, research able alternative - a paradigm candidate, as Brante phrases it (2005). Therefore, one obvious question is, what the most feasible alternative to the existing neuropsychiatric modes of explanation is, and what challenges must be faced in trying to establish a viable and qualified alternative.
The year of 2011 marks both the Fukushima disaster in Japan, and a one-generation time distance from the nuclear disaster in Chernobyl in 1986. Does it also mark any new emergent – perhaps more reflexive, inclusive and participatory modes of nuclear power in CEE countries? Have these expectations of participatory governance materialized in new structures and modes of more inclusive decision-making? This paper examines these questions by addressing the public controversies around new and old nuclear power facilities in divergent post-Soviet societies, particularly Lithuania, Belarus and the Ukraine. What are the lessons (if any) reflected in the public attitudes and public policies in terms of participatory governance of nuclear power? Are the EU newcomers, whereas the others are still characterized by rudiments of totalitarianism? Have they triggered environmental, climate and energy policy change towards more inclusive, participatory mode stemming from social trauma? By contrast, this paper concludes on the basis of empirical evidence from Lithuania, Belarus and neighboring countries and processes point to the opposite direction. This direction is geared towards privatization of the public domain, towards new forms of state-private oligarchy in the nuclear power sector, epitomized by the establishment of LEO LT nuclear power conglomerate in Lithuania. Instead of any new off-springs of participatory governance, as paper indicates, there are tendencies of the opposite. Inter-twined with the recent nuclear power “initiatives” by Russia and Belarus, these tendencies could be described as leading towards emergence of a nuclear “renaissance” as some observers have termed it. This is a “renaissance” a reflection of public attitudes towards energy security in the period of economic crisis? Or is a more general tendency of societal neglect of the Fukushim and Chernobyl lessons vis-à-vis globalizing uncertainties in the fields of economy, ethno-centric politics and climate change?

Subjective Time to Retirement in Older Workers: Gender Differences in the Role of Social Networks and the Importance of Reasons to Retire

Research has shown that males' and females' life course experiences in relation to work and family usually result in different retirement transitions and timing. Previous research has focused mainly on the effect of childbearing and caring responsibilities on males' life course. In this paper, we focus on the role of social networks and the importance of reasons to retire for both males and females.

Based on the European project “Shrink Smart”, different shrinking cities in Northern, Central and Eastern Europe will be dealt with related to different housing markets. The paper draws on research undertaken within the EU 7 FP project SHRINK SMART (04/09-04/12), grant agreement no. 225193, www.shrinksmart.eu. The paper uses empirical evidence from Lithuania, Germany and Bytom (Poland).

3 Silesia University, Katowice (Poland)

Across Europe, since the late 20th century, urban shrinkage has become a normal path of urban development for many cities. Shrinkage results in a mismatch between supply and demand of built structures, urban space and infrastructure. Urban shrinkage impacts on almost all areas of urban life, one of them is on housing markets and the built environment. Typical for shrinking cities is a situation of disinvestment, since revenues from investments in housing are uncertain or improbable. The consequences of disinvestment in housing markets are undermining, lacking modernization, housing vacancies and abandonment with subsequent physical decay. Mostly this concerns not the whole territory of a shrinking city, but distinct areas. What areas of a city are affected is dependent from the specificities of the respective local markets, the same is true for the concrete impacts on the built environment. The paper addresses specific problems related to vacancies, how they are perceived, what are typical impacts on the affected neighbourhoods and what are strategies to deal with them.

Based on the European project “Shrink Smart”, different shrinking cities in Northern, Central and Eastern Europe will be dealt with related to different housing markets. The paper draws on research undertaken within the EU 7 FP project SHRINK SMART (04/09-04/12), grant agreement no. 225193, www.shrinksmart.eu. Rethinking Localism in the Global Risk Society: The Ethics of Care and Coalitions of Anxiety Confronting Gas Fracking in Lithuania

Rethinking Localism in the Global Risk Society: The Ethics of Care and Coalitions of Anxiety Confronting Gas Fracking in Lithuania

Focusing on the global dimension of risk society, Ulrich Beck has made a case that earlier social and economic formations are increasingly replaced by the world risk society where risks and uncertainties are no longer bound by particular locales, but are distributed globally. To conceptualize this new political organization, Beck and others have developed the notion of cosmopolitanization that refers to the emergence of new alliances and social movements that challenge and transform the nation state and its institutions. At the same time, scholars have also underscored the growing significance of localist movements that are actively promoting regional and national sovereignty agendas, while working to unplug from global economies and political infrastructures. The purpose of this paper is to articulate the connection between these two contradictory processes by employing conceptual tools developed in the scholarship focusing on care politics and ethics. Building on the work by N. Noddings, E. Kittay, and J. Tronto, we aim to identify gender differences in the determinants of subjective time to retirement, with a particular focus on social networks and the importance of reasons to retire.

The present analysis used the first wave (2010-2011) of the SNAP survey (Social Networks and Ageing Project, based at ANU), a nationwide survey of 2,122 Australian older workers. In this paper, we focus on the role of social networks and the importance of reasons to retire for both males and females.

Results show that several variables on the importance of reasons to retire are significant, illustrating the particularities of women's life course experiences. Moreover, the median retirement age for both males and females is between 60-64 years. Therefore, this paper aims to identify gender differences in the determinants of subjective time to retirement, with a particular focus on social networks and the importance of reasons to retire.

RIPPEYOUNG, PHYLLIS* (University of Ottawa, phyllis.rippeyoung@uottawa.ca)

Mandated Breastfeeding: Women’s Bodies As A Solution to Global Poverty

Mandated Breastfeeding: Women’s Bodies As A Solution to Global Poverty

As a means to address high rates of child malnutrition, stunting, and infant mortality, Indonesia has implemented Law No. 36 stating that enacted Health Law No. 36 states that children have the right to be breastfed. Thus, exclusive breastfeeding is now mandatory until infants are 6 months old. To add teeth to the law, in 2011 the Indonesian legislature added stiff fines and potential jail time as penalties for employers, relatives, the general public or others who pose barriers to women's ability to achieve this goal (Soegaard and Zahnner 2011).

In February 2013, the U.K. NGO Save the Children launched their campaign to promote breastfeeding in poor countries with their report “Superfood for Babies: How Overcoming Barriers to Breastfeeding will Save Children’s Lives.” Like a superhero, breastfeeding was touted as one of the most important solutions to the problems facing the most innocent of all victims—infants in developing coun-
tries. Fingers were pointed at formula companies, policy makers, grandparents, fathers, and health care providers for posing barriers to breastfeeding. The report focused on the heroic efforts NGOs and other actors can make to "empower" poor women to make the "right" feeding decisions; however little recognition was given to women as possible heroes. Rather, women were portrayed as either victims of their environments or ignorant villains doing the wrong thing. In this talk, I will explore the implications of legislating women's bodies as a solution to structural problems, as well as the problematic structural barriers posed to women being able to do what they are told to do. By exploring the Indonesian case and the framing of breastfeeding campaigns, I aim to demonstrate how breastfeeding promotion can be both empowering and detrimental to women. I will conclude with a possible way forward drawing on an ethic of care and a praxis of humility.

Labour Precarity and Other Structural Forces Affecting Migrant Workers' Health: The Case of the Undocumented Workers in Ontario, Canada

This paper will discuss the ways in which the labour dynamics that have emerged in the agricultural production in Ontario during the last decade have been organized. Particular forms of precarity that affect the physical and mental health of the undocumented migrant workers and other working women of precarious status (UMW and MWPS) that are employed in such industry. Likewise, it will analyze how this phenomenon of labour precarity, along with legal and linguistic barriers; fears of deportation; and perceived forms of racial subordination in the local health institutions, have prevented the workers from seeking and receiving medical services. Finally, the paper will discuss some of the ways by which the workers have contested the social forces affecting their health, and will offer some reflections on why such forms of collective action haven't been entirely successful.

This paper draws upon the analysis of twenty in-depth interviews with UMW and MWPS, as well as upon field notes generated as part of a sociological, ethnographic research carried out in Ontario, Canada.

Capabilities and Missing Users: Progress In Gender Analysis In Transport

The paper uses a normative framework of transport justice to recognize the link between mobility and "capability enhancement" as articulated in Sen's writing and expanding on the gender dimension of transport (Bezzy, 2011; Caddell 2004; Martens, 2012). Transport justice reveals the mode of thinking and institutional mechanisms behind a nation's transportation planning and delivery systems (Vasconcellos, 2001; Litman, 2012) to elucidate how and why particular social groups (e.g. low-income women and minority communities) often face the brunt of negative impacts of transportation investment in terms of access and transport-related burdens of poor safety and environmental standards. Gender is a key analytical concept used alongside transport justice to address a set of policy concerns to show how particular understandings and values of "gender" influence the construction of categories of analysis in transport and spatial planning (Levy, 2013). Empirically, the study documents the needs and perspectives of urban transport users in Davao City, Philippines as related to their access, or lack thereof, to transport and their access to employment, education and services. These findings are contrasted with the realities of power and political processes in decision-making to show how concerns of users from low-income groups and how gender differentials in preferences, choice and agency are yet to be taken seriously by planners.

Recognizing methodological pluralism as important in interdisciplinary research, this paper uses a combination of methods which have distinctive roles. The survey captured similarities and differences among 360 transport users, mostly of women traders and workers. Focus-group discussions with various sectors, field observations and in-depth interviews with a subsample of 8 brought deeper insights on meanings of "safety" and "security" from the perspectives of women. Textual analyses looked into issues of misrepresentation and invisibility.

Ouvrir La Boîte Noire Des Peurs Féminines : Encadrement Parental Des Pratiques Urbaines Des Enfants Et Dimension De Genre

Intéressant la spécificité urbaine dans le cadre familial, l'approche compréhensive de l'encadrement parental des pratiques urbaines des enfants per- met de mieux saisir la genèse de cette différenciation genrée de l'expérience des espaces publics. Menée auprès de parents de 123 enfants âgés de 8 à 14 ans à Paris et Milan, une enquête par entretiens (n=78) montre ainsi que les filles font face à un encadrement parental différencié et intentionnel. La forte prégnance de la représentation d'espaces publics à dominante masculine et hétéronormée con- duit les parents à mettre en œuvre des précautions spécifiques pour les filles, qui recoupent largement celles prises par les femmes dans les espaces publics : évite- ment de lieux, recherche d'une escorte, contrôle de l'habillement et de manière plus générale de la présentation de soi.

Pour reprendre la typologie d'Albert Hirschman, les filles sont socialisées à l'évitement (exit) et à la discrétion (loyalty), mais pas à la remise en cause des normes de genre (voice). La transmission de normes genrées semble ainsi pouvoir être considérée comme la clé de voûte de la vulnérabilité ressentie et perçue des femmes dans les espaces publics urbains, l'encadrement parental contribuant dans cette perspective à la (ré)production d'inégalités d'accès à la ville mais aussi à l'incorporation du genre par les enfants.
ganizers of the January 25th uprising has been clearly documented, their changing values over the decade preceding the uprisings have not. This paper will examine how sociopolitical and cultural values that reflect the three demands of the January 25th uprising—bread, freedom and social justice—changed among Egyptians in the decade preceding 2011 and whether Egyptian youth exhibited attitudes that were more supportive of these goals than the rest of the population. We will use data from nationally representative value surveys conducted in Egypt in 2001, 2005 and 2008 to address our research questions.

GOEMANS, ADELINE* (HEC-Management school-University of Liege, adapog@hotmail.com)

Multinational Companies, Social Responsibility and Human Resources Manager

This communication analyzes the situation of six multinational companies’ policy of “social responsibility” and of “sustainable development”. The purpose of this communication is to define how these companies, especially the subsidiaries, are socially responsible and take into account environmental issues. This exploratory and qualitative study is based on the analysis of official discourse of six firms and those of human resources managers. We highlight different types of “social responsibility”, the “stakeholders” that are taken into account by companies and the need to achieve the policies of “sustainable development” and of “social responsibility”. Our purpose is to show, beyond the official discourse, which role the subsidiaries play and which autonomy they have in their policies’ implementation. We wonder in conclusion about the hypothesis that a new way of human resource management of organizations is likely to appear through this new “social responsibility” and, conversely, if the new management involves the emergence of a new social responsibility. We will show that the types of responsibility, shown through the web site and in the HR discourses, are “ethic” (stands for the respect of the values, the standards and the requirements that stakeholders find fair) and “economic” (focuses on the production of goods and services). Those classifications depend on the firm’s sector.

The Human Resources can be more regardful for the legal aspects or for the political aspects, especially in crisis situation. The human resources play different roles and highlight different priorities: respect of fundamental values, actions of the subsidiary that are presented as models, transparent communication, gather the employees around values and projects.

The Embedded Economy and National Income Inequality

The ubiquitous growth of national income inequality in developed and less-developed countries has raised major concerns amongst academics, policy-makers, and the general public. In response to this trend, researchers have offered a multitude of explanations for the persistence and growth in national income inequality. Here, we focus on two factors that lead to substantial disagreement over the proximate and fundamental mechanisms of economic inequality. Drawing on insights for world-systems, world polity, and institutional theories of inequality, I develop and empirically evaluate an integrative theory of inequality. According to this perspective, the emergence of global production networks indirectly affects income inequality by reshaping national labor laws and practices. This study evaluates this proposition using multi-level structural equation modeling and unbalanced panel data on 70 developed and less-developed countries over the 1985-2002 period. According to preliminary results, economic globalization exerts both direct and indirect effects on income inequality. In developed countries, global economic integration indirectly affects income inequality by inducing processes de-industrialization and labor market flexibility. In less-developed countries, investment-based global economic integration indirectly reduces inequality by promoting the development of collective labor laws and practices which trade-based integration indirectly increases inequality by hindering the development of these laws. Overall, the study suggests that researchers need to account for the interaction of economic globalization and labor market institutions to explain the recent growth in national income inequality.

The World Has More Leisure! so What?

The sociology of leisure (and leisure studies more generally) were born amid confidence that leisure would continue to grow and become a larger component of people’s lives. This confidence has proved justified. Leisure has grown in time, spending on leisure goods and services, and hence participation rates in many leisure activities. Meanwhile, researchers have identified and distinguished the various ways in which leisure plays a role in people’s lives. Apart from re-creation – restoring body and mind to states fit to return to other social roles – leisure can enhance well-being (or ill-being), it can be a source of social bonds and belonging, identity, and capabilities that enhance performance in other social roles. However, this paper argues that the sole sense in which its growth has made leisure functionally more important is economic – as an object of investment and consumer spending, and as a source of employment. The paper explores the implications for leisure’s additional functions, and its future in the twenty-first century.

ROBERTS, KENNETH* (University of Liverpool, k.roberts@liverpool.ac.uk)

Youth and Leisure in Europe in an Age of Austerity

Despite young people’s above-average risks of unemployment in most countries, the evidence to date suggests that young people’s leisure has remained largely austerely-free. This is explained not in terms of historically novel features of the recession itself, but in terms of changes in youth’s leisure that occurred in preceding decades with the lengthening of the youth life stage, the advent of new leisure industries based on the latest information and communication technologies, and changes in the pattern of class inequalities. The evidence indicates that it is child-rearing households whose leisure has proved most vulnerable during the recession, which has implications for leisure socialisation during childhood, which will have lifelong consequences.

ROBERTS, PATRICK* (Virginia Tech, robertsp@vt.edu)

Focus On Fukushima: The Iaea’s Response To Fukushima As a Focusing Event

What does it mean for the Fukushima disasters to be a “focusing event”? A focusing event provides a “little push” to bring a problem onto the policy agenda. It acquires its power by aggregating harms in a short timespan and large number (Kingdon 2003; Birklund 1997; Downs 1972). Some scholars use the term to describe the event itself, while others locate causal power in the symbol surrounding what they refer to as “catastrophic events” (Birkland and others 2009). For some events, the public view through the media, and yet not all such events lead to policy change. How the IAEA responded to Fukushima promises to shed light on why some focusing events lead to only very limited change. Birkland and others (Walgrave and Verhulst 2009) find that nuclear power is a domain where advocacy coalitions (roughly pro-industry versus pro-environment) are in competition and therefore policy change after a focusing event is not likely. Yet the IAEA had similarly divided advocacy coalitions in safeguards and security, and these policy areas still underwent dramatic policy change after a focusing event. My paper investigates what degree policy change occurred in IAEA’s safety responsibilities in response to Fukushima. Preliminary research shows that some change did occur, especially relative the IAEA’s limited power compared to states. My paper will also examine how and why change occurred, paying attention to the advocacy coalitions in competition hypothesis, theories of framing, as well as to internal bureaucratic politics and the technical limits on what the IAEA can accomplish. The IAEA’s response to Fukushima may show that managers are able to shape the effects of some focusing events as much the literature suggests the media and policy entrepreneurs can do in other contexts.

Virtual, Augmented or Real? Ageing Research in an Era of Spatial Technologies

Population ageing has become the demographic phenomenon of the twenty-first century. Developed and developing countries are experiencing significant growth in the total number and proportion of their populations who now qualify as ‘aged’. The rise and rise of ageing as the new ‘crisis’ in population theory and policy should not be a surprise since it is the inevitable result of more than a century of active policy interventions on the object we know as ‘population’. Consequently we are experiencing a lag between the phenomenon of ageing and our conceptual and analytical understanding of ageing across multiple knowledge domains. The science of ageing remains highly developmental ranging from key
Labor relations have undergone significant changes over the last decades. Job precariousness and work precariousness weaken assured and stable occupational integrations. These changes challenge rigid, continuous and foreseeable conceptions of occupational career (the choice of a profession, training, labor market integration, promotion and retirement), and question both material and symbolic recognition that are linked to professional activities. Facing this rise of uncertainties, we first analyze how unemployment periods impact job recovery in terms of 1) level of individual and household income 2) job quality (job and work precariousness) 3) social mobility (using social stratification schemas: CAMSIS and CSP-CH) in order to determine if people know stability, improvement or deterioration of their situation. We then identify how particular groups of people are unequally exposed to these three potential forms of changes, and particularly in terms of nationality, sex, education, age and presence of children in the household. The relation between these variables and the observed effects are analyzed with a logistic regression that includes interactions between the dependent variables.

We use longitudinal data from the Swiss Household Panel (SHP) between 1999 and 2012. The SHP is a yearly conducted centralized CATI panel survey which started in 1999 with slightly more than 5,000 households, representative for the Swiss resident population.

* Everyday Masculinities and Extreme Sport: Re-Thinking Methodologies

This paper considers the taken-for-grantedness of everyday masculinity in relation to a UK research project on sporting masculinities (Robinson, 2008 and 2013). In this study of rock climbers some participants found it hard to reflect on their experiences in gendered terms. However, some participants were able to be open about and critically engage with such processes, which can be seen to constitute ‘masculinity’ or ‘masculinities’. This was partially due to the ‘extreme’ nature of many aspects of the embodied and emotional rock climbing experience, as extraordinary as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiated or rethought in the aftermath of extreme events such as death of a climbing partner or the need to trust another man, sometimes literally, with their life, entailed that taken-for-granted aspects of masculinity had to be renegotiat
The focus of this article is the causation and possible models of Happiness. Thinking on Happiness takes us above the individual and towards the many social spaces generated by social interaction. In that way we are able to move beyond the classical points of view of material satisfaction from economy or the psychologist grounded well-being. We specify the social dimension of Happiness with indicators of social interaction and social action. We propose a basic general model based on three dimensions: Love, Money and Health. We contrast this general indicators of social interaction and social action. We propose a basic general model in 44 countries with data from the fifth wave of the World Values Survey. Given the close relationship between Happiness and Satisfaction, we want to test two rival models to explain Happiness and Satisfaction separately. In order to do so, we use binary logistic regression with its standardized coefficients. We discuss in detail our models in those 44 countries looking for explanatory patterns. The statistical analysis of logistic regressions and their standardized coefficients are the raw material for the conceptual and material construction of a complex relational system between countries, between models and between countries and models. This approach leads us to a sort of DNA definer of social models of Happiness and Satisfaction. We use the Social Network Analysis as a way to explore the existence of different explanatory structures and their features. We conclude that, despite the close conceptual relationship between Happiness and Satisfaction, the explanation of Happiness is more complex and accurate. Love is a necessary condition for Happiness while to explain Satisfaction material and other substantial aspects of Health and Money are more relevant. That points to a differen...

RODRIGUEZ, LENA* (University of Newcastle, Lena.Rodriguez@newcastle.edu.au)

Constructing Transnational Polynesian Identities: Soldiers, Sportsmen and Illegitimate Masculinities

For the small Polynesian island states of Tonga and Independent Samoa, their biggest export is labour – their people. Six out of ten Tongans and Samoans are born outside their home countries. In a climate of transmigration and globalization Polynesian men are sought out as sportsmen, heavy manual workers and standover men. They also have the highest over-representation of any racial group in the US military. This paper argues that contemporary Polynesian masculinity has been externally constructed through the physicality of Warrior in a colonial and post-colonial context and questions whether internalization of this representation as a “regime of truth” leads to an embodiment of race, class and cultural identity that is inherently informed by the physical. Through this lens of heightened and exaggerated physicality, acceptable expressions of Polynesian masculinity are readily acknowledged through work and sport. However, its illegitimate expression – as gang member - is less understood. Polynesian gangs have an extremely high profile in New Zealand and are now the fastest growing ethnically-identified gang population in the United States. Proportionally, this population group is progressively over-represented in the penal systems of the two countries. This paper will explore how this narrow range of acceptable masculinities, when combined with increasing socio-economic marginality, contributes to low civic engagement and greater interface with agencies of law and order. As conventional employment opportunities are reduced for unskilled labour, more young Polynesian men are at risk of being drawn into gangs and are likely to engage in other forms of criminal behaviour. This paper will therefore discuss how popular perceptions of Polynesian strength and aggression, so valuable as sporting commodities, are regarded as threatening and violent outside of sporting domains. Interviews were conducted with 48 Polynesian men aged 18-60 in two studies.

Desafíos De La Adaptación Para La Prevención De Desastres En México

La vulnerabilidad social se incrementa en condiciones de variabilidad climática asociada con el cambio climático antropogénico; los desastres asociados a fenómenos hidrometeorológicos ocurridos durante el siglo XXI en México nos dan la oportunidad de cuestionar teóricamente conceptos tales como “eventos extremos”, “lluvias atípicas”, pero principalmente “desastres naturales”, que forman la realidad desde las ideologías tecnocrática y naturalista. El fracaso del desarrollo sustentable, dio lugar a la irrupción del cambio climático como uno de los efectos más perjudiciales para la humanidad, sobre todo para los sectores excluidos, sobrevivientes de la pobreza, en los territorios donde la vulnerabilidad social y al calor de la interrelación entre desigualdades de la riqueza y la marginalidad.

Con base en los postulados internacionales de adaptación y reducción de riesgos de desastres el gobierno mexicano ha asumido formalmente compromisos para diseñar y ejecutar políticas y programas orientados a fortalecer la resiliencia comunitaria y ciudadana, sin embargo las decisiones privilegian la resiliencia institucional, con enfoques en la política de protección civil, orientada a la atención coyuntural de emergencias, desatendiendo la prevención de desastres como eje de política pública. Recientemente el Plan Nacional de Desarrollo 2013-2018 define los lineamientos programáticos en materia de cambio climático, sin incluir la adaptación y la crisis de vulnerabilidad nacional.

Los desastres plantean el desafío de reducir la desigualdad social como premisa para también reducir la vulnerabilidad y los riesgos a la población. Se propone trabajar investigaciones futuras con las experiencias populares de autogestión social y comunitaria, mismas que requieren apoyos institucionales y académicos para consolidar procesos de planeación popular del territorio, fortaleciendo las capacidades locales para mejorar la calidad de vida y la preparación colectiva frente a los riesgos asociados a cambio climático, con experiencias en comunidades de los estados de Tabasco, Chiapas, Veracruz y Guerrero.
sibilisation and observational techniques/tactics in response to the riots reveal a moral ordering of the ‘legitimate’ citizen/subject at odds with the rhetoric of inclusive resilience. The visibility of the disorderly citizen was used to objectify the ‘risky subject’; turning the riots from a societal reaction (to the negative impacts of neoliberalization) into wanton criminality inherent to the ‘worst 100,000 families’ in Britain. This paper situates the disorderly and ‘risky’ citizen/subject within a critical reflection on risk, order and surveillance. It is argued that a complex interplay of thinking, doing and acting out citizenship forms tendential links between risk and surveillance that scholars need to investigate further.

_Protest, Conflict, and Class Struggle in South Korea: Two Cases of Urban Redevelopment in Incheon_

South Korea has suffered from major economic dislocations under the pres- sures of globalization, marketization, and economic restructuring particularly since the Asian Financial Crisis of 1997-98. Labor responded in the last decade with a wave of labor militancy that receded with the decline of the labor move- ment and a period of labor peace during the recent economic crisis. At the meantime the public has asked for more welfare spending. Throughout the period, though, there has been sustained resistance to capital in the form of protests against urban redevelopment. In recent years, urban protests have even taken a similar form to labor protests, with both involving sustained occupations and a common protest culture. This study reviews the recent trends in resistance against domestic (and foreign) capital and then looks at the specific cases of hous- ing protests in the Kajaya and Dohwa neighborhoods of Incheon. In both cases, a lower-income community was displaced by landlords seeking profit by building more expensive housing in a pattern common throughout Korea despite plenty of housing stock that could be rehabilitated at lower cost. The capital drive to redevelop has in spite of a collapse in the luxury housing market, and a lack of affordable housing. The course of the occupations and protests are re- viewed and linked to broader issues of class conflict in Incheon and South Korea.

_Being a Housewife – Is It a Traditional or Progressive Female Gender Role? Understanding Gender Role Constructions in a Transcultural Russian-German Research Setting_

This paper is based on a PhD project investigating the au pair migration from young Russian women to Germany. Two aspects of this project will be discussed: 1) What kind of biographical research design may be employed in a transcultural research setting and 2) how does this design help to reconstruct the socio-cultural constructiveness of social categories such as gender. The methodological design of the research project consisted of data collection with biographical narrative interviews mainly done in German language (to lesser extent in English or Russian with interpretation). Data were analysed by the method of sequential analysis with a group of researchers, who belong to German and Russian backgrounds, enabling the reconstruction of cultural specific social categories. Concerning the question of gender this project depicts how this category not only in everyday knowledge but also in research is formed by socio-cultural and historically shaped contexts.

_The Male Au Pair: Migrant Men Providing Domestic and Care Services In Au Pair Jobs_

Research on migrants working in low income jobs show a gender logic accord- ing to which female migrants typically work in domestic and care work, while male migrants hold jobs in the industrial sector. The increasing popularity of male au pairs offers a unique opportunity to research a specific case of migrants’ labor market position contrary to this logic. Since there do not exist any studies and statistics on male au pairs yet, I propose an explorative research project on male au pairs in Germany. It is based on 3 in-depth interviews with male au pairs, data from online forums, journalistic articles, advertising materials of au pair agencies as well as interviews with agency staff.

Au pair work is a specific type of reproductive labor because the working relation- ship between au pair and the employing family is only very poorly regulated. Thus, every case shows which specific tasks are delegated to the au pair and which ac- cording competencies are expected of the au pair. At the intersection of ethnicity/ nationality and masculinity the male au pair is constructed as a suitable worker for families with sons. Alike the broad discussion about the importance of men for socializing male children, male au pairs are hired when the male parent is absent and are expected to fulfill the position of a male role model. The foreignness of the au pair is portrayed as a value of intercultural education. At the same time offering low waged work within the own household is legitimized as providing life chances to a young person from a less developed country. Biographical interviews show that male au pairs often feel overburdened by the expectation to be a male role model and report to feel pressured into adjusting to the families cultural/ individual routines instead of pursuing their own lifestyle.

« Je Fais Ce Que Je Peux ». Les Pratiques d'accompagnement Et Assistance Aux Pauvres Au Chili

Cette contribution porte sur les politiques contemporaines d'assistance au Chili. Plus spécifiquement, sur l'analyse des pratiques d'accompagnement psychosocial à familles vulnérables. Ce travail est le résultat d'une enquête ethnographique réalisée au sein de visitations à partir de cas pratiques de demandeurs de protection à Santiago. J'étudie comment les différentes organisations d'intervention sociale se mettent en place à l'intersection de cas de personnels de travail social et de cas de familles à traiter. Cette étude révèle comment ces institutions se mettent en place et comment elles interagissent avec les familles. Les conclusions sont que l'intervention à double cible qui traite et qui met sous contraintes tant aux pauvres que aux aidants est une nouvelle perspective d'intervention sociale. Les résultats de cette étude sont que la nouvelle logique de gestion du social s'appuie sur une intervention à double cible qui traite et qui met sous contraintes tant aux pauvres que aux aidants.

_Social Psychology of Relationships of Domination in Hegel, Nietzsche and Fanon_
This paper explores the writings of G.W.F. Hegel, Friedrich Nietzsche and Frantz Fanon on the dynamics within relationships of domination and subordination. Although the three authors held quite different political perspectives, there are commonalities, as well as differences, in their discussions of this dynamic. All explore the subordinate as an object, the importance of the Other, and the effects on the member involved in such relationships. Nietzsche and Fanon also discuss the role of resentment and the importance of physical coercion and repression in maintaining and then undermining domination. Hegel considers the labor of the subordinate significant. Despite their differing views of the processes by which an outcome is reached and the desirability of that outcome, the three writers suggest that the destruction of the inequality is an inevitability.

The Financialization of Housing and Spatial Segregation: New Frontiers in Brazilian Cities

Urban space plays a crucial role in the contemporary processes of capital accumulation, which is essential to analyze transformations on social housing policies and their impacts on patterns of socio-spatial segregation in the cities. More than mere effects of the financialization of the world economy, changes in the production and consumption of urban space have figured as driving forces of a new economic order, characterized by deep connections between financial markets and real estate.

In this context, rather than ways of providing social rights, housing policies have been progressively conceived as means of opening new frontiers of financialization in low income residential markets. Like in many other countries, this is the case of “Minha Casa Minha Vida” program, the main housing policy implemented in Brazil, which subsidize homeowners to low income households.

With the protagonistic role of private developers in the formulation of social housing projects, their spatial dimension are conditioned by cost calculations made by economic agents seeking to maximize profits. Without taking into account urban policy goals, the definition of the projects’ location is mainly guided by the criteria of the cheapest land available - generally also the most precarious places. As a consequence, social housing projects are reinforcing historical trends of segregation and ghettoification of the poor in Brazilian cities.

Lone Mothers and Long Hours. Work-Family Conflict In The Everyday Lives Of Lone Mothers In Sweden

The gendered nature of the struggle to integrate caring, family and paid work has been repeatedly demonstrated. Most research, however, has focused on dual parent families. This paper discusses work-family conflict in the everyday lives of lone mothers in Sweden. We use an agency-centered framework inspired by the capabilities approach, which emphasizes that the options of an individual depend greatly on institutions and relations with others. Drawing on 38 in-depth interviews with lone mothers from different social backgrounds we explore i) how the proper relation between motherhood and paid work is conceived of, ii) the institutional and relational factors that influence lone mothers’ opportunities to attain work-life balance, and iii) the strategies employed in negotiating paid work and family. Results show that paid work is integral to good motherhood to all mothers regardless of social class. They also show that lone mothers typically experience work-family conflict. Occupational family conflict facilitates and mediates work and family depend on employment conditions, accessibility to social support networks, the role of the absent father, household composition, and access to public childcare on irregular hours. In the case of middle class mothers, blurred boundaries between work and family life and late meetings restrict opportunities to attain work-family balance. For working class mothers temporal employment, irregular working hours and low earnings are significant constraining factors. Reducing working hours, negotiating working schedules, and asking relatives and friends for help are examples of strategies used to reduce work-life conflicts. Reducing working time between the job and the home by moving from one place to another, and moving closer to relatives to increase the chances to get practical support are other examples. While middle-class women typically used flexi-time at work to alleviate conflicts between different responsibilities, several low-income mothers changed jobs in order to improve their situation.

Cooperaci*N Aerospacial ENTRE China Y Venezuela. La Formaci*N PARA La Transferencia EN Tecnolog*a Satelital 2005 - 2013

Venezuela ha establecido a partir del año 2005 acuerdos de cooperación científica con China para la transferencia de tecnología en materia aeroespacial, los cuales contemplan tanto la construcción y puesta en funcionamiento de sistemas de satélites como la formación científica de personal venezolano con relación a los sistemas de satélites en uso, la formación del personal técnico en China, el intercambio de personal y la transferencia de tecnología. El objeto principal del trabajo es mostrar que la formación científica y tecnológica ha servido como medio para la consolidación de la transferencia de tecnologías. El estudio presenta los resultados de las visitas al país chino y las condiciones de las transferencias de tecnología a Venezuela. El trabajo proporciona una visión general de la situación de la formación científica y tecnológica en China y Venezuela en la materia aeroespacial. El resultado es una contribución importante al desarrollo de la cooperación científica entre ambos países, ya que ofrece una visión clara de las posibilidades y desafíos en esta área. La transferencia de tecnología es un tema de gran importancia para la cooperación científica entre China y Venezuela, y el estudio de este tema proporciona una visión general de la situación actual y futura de la cooperación en esta área. Debe destacarse que la transferencia de tecnología es un tema de gran importancia para la cooperación científica entre China y Venezuela, y el estudio de este tema proporciona una visión general de la situación actual y futura de la cooperación en esta área.
Age, Gender and Migration Status on the Labour Market – A Case for Accumulation of Advantages and Disadvantages

The analysis addressed in the presentation will show the situation of the older workers from the perspective of their minority status, namely belonging to the group of migrants, as well as from the perspective of gender. We will present the problem of the accumulation of certain advantages and disadvantages during the life-course of individuals with regard also to their socio-demographic characteristics. The questions this presentation will answer are the following: Are there significant differences in the labour market outcomes between the workers with migration background and the workers without migration background? Do these differences increase with age? What is the impact of those two dimensions – age and migration status on one of the labour market outcomes, namely the wages? and finally, what is the role of gender in determining the changes in employment status?

The analyses in this paper draw on data from the SOEP (German Socio-Economic Panel) which is a representative, interdisciplinary, and longitudinal survey of the German population. For our analyses we apply the SOEP data from 1991 to 2011, distinguishing between population with and without migration background. To investigate wage differences between individuals we use the methodology developed by Oaxaca and Blinder (1973).

In the empirical analysis we have found that initial disadvantages in education of men with migration background cumulate across the life span resulting in large differences in earnings, whereas the group of women with migration background do not face the same disadvantages. In the group of migrants, as well as in the group of non-migrants, the workers with migration background have a pronounced negative development. Furthermore, the wage analysis reflects that wage differences between individuals with and without migration background are due to their different endowments and not an effect of direct discrimination.

System Trust and Cooperation: The Case of Recycling Behavior

In this paper, I develop and test the hypothesis that system trust – trust in the reliability, effectiveness, and legitimacy of social institutions – promotes cooperation in social dilemmas and the provision of public goods, focusing here on the example of recycling. I discuss three models that can explain recycling behavior (rational choice, low-cost hypothesis, dual-process theory) and show how they link incentives and attitudes. All three models claim that incentives are an important factor mediating the attitude-behavior link, but they develop contradicting hypotheses about the direction of this effect. I use survey data collected by Sander, Facebook, and Daughberg (2011) to advance an empirical test. I find a positive and significant interaction between the attitude of system trust and recycling costs, as well as a negative and significant interaction between system trust and recycling benefits. The data rule out the rational choice and low-cost hypothesis explanation of recycling behavior. Instead, they indicate that attitudes moderate the impact of the incentive structure, increasing cooperation in collective action dilemmas irrespective of the costs associated with compliance.

Trust and Adaptive Rationality: Towards a Causal Explanation of Conditional and Unconditional Trust

This paper provides a theoretical framework to reductively explain conditional and unconditional trust; it also presents an experimental test of the correspondingly integrative model and its predictions. Trust research has neglected the importance of (1) an actor’s context-dependent definition of the situation and (2) individual-level adaptive rationality. The diversity and fragmentation of trust research is as the more or less common outcomes in terms of spatial and economic polarizations of social and economic inequality. The model demonstrates the impact of a flexible and dynamic degree of rationality in interpretation and choice on trust. It describes a finite set of parameters that guide the selection of the processing mode and provides a causal link between an actor’s definition of the situation, individual-level adaptive rationality, and the behavioral outcome of trust. I predict a closed set of admissible interaction patterns in an experimental context using a measure of chronic norm accessibility (interpersonal trust scale) and two situational parameters. In a 2x2 factorial design, I vary the context and initial endowments in a standard investment game. The data show that negative incentive effects on trust in high-cost situations (SE vs. 50€ real initial endowments) can be mediated by high norm accessibility or a positive social context. Decision-times analyses reveal a consistent pattern of interactions.
specific form of the phenomenon: right-wing populism. Other forms of populism, such as left-wing populism or liberal populism, have received far less attention in comparative research. This paper conceives of populism as a set of ideas that can be combined with every political ideology. Moreover, it is assumed that political parties can employ the populist set of ideas to a larger or lesser extent. As such, populism becomes a matter of degree: parties – on both the left and the right – can be more or less populist. This raises the question as to how the success of the populist message can be explained. Why and under which circumstances do citizens vote for parties that employ a populist discourse? In order to answer that question, I focus on both micro-level explanations (socio-demographic characteristics and political attitudes on the individual level), and macro-level variables (corruption, social inequality, party system polarization and the electoral system).

The paper combines the results of a computer-based content analysis of election manifestos with the European Social Survey (2002-2010). By means of multi-level analysis, I seek to explain why and under which circumstances do citizens vote for parties that employ a populist discourse? In order to answer that question, I focus on both micro-level explanations (socio-demographic characteristics and political attitudes on the individual level), and macro-level variables (corruption, social inequality, party system polarization and the electoral system).

The paper offers examples of critical approaches to evaluation based on a method of exchange practice this paper offers a critical perspective on the 'norms' and 'forms' of evaluation as a critical practice and the relationship between participatory arts and cultural policy.

ROOKE, RONICA* (University of Colorado Denver, ronica.rooks@ucdenver.edu)

Race/Ethnicity and Health Information Seeking and Use Outside of the Medical Encounter: Is It Associated with Chronic Conditions?

Increasingly, adults in the United States of America (USA) are seeking and using health information (HI) within and outside their medical encounters. Patients actively involved in their self-care are more likely to manage chronic conditions (CC) effectively. But, HI use trends are unclear for those with CC, who use more healthcare services associated with aging. One study on older, racial/ethnic minority adults found HI seeking could change their eating, exercise, and illness treatments but did not lead to changes in health promotion/prevention or healthcare providers. The theory of uncertainty management suggests that patients reduce healthcare uncertainty by increasing their understanding of disease etiology or treatment options, improving patient-doctor communication, and enhancing disease self-management knowledge through HI seeking. My prior research found African Americans and Whites were similar in seeking and using HI when they talked with their doctors, but Latinos were significantly less likely to do so. However, African Americans and Latinos were significantly more likely than Whites to seek and use HI to change their approach to maintaining their health and better understand how to treat illnesses. We examine if race/ethnicity is related to HI use outside of medical encounters by CC. We use data from the 2007 USA Health Tracking Household survey, a nationally-representative survey of civilian, non-institutionalized Americans (n=12,549). Descriptive analysis showed Whites were more likely to seek HI from the Internet (35.7%), while a higher percentage of African Americans sought HI from books or magazines (33.3%) and friends or relatives (32.3%). Latinos were more likely to get HI from friends or relatives (24.0%) and books or magazines (23.1%). Logistic regression models using a knowledge beliefs scale about care for CC, and alternatively stratifying by any CC or not, will aid our understanding of the self-care practices and needs of racial/ethnic adults with CC as they age.

Work After Retirement or Work Instead of Retirement?

Work after retirement or work instead of retirement? In Europe the problem of population aging has aroused much worry. The debates on aging populations in need of care, consuming lots of resources, have been common. Consequently, the raising of the retirement age has been one of the themes in the discussion. There is strong opposition against increases in the retirement age. Therefore, alternatives are needed. There are also spontaneous developments which affect the retirement age debate. One alternative which has been tested is the elimination or raise in the upper age limit for retirement. In Finland people may retire already at 63 or 65, but they have to retire at 67 or 68. This upper limit could be raised to 70 without much protest, or eliminated completely.

Another new development is the combination of retirement and (paid) work. The retirees are healthy and wish to stay in the work life. This means that they do not wish to work full time, but on the other hand are not primarily interested in remuneration. In fact, there seems to be also an increase in the unpaid work, which is difficult to follow statistically. In our Finnish Generational Transfers study we follow the Finnish baby boomers (born 1945-1950) and their activities. From our data we can see that working when retired is quite common and has interesting correlations with education, income, happiness etc. The paper will present these results and compare them to data from other European countries. On the basis of these results some recommendations about retirement policy are made.

Between Rhetoric and Reality: Shari'a and Neo-Liberal Multiculturalism in Australia

Abstract

The past decade has been characterized by attacks upon and critiques of multiculturalism. This has been particularly the case in Europe, where in the context of the European sovereign debt crisis a politically driven, anti-multicultural tendency has spread at rapid pace. It is clear that multiculturalism in Europe faces

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
immense political challenges from its opponents, many of whom currently constitute ruling governments. Leaders and opposition parties in Switzerland, Germany, the United Kingdom, France and the Netherlands have made strong public statements against multiculturalism and linked this rejection to the presence of Muslim populations. Banting and Kymlicka note that even though multicultural policies remain in place in many of these nations, the delegitimation of the word multiculturalism is not just a change in discourse, but jeopardises the very conditions under which multicultural policies can actually work. It would be easy to consider that in this context, multiculturalism has a dim future.

This paper, based upon extensive research conducted for an Australian Research Council-funded study examining sharīʿa and legal pluralism in Australia and the United States. In 2013, he served as a visiting scholar and researcher on the same project (with Professor Bryan Turner) at the Committee for the Study of Religion at City University of New York. He is also a co-convenor of The Australian Sociological Association (TASA) “Ethnicity, Migration and Multiculturalism” thematic group with a focus on religion and multiculturalism.

Muslim Elites in the Neo-Liberal Sphere: Implications for Citizenship and the Future of Islam in the West

In recent years there has been a vast array of studies examining Muslims in Western contexts at the level of radicalisation, impacts of negative representations and civic engagement. However, little research has examined the emergence of Western born Muslims into the elite professions that are central to the operation of the neo-liberal free market and that serve as a central location of economic and political power. Less research still has examined how this new Muslim ‘elite’ is shaping citizenship amongst Muslims and the future of Islam in the West (and the tensions this produces with traditional Muslim community leadership). This study aims to reveal important empirical and theoretical insights into these developments. Significantly, this study shifts the focus from the ‘Muslim question’ to how Muslims are actively contributing to a Muslim Solution.

This paper is based on findings from a three year project (2012-2014) funded by the Australian Research Council and conducted by a multidisciplinary team (Law, Sociology, Criminology and Political Science) from the University of Western Sydney (UWS) and City University of New York (CUNY). Empirical research was conducted in the global cities of Sydney and New York with Muslim attorneys, Islamic finance specialists, Imams and community leaders. The study aims to explore the intersection of sharīʿa and the secular legal system, as well as gaining a broader insight into how sharīʿa shapes the daily lives of observant Muslims.

Can International Framework Agreements Facilitate Transnational Labor Cooperation?

Marx & Engels predicted that globalization would lead workers of the world to unite. Indeed, the world economy is today “global.” However, globalization seems to have hurt workers’ organization as labor unions have lost membership and influence almost across the board. But in the past decade global unions have even been able to persuade more than 100 multinational corporations employing over eight million workers to sign so-called international framework agreements (“IFAs”).

At a minimum, all IFAs must submit to the “core labor rights” of the International Labor Organization (“ILO”), to wit, the right of freedom of association and effective collective bargaining, the right to be free from discrimination at work, the right against compulsory labor and the right against the worst forms of child labor. Could Marx & Engels have been correct, after all, about an international formation of workers acting in a class-conscious way for fundamental social change around the world? After doing empirical field research for about 6 months in Europe and the U.S.A., I do not think that IFAs yet signal a significant and new labor upsurge.

First, I found out that the mostly German, Nordic, and French labor organizations seem to determine the specific meanings of the IFAs. These specific national labor organizations broker the IFAs and the relations that give IFAs meaning and life. In this sense IFAs are not truly “global.” They have important national roots. Second, unions across economic sectors seem to have conflicting interests. No brokerage seems to mend those ruptures, leading some global unions and their IFAs to clash with others. The paper concludes by arguing that the ILO may help to broker these conflicts to propel IFAs forward.

Communicating the Challenges of Climate Change Adaptation in the International Red Cross and Red Crescent Movement

The paradigm of climate change adaptation (CCA) plays an increasingly important role in numerous types of civil society organizations. Dukic and Biddle (2012; Hall 2013). The International Red Cross and Red Crescent Movement discussed the topic of climate change as a humanitarian challenge for the first time in 1999. The foundation of the Red Cross/Red Crescent Climate Centre (RCCC) in Den Haag in 2002 institutionalized this new organizational commitment to address climate change induced challenges in disaster preparedness and the securing of livelihoods. Today, CCA is being discussed as a cross-cutting issue in humanitarian
projects across the 187 national Red Cross/Red Crescent societies. The communication of climate risks to reach various target audiences from local communities to national stakeholders and volunteers to donors at the institutional and individual level has become a key challenge in the process of organizational change. This paper comparatively analyzes three different methods of communication that address RCEA issues in the Red Cross/Red Crescent movement. First, the different visualization tools of the vulnerability and capacity assessment are analyzed with a focus on community based perceptions of climate change (RCCC 2010). Second, participatory games that model complex dynamic systems and that are facilitated by the RCEA at the local to the national level are discussed as a tool to foster awareness on the complexity of climate change impacts for local livelihoods and disaster preparedness at the level of donors and practitioners. Third, the climate change campaign of the German Youth Red Cross is analyzed with regards to its approach to motivate young people and the general public to address a complex issue in their daily lives. Together, these case studies illustrate the need to find innovative ways to communicate and simplify the complexities and uncertainties that are linked to changing environmental factors.

**Innovative Strategies to Cope with Climate Change Across Time and Space - Local Preparedness As a Humanitarian Challenge?**

This paper addresses an innovative climate change adaptation strategy in the area of disaster preparedness developed by the German Red Cross in cooperation with civil society partners in Africa such as the Ugandan NGO Tohaa and the Red Cross. Discussing the concept of "early warning/early action" and its practical implementation, this paper addresses organizational learning processes in transnational organizations from an actor centered perspective. By looking at a new project approach in the area of indicator based disaster preparedness systems, the importance of knowledge creation and transformation across time and space is highlighted. Time is important to respond adequately before a disaster strikes which requires new forms of institutionalized cooperation (for example, with meteorological departments and other stakeholders), while the spatial dimension refers to processes of organizational learning across borders and hierarchies from the local to the regional level. The role of both local communities and organizational change agents, meaning key persons within and outside the organizations, is addressed systematically to analyze the possibilities to foster climate change adaptation projects and their successful implementation in the long run.

**Talking about Sexuality in Order to Deal with Discrimination? Gay Men in Palestine**

In the context of a German-Israeli-Palestinian research project, we conducted biographical-narrative interviews with Palestinians in the West Bank and Jerusalem. We asked our interviewees to tell us their family and life histories without suggesting any other topic during the first (and main) part of the interview. In all our research settings we had several interviews with men who define themselves as homosexual or who experienced serious discrimination because of being defined as homosexuals. It became obvious that these men wanted to speak with us because we represent, from their perspective, the so-called Western culture that they associate with more sexual liberty and because they felt a need to speak about their suffering from discrimination. In order to understand and explain the interactional dimension of the interview it is crucial to understand their specific definitions of the concrete relationship to the male interviewers from Germany. These biographical self-presentations are marked by talking about experiences of discrimination and about struggling with their self-definition (Am I gay, trans-gender or heterosexual?). Thereby they touch on the issue of homosexuality being a ‘Western’ concept. In our paper we will present our assumptions, that are based on several case studies, about the interrelation of these self-presentation and self-definations with the hegemonic discourse about male homosexuality, or non-normative sexualities in general. Furthermore, we will discuss the assumption that these interviewees, who are in a position of outsiders (in the sense of Norbert Elias) in Palestinian society, are talking more openly about internal conflicts inside the Palestinian community than other interviewees.

**Climate Upsurge: An Ethnography of the Climate Movement**

In this paper we report on a project analysing the emergence of a grassroots social movement dedicated to direct action against the root causes of climate change. The project investigates the dramatic turn in climate politics that occurred in the mid-2000s. Engendered by mounting evidence of climate change, and by the base-denominating level politics science the 1990s, and the legitimacy of the carbon-intensive economy. The paper explores this significant moment, when a radical climate politics introduced a new dynamic to the landscape. The authors are to publish this work in 2013 as an ethnography of the search for climate agency, based on the authors’ involvements in the climate movement and in-depth interviews with climate activists from 2007 to 2010. Focusing particularly on the climate movement in Australia, a country reaping the economic benefits of the coal and gas boom, the book charts both the possibilities and pitfalls revealed by the upsurge, interpreting it as a pre-figurative moment for an anti-systemic climate agency.

**Imperialism In a Wool Blanket: Aboriginal Iconography, Denomination and Canadian Paper Monies**

Imperialism in a Wool Blanket: Aboriginal Iconography, Denomination and Canadian Paper Monies

National currencies, especially paper notes, are emblems of the nation-state and its power. This paper builds on these literatures to explore iconic representations of Canada’s Aboriginal Peoples in its monies, using examples of colonial and (ostensibly) post-colonial notes. Research on images of imperialism and nationalism in African colonial and African and East Asian post-colonial monies and stamps is a well-established field. However, Canada’s imperialist, colonialist legacies are neglected, sometimes denied, history, and its monies are barely studied from critical, social science perspectives. Beginning with an 1870 Dominion of Canada $2 bill, and culminating in the 2004 Canadian Journey series $20 bill, this paper asks whether Canada’s claim of multi-culturalism vis-a-vis First Nations Peoples is indeed supported by nation-building imagery on its own currency. Hudson’s Bay Point Blankets were traded between colonisers and First Nations in 19th century Canada. These wool blankets were re-purposed by Aborigine peoples as garments, ceremonial exchange and prestige goods. On the 1870 $2 bill, the blanket draped across an Aboriginal man’s body is an imperialist icon of le duex commerce that ‘tames’ the ‘noble savage’. In the 2004 $20 bill, First Nations are represented by a modern sculpture by a Haida artist, Bill Reid, depicting the creation of mankind, Raven and the First Mer. But on this bill is contemporary Aboriginal art and ‘traditional culture’ – the sculpture depicts a key event in Haida cosmology – presented as truly valuable?

**When 150 Becomes 100: Conversions and Denominations In Grocery Shopping**

When 150 becomes 100: Conversions and Denominations In Grocery Shopping

This paper explores two aspects of expatriate money practices with Russian rubles, focusing on everyday shopping: conversion rules of thumb and denominations. The Russian ruble is a currency whose base denomination is one hundred (100) rather than one (1). Many expatriates living in Moscow are accustomed to currencies like the United States dollar, the Euro or British pounds sterling, whose base denominations are one not one hundred. Conversion becomes a way of managing ‘sticker shock’, a means of making sense of how a can of coffee can cost 800 currency units (rubles in this case), and coming to understand new regimes of value and price for everyday goods. Yet even expatriates from countries with a currency whose base unit is 100 – Japanese yen, South Korean won, Swedish krona – talk of curious conversion negotiations under a rule of thumb that 150 of one unit equals 100 of another eventually becomes a 1:1 ratio. Learning to use rubles, especially in buying daily necessities, means not only developing a handy conversion to assess prices, but also adjusting to new arithmetic based on
different monetary denominations, even when the base unit may be the same. I will argue that conversions are slowly adjusted to better match not official rates of currency conversion, but notions of worth and value that are linked to available denominations of money at ‘home’ and abroad.

Ethnographic Studies Approaching Violence and the Transaction of Illegal Drugs in Montevideo, Uruguay

The present work is a result of a process of ethnographic investigation that took place in three different social locations: the downtown area (with a population conformed by homeless teenagers and young adults); a peripheral suburb location in Montevideo (focusing on consumers of cocaine paste base); and, prison (within a system created for people with no criminal records). The focus of this study discusses the social interrelations and the transactions of illegal drugs. Given the general assumption that the foundation of social interrelations is exchange itself, the case of an exchange that occurs within an outlawed background will be debated— an illegal market which is necessarily (re)producing violence—; a market that is illegal due to the fact that those merchandises are considered non-legal by national and international normatives. The present investigation was held during the debate that arose in Uruguay on the topic of the legalization of one illicit drug (cannabis), a critical debate to which attention is paid along this work: while the Uruguayan government formulates the regulation of the market of marihuana, it also proposes to implement stricter measures against the traffic and transaction of cocaine paste base. This rationale implies contradictory policies and thus, drug-related social violence is strictly connected to an illegal framework of its transaction than to drug abuse psychological and phisical effects.

In and out of the Mass Media System: Crisis Microblogging in a Social System Theory Perspective

The large diffusion of social media platforms, together with the diffusion of mobile connectivity, has generated, during the last few years, a growing amount of real time production of user generated content. This broad phenomenon is even more abundant when it comes to crisis-related communications. During crisis events traditional mass media communications might be slower less efficient and less accurate than user-generated information. This is why, over the last few years, we are seeing a growing number of research projects aiming at using these data for rescue operations or other civil protection activities. We are facing this kind of data from a different perspective. Within this paper we will claim that—within specific circumstances—user generated communication will act surrogating the traditional Mass Media System in its function of self observation of the Social System (Luhmann 2000) by applying the same operational selection between information and non-information. In addition we will claim that, as soon as the initial conditions disappear, user generated communication will evolve into a new—and still largely unexplored social function.

To support our thesis we will use Twitter data collected during the first five hours after the earthquake that struck Emilia Romagna region in Italy on May 20th 2012 monitoring the #terremoto hashtag. By focusing on the first 5 hours of the Twitter stream we have been able to detect the early user-led phase of the phenomenon, showing which type of users has been the first to fill the information gap and, by then, what happened until the early morning when traditional media came on stage. We will show how in this time span it is possible to observe how specific social network analysis metrics (Bruns, Stiegitz 2012) evolve from a specific mass media like structure toward a more conversational structure.

Ageing and the Development of Community Care in East Asia – What Way Forward?

With the ageing of societies, there is growing interest among also East Asian countries to implement new policies of long term care. Home care arrangements now predominate in OECD countries, reflecting older people’s preferences for home based help and care but also as an attempt to reduce reliance on expensive institutional care, particularly for recipients with lower levels of disability (OECD, 2005). Countries without extensive formal community-based care systems such as the East Asian countries are in a demographic situation which requires them to consider how to organize and provide adequate, affordable and quality community-based care, in both urban and rural settings, and in a financially sustainable and culturally diverse way. They can draw on the lessons learned from other countries in the development of national community-based care models, but new models of community care must develop according to their respective cultural, political and social background and taking into account financial and systemic capabilities. This paper investigates what models of community care have been implemented or is under way in 9 East Asian countries, outlining their characteristics and the challenges forward.

The Gendering of Internet-Based ICTs in Everyday Life

Dealing with the implications of ICTs for social inequality requires taking the everyday processes and actual situations into account in which ICTs are used and where participation is negotiated and constituted.

Relating to Cultural Studies the domestication approach argues that everyday life especially in the domestic sphere can be seen as a microcosm of society, where institutional and discursive inequalities are reflected as well as being reproduced. Within the domestication process ICTs are actively integrated into daily routines, social interactions and spatiotemporal structures of the households revealing processes of inclusion and exclusion.

The present paper presents findings from the ethnographic-orientated, interview-based long-term study “The Mediatized Home” analyzing the integration of the different internet-based ICTs into the everyday lives of 25 (heterosexual) couples over a period of over 5 years. The findings show that due to a technological framing, inequalities in internet use and skills are especially tied to gender roles and practices. Although the technological framing and thereby these inequalities diminish during the process of integrating the internet into everyday life, they do not dissolve entirely, but prove to be resilient to its changing surroundings. Causes for the persistence of these inequalities can be identified on an institutional and discursive level as well as within the interaction of the couples. Various aspects on these different levels lead to a gendered division of labor within the relationships of the couples, which is evidently affecting the use of internet-based ICTs.

In order to understand the ways in which internet-based ICTs interact with questions of social inequality, it is crucial to ask for its latent implications. Our study shows that looking at everyday life from a domestication perspective allows us to not only identify latent implications of internet-based ICTs, but also to understand how they unfold their effects on social inequality.

RC14-248.4 ROTH, ULRIKE* (University of Münster, ulrike.roth@uni-muenster.de)

Where Participation Is Negotiated: New Media in Everyday Life

Addressing the intersection between New Media and social inequality requires taking the everyday processes and actual situations into account in which New Media is used and where participation in New Media is negotiated and constituted.

Relating to Cultural Studies the domestication approach argues that everyday life especially in the domestic sphere can be seen as a microcosm of society, where institutional and discursive inequalities are reflected as well as being reproduced. Within the domestication process New Media Technologies are actively integrated into daily routines, social interactions and spatiotemporal structures of the households revealing processes of inclusion and exclusion.

The present paper presents findings from the ethnographic-orientated, interview-based long-term study “The Mediatized Home” analyzing the integration of the different New Media Technologies into the everyday lives of 25 (heterosexual) couples over a period of over 5 years. The findings show that inequalities in internet use and skills are especially tied to gender roles and practices. Although these inequalities diminish during the process of integrating the internet into everyday life, they do not dissolve entirely, but prove to be resilient to its changing surroundings. Causes for the persistence of these inequalities can be identified on an institutional and discursive level as well as within the interaction of the couples. Various aspects on these different levels lead to a gendered division of labor within the relationships of the couples involving a gendered construction of New Media expertise, which is evidently affecting the use of New Media.

In order to understand the ways in which New Media can open up possibilities to participation, it is crucial to ask whether people are equally taking part in New Media or not. Our study helps explaining processes of inclusion as well as exclusion showing how participation in New Media is negotiated in everyday life.
One distinguishing trait of Finnish fertility during the last decades is the increase in the proportion of families having three or four children. We study how socio-economic status (SES) and numbers of unions relate to above-average (3+) parities among Finnish men and women across age cohorts. In previous studies of wealthy low-fertility countries, both male SES and number of unions has often been shown to increase fertility, while their effect on women is mixed or negative. We use the FINNUNION data, a 11% sample of all Finnish-born persons resident in Finland during 1970–2010 and covering the fertility of age cohorts 1930–1960. It includes data on co-residential unions and marriages, childbirth and central socio-demographic indicators of the women and men on an annual basis. It also includes sociodemographic indicators and childbearing history of all partners in marriage or cohabitation of the index person.

Results show that across all male cohorts, higher social status increases the proportions of 3+ children. There is no comparable clear trend among women, although the negative effect of female education on higher parities diminishes over time. Interestingly, the gender differences appear to diminish among younger cohorts. We discuss reasons for the shift towards gender equality in mating patterns in families with many children.

**Plural Modernities and Post-Western Sociologies: Individuation in Europe and in China**

In a context of plural modernities we have entered in a period of Post-Westernization of knowledge and construction of the construction of situated knowledge. We are in the midst of a “global change” which is distinct from previous changes in the history of the social sciences. In this communication we will consider the diversity of epistemic injustices and reticular dominations, the emergence of Post-Western sociology through the dialogue between European and Chinese sociologies; finally we will be focused on theoretical continuities and discontinuities between Chinese and European sociologies through the analysis of the process of individuation in Europe and in China. The concept of the individual is not very highly developed in Chinese sociology, whereas it has assumed a central position in European sociology. On the other hand, various theories of the “guanxi” have been developed; some Chinese sociologists advance the ‘we’ is produced, on the one hand, by guanxi, which delineate the particular boundaries of the ‘self’ in the construction of the individual, and, on the other hand, by categorisations, identifications and social affiliations. Over the past 20 years or more, it has been interesting to observe that in European sociology, and particularly French sociology, the contemporary individual, whether he appears uncertain, reflexive or autonomous, lies at the heart of sociological thinking, whereas he is scarcely visible on the Chinese sociological scene. This phenomenon highlights the affirmation of the process of individuation as a process of civilisation—in Norbert Elias’s sense of the term—and shows that, whereas in the past it was social structures that sustained the individual and the level of reflexivity was consistent with the social structure. We would consider discontinuous continuities and continuous discontinuities between Chinese and European sociologies.

**ROULLEAU-BERGER, LAURENCE** (CNRS, Laurence.Roulleau-Berger@ens-lyon.fr)

**Sociologies and Methodological Cosmopolitism**

Methodological reflection in sociology is linked to the development of the Western society which saw its birth. If the process of pluralisation of contemporary societies questions even the idea of society as a narrative attached to that of modernity, and in particular that of European modernity, European thinking has continued through methodological nationalism to see itself as universal mediator of the other narratives (Chinese, Indian, Arabic, African, Brazilian and so on). Certain forms of scientific hegemony have marked the development of sociological thought. The most pressing task, however, is to produce methodological cosmopolitism in which continuities and discontinuities, connections and disjunctions are constructed between different places in the world and potentially capable of bringing to light the multiplication of “regimes of alterity,” the different ways of being with Others. The Others became a major methodological and epistemological scientific issue. Here, a methodological cosmopolitism is based on a multisited ethnography of recognition, in which all Others are regarded and recognised with their experience, their competence, and his fluctuating, reversible and varied identities anchored in a diversity of locations and temporalities. Methodological cosmopolitism is a way to access to the multivocality and the polyphonies of the plurality of narratives. Here methodological cosmopolitism allows for a universal sociology, which means integrating different points of view, which European, Asian, American sociologies put together. We propose to create a transnational intermediate space of knowledge in sociology by favouring an harmonisation between different theoretical, epistemological and methodological traditions from Asia, Europe, Africa, North and South America and Arabic countries. Methodological cosmopolitism is related to a conceptual space based on the articulation between a critical sociology and a pragmatic sociology where structural processes, collective and individual action, interaction orders are thinking together in different places in the world and different temporalities.

**The Comprised Mobility of Moscow’s Labour Migrants: States of Exception in a Super-Diverse City**

While Moscow is a super diverse city with between 4-5 million of its population international labour migrants, the majority from Central Asia, and despite the state recognising their economic importance, levels of integration and tolerance are extremely low. This paper argues that increasing xenophobia and unclear legislation forces many migrants to live and operate within shifting states of exception, ensuring a precarious everyday which impacts greatly on their mobility. While often used to describe migrant camps this paper argues that the state of exception concept applies to Moscow as a whole as even documented migrants are prey to state officials and, increasingly, its citizens due to the uncertain everyday life that impregate legislation creates. Thus migrants share informal knowledge about the safest places in the city and the routes around it which reduce their chances of interactions with state and police. Furthermore migrants are forced into informality by their employers and landlords refusing to register their documents correctly, increasing their vulnerability and denying welfare access. Compounding this, while it is extremely unclear who can demand a migrant’s documentation they are routinely stopped by the police and increasing numbers of the public, with groups such as ‘Moscow Shield’ proclaiming themselves as the city’s protectors. This ensures that migrants wish to spend as little time as possible in ‘public’ spaces to reduce the risk of confrontation, punishment and violence. For many their spatialities of Moscow are reduced to their workplace, accommodation and there are very few places where integration occurs. Through the work of Lefebvre and de Certeau the paper then addresses how migrants develop informal tactics to ‘cope’ with these everyday realities and carve out spaces of the city for themselves.

**JS-80.6**

**ROUND, JOHN** (Higher School of Economics, j.round@me.com)

**The Precarized Everyday of Moscow’s Labour Migrants: Rising Xenophobia and the Migrant As a Political Subject of Disgust**

Since the collapse of the Soviet Union Moscow has positioned itself as a global city (re)built on the profits of its energy boom and the efforts of, currently, over 9 million inhabitants. Labour migrants, the majority from Central Asia, are too many migrants endure an extremely precarious everyday as they are forced to live in what the paper describes as a city wide state of exception, within which legal frameworks protecting migrants are ignored or misinterpreted to the benefit of the market. Many migrants who desire ‘legality’ are forced into ‘illegality’ by either their employers and landlords refusing to register their documents correctly, increasing their vulnerability and denying welfare access. Based on in-depth qualitative research this paper explores the human rights abuses that labour migrants experience, ranging from arbitrary fines by the police, a total disregard for their workplace safety to xenophobic attacks. The research demonstrates that migrants are simultaneously visible and invisible to the state, as for the latter the legal uncertainty denies them access to welfare and a voice within the city but they are visible for exploitation both in terms of their labour and the political capital gained from their presence. Migrants, the paper demonstrates, are constructed as ‘illegal’ regardless of their documentation status and politicians, pandering to growing nationalist sentiments, castigate the migrant body (in all meanings of the word) as ‘diseased’ or ‘criminal’, to be seen as separate from the rest of the city. This feeds into xenophobic attitudes making migrants even more vulnerable with, for example, volunteer groups emerging to check their documents as they are seen as a danger to the city. Drawing upon the work of Lefebvre and de Certeau the paper concludes by exploring how migrants develop informal tactics to try and neg and these problems to ensure their general well being.

equality, a notion useful in building sound personalities, ready to participate in a democratic state. In this paper I will be present the analysis of "Lysistrata" through the mask/prosopoeia of the ancient Greek drama. The results were acquired after going through and studying elements from a variety of sources, such as masks form pottery, bas-reliefs, sculptures, frescoes, statuettes and texts. Aristophanes, who is considered to be the best ancient Greek comedy writer, was well aware of the social problems faced by the Athenian republic during and after the Peloponnesian War and thus felt challenged to present these problems through his writings. One famous persona he made up was "Lysistrata", an audacious, viv- id, powerful woman. Nowadays, "Lysistrata" is taught in philosophy schools and played in theatres around the world. The messages conveyed involve idea of the equality, peace, reconciliation, dialogue, human rights. The educational activities deriving from the ancient masks presented masks could take the form of articles, lectures, e-lectures, workshops, interactive programs, videos etc.

Epistemological Standpoints and Steps in Social Sciences. Intersectionality in Gender Studies

Human and social sciences are the subject of a long lasting confrontation between the ideal-type standpoint of the researcher's neutrality and the inevitable subjectivity in everyday life situations, between positivism and subjectivism. As a result of these paradigmatic oppositions, we encounter a cleavage between statistical quantitative methods applied to experimental data, "objective methods", and qualitative research, "subjective methods". Since 1980's, in information and communications sciences but also in management and gender studies, we are talking about the reliability of qualitative methods, the role of experience, memory and standpoint. The objectivity is actually non-achievable, so the subjectivity must be assumed, explored, transferred. Feminist studies (sociological first, then communicational, discursive, histori- cal) are designed to reveal the women's perspectives, as the feminist approaches had been ignored over the centuries. The main operator for the methodologi- cal change was the women's testimony through methods like life story, narrative analysis, and ethnography. It will be improper to talk about the exclusion of the quantitative methodology from the feminist research, but of the intersectionality of problemat- ics and methods. What makes a quantitative or qualitative approach feminist is the focus on the topic of women and their issues. The feminist research prefers the individualization and not the generalization, the correction of the view from nowhere postulated by positivist research. With this new orientation towards a "situated knowledge" (see D. Haraway), with the triangulation of methods and the intersectionality of sociological parameters, the traditional separation between the subject connoisseur and the object to be known is abolished and the group or community perspective can replace the neutral, individualizing perspective.

La Dimension De Genre Dans Les Organisations

La visée de cette intervention c'est de s'inscrire dans l'historique des efforts entre- pris pour éradiquer l'arbitraire, l'injustice et la discrimination envers les femmes en utilisant l'arme de l'information. Pour faire avancer la cause de l'égalité, il faut d'abord arrêter de considérer que le pôle des inégalités, rendre visibles leurs causes et leurs effets, comprendre le degré de leur résistance et les implications de leur persistance.

En dépit des modifications de jure (loi contre la discrimination de genre-2002 pour la Roumanie), de facto les changements arrivent plus lentement. L'inégalité de genre reste une caractéristique majeure de la société globale et par voie de conséquence de la Roumanie postcommuniste aussi.

Dans les sociétés contemporaines marquées par la désindustrialisation, la production et la reproduction, le marché et la famille sont moins séparés ; ils deviennent des espaces où le sexe, la race, la classe se confrontent afin de donner une signification et valeur nouvelle au travail. La crise (de la production , du tra- vail, de la famille etc.) entraîne des travaux temporaires , ce que des chercheurs féministes appellent du travail féminisé (moins payé, moins valorisé, etc.) ; c'est pourquoi on parle de féminisation de la pauvreté (accentuée par la crise).

Même si les femmes ont investi dans presque toutes les professions, la ségrégation sexuée du travail demeure une réalité qui se traduit notamment par la persistance de l'inégalité salariale et symbolique (ce que l'on va prouver par les vingt entrevues en profondeur avec des femmes appartenant à des professions, catégories d'âge et de leadership différents).

ROVISCO, MARIA* (Bankfield House, mr268@leicester.ac.uk)

Suffering and Aesthetic Identification in Cosmopolitan Cinema

Looking at specific film examples of cosmopolitan cinema, this paper is con- cerned with both theorizing and probing how different modalities of aesthetic identification with the suffering hero – sympathetic, cathartic and ironic – are consequen- tial for the ways in which the viewer is capable (or not) of detaching herself from the immediacy of the emotions underlying her identification (e.g. compas- sion, sympathetic tears, tragic emotion, estrangement) and rise to moral judg- ment and reflection about what is represented. It is through the fictional exercise of the imagination that audiences are invited to identify and empathize with the fate of individual characters and to consider the moral implications of their suffer- ing in their own worlds. If fictional characters can become 'real', personalized and tangible as subjects experiencing pain, it is also because the suffering 'other' is perceived not as a distant object of pity but as a fully-fledged subject just like 'us'. We will see that some modalities of aesthetic identification with suffering charac- ters have the potential to trigger cognitive linguistic deliberation– and, therefore, new cultural meanings of suffering - in a discursive ethical space where a range of interlocutors - audiences, filmmakers, creative personnel and critics – enter into conversation with each other about what constitutes human dignity and its violation. It is argued that cosmopolitan cinema challenges the idea that suffering is 'unrepresentable' by personalizing suffering and bringing its visual presence before us in ways that verbal representation cannot.

Changing Society, Changing Sport? Social Diversity, Cultural Citizenship and the Sporting Nation

Sport is routinely evident as a key signifier of nation around the world. But in Australia the unusually elevated place of sport in ‘official’ and popular national culture means that questions surrounding sport, citizenship and national fealty have an especially deep resonance. For example, sport is more prominent in the information for Australia's citizenship test, and more closely connected to its characterisation of national cultural identity, than in equivalent documenta- tion of comparable countries such as Canada and the United Kingdom. Key na- tional sports events are also protected for free television viewing by the world’s most rigorous ‘anti-siphoning’ regime in the name of safeguarding ‘events of national importance and cultural significance’ from less accessible subscription television platforms. Affinity with sport, and to the nation through sport, is likely to be less secure as global population mobility alters the demographic composi- tion of Australia’s citizenry. It is for this reason that its most dynamically diverse region, Greater Western Sydney (GWS), was selected as the primary research site for a current project addressing sport’s relationship to cultural citizenship in Aus- tralia. GWS has an estimated resident population approaching two million, with almost a third born overseas and of non-English speaking background, approxi- mately half of whom arrived in Australia during or after 2001. With almost forty percent of residents speaking a language other than English at home, over a half aged below thirty five and approximately a fifth in low income households, GWS - to its characterisation of national cultural identity, than in equivalent documenta-

"State-Formation From Below": Social Movement Of The Dam- Evictees' and 'Legal Transformation' Of The State In Maharashtra (India), 1960-1976

Dam- evictees' movements in Maharashtra have a long history. Peasants in Ma- harashtra fought the first struggle against dams in early 1920s, which opposed
the Mulshi dam built by the Tatas. Significantly, this is the first known move- ment organized by the dam-affected persons in India and throughout the world. However, for various reasons, this movement failed. From 1960 onwards, the dam- evictees’ movements in Maharashtra are being led by a federally structured organization named, Maharashtra Raoye Bharrangarva va Prakalpargrasta Shetkari Parishad (MRDPSP; Maharashtra State Dam-affected and Project-affected Farm- er’s Organization).

Many of the demands of MRDPSP, such as—equity in water distribution and civic amenities for the rehabilitated villages, have been largely fulfilled by the state. Moreover, these movements of the peasants have considerably transformed the structure of the state in Maharashtra. As a result of their mounting resistance, Maharashtra government mooted the first rehabilitation law in India, in the year 1976, which was further amended and replaced in the year 1986 and 1999. Though the movements of the dam displaced still continue to operate, in this paper, we shall analyse and analyse the impact of water conflict from 1960 to 1976, when the first rehabilitation law was formed in Maharashtra that legally empowered the dam evictees.

In this paper I argue that, dam-evictees’ movements in Maharashtra, were largely successful in getting their ‘material’ demands fulfilled because of having a long ‘historical legacy’ of movements against hydro-power projects and mainly by their strategy of — a) raising purely local ‘ecological concerns’, in strategic disjuncture from global environmental issues, b) increasingly rationalizing their demands through legal ‘rights based approach’ and c) orienting their movement towards claim-making on the Maharashtra state resources, through recurring cy- cles of conflicts and negotiations that ultimately caused the legal transformation.

Many Shades of Grey: Past, Present, and Future of Age Relations in America

Population aging is considered one of the top three challenges of global devel- opment by the United Nations. By 2025 one in every seven Americans, one in five Japanese, and one in four Europeans will be over the age of 65. This presentation reflects on the key sociological question: in the context of this historically unique transition towards aging society, how does age matter to deviance and to social status? It describes how the 21st century cult of the youth is linked to the revolu- tion of life and death. First, it brings up the media case of “disposable lives” of nursing homes, and mixed methods research, it shows when age relations may become a matter of conflict, the collision of ideological and institutional employers. To avoid conflicts with workers, local communities – and to be used as a reference – in their relationships with public authorities, make clear, these models, or norms, continue to influence workers’ expectations – and to be more and more put into question . Nevertheless, as several examples will make clear, these models, or norms, continue to influence workers’ expectations – and to be used as a reference – in their relationships with public authorities, with their wife and children, with (former) colleagues, and with non-Gécamines workers. At a more general level, the paper suggests that, far from being limited to ex-Gécamines workers, this paternalistic “moral economy” underlies the relation- ship that most inhabitants of the Congolese copperbelt have with wage work – the individual worker as a responsible, Christian, pater familias and to come into contacts with local students. The data comes from a 2011 survey of Mainland undergraduate students in a Hong Kong university, and from in-depth interviews with them. Preliminary find- ings reveal three sets of factors that promote establishment of in-group contacts (discouraging out-group relationships) for mainland students in Hong Kong. First, differences in values, beliefs and behavior are major obstacles in establishing cross-group relations. The second factor is status homophily. Most of the mainland students are from upper-middle class or upper class families; whereas the majority of local students come from middle class or lower middle class fam- ilies. The two groups differ not only in terms of consumption patterns but also in terms of future career aspirations, making cross-group relationships more diffi- cult. The third factor is about contact opportunities. Our findings show that it is not just the presence of opportunities that makes a difference. The timing, that is, when these opportunities become available, is also very important.

"to be Controversial" - a Social View on the Russian Art Piece at the Venice Biennale in 2013 ("Russia: Never overturn")

The author analyzes the art piece, which was established on the basis of na- tional competition concept art with the focus of Russian national idea. The ro- ly-poly, a 5-meter-high dynamic sculpture, featuring a wooden log crowned with a double-headed eagle, which rises back up when pushed over, is showcased at Ly-pol (Ly-poly), a 5-meter-high dynamic sculpture, featuring a wooden log crowned with the symbol of life and death. First, it brings up the media case of “disposable lives” of nursing homes, and mixed methods research, it shows when age relations may become a matter of conflict, the collision of ideological and institutional employers. To avoid conflicts with workers, local communities – and to be used as a reference – in their relationships with public authorities, make clear, these models, or norms, continue to influence workers’ expectations – and to be used as a reference – in their relationships with public authorities, with their wife and children, with (former) colleagues, and with non-Gécamines workers. At a more general level, the paper suggests that, far from being limited to ex-Gécamines workers, this paternalistic “moral economy” underlies the relation- ship that most inhabitants of the Congolese copperbelt have with wage work and institutional employers. To avoid conflicts with workers, local communities and public authorities, the mining companies that came in Katanga during the last decade have but no choice to take such expectations into account. By doing so, they contribute to the emergence of a new form of paternalism, distinct from the one developed by Gécamines in the 20th century.

Aires De Discordia: Autonomía, Territorio y Relaciones Interétnicas Ante El Avance Eoleolétrico En El Istmo De Tehuantepec

The expansion of the eoleolétricos en el istmo de Tehu- antepec has dado lugar a un número importante de conflictos sociales. En una región socialmente diversa, los actores de tales conflictos han sido propietarios privados, ejidatarios y comuneros, pueblos, autoridades y empresas. Si bien no todos los conflictos han escandalizado y la gran mayoría no se han negociado, una resolución ha sido el único objetivo del proceso.

From the U.S. and Australia who travel to India for surrogacy purposes. Among both Indian surrogate mothers and commissioning parents, industries assert that the baby is a commodity, or contest that the baby is a gift.

Are the babies born through commercial surrogacy commodities or are they gifts? Based on interviews with seventy surrogate mothers and thirty-one egg donors who live in Bangalore, India, and twenty families who reside in various parts of the U.S. and Australia and have engaged in surrogacy in Anand, Delhi, and Mumbai, I pose three interrelated questions:

1. What do surrogate mothers make of the commodification of their pregnancies? Is pregnancy a part of a gift relationship, or is it a market relationship for which they receive wages?

2. If the newborn baby is a gift to the commissioning family residing in India or elsewhere, then what is the ongoing relationship between surrogate mother as gift-giver and commissioning parents as gift-receivers?

3. Conversely, if pregnancy is wage labor, then how does one make sense of the baby as a commodity, a product of market pregnancy?

Beginning with Tittmuss’s seminal The Gift Relationship, where he endorses the virtues of blood donation in the U.K. versus the demerits of blood distribution as a commodity in the U.S., the social circulation of bodily fluids, tissues and organs is well examined (Rabinow, 1999; Scheppe-Hugers and Wacquant, 2003; Waldby and Mitchell, 2006). Reaching back to a much larger treatise on the gift (Mauss, 1923; Levi-Strauss, 1969; Rubin, 1975; Bourdieu, 1988), and commodification (Polanyi, 1944; Hochschild, 1983, 2003, 2012; Boris and Parrenas, 2010), I ask why the various agents involved in global intimate industries assert that the baby is a commodity, or contest that the baby is a gift.

This paper contributes to the growing literature on intimate industries (Parrenas and Silvey, forthcoming) through examining the meanings attached to markets in life itself among both Indian surrogate mothers and commissioning parents from the U.S. and Australia who travel to India for surrogacy purposes.

Coping with Discrimination. From Subjective Experience to Social Consequences of Discriminations

To what extent studying discrimination from the subjective experience of discriminated persons throws new light on the sociology of discrimination? Whereas most of the studies aim to measuring discriminations (usually with quantitative methods) or aim to evaluating policies implemented to reduce them, the point of view of those who are discriminated or susceptible to be discriminated is less often analyzed. This last perspective is at the core of the research this communication is based on. Our research has been led in France using 4 sociological interventions and 220 interviews with persons concerned by discriminations due to their origin, their culture, their sexuality or their sex. (Dubet F., Cousin O., Macé E, et Rui S. (2012), Pourquoi Moi ? L’expérience des discriminations, Paris, Seuil.)

Our study emphasizes the gap between the subjective experience and the objective situations people go through. The experience of discrimination is therefore determined by structural and individual factors, by institutional, economic and social practices, but also by subjective experiences. We will focus on the way people cope with the discriminations, the way they avoid, resist, ab-"
The susceptibility of different territorial units to be affected by natural hazards has been usually associated with the nature of the hazard itself, together with the socio-economic conditions of the local population. However, the political conditions that underlie planning and emergency response are usually overlooked. We argue that vulnerability varies in relation to the political inequalities regarding law enforcement, effective planning, land use control, environmental knowledge and resources availability among different territories in response to hazards; and these inequalities would significantly influence vulnerability outcomes of municipalities subject to similar hazards. This paper reviews the debates of political inequalities and their spatial effects. It also discusses the differences in vulnerability outcomes in different territorial units in Mexico, associated with such inequalities, from a qualitative comparative approach.

Participación Social Ciudadana. Reflexiones Desde El Pensamiento Comunitarista De Amitai Etzioni

La participación ciudadana, desde la aparición de las Tecnologías de la Información y la Comunicación (TIC), ha experimentado una radical transformación. Las teorías clásicas sobre participación social y creación y desarrollo de comunidades, se encuentran con el reto de adaptarse y contrastarse con los nuevos fenómenos de desarrollo tecnológico. Internet y las herramientas 2.0 tienen en común la participación colectiva mediante procesos de colaboración e intercambio con otros usuarios. El cambio de mentalidad que supone esta nueva forma de comprender y utilizar internet desarrolla interacciones peculiares. Los individuos establecen relaciones de roles y las redes personales se convierten en lo más importante, creando comunidades antes insoportables.

Esta comunicación se centra en el estudio del pensamiento de Amitai Etzioni, uno de los principales investigadores sociales sobre la creación y desarrollo de comunidades, y pone en relación su pensamiento clásico sobre participación con sus aportaciones recientes a la luz de las nuevas posibilidades de participación ciudadana.

Cycles of Contention Post-Apartheid: A Challenge to Current Theory

Since 2004 South Africa has been undergoing a wave of protests predominately led by the unemployed within South Africa’s impoverised townships and informal settlements. This protest wave reached a peak in 2012 where it has been estimated that there was an average of three protests a day (IRS, 2012). Furthermore, there has been a discernible rise in industrial unrest with an increasing number of wildcat strikes occurring as workers choose to take their demands outside organised trade unions and collective bargaining processes. The intensity of this movement and the hostility of the State to it was tragically highlighted by the events at Marikana in 2012. This upsurge in contentious politics falls within a wider global cycle of contention. This paper uses the South African experience in order to challenge Tarrow’s theory of cycles of contention in order to advance social movement theory from a Southern perspective. It will be argued that Tarrow’s framework, and social movement theory more generally, pays insufficient attention to the specificities of capitalist development. This paper seeks to expand social movement theory and the analysis of popular protest through an examination of the specificities of capitalist neoliberal development and how this has shaped the working classes post-apartheid. The paper will demonstrate how a greater emphasis on the role of capitalism within social movement theory has much to contribute not only to the understanding of protest and social movements in South Africa but also for the analysis of the global cycles of contention.

Independent Cultural Centres As Amenities in Urban Regeneration

This paper reports results of a research project on 15 independent cultural centres around Europe. These specific sites, promoting culture and arts and related industries, have often acted as “urban pioneers” in their neighbourhoods, converting spaces considered “difficult” in size or because they are listed properties. The centres involve combination of different creative actors and action. They are professionally managed, and agree that visionary leadership is essential to succeed. They are usually organised as independent associations, but require acceptance and partnering of cities, often as owners of the properties. However, not all of them are dependent on subsidies, even in the form of land rent, but illustrate other examples how to organise such activity.

The paper discusses the role of independent cultural centres in urban regeneration. The current literature acknowledges both the supportive role of such activities in place-making and providing spaces that the market otherwise does not, but also highlights the paradox that if a development becomes commercially successful, rising rents may lead to their displacement, which eventually also lessens the character of the whole area. This study argues that instead of transitional activity in a particular property, planners should consider independent cultural centres as new kind of civic activity supporting heterogeneity and mix in changing urban areas. This use of vacant spaces should be conceptualised as amenity—non-profitable venue that has broader significance for area’s atmosphere and liveability.

RUSER, ALEXANDER* (Hertie School of Governance, ruser@hertie-school.org)

It’s Climate Change, Stupid! The Role of Think Tanks in Maintaining a Knowledge Divide in Climate Politics. Evidence from Germany, the United States, Japan, and South Korea

‘Global environmental inequalities’ are often used synonymously for the asymmetric tragedy of the commons problem posed by anthropogenic climate change: polluters (mostly countries in the developed world) are less affected and more capable to deal with the consequences of global climate change than the less industrialised countries in the global south. An important aspect of this problem is the rejection of national responsibilities or the outright denial of climate change by important emitting countries.

The consequences of environmental degradation and climate change can be felt directly at the local level. In contrast, public awareness as well as an understanding of the complex interplay of local and global aspects by national electorates is highly dependent on the production and distribution of scientific knowledge. While the production of relevant knowledge is institutionalised at the international level (e.g. IPCC), national level knowledge production and modes for distributing it to political elites and the wider public differ considerably. To estimate the impact of diverse patterns of knowledge production and distribution on ‘climate scepticism’, I will focus on the influence of environmental Think Tanks. Think Tanks are said to provide applied research and impartial advice as well as political advocacy in ‘scientific disguise’. It’s therefore important to analyse their network ties to government authorities and among each other in order to estimate whether they are part of an epistemic community or forming advocacy coalitions instead. Linking the findings for selected countries (Germany, the United States, Japan, and South Korea) with the theoretical framework of differing ‘knowledge regimes’ helps estimating the consequences of an unequal access to and the distinction between a biased and a more neutral presentation of scientific findings for national climate politics and international burden sharing alike.
Consuming Cuteness: The Visual Code Of Youth In Kawaii (cute) Fashion Subcultures

The kawaii (cute) fashion subcultural scene of Harajuku, Tokyo, presents a complex visual sphere in which youth produce and circulate images through the consumption and design of clothing products. This paper examines the power that the image can have in bringing together young designers and consumers. Using visual data from Harajuku and qualitative interviews with key cultural producers, it unpacks the idea that aesthetics in fashion subcultures can be used to signify wider thematics in the subculture. This paper aims to revive the use of semiotics in the study of fashion subcultures, working under the Birmingham Centre for Contemporary Cultural Studies’ premise that there is resistance within fashion subcultures which is symbolic and counter hegemonic. It also integrates a discussion of cultural industries to map out how these images and their related mythologies are produced and circulated in the subculture. It combines the literature from these three fields to examine the ways in which kawaii fashion subcultures engage with residual and emergent social cultural forms, particularly pop culture. Youth in kawaii fashion subcultures claim images of childhood, and arrange them into a system of signs mediated through fashion styles as a form of symbolic resistance to hegemonic norms of Japanese adulthood. The clothing of kawaii fashion subcultures allows for self-transformation, as prints, motifs and textiles are used to signify individual identities and collective dreams centered around cuteness and passive doll-like archetypes. The streets of Harajuku become a public theatre in which participants act out these identities, utilizing a complex code of cuteness to communicate ‘authenticity’ to other subculturalists. Over the past decade, the subculture has been commercialized, and new codes are mediated through specialist magazines and shop fronts. This raises further questions around the extent to which subcultural resistance is formulated around active image making or consumption.

Population and Forest Land Use Cover Transition: The Case of Brgy.Puting Lupa, Mt. Makiling Forest Reserve, Laguna, Philippines

Theoretical propositions about the adverse impacts of population growth to the natural systems have found grounding in many empirical-based literature since the environmental discourse became global. Neo-Malthusians predict ecological destruction when there is unrestrained population growth coupled with advancement in technology and increase in per capita affluence in a society. When industrialization in Calamba legitimized by local and national policies materialized, the Makiling Forest Reserve (MFR) became vulnerable to on-site and off-site environmental pressures. In 1990, the University of the Philippines Los Baños (UPLB) was vested exclusive jurisdiction, control, and administration over MFR and in the following years, adopted a ‘participatory’ approach to management. Chronologically following the implementation of these policies is the abandonment of agricultural clearing and development of state-owned forest land near the MFR buffer zone in Barangay Puting Lupa. Results of this study show that forest land use transition occurred in MFR-Calamba characterized by first, deforestation and forest land conversion to agriculture, then to gradual forest recovery. Spatial analysis of the 1993-2002 Calamba land cover shows that forest cover increased by 18%, agricultural land use decreased by 34.9% while built-up areas expanded by as much as 79%. Albeit forest land regenerated through time, land cover changed from forest species to agroforestry specifically in Barangay Puting Lupa. While industrialization is associated with increase in population and eventual environmental degradation, this study suggests that there are other socioeconomic elements that interact compatibly with each other to arrive at a different scenario of forest regeneration. Seemingly contradicting but synchronous commitments of policies of the university and of Calamba among other socioeconomic factors have a synergistic effect that amounts to the improved forest land use cover transition in Barangay Puting Lupa despite increase in population and pressures of industrialization.

Labor and Populist Politics in Ukraine

This paper looks at the labor movement in Ukraine by considering two types of workers’ power (as defined by Wright): structural, resulting from their position within the economic system; and associational, contingent on the ability to form collective organizations – unions, parties, workers’ councils or community organizations. Silver’s observation that the role of workers’ associational power is growing in the XXIst century and that therefore perspectives of the labor movement are conditioned on the broader political context, requires us to extend the definition of associational power also the alliances between labor and political movements. This paper discusses consequences of alliances between Ukrainian workers and various political projects since the break-up of the USSR, focusing or programs do not focus on stimulating women's critical consciousness and their capacities to articulate their interests individually as well as collectively. It's indicated that women's roles as economic actors are being positioned as instrumental roles, not substantive/transformative ones. The main root of this issue refers to the weakness of local government commitment and capacity which can not be separated with the national agendas on economic development. And the agendas might be based on economic assumptions (blinkers) that tends to disadvantage women's conditions as well as positions. It's been reflected from several regions in Indonesia.

Referring to Chafer (1988), empowerment as structural transformation efforts – which only possible if local (also national) economy policy responsive to women's economic right. In term of relation between state and women, the other crucial issue is to enhance or to empower women's commitment as well as their capacities as a collective/interest group. This paper also raises women's strategies for organizing and enhancing their economic roles at local level.

Key words: Women's economic participation, local economic empowerment, institutional or structural transformation, women's collective action.
in particular on the growing support for populist demands of nationalization of key industries and natural resources, voiced in particular by a right-wing populist party “Svoboda” as well as by the Communist party. The paper questions long-term perspectives for the labor movement if populist politics take on a right-wing flavor, and a left-wing populist alternative is lacking. Furthermore, it discusses the role that politically-engaged social scientists can play in evaluating labor movements alliances with various political projects and in strengthening workers’ associational power.

RYAN, LYN* (Macquarie University, Australia, lyn.ryan@mq.edu.au)
Ageing, Ageism and Discrimination

In Western society our populations are ageing, and even developing nations are showing increases in elderly populations. This is due to declining fertility, advances in healthcare services, leading to greater longevity, immigration rates not keeping up with ageing, and also the Baby Boomer generation began to turn 65 in 2011. Older age is an inevitable part of life but some people use stereotypes of older people to discriminate against them due to their biological age. People hold views about ageing people which are not consistent with their views about other people and this forms the basis of prejudice, discrimination and ageism. While respect for elderly people has been a prominent part of Asian cultures which upheld Confucian principles, respect for the elderly has not been given such a prominent place in the history of Western society or its discourse. Issues around egregious abuse, such as financial abuse have been commanding the attention of most social science researchers studying the maltreatment of older persons since the late 1970s. The more subtle, everyday experiences of disrespect, which arguably is a precursor to more notorious forms of abusive and violent behaviour; or respect which, arguably, can prevent such abuse from occurring, are less researched. Therefore, respect for elders is defined and disrespect versus respect, ageism, personhood and the quality of life of elderly people are all discussed.

Society categorises older people into socially constructed age groups. It is important to recognise that while age has a biological meaning, income, work and retirement construct groups and meanings about age that may reflect negatively on older people and, therefore, lead to experiences of disrespect amongst our older population.

The Doctor-Patient Relationship and Type 2 Diabetes: What Can We Learn from a Cross-National Comparison of Three Qualitative Datasets?

Background: Evidence suggests that higher levels of patient involvement results in more beneficial care. Patient involvement can be higher in long term conditions, such as type 2 diabetes, where self-management is important. But we need to better understand what happens in the shared decision process and which factors contribute to the inherent inequalities. In this paper, we explore models of doctor patient relationship in three qualitative datasets from Germany, Spain and the UK. The data were originally collected to explore the experiences of patients with type 2 diabetes. Lay summaries are published at www.krankheitserfahrungen.de, http://www.dipex.es, www.healthtalkonline.org.

Methods: A secondary analysis of the datasets using a two strand approach. First, a thematic analysis of the individual datasets to identify models of doctor patient relationships, and examine what factors may contribute to these models. Second, a comparison of these findings to identify similarities or differences across the datasets in order to enhance our understanding of shared decision making.

Results: Early analysis suggests the importance of a trust within the doctor-patient relationship and an enduring paternalistic model in the management of diabetes. While UK patients may suggest some partnership working in the way they articulate their self-management, in practice, they do what the doctor tells them. In contrast, German participants emphasize a desire to preserve a certain level of autonomy. This was most obvious with eating and weight management, where participants reported enjoying pleasures that their GPs regarded as unhealthy.

Several Spanish interviewees experienced some lack of control from their professionals and felt their treatment was routine rather than an individually tailored process.

Conclusions: While management recommendations of diabetes are largely standardized, patient experience and expectations may differ according to cultural and national peculiarities. Interestingly, a paternalistic model is not necessarily experienced as a contrast to self-management.

Postsekularism of Modern Society: Russian Option

We observe a social request for religion and religious values comeback in the public space today. This can be observed by the example of protests actions in defense of traditional family in France, protests actions in defense of keeping crucifixes in Italian schools, the Christmas tree as a Christian symbol of Christmas in the Benelux countries, etc. etc.

The Russian society lost faith in the communist ideas at the turn of the 80's and 90's and later liberal ideas - which were approved during the epoch of liberal democratic reform of 90's - had become nothing for the vast majority of people. This happened due to the fact that neither one nor the other idea contained the core of cultural and spiritual traditions of Russian society.

At what point and why the ‘Orthodox believer’ in Russia becomes the dominant force of the modernism of social change? At the time of the Soviet Union collapse, the destruction of Soviet type societies institutional structure, during the state of anomie. At this point, the fabric of social relations becomes loose, able to sense even a small impact as triggers for deep and large-scale social change. At this point, the ‘Orthodox believer’ is gradually becoming a carrier of dominant Orthodoxy identity and ceases to be a ‘stranger’.

During the 90's and early 2000's the number of carriers Orthodox identity and Orthodox believers, including church Orthodoxy believers increased several times. ‘Generation in the way’ are those who have experienced religion and found a new identity for themselves after 1991. ‘Generation in the way’ is a notion which more or less accurately captures a new social set, which is characterized by varying degrees of perception by this Orthodox identity: from the identity of the Orthodox by self-identification to deeply churchord orthodox believer.

Chinese Migrants in the Russian Labor Market Competitors or the Driving Force of Economic Development?

This presentation shows trends in labor migration from China to the Russian Federation for the period 2000-2010, including the regions and industries of employment of Chinese migrant workers. Described economic “niches” that are Chinese migrant workers in the Russian labor market. Chinese migrants adapted to the Russian labor market quite well. Mostly of them working in Chinese companies. Social and economic component of their integration can be considered particularly successful - they have jobs, relatively high level of income for labor migrants in Russia. Chinese are known as great farmers, who know perfectly well the characteristics of agro-climatic conditions, they are much more efficient, professional, and disciplined workers than Russians. The examples of ethnic Chinese business in Russia, including those identified a strong correlation between investment and labor migration from Chinese in Russia. Currently Chinese investors in Russia are represented by investments made by large Chinese state-owned companies which purposefully invest their funds in basic projects related to development of transportation system, communications, and exploration of mineral resources in Russia. This type of investments goes through official channels, legally based on official contracts. The second type of Chinese investments includes private investments in development of business with quick pay off - trade, food service, restaurant and tourist business. In this part of investments Chinese private business is oriented at semi-legal and illegal methods of penetration in the Russian market. The presentation also discusses the features of labor migration and trade between China and Russia in the border regions of the Far East. It also describes features of the regulation of labor migration between Russia and China.

Integration of Vietnamese Migrants in the Countries of Eastern Europe and Russia: A Comparative Study

Questions of migration and integration of the Vietnamese migrants into social and economic processes of Russia, Ukraine and countries of Eastern Europe will be considered in presentation. Results of research revealed significant differences
es in the number of Vietnamese in comparison with official statistic data. So in Russia according to 2002 census number of Vietnamese made 26 thousand people, however, study results suggested 100-150 thousand people. Part of Vietnamese was “veiled” by integration process.

Based on the methodology developed by the authors, assessment of extent of integration of the Vietnamese migrants in host countries was given. The technique is based on allocation of integration components of Vietnamese in host countries, namely civil, economic, ecological, social and psychological, religious, cultural integration. Research was conducted in Russia, Ukraine, the Czech Republic, Hungary and Poland by interviewing scientists, representatives of government, business, they were offered to put points from 1 to 10 to each component.

Results showed that integration proceed differently. Vietnamese are most integrated in the Czech Republic and Hungary. According to experts, total score made 50 points out of 60 possible. State policy in the Czech Republic and Hungary was directed to the need for integration of Vietnamese in society through development of integration programs. In Hungary and the Czech Republic much of the Vietnamese citizens received citizenship in host countries, they became citizens. The success of economic integration is associated with high entrepreneurial activity, professional qualifications and access to the labor market of Vietnamese. Much less successful is integration of Vietnamese in Russia and Ukraine, civic, environmental, and socio-psychological component integration is low there. Evaluation of Russia is 40 points, Ukraine is 34 points.

Over the past few years, neither Russia nor Ukraine has developed mechanisms for integration of Vietnamese. Bureaucracy, absence of standard and legal base strongly complicated integration process.

*Higher Education and the Labour Market: A Polish Perspective*

The structural conditionality of normal sciences, including state ideologies and financial support, is essential for the structure of higher education. The system's transformation in Poland, based on the neo-liberal ideology, involved the dependent development model not only to the economy but also to science, with its dramatic decrease of expenditures. This reinforced a negative selection of the scientific cadres, who, by the inter-generation transmission of values and norms, were unable to adopt the traditional scientific ethos. The official ideology tends to transform the structure of academia in the market-oriented corporate management model. After 40 years of private institutions of higher education were established, based on the ideology of “practical” knowledge, which changed education in a commodity and the education process in a vocational training. The overproduction of formally well educated young people, hardly able to abstract thinking, resulted in a high unemployment of the youth. The government's remedy is to apply this model of education/training to public universities, which are expected to teach for the needs of the current market, notwithstanding the fact that much less successful is integration of Vietnamese in Russia and Ukraine, civic, environmental, and socio-psychological component integration is low there. Evaluation of Russia is 40 points, Ukraine is 34 points.

Over the past few years, neither Russia nor Ukraine has developed mechanisms for integration of Vietnamese. Bureaucracy, absence of standard and legal base strongly complicated integration process.

*Global Citizenship – New Pedagogical Aim or Market Strategy?*

The development of education in the globalization context poses a lot of questions, being quite a challenge for scholars. The analysis of such new trends as integration processes in education, the growth of educational migration, the involvement of international organizations and NGOs, and the education policy of national states leads to referring to the seemingly established concepts of particular features of education.

The urgency to implement educational reforms is stressed by various international organizations. One of the promulgated aims of these new educational projects is bringing up global citizens.

In recent years the concept of “global citizenship” came into a broad use in European and American educational and public discourses. However, its meaning remains blurred, and its content is interpreted very broadly.

Analysis of the global education concept takes into account current sociopolitical and scientific discourse on the concepts of citizenship, nation and state. Previous understanding of citizenship as membership in nation-state gives way to a new variety of interpretations, which are based on the concept of universal deterritorialised human rights.

The concept of education for global citizenship captures in what way this new understanding of citizenship and identity is interpreted in pedagogical discourse. Global citizenship is treated as a social engagement with the voluntary obligations undertaken, and priority is given to civil rights of the individual. It still stays unclear in what way state educational system as the key element in nation-state gives way to a new variety of interpretations, which are based on the concept of universal deterritorialised human rights.

In the 2000s, the landscapes of leisure consumption have changed dramatically in the Western societies. Many traditional industries such as tourism, sports, and cultural activities continue to flourish. In addition, the new information and communication technologies (ICTs) have become widely adopted in everyday life. Access to ICTs is often considered as essential while at work, home, and even when spending free-time outdoors. As the alternatives for productive leisure activities have increased, we have also witnessed a trend of narrowing population disparities in the consumption patterns. Against this development, it is possible to argue that engagement in various leisure activities has become more versatile and less connected with individuals' socio-demographic background. But does this assumption also apply to older consumers, people living outside urban and densely-populated areas, economically less well-off people, single parents, and the less educated population segments? Or, is it possible to argue that the expenditure patterns of the many disadvantaged population segments have changed differently from those of the better-off segments during the past decade? The paper examines temporal changes in leisure consumption by examining Finnish household expenditure patterns between 1998 and 2012. The data are derived from nationally representative set of household budget surveys (N= 17,412). Empirical analyses will concentrate on money allocation on cultural services, books and magazines, arts and culture, media and technology. In the analysis, structural disparities by educational level, economic background, age and life-stage, gender, and place of residence will be compared.

How Can Decision-Makers Cope with the Heterogeneity of Values in Public Innovations

In the last two decades the concept of innovation has been taken from Schumpeter's logic of competition at the market to the public sector. In the private sphere the making of profit is essential, and added profit can be seen as added value. For the public sector this is much more complicated, and it has been a large debate about the concept of "public value" since the publication of Moore's book "Creating Public Value" (1995). Values in the public sector can both be inputs (public ethos) or some sort of outcome (efficiency, improved quality etc.). But both for input and outcome there will be a heterogeneity of values. Beck Jørgensen & Bozeman (2007) are mentioning a "universe of public values". In the invitation heterogeneity is understood as the "coexistence of different rationales". We will argue that different set of values can be seen as different rationales. Creating new and innovative solutions in the public sector is part of the struggle for power in society. Different actors will use different parts of the "universe of values" to support their arguments. To get a decision the parts will have to bargain with others about the blend of values they try to realise. The context will influence the weight of different values.

The paper will discuss how the heterogeneity of values is treated in decision-processes in public sector. We will draw on relevant literature about "public values", but especially on the case-studies in our edited volume "Framing innovations in Public Sector Services" (Fuglsang, Rønning, Enquist (eds.) (Routeledge Oct 2013))

Innovation in Nordic Elderly Care

Innovations has for some decades now been seen as the engine for success in the competition at the market. Now the concept of innovation has made its way into public sector and even into elderly care. This paper is about the efforts to innovate elderly care in the Nordic countries. In many European countries there is a worry about the demographic changes in the populations. The declining fertility rate and numerous cohorts from the after Second World War baby boom fading out of the labor market, are a challenges for the pension system and the economy, as well as for the caring system. The challenges of the caring system are the focus for this chapter, especially the need for labour, or caring hands. The diagnosis is that too few people have to care for too many frail and elderly. Even if the Nordic countries do not have the most challenging rates between the generations, a caring deficit is seen as a growing and upcoming problem. In 2050 20% of the population is expected to be above 70 years, rising from 10% which is the situation today.

Most attention will be paid to the Norwegian situation. Because of the fortunate economic situation in Norway, the country has probably been able to maintain a (Nordic) model with a strong public responsibility to a larger extent than their neighbors. Attention will be given to three of the main paths to innovations of the elderly care in the Nordic countries, we have labeled them privatization, use of caring technology and extended use of voluntary work.

The paper is meant to be a "state of the art" paper, summing up the experiences so far, and reflecting on possible paths into the future.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
neoliberal principles of global justice. This suggests that individuals are guided by a complex justice belief-system that encompasses both neo-liberal global principles and the social-justice tenets of the domestic arena, creating co-existing and at times contradictory social justice judgment profiles.

Clinical Sociological Analysis Of The Issues And Challenges To Healthcare Delivery In Nigeria Today

Clinical Sociological Analysis Of The Issues And Challenges To Healthcare Delivery In Nigeria Today By Abdul-Mumin Sa’ad Professor of sociology (Criminology) Provost, Federal College of Education, Yola, Nigeria And Ruth Bulus Iganus Medical Sociologist, Department of Sociology and Anthropology University of Maiduguri, Maiduguri, Nigeria Abstract Health care delivery refers to the work done in providing primary care, secondary care and tertiary care, as well as public health. Health care is delivered by practitioners in medicine, chiropractic, dentistry, nursing, pharmacy, allied health, and other care providers such as medical social workers, clinical sociologists, etc. Constitutionally, health care provision in Nigeria is a concurrent responsibility of the three tiers of government. However, private providers of health play a visible role in the country’s health care delivery. The federal government’s role is mostly limited to coordinating the affairs of the tertiary health care (university teaching hospitals, Federal Medical Centres) while the state government manages the secondary health care (the various general hospitals) and the local government focuses on primary health care (dispensaries). In spite of this clear constitutional provision there are myriad of challenges regarding healthcare delivery in Nigeria. Of course health issues have always been issues that nations grapple with. Added to this is the fact that natural and manmade disasters are becoming frequent, catastrophic and unpredictable and these are posing great challenges to healthcare delivery. Nigeria, being an underdeveloped nation is even more vulnerable to these challenges. This paper therefore identifies and discusses these challenges and proffer solutions to them from clinical sociological perspective with a focus on the need and strategies for active collaboration of all stakeholders (especially the Clinical sociologists, healthcare professionals, the government, the organized private sectors and the society generally) to effectively surmount the challenges.

SABBAGH, CLARA* (University of Haifa, csabbagh@edu.haifa.ac.il)

The present study identifies major preferences for combinations of rights and duties (henceforth, citizenship orientations), as reflected in the political world-view of Israeli junior-high school students. Two distinct orientations were found, termed here “liberal” and “ethno-republican.” In order to contextualize the examination of citizenship orientations in the deeply divided Israeli society, the study compares three educational sectors which represent these rifts. Findings suggest that citizenship orientations are context-bound, in the sense that they depend upon the educational sector. As expected, ethno-republican orientations were more salient in the Arab schools. On the contrary, the Islamic schools (Higher among either secular Israelis and Israeli Arabs students. Secular-Jewish and Israeli Arab students tend more strongly to endorse the liberal orientation, a propensity that is especially manifest among Arab adolescents. This trend supports the perception that Israeli Jewish population is bifurcated.

Betwixt and Between Global and Domestic Forms Of Justice: The Israeli Case Over Time

This article elaborates on the global/domestic binary division in the social psychology of justice judgments. We analyze the interplay between global and domestic perspectives on justice behavior and theoretically represent and empirically examine the dynamics of a society’s domestic system of distributive justice within a global context. The intersection of these two contesting, though intertwined, perspectives of justice is explored in the case of Israel. Integrating conceptualizations of neoliberal globalization, social justice, and the socio-cultural and historical conditions of Israeli society, we gauge the effect of macro-level globalization trends on the Israeli domestic ‘spheres of justice’ as evaluated by a representative sample of secular youth. We find that neoliberal globalization trends present a considerable challenge to Israeli Zionism’s foundational pioneering ethos. Yet the 2011 cohort of Israeli adolescents have not unanimously embraced societal participation in efforts to address climate change. Do awareness and knowledge actually translate into tangible efforts?

Correlation analyses reveal significant relationships (moderate to strong) between awareness and knowledge on climate change and these variables: locale (higher among urban dwellers), socio-economic class (higher among upper class– and educational attainment (higher among those with greater education). Climate change resonates on average Filipinos as a public health issue. When asked to identify the effects of climate change, half of them cited “increased incidence of illnesses”—significantly greater compared to other responses such as degradation of natural resources, ozone layer depletion, and rise in sea level. Participation in efforts to mitigate climate change is higher among those in rural areas and the youth (with moderate to strong correlations). There exists very weak relationship between awareness on climate change and participation. However, there is moderate evidence to support that those with more extensive knowledge on the impact of climate change also have greater tendency to participate in actions on climate change.

From Facebook to Parliament: Civic Participation through Social Network Organizations Between Success and Failure

Computer Mediated Communication has given access to political participation to an ever increasing number of citizens around the world mostly regardless of their ideological, social, ethnic, economic background. People living in different Countries or even who have voted for opposite parties for years may unite for a single issue purpose, for a protest, a petition, for organizing a revolt or a deeper change in government. The No-Global Movement years ago and, more recently, the Arab Spring have proved the possibilities of the Net in terms of political organization and impact. In Egypt and in Italy things have gone even further: Social Networks have become the means and the place for civic organization that later were transformed into political parties running for government. The paper will analyze possibilities and limits offered by the Web-Democracy in relation to these two recent examples.

RC26-457.2

SACCA, FLAMINIA* (Tuscia University, sacca@unitus.it)

Web Democracy and Digital Rhetoric

The relationship between communication and politics has always been a tight one, but information technologies have taken this relationship a step further: in many cases they are no longer just a mean through which political parties or movements disseminate policies, slogans and values processed off line. This process has now been reversed: they have become the means and the place where policies, decisions, slogans and positions are discussed, elaborated and voted. They have turned into a milieu of political organization as the Tahar Square Movement in Egypt and the 5Star Movement in Italy have shown us, contributing to a wide-spread rhetoric over the democratization power of the Internet. But while it is indisputably true that Computer Mediated Communication allows an easier access to political discussion and participation virtually to anybody, we cannot disregard that it also carries the seeds of disengagement, self-consolation and amusement which could have the counter-effect of enhancing citizens de-democratization levels. The paper will analyze both aspects of information technologies’ impact on political processes.

SACCO, NICOLÁS* (Universidad de Buenos Aires, nsacco@sociales.uba.ar)

Argentina’s population has experienced irreversible changes in the age composition. This changes must involve the implementation of public policies related to the labor retirement that provide fair living to the retired population. Health systems and social security should be able to absorb a growing number of beneficiaries.

The socioeconomic conditions of life of the elderly depend not only on the mechanisms that provide social security systems, but the role that family and relationships between them. In the past, large families accounted for the greatest protection, however, demographic change will result in a huge change in family composition. Reducing the size of the family will have significant impacts in terms of living arrangements of older people and the relationships among its members. How did change the older population over time? How are they alike and how they differ over yesterday and today? What are the socio-demographic profile of the cohort members in the coming years who will transit to older ages?

The goal of this communication is to investigate the changes observed in the last thirty years in the demographic profile of the population of 65 old years and over, based on cross-sectional analysis in four points in time, according to census data (1980, 2010) and to describe the socioeconomic characteristics of the population over age 65 living in the city of Buenos Aires.

This should take into account current theoretical developments in sociology of population that formulate a new paradigm with significant analytical potential for understanding the phenomenon of aging (MacInnes & Diaz, 2008).

SACHSE, CAROLIN* (University of Vechta, carolin.sachse@uni-vechta.de)

Keeping Elderly Care Nurses through Organizational Commitment– An Inner-Organizational View

The demographic trend influences the geriatric care sector twofold: While the demand for geriatric care increases constantly, the number of work force declines at the same time. For 2025 a shortage of about 125.000 full time nurses in Germa-
ny is estimated (Afentakis, Maior 2010). Additionally, the problem of fluctuation in the geriatric care sector causes a competition about qualified personnel among care-providing organizations.

Other sectors already use the idea of organizational commitment to keep their employees. The basic concept of commitment (Allen, Meyer 1990) distinguishes three components: affective, continuance and normative commitment. These components are not mutually exclusive but rather coexist. So far no specific study has researched the concept of commitment considering the specifics of geriatric care.

This paper is based on preliminary results from a qualitative research project looking at this topic from an inner-organizational perspective. As geriatric care in Germany is provided by non-profit organizations as well as for-profit organizations both types will be looked at.

Results from interviews with elderly-home managers give an overview of problems about keeping qualified employees. The range of instruments, which are already used by organizations to strengthen organizational commitment and problems in everyday work, will be illustrated. In addition determining factors, which restrict human resource management in the geriatric sector, are identified.

Besides general factors also organization-linked factors are included.

Furthermore, results from problem-centered interviews with elderly care nurses provide reasons and conditions for why they work for their current organization. These results will be set into context with the Allen/Meyers organizational commitment model to specify the three commitment components in the context of geriatrics.

Finally a guideline based on the research results is presented. It will help organizations in the geriatric care sector to strengthen the organizational commitment.

SACKMANN, REINHOLD* (University Halle-Wittenberg, reinhold.sackmann@soziologie.uni-halle.de)

Education Inequality Among Shrinking Cities and Regions in East Germany

When birth rates drop the education system is the first social field to be confronted with new challenges. Due to compulsory schooling the size of birth cohorts affects the general school system quasi-automatically with dwindling enrolments. Newspapers in shrinking regions announce regularly school closings, a topic which is highly controversial both among the decision makers in charge and the affected communities. Pupils do not only have to cover larger distances to school but also the affected places fear to lose their attractiveness as a business and housing location. As the number of shrinking cities and rural areas (especially in Europe and East Asia) increases, it becomes crucial to investigate which consequences declining cohort sizes have for the school system. Are declining birth rates increasing inter-regional education inequality?

The basic assumption of the proposed paper presentation is that some cities and rural areas are more resilient than others when their schooling infrastructure has to cope with declining birth rates. Cities and rural areas have different economic bases. This is not only true when cities and rural areas are compared with each other but also within these broad spatial categories. From this point of view it can be suspected that school infrastructures in more affluent regions will be more resilient to declining birth rates than those in economically poorer regions. However, as schools are part of public infrastructure in many countries, this theoretically plausible relationship might also be modified by political decisions.

The analysis is based on school level data from East German regions for the 1990 and 2000 years. This regional focus is especially interesting for East Germany faced a very steep decline in birth rates during the early 1990s. The empirical strategy applies (fixed effect) panel regression models which are especially suited to analyse changes over time.

RC08-153.6

SACKMANN, REINHOLD* (University Halle-Wittenberg, reinhold.sackmann@soziologie.uni-halle.de)

Totalitarianism and Dead Ends in Sociology

The 20th century did not only see the rise of academic sociology, but highlighted also strife within societies that resulted in specific forms of totalitarianism. Literature on the relationship of sociology and these totalitarianisms is controversial. Some authors state that sociology is not a natural antipode to dictatorships: Some sociologists like Sombart and Michels were active proponents of totalitarian ideology, and most totalitarian regimes quite liked the technical expertise of social research.

Other authors propose that a flourishing sociology needs a certain form of society characterized by openness and tolerance to find a constructive climate for theoretical reflection, empirical research and practical relevance. From this position one might say that there is a "Wahlverwandtschaft", a structural affinity, between sociology and democracy.

The presentation will use empirical material from a case study on the development of sociology at the University of Halle between 1900 and 1990. The University of Halle is an interesting case in so far as in this East German university the sociocultural context varies between monarchy, democracy, fascism and communism. The empirical material focuses on published and unpublished work of Friedrich Hertz and Rudhard Stollberg, as well as archive material to their activities and conflicts. Specific dead ends of forms of historical sociology and empirical sociology are treated with regard to the guiding question, whether there is a structural tension between forms of totalitarianism and sociology.

Dioxin Risk Controversy in Japan

In this risk society, we are confronted to many kinds of environmental risk and involved risk controversy. Whether the risk is small or large, we have right to choose that risk or not. But we sociologist should try to grasp the quantitative size of the risk to analysis the discussions of scientists or experts in the public sphere. So I try to propose the sociological analytical method of symmetrical scientific controversy through the case study. The case I focused in this paper is Dioxin risk controversy in Japan.

Dioxin had caused a great deal of public concern in the 1990s. It was exhausted from industrial waste incinerators and municipal waste incinerators all around Japan. People around the incinerators started anti-pollution movements. And some of dioxin researches in Japan helped them and measured the exhaust of dioxins in environment. At last those movements resulted in the enactment of anti-dioxins law. However, risk studiers in Japan consisted that dioxin’s risk is not so large, according to their own risk comparative studies.

On the context of environmental movement, this kind of risk studiers may be often criticized; “they are political.” But in many cases it is not clear how it is political and on what point it is political. In this study, I analyzed the scientific paper of risk studiers and compared those of dioxin researchers. As a result, several assumptions were found in the “scientific” paper of risk studiers. Especially, average values they used are different from that of dioxin researchers. We can say this is political. And we have to pay attention to the point that this is not derive from the risk study, but it is from the attitudes of risk studiers. This distinction is important in the debate in public sphere. Symmetrical analysis can make this distinction possible.

SAEIDNIA, SAHAR* (École Hautes Études Sciences Sociales, s.saeidnia@gmail.com)

SAIDI SHAROUZ, MINA* (Université Paris Ouest-Nanterre La défense/ Mosaïques-LAVUE, France, minasaidi@yahoo.com)

Since 2006 Tehran municipality has started a pilot environmental and urban development project in Beryanak, an old southern and popular neighbourhood particularly exposed to seismic dangers. This new urban experiment, part of a wider environmental-seismic prevention project, aimed at implementing a participatory urban renewal based on a dialogue with inhabitants, the neighbourhood council, local associations and with a scientific mediation of a research unit of anthropologists and town planners.

This project involving professional and social dialogue was innovative in Tehran, where a centralized and technical approach was traditionally favoured. More broadly, it reflects the participatory shift in urban policies illustrated by the decentralization law of 1997 and the creation of elected neighbourhood councils in Tehran in the 2000’s.

This paper will examine this complex dialogue and the way neighbourhood councils have progressively positioned themselves as key actors of urban development in Tehran. Indeed these collaborative and participatory organizations designed to integrate ordinary citizens to the definition of their city’s public policies, have encountered many difficulties to fit in the local political space. Thus, this paper will focus on the different conditions and modalities of mediation and cooperation in the Beryanak project and how they evolved through time. We will both study the structure of the dialogue, mainly the habitus, backgrounds and representations of the actors (town planners, neighbourhood councils, municipality, etc.), and the tensions, conflicts or the asymmetry between them in terms of positions, knowledge, power and or resources.

This paper is mainly based on a long-term field study conducted in Beryanak (Teheran) since 2006 (participant observations of deliberative experiences, project’s meetings observations and semi-structured interviews with City advisors, neighbourhood councillors, citizens, researchers, state representatives, religious field actors, etc.).

RC12-226.2

SAEKI, MASAHIKO* (Chiba University, m-saeki@chiba-u.jp)
The Impact of Sentencing Decisions about Similar Cases and Others’ Opinion on Sentencing Decision

In 2009, Lay judge system started in Japan. Under this system, lay judges and professional judges determine guilty of crimes and sentences to the convicted criminals. After the determination of introduction of this system, some scholar have explored how that decision making is done by psychological experiments –mock trial study. However, the research which employed this method focused on private lay judges' decision, not outcomes after deliberation. It is due to the difficulty of conducting mock trial study with deliberation.

Of course, the results of this research are useful when thinking about modi-
fication of trial procedure. However, the determination of sentences to the con-
victed depends not privately, but is done through deliberation by lay
judges and professional judges. In this paper, the impact of information which is
given to lay judges is examined. In trials and sentencing deliberation, lay judges
look graphs about past similar cases. This is basically shown in the form of graph
of distribution, and it has powerful effect on lay judges' sentencing decision.

In a psychological experiment, the impact of that graph and participants' opinion
about how useful that graph is and how respectfully we should treat that graph
are explored. In addition, there might be conflicting opinion with regard to sen-
tencing outcomes by other lay judges. In the same experiment, reactions to those
different opinions are also examined. This psychological experiment did not in-
clude sentencing deliberation itself, but due to that experiment, some important
aspects about sentencing deliberation can be explored.

In this paper, the results of the psychological experiment are shown. Then,
some practical implication about trial procedure is discussed based on the re-
sults. Especially, to incorporate general public opinion into judicial system is one
of the goals of Lay Judge System in Japan. Therefore, the results are examined
from this perspective.

RC41-692.4

The Demographic Transition and Subsequent Transitions: The Case of the United States

The United States has experienced major demographic shifts throughout its
history. Like many other developed countries around the world, the traditional
demographic transition associated with declining mortality and declining fertility
has spawned subsequent demographic transitions. These transformations have
included the urban transition, the marriage transition, the household transition,
the aging transition, and the race/ethnic transition. Of these transitions, the two
most prominent at the beginning of the 21st century are the latter two— the aging
transitions and the race/ethnic transitions. In particular, the country is in the pro-
cess of aging rapidly as the large cohort of baby-boomers start reaching age 65
between 2011 and 2029. In addition, as the white population begins to decline
due to low fertility and major aging, the Latino population due to its youthfulness
will dominate the nation's population growth. Indeed, population projections
suggest that the Latino population will more than double from 50.5 million in
2010 to 111.7 million in 2050 compared to a 5 percent decline in the white
population from 196.8 million to 186.3 million during this period. These major demo-
ographic transitions will have major impacts on demographic, social, and economic
trends in the coming decades and in many ways is likely to lead to varying expe-
riences between the United States and those of other developed countries.
The implications of these trends in the future of the United States will be discussed.

RC05-112.3

The End(s) of Diversity: the Struggle Between Nationalism and the Hyperdiverse City

In the framework of the FP7-project Diversities, we investigate how urban pol-
cymakers deal with the increasing hyperdiversity in European cities (Tasan-Kok,
van Kempen, Raco & Bolt, 2013). In reaction to migration and the intense di-
versification of the population, nationalist parties have gained electoral success
in several Western-European cities. As a political ideology that focuses on con-
structing and maintaining a homogeneous nation-state, nationalism seems to be
at odds with the hyperdiversity in contemporary Western-European cities. Char-
acterized by the coexistence of people with very diverse socio-economic and eth-
no-cultural backgrounds, the hyperdiverse city is an anomaly to most theories of
nationalism. While authors like Anderson (1983), Gellner (1983) and Smith (1986)
explained nationalism on a countrywide or regional scale, little has been written
about the relationship between nationalism and the city. In this paper, we want to
address the question how nationalist policies deal with hyperdiversity in the city.

In order to answer this question, we take the example of Antwerp in Belgium.
As the largest city of the Flemish region, Antwerp is an interesting case because of
the electoral success of Flemish nationalist parties on the one hand and the diver-
sity of its population on the other hand. While extreme right-wing Flemish nation-
alisim has long been relegated to the opposition, a moderate Flemish nationalist
party recently came to power in Antwerp. Based on a critical discourse analysis
of policy documents and interviews with policymakers, we compare past and
present integration policies regarding immigrants in Antwerp. This comparison
illustrates how urban integration policies have shifted away from multicultural
assimilationist policies. Serving nation-building ideals rather than the pragmatic
inclusion of immigrants in the city, the nationalist assimilation policies seem to
be ill-equipped to deal with the increasing hyperdiversity in the contemporary
Western-European city.
support to the world-society approach; cultural-institutional divisions retain and, eventually, even increase their influence.

SAGAWA, TORU* (Kyoto University, waraji.1125@gmail.com)

**Empirical Measurement of Integration & Cohesion in East African Battlefield**

The Daasanach in the border regions of Ethiopia, Kenya, and the South Sudan have fought with neighboring pastoral groups, viewed as "enemies", for more than a half-century. The Daasanach claim that their primary motive for going to war is the demarcation of masculinity, allowing men to be recognized as "brave" by community members. Various cultural mechanisms praise the "brave man" who kills a member of enemy group and who raids their livestock. Since the 1980s, the proliferation of automatic rifles in East Africa has increased the seriousness of conflicts. It has been reported that the youth are drawn to the destructive power of the automatic rifle, and their behaviour is carelessly destructive of the social order. However, many Daasanach youth told me that recent war experiences with automatic rifles had led them to "renounce war". Two main types of experiences contributed to such decisions. First was the bodily (including "physical" and "mental") pain of war, such as being grazed by a bullet or surrounded by dead bodies. Second was the shameful conflict that could occur among the Daasanach during the course of a war. In wartime, the unity of "we Daasanetch" could break down under the violence. Many persons who "renounce wars" said, "I became cowardly" as a result of such experiences. In this presentation, I will discuss how the change of weapon influence on the forms of war and bodily experiences in the battlefield, and how people reflect their pain and suffering in the battlefield to their life.

SAGGAR, SHAMIT* (University of Sussex, shamit@essex.ac.uk)

**Empirical Measurement of Integration & Cohesion**

The empirical measurement of the integration and cohesion impacts of migration throw up key conceptual, practical and sociological challenges. The paper features the findings of a study of such impacts in the UK commissioned to develop evidence-based public policy. Integration and social cohesion are elusive concepts that are defined in different ways. There are impacts on national identity. Measures here refer to perceptions of feeling or belonging to a national society. In the British case, the trend over time is of a move from an ancestral understanding of identity, couched in ethno-cultural fixtures, to one based more on civic values and responsibilities. Secondly, migration impacts on integration, defined as group outcomes set against the societal average. Here migration's impact assumes a great deal of importance—as migration and policies that modulate migration have impacts on trajectories. Notwithstanding that the choice of measure is critical, it is clear that different immigrant groups perform very differently. Finally, migration impacts on integration, namely how migration affects neighborhoods, and is defined by people's perceptions of how people get along with each other in their local area. The paper reports UK empirical measures of this in two ways, first by perceived positive or negative changes in neighborliness and in respect and interaction between social groups; and second by levels of trust in local institutions (such as the police). The findings suggest that new migration does not notably affect cohesion but pre-existing diversity and high levels of poverty are predictors of lower social cohesion. There are important insights for social researchers examining issues around the size of migrant communities and for policymakers in respect of managing the pace of change in neighbourhoods.

**Aimless or Flexible? the Consequences of Uncertainty in Youth Career Plans**

The aspirations of young people have been extensively studied, and were key variables in early status attainment research in the late 1960s. The link between youth ambitions and eventual educational and occupational outcomes has never been doubted, although the ways in which the variables are related has been debated. Throughout this 50-plus years of research, it has always been thought that all young people had ambitions, but that how much, and for what attainments, needed to be explained. Only recently have researchers begun to pay more attention to the significance of youth's uncertainty about what they want to do later in life. Some researchers have referred to this as aimlessness or role exploration. Yet this uncertainty can be also viewed as flexibility which is typical or even beneficial in a world in which life-long careers are a thing of the past. In this study we investigate the consequences of uncertainty shown in youth educational and occupational ambitions. We conduct our study from a longitudinal perspective, and use the 2003 Cohort data of the national Longitudinal Study of Australian Youth (LSAY) which involved over 10,000 students. Following this cohort of youth between ages 15 and 24 we will examine the consequences of uncertainty in educational and occupational ambitions focusing specifically on differences between those with and without aspirations and the possible various reasons behind them. We also discuss the implications of our findings for theories of youth social/psychological development, career development, and occupational attainment.

**5 Pm-10 Pm: Interrogating Domestic Inequality**

William J. Goode proposed rightly that world revolution toward industrialization and urbanization has led to the change in family pattern from extended towards conjugal. Talcott Parsons emphasized that in the absence of extended kinship ties, nuclear family has become important in the respect that it meets two major societal needs: socialization of children and satisfaction of emotional needs of family members namely husband, wife and dependent children. Modern nuclear families and their members i.e. husband and wife are not handicapped by multitude of obligations often conflicting to extended relatives and can take full advantage of occupational opportunities. Demands of modern industrial life and more recently globalization have brought about myriad of changes in the way in which traditional gendered roles and division of labour was constructed. Women today are empowered, independent, working in the public space along with the man. But what we need to interrogate at this juncture is how far the division of labour and responsibilities between spouses inside family space become degendered? Do we have a situation of role-reversal for both the genders or do we have a situation of role addition/burden for the female gender. Contemporary educated, urban woman is a career woman working in the office from 10 am to 5 pm like her male counterpart, but after coming back home she has to play the traditional, ascribed role of the mother, wife, care-giver, nurturer and home organizer. Inside the woman working and earning, there is internal stratification of family life, in which men are in a more advantageous position. Husband-wife relationship can be identified as power relations, in which men dominate over women. Ideological legitimations of gender inequality are more often than not internalized by women themselves. My paper, on the basis of primary data would examine this gendered inegalitarian domestic space in Kolkata.

**Changing Food Consumption Practices Among the Emerging Middle Classes in Metro Manila**

This paper will present preliminary research results from an ongoing research project that considers the dynamics of food consumption among the middle classes in Bangalore and Metro Manila, including consumption patterns, practices and policies. Asia is often seen as the center of gravity for the “new consumer” phenomenon, where a rise in affluence can translate to consumers who enjoy better diets, private transport, throwaway products, and fashionable versus functional clothing (Myers and Kent 2004). The focus of this paper is on Metro Manila and the emerging middle classes, who may not necessarily be experiencing ‘better’ diets, but where there does seem to be a trend towards ‘organic’ and ‘local’ food consumption and production among some people. This paper wishes to highlight the emergence of organic and/or local food and composting as entry topics for environmental concern, as well as the influence of globalization on environmental initiatives.

One main finding is that changes in food consumption practices are not only related to a rise in affluence, but to changes in other practices, such as changing the location of your home, joining a new workplace, or the employment of a domestic worker. Specifically, a change towards organic food consumption seems to be motivated by a different set of reasons, not directly related to environmental concerns: certain people interviewed as part of this research project and who have chosen this kind of diet claim to do so because of health reasons, proximity to certain markets, as well as the influence of travels abroad. Looking upstream at organic farming and further downstream at composting, people engaged in these new practices had all been ‘elsewhere’ and brought new ways of doing back with them, upon returning to the Philippines. The significance of demonstration projects towards more ‘sustainable’ practices will be discussed.

**Keeping Cool: Air Conditioning Consumption in the Philippines**

Southeast Asia is growing in every possible way. Addressing the electricity needs of the region’s urban households is particularly relevant where cooling is concerned. This paper is about how people go about keeping cool in Metro Manila, the Philippines, focused on air-conditioning in the home. It is part of a grow-
ing body of research in ‘sustainable consumption’, tackling the related themes of air-conditioning consumption patterns, practices and policies, as well as the potential for change. Research was conducted among three socio-economic groups: households based in low-income housing, the growing middle classes in new housing developments, and affluent households based in gated communities. As a baseline, the paper provides information on the environmental impact of household electricity consumption, in relation to economic and population growth. The history of cooling practices and air-conditioner manufacturing is also briefly discussed. The central theme of the paper is how current practices are tied up with a complex consumption, from night to day, from high-end to low-end into dressing fashionably. The material dimension of air-conditioning is discussed, specifically in relation to ‘west is best’ housing trends in Metro Manila: certain housing styles may be locking in the need for artificially cooled air for years to come.

General trends in the region will no doubt contribute to an increase in air-conditioning consumption, yet current consumption patterns are not homogenous: how people go about keeping cool in Metro Manila varies greatly. This paper considers what the future might hold for keeping cool in one of the hottest regions of the world – hot, both in terms of economic development and temperature levels. The conclusion provides insights, which may be relevant to other mega-cities in the region.

Background: In France, the important proportion of teenagers who develop a repeated consumption of cannabis, tobacco or alcohol consumption worries the security and public health authorities. The consumption practices among young people are categorized by social and scientific discourse as a risk behavior. Many scientific researches try to explain why they develop a health, social and penal risks behaviors. However, very little one has analyzed the way that experience of consumption is lived by youth. How do teenagers perceive their consumption behavior, what meanings that they attach to their behavior.

Methods: In order to apprehend the subjective experience of drugs consumption, we have lead a qualitative investigation. We carried out 42 biographic interviews with twenty-one girls and twenty-one boys between seventeen and twenty years old. They live in Ile-de-France. These interviews have permitted us to apprehend subcultures about their consumption experience and analyze the dynamic by which the have developed the substances use.

Results: The public health categorization on consumption by youth does not tally with what happen in reality. The perception of the teenagers on their consumption moves away from the epidemiologic categorization. The drugs use means to the participants festivities or conviviality. Moreover, teenagers, who are currently looking for an autonomous identity, develop consumption, not to oppose to their parents or social and penal norms, limits. We observe that if the youth people develop the consumption of cannabis, alcohol and tabaco it is especially to build a personal and individual identity. It is in a context of individual emancipation (Kaufmann, 2004) that we consider voluntary risk taking is part of individualization process.

Conclusion: There is a contrast between the collective and scientific perception and perception of teenagers on drugs consumption. Voluntary risk taking is a subjective and positive experience which responds to his quest for identity.

The paper explores the relation between emigration and empowerment of Moroccan indigenous groups from the regions of Souss and Rif. It is based on semi-structured interviews conducted between September 2012 and January 2013 with six migrant community leaders engaged in transnational activities between France and Morocco, participant observation within a French-Moroccan NGO, as well as semi-structured interviews with three government officials and three migration scholars in Morocco. Regions inhabited by indigenous minorities, the Amazigh, in the North (Rif) and in the South (Souss) of Morocco, were essential sources of emigration in the 1960s and 1970s. These regions were particularly suspected of political unrest and large-scale emigration offered a safety valve as men left the country in significant numbers and began to send remittances back home (Lacroix, 2005). A few decades later, the engagement of diaspora-led NGOs started to play a role in the reconfiguration of power relationships in the Moroccan political and institutional landscape. As many Moroccan emigrants came from the most economically disadvantaged and politically marginalized regions, their engagement in development initiatives has called into question existing policies and role of the state. This paper makes the point that Moroccan communities abroad have undergone a process of political empowerment, from the marginalisation that characterized indigenous minorities in Morocco to the activism of NGOs in the diaspora. Without necessarily building upon ‘ethnicity’, but simply by supporting their regions of origin, these emigrants brought about social and economic change to their communities and regions. It is therefore argued that diaspora activism needs to be taken into account in the analysis of democratisation processes in Morocco. Research findings are presented in the broader framework of migration and transnationalism studies, and more specifically draw on earlier contributions on the Moroccan diaspora (Belguendouz, 2006; Issa, 2010; de Haas, 2006; Daoud, 1997, 2011; Khachani, 2008).
Development Induced Protests in Contemporary India: Response from the State and Civil Society

The issue of forced human mobility has been receiving much attention from the government, policy makers, civil society organizations, activists and academia in contemporary India. Social scientists interpret forced human mobility as involuntary departure or internal displacement, the desire to take control over a certain territory and its resources becomes a cause of conflict which forces its residents to leave their current homes. The most visible are displacements associated with conflict over resources or antagonisms based on ethnic background. In the case of development-induced displacement or conservation-induced displacement, territory becomes an arena of specific conflicts between the interests of the public or private sector and the needs of people displaced or affected by particular development decisions. Development-caused displacement is often associated with conflict over resources which have led to landlessness and consequent problems. The paper attempts to analyze the contemporary Indian society and development-induced displacement from a class-caste-gender perspective. The lower one is on that ladder, the greater the negative impact of changes introduced in their lives without their consent. The marginalised communities especially Dalits and tribals feel it more than the others do and women among them are the worst affected. They are deprived of the resources that were basic to their survival and are denied access to education, health services and nutrition. It forces them to deny their children right to childhood and to a decent adulthood. Women are deprived of the little autonomy they had. Development cannot be real till such failures are remedied and its benefits reach those who pay its price.

Factores Que Inciden En La Influencia De Los Usuarios Twitter Más Prominentes En Iberoamérica

En el marco de esta ponencia se expondrán los resultados generados del proyecto ‘Análisis de los usuarios Top20 más prominentes en Twitter en Iberoamérica’, en el que se analizaron, a partir de la recolección de datos primarios y secundarios, a través de Twitter, Brandwatch Statistics, Tweepy y Klout, entre otros, la percepción de datos generales de esta red social, los rasgos que caracterizan este tipo de usuarios en 22 países Iberoamericanos y los mensajes que han generado mayor compromiso (engagement) en este social media, así como los rasgos que distinguen las relaciones construidas entre sus following y follower, además de las redes construidas y factores que inciden en el proceso de generación de influencia de estos usuarios, tanto a nivel global como dentro de cada uno de los países en los que ejercen un rol prominente desde esta red social. El abordaje de este tema, ayudará a debatir en torno a los escenarios de participación y movilización social generado por parte de este tipo de usuarios en Twitter, en constante interacción con sus followers y following.

Democratization of Art Production and Voicing Subversive Vision of the World

Tunisian youths are experiencing new form and styles of art production. This is especially true for rap music ans graffiti. Facebook and you tube networks are the predelected means of diffusing the products. Onr can see in this a wave of democratization of the production of art which sappers the old rules of ranking popular and mass arts. In the other hand, the content of these products are more and subversive especially after a massive youth participation in the revolution which did not keep a real change. This widespread disappointment enhanced practices of anger and refusing. A subversive imaginary is more and more inspiring the youth vision of the work. Authorities are facing these new manifestations of the youth rebellion with police controle of the scences of shows, trials... Is this a new style of telling the crisis ? Why does the social narration of inequalities take this form?

Spousal Violence Among Rural Women: A Sociological Study in North-East India

Spousal violence is a grave challenge to a happy marital life. When proclivity of violence takes place in dyad relationship, it crushes the bond of family. Therefore, spousal violence has been considered as one of the most serious social problems throughout the world. Hence, this issue has a sociological significance. The theoretical arguments regarding spousal violence can be classified into different categories. But in this study specific focus has been laid upon wife-battering only. This paper seeks to know the nature of violence and to find out the causes and consequences of spousal violence in rural areas of North-East India. Apart from these two objectives, awareness and knowledge of the victims towards legislative measures to save them from spousal violence have also been investigated with proper method. The field of the study concentrates around a village namely Goskata in North-East India. Keeping in view the subjective nature of the study, basic information about spousal violence was gathered from 100 married women out of 208 households of Goskata village. The data were collected purposively and in this context accidental sampling procedure was followed. The findings of this study have revealed that rural women of North East India have been suffering from spousal violence. The relationship in between the husband and wife became more crucial and complex in rural areas, but it is also true that most of the violence have been hidden from public eye. Due to rigid traditional norms and values of rural society, victimized women never try to disclose it. The rural societies have been strictly controlled and regulated by traditional norms. This is the reason behind the failure of rural women to accept spousal violence as a serious criminal offence; which presents a grave challenge to society.

Leisure in Spiritualism: Alien to Mole-Folk

The present paper intends to make a comparison between the male and female members of the Marwari community in terms of their participation in socio-religious gatherings. Marwaris are known to have two religious sects: the first comprises idol-worshippers, like the Agarwals, Maheshwaris and Oswals, and the second, the non-idol-worshippers, like the Jains. Active involvement in religious gatherings is a commonplace characteristic of the Jains and this particular custom is seen improving social relations both within and outside the community.

The role of Marwari Jain women is noteworthy in this context. For most of the time they are found tied to their apron with little or no association outside the threshold. Obstenseness of husbands also adds to their misery. In such circumstances, religious organizations, mostly named ‘GOSTIS’ prove beneficial in vesting their shriveled up emotions to other female peers and building ties with them. These women, irrespective of any predisposition, regularly gather in such meets, where through prayers and incantations (precisely, chanting of ‘Samayak’) some remarkably pleasant time is spent. Often, such assemblages are followed by religious assemblies where through prayers and incantations (precisely, chanting of ‘Samayak’) some remarkably pleasant time is spent. Often, such assemblages are followed by religious assemblies where through prayers and incantations (precisely, chanting of ‘Samayak’) some remarkably pleasant time is spent.

Men, however, remain aloof from such settings and only partake when their ‘Guruji’ visits at any juncture. Marwari women thus, enjoy an upper hand in all aspects, religious organizations, mostly named ‘GOSTIS’ prove beneficial in vesting their shriveled up emotions to other female peers and building ties with them.
cases relating to spiritualism, and enjoy this authoritative position as it gives them the opportunity to spend their leisure in a healthy manner. A considerable demarca-
tion thus separates the Marwari men and women in connection to their notion of
leisure in spiritualism and this is what this paper intends to throw light upon.
A detailed survey-work has been undertaken with some in-depth interviews to
represent this field as accurately as possible.

Two Visions of Cosmopolitics

This paper explores how Ulrich Beck’s world risk society theory (WRST) and
Bruno Latour’s actor-network theory (ANT) can be combined to advance theory of
cosmopolitics. On the one hand, WRST is good at illuminating how relevant polit-
ical actors interact with each other to deal with global risks while negotiating the
two logics of politics, cosmopolitanism and nationalism. On the other hand, ANT
is good at showing how scientists participate in the construction of global risks
and helps to elaborate how science and politics are intertwined in cosmopolitics.
By combining the strengths of WRST and ANT, it becomes possible to examine
simultaneously the tension between the two logics of politics and the co-constitu-
tion of science and politics, both of which, I argue, are crucial for theorization of
cosmopolitics. The proposed synthesis of WRST and ANT also force sociologists to
critically reflect on their role in cosmopolitics and envision a new form of critical
theory.

Nation Consciousness and “Multiracialism” of the Singaporeans: Focusing on the Concept of “Racial Difference” and Their Interactions

Singapore is well-known as a ‘multi-racial’ society, but then, how they form
their identity as ‘Singaporean? Considering this problem, ‘multiracialism’ be-
comes an important concept in making ‘Singaporeans’. However, its purpose is
to make ‘racial differences’ obvious and emphasized. Therefore, how do people
create Singaporean consciousness in these kind of society?
The aim of this research is to study this problem by using free talking interview
and observation data carried out by the speaker. We can say that the govern-
ment of Singapore reinforces the ‘races’ in order to make differences among ‘rac-
es’ highly visible by emphasizing the differences among the ‘races’. In Singapore,
differences among ‘races’ are visible even though people from different ‘races’
interact with each other daily. Moreover, a sense of community or even of being a ‘Singaporean’ begins to grow and maintains; at the same time, differences among
‘races’ are maintained.

Rainfall Variability, Coping Strategies and Livelihoods: Case Study from Godavari Basin, India

Natural resource-dependent rural households are likely to ensure a dispro-
portionate burden of the adverse impacts of climate change -- droughts, fam-
ines, floods, variability in rainfall, storms, coastal inundation, ecosystem degra-
dation, health issues, fires, epidemics, and even conflicts. In some parts of the world,
these effects may already be in play with potentially disastrous consequences for
the poor. Reliance on subsistence agriculture means the impact of stresses and
shocks (such as droughts or floods) are felt keenly by rural poor people, who
depend directly on food system outcomes for their survival, with profound impli-
cations for the security of their livelihoods and welfare.

Variability in rainfall had been plaguing the farmers of Andhra Pradesh during
the recent past resulting in crop failure and indebtedness. It would be important
to find out the coping mechanisms that are being developed by the farmers to
deal with variability in rainfall and the support being provided by the government.
In some parts of the state, farmers are opting for cultivation of commercial crops
instead of food crops as they are finding better returns from these new types of
crops which could lead to issues like food security and loss of livelihood for certain communities.

This paper focuses on identifying livelihood adaptation strategies of cultivators in
Nizamsagar project, where farmers developed new water sharing mechanisms and
brought about changes in farm practices to deal with rainfall variability.
Data used for this study were derived from a web questionnaire survey conducted in September 2013. The sample is consisted of women having husband and children (under 15 years old), who reside in the Tokyo metropolitan area. In order to correct the potential bias of the registered monitors, we adopted stratified random sampling based on job status and the age of the smallest child. The valid sample size excluding quite short time response and/or inappropriate answers was 483. The average age of these women is 40.5, 59.8% are employed and 40.2 are non-employed.

Multi-group analysis of covariance structure modeling test the effects of using ICT on work-family life focusing on the housework frequency, time used in their daily life and their perception of them. We analyze the mediating effect of domain identification, influence and across-the-border communication. Our findings advance our understanding of how we manage the permeability between work and family life.

The Effects of Using ICT on Work-Family Life: an Empirical Study Based on the Work-Family Border Theory

One of the features of ICT use is greater alleviation of time and location restraints in communications. Although positive effects of ICT for improving work-family life have been reported, much of the ICT literature stresses negative effects on work-family life through increased extra work. Sakamoto and Spinks (2011) found that a higher degree of using ICT tools directly related to higher work-family conflict of Japanese workers. This study explores the effective mediating factors that can reduce the negative impact of ICT use, applying work-family border theory to measure the concepts and propose hypotheses.

Data used for this study were derived from a web questionnaire survey conducted in September 2013. The sample is consisted of women having husband and children (under 15 years old), who reside in the Tokyo metropolitan area. In order to correct the potential bias of the registered monitors, we adopted stratified random sampling based on job status and the age of the smallest child. The Effects of Using ICT on Work-Family Life: an Empirical Study Based on the Work-Family Border Theory

This presentation will examine the work and private life situations of female and male university professors in Japan, and offers some examples of positive or affirmative action taken by Japanese universities and discuss its effectiveness.

In Japan, the ratio of female researchers is low, as is the case of other countries. In 2011, just 13.6% of university professors (full professor, associate professor, lecturer, assistant professor) were female. From around 2006, the Japanese government started a positive action policy to increase the ratio of women. The government grants subsidies to offer about 10 universities each year for three years. The universities offer support centers for women, gender equal office, childcare centers and so on.

The presenter has worked in one of the gender equal offices as a staff member. My observation there and a questionnaire research for university professors are the main data source of the presentation. First, the presenter will discuss their work and private life situations. Many researchers have shown that male productivity tends to be higher than that of females. However, the results show gender does not explain scientific productivity when we control other variables. These findings advance our understanding of how Japanese companies can take specific measures to improve low fertility.

Role of Dalit Mahila Vikas Mandal Against Femalefeticides in Maharashtra, India

Strong preference for sons over daughters exists in the Asian countries and Indian subcontinent. The female feticides over the last four-five decades have distorted sex ratios at birth in several Asian countries in general and in India particularly. Foetal sex determination clinics have been established all over India in the last two decades. There are studies on the outcome of an intensive abuse of prenatal diagnostic techniques for sex selection in India. Parents tend to be calculative in choosing the sex of the next child and the decision is based on the birth order, sex sequence of previous children and number of sons. The misuse of medical technology in India is resulting in reinforcement of patriarchal values as professional medical organizations seem to be indifferent to ethical misconduct.

Medical researchers pioneered sex selection techniques in the 1960s and later, with the contribution of sex determination tests (SDT) to the rising sex ratio has been vigorously debated. While urban feminists demanded legislation against SDT, some social scientists felt that SDT had little impact on sex ratio.

The paper presents the assertive action by ‘Dalit Mahila Vikas Mandal’, a social organization which was established in 1990 in Maharashtra. Female feticides done by medical fraternity have been exposed by this organization through sting operations carried out in Maharashtra and Gujarart state. The shocking facts found during the field work carried out by the author are also presented in the paper.

Professional Turf Battles Vs. Inter-Professional Collaboration: Their Impact on Inequalities in Health and Social Care in the UK

From a neo-Weberian perspective, it is argued that professions have long competed with each other in turf battles to enhance their respective positions in terms of income, status and power from the viewpoint of their professional self-interests. Using illustrations drawn from health and social care in the UK, it is argued that this has come at a substantial cost to both the user and the wider public - and has in particular exacerbated existing social inequalities. This paper outlines the growing trend for inter-professional collaboration in health and social care in the UK. Although there can be downsides to greater inter-professional working in relation to such issues as the complexity of communications and supervision arrangements, there are many positive generic reasons for such engagement – from creating a more satisfying work role for the professionals involved to enhancing the service given to the user. This paper specifically asks questions about the benefits or otherwise of inter-professional working in terms of social inequalities. In so doing, it acknowledges that inter-professional collaboration can take a number of forms. It also again draws on examples from health and social care in the UK to support its general argument that inter-professional collaboration can make a significant impact on social inequalities, not just in the UK but more globally.
Broken Promises. Temporary Labour Migrants’ Experiences of Working Conditions and Social Security in Finland

West European countries, including Finland have started to recruit more labour migrants to low-income sectors in hope of a partial solution to the consequence of rapidly aging working population. This paper demonstrates how highly skilled labour migrants from non-EU member countries face social disqualification in their efforts to become part of the Finnish labour market. Particularly, African and South-Asian male workers find mainly cleaning or dish-washer jobs despite their academic background. Our study explored the temporary-labour migrants’ experiences of acquiring opportunities to working rights and social security. The results show that the majority of the interviewees had been reluctant to look for information either due to the fact that they were working only temporarily in Finland or due to their week bargaining positions. The information of recruitment, working rights, the Finnish taxation system, and of the Finnish social security rarely reaches the labour migrants. These features can partly be explained by labour and migration policies, and by the natives’ strong creation of ‘otherness’ between the native Finns and the non-white foreigners. In the analysis an intersection of gender, ethnicity and class has been applied to describe the unequal and sometimes precarious position of the labour migrants. The research material consists of documents, memos based on ethnographic observations and of seventy-eight semi-structured interviews, of which forty-nine were conducted among cleaners, bus drivers, and seasonal agricultural workers.

Re-Creating Mutual Belonging: Filipino Labour Migrants’ Local and Transnational Practices Between Finland and the Philippines

This paper demonstrates the unequal embeddedness of transnational Filipino labour migrants in the Finnish and Filipino society. My study of Filipino labour migrants’ working and living conditions in Finland explored the migrants’ adaptation strategies in their efforts to become integrated in the Finnish society and in staying in touch with the ones left behind. The analysis showed how the integration of Filipino labour migrants to their new host society is influenced by their adaptation strategies, such as of the migrants’ local and transnational practices and contacts. The active participation in sociocultural and religious practices helps the Filipinos to find their way of being in Finland without losing their contacts to the Philippines. The migrants’ adaptive strategies strengthens the Filipinos ethnic identity and in their turn their ethnic belonging to an ethnic minority community in Finland as well as to a transnational community. These two communities should not be perceived as two opposites but as dual sites of mutual belonging consisting of a hybridity of transnational and ethnic collective identities. At the same time, the migrants’ opportunities to become familiar with the Finnish society and to learn the Finnish language have been vague. There is a risk of segregation from the Finnish society if the Filipinos do not become familiar with the Finnish society and language. The research material consisted of open-ended interviews conducted among twenty Filipino cooks, nurses and cleaners and of memos based on ethnographic observations.

Occupying Gezi: From an Uprising to a Social Movement?

Occupy Gezi started as a small protest to oppose the demolition of a park in Istanbul and quickly transformed into a national grassroots initiative against the government’s authoritarianism and a hybrid democracy, which locks political action into the ballot box. After a month of intense street protests leaving 5 dead, dozens wounded and under arrest, it has shifted to “park forums” as thousands gather in their neighborhood parks to discuss the future and come up with a game plan. This lecture will look into how the #OccupyGezi experience opened new social and political possibilities, spaces of political action (online and off) and a new kind of political language; what shook the so-called “apolitical” generation out of their comfort zones to the streets; and brought people from all walks of life and political spectrums together. It will also look into the chances of Occupy Gezi becoming a full-fledged social movement and the limitations it faces in the process.

Mysteries of the Discourses That Encourage Cooperation, Ver. 2

This paper demonstrates the unequal embeddedness of transnational Filipino labour migrants in the Finnish and Filipino society. My study of Filipino labour migrants’ working and living conditions in Finland explored the migrants’ adaptation strategies in their efforts to become integrated in the Finnish society and in staying in touch with the ones left behind. The analysis showed how the integration of Filipino labour migrants to their new host society is influenced by their adaptation strategies, such as of the migrants’ local and transnational practices and contacts. The active participation in sociocultural and religious practices helps the Filipinos to find their way of being in Finland without losing their contacts to the Philippines. The migrants’ adaptive strategies strengthens the Filipinos ethnic identity and in their turn their ethnic belonging to an ethnic minority community in Finland as well as to a transnational community. These two communities should not be perceived as two opposites but as dual sites of mutual belonging consisting of a hybridity of transnational and ethnic collective identities. At the same time, the migrants’ opportunities to become familiar with the Finnish society and to learn the Finnish language have been vague. There is a risk of segregation from the Finnish society if the Filipinos do not become familiar with the Finnish society and language. The research material consisted of open-ended interviews conducted among twenty Filipino cooks, nurses and cleaners and of memos based on ethnographic observations.
Materials and methods: the variables in the model proposed by the pilot study have been reviewed on the basis of the individual data available in the information systems of the local actors. They have been used for defining evaluation models based on the characteristics of the individuals, with the same techniques used in the pilot study. As a case study the municipality of Genoa, whose population is among the oldest in Europe, has been taken into account.

Results and discussion: The passage from regions to individuals in a large municipality confirms the validity of the model for people 65+ years old. ADL disabilities are the main disability dimension with highest association with the worsening of the SE condition, also due to the effect on the social relations dimension. The public strategies seem to better protect individuals and families, with the help of the informal network of support for the family care. The indicators in the models could be very useful for the Social Services, in order to develop tools for better addressing policies and intervention at local and national level. Moreover, this work could extended wherever these kind of data are routinely collected.

What's the Impact of Coverage Error to the Study of Social Inequalities?

In some European countries, including Italy, survey organizations use the Directory of Landline Phone Numbers as sampling frame to survey the general population and study social inequalities (Häder and al. 2012). Under certain conditions, the use of this sampling frame may be problematic.

In Italy, with the only exceptions of Callegaro's work (2004 and 2008), there is very little interest in this topic. Little is known, for example, on the extent to which coverage error occurs and its impact on survey estimates, although in 2011 only 50% of households are included in the sampling frame (e.g., the directory of landline phone numbers). We believe a clear understanding of the nature of coverage error is urgently needed (households may be excluded from the sampling frame for different reasons) to develop appropriate strategies to tackle the coverage problem.

The overall aim of the paper is to evaluate the impact of coverage error on the accuracy of the survey estimates for a set of key socio-economic variables and, should evidence of bias arise, to discuss possible strategies to correct for it.

We first describe changes over time in the pattern of coverage error by focusing on three groups of Italian households (household included in the sampling frame, households excluded from the sampling frame as they do not have a telephone, households excluded from the sampling frame as they do have a telephone but the telephone number is not listed). We then explore whether there are any differences in these groups in their socio-economic characteristics, including indicators of general trust and, for a selection of survey items (including income, health and social class), investigate the impact of coverage error on bias.

We use the 1997–2012 Multiscope survey (“Aspetti della vita quotidiana”) run by the Italian Statistical Institute (n=20.000 households).

Research on preschool education and day-care programs is gaining momentum since the discovery of its potential to reduce social inequalities in education- al outcomes. Many of these research relies on case studies to measure mid and long term effects of preschool attendance on academic performance and school transitions. In this paper we adopt a broader focus and a comparative approach by exploring the extent to which early (pre-primary school) child stimulation can reduce background differentials in learning outcomes across 28 countries from the Americas, Asia and Europe.

Particularly we seek to unveil the relative impact of direct parental involvement and preschool education, as different ways of child rearing, on educational disadvantages that stem social origins, and the extent to which this applies to all the countries in our sample. Are the effects of both practices (institutional vs. at parental home; formal vs. informal) substitutive or complementary? Are there measurable cross-country differences in the learning benefits of preschool education? Is kindergarten attendance equally stimulating for children from different socio-economic origins? Is the impact of different parenting practices sensitive to contexts? How do institutional characteristics of the educational system affect performance at this stage?

To answer these questions we use PIRLS 2011, an international data source clustering students of primary education (4th grade) across countries. PIRLS provides a standardized measure of reading literacy among 4th graders. We estimate random constant and random intercept multilevel models to assess the effect of the type of child care adopted by families on educational outcomes. This approach enables us to decompose the observed variance in reading skills into its constitutive parts at the country and student level. Beyond our substantive findings, we also discuss the potential for a broad comparison of multilayered processes that result in unequal life chances among children.
In the Philippines, there has been some amount of talk and, fortunately, some amount of action too, about climate change. We ask: What is being said and done about climate change in the country? How is climate change being framed and acted upon? Why are these developments unfolding the way they do? How do these discourses and practices reflect and influence sociocultural dynamics? The paper presents voices, views, and vignettes from the country. It attempts an understanding of these realities by drawing from social constructionism, critical discourse analysis, and social movement theory.

Salazar, Robert* (Ritsumeikan Asia Pacific University, salazarrobert@yahoo.com)

Managing NGOs for Older Persons in East and Southeast Asia: Lessons and Good Practices from the Field

The paper reviews the roles and experiences of non-governmental organizations for older persons (NGOs-OPs) in East and Southeast Asia. It is based on case studies of selected NGOs from Hong Kong, Japan, Korea, Indonesia, the Philippines, Singapore, Thailand and Vietnam. The study finds an increasing number of NGOs-OPs present in the region, working in diverse areas of service delivery, education, research, training, and advocacy. Community-based older persons’ organizations or senior citizens associations are also becoming more active, with some organized beyond the local and national level, participating in regional and international activities, and venturing into policy advocacy and other areas traditionally served by non-commUNITY-based NGOs. NGOs are taking on multiple roles simultaneously, e.g., adding advocacy to their other programs, while a few are beginning to focus on a gender-based NGO. On the organizational and management side, NGOs-OPs are also becoming more accountable and are taking creative and innovative steps in meeting the challenges of management. To be sure, NGOs-OPs need to address important gaps, notably the lack of capability-building at the community level, the lack of follow-through in policy implementation, and the need to solicit critical, hopefully constructive feedback from the older persons they are serving. Nevertheless, like the older persons they are working for and with, NGOs-OPs themselves are getting more active and growing wiser with age.

Genealogía del Pensamiento Crítico

En América Latina y en castellano se usa mucho la expresión Pensamiento Crítico, sin que siempre se tenga clara a qué se refiere con ella. Este trabajo pretende aclararlo desde su origen, para ello se piensa revisar los aparatos críticos más originales y reconocidos durante la modernidad, se piensa acudir a la ilustración y al romanticismo, toda vez que, tanto Kant por vía de Nietzsche, como Hegel por vía del marxismo, han estado presentes y son imprescindible para la sociología actual. De tal forma se espera alimentar la vía crítica del discurso sociológico.

Salcedo, Manuel* (EHESS/IRIS, manusalsalcedo@gmail.com)

L’Autre, un “escròc sentimental a but migratória”: els discours polítics sobre les homes estrangers dans les couples binacionals en France

Les politiques d’immigration en France depuis une dizaine d’années visent très particulièrement les couples binacionaux dont le ressortissant étranger est sans papiers. Depuis 2003, sont inscrits dans la loi les délits de mariage « blanc » et mariage « gris » : le premier se réfère au délit de mariage de complaisance, et le deuxième concerne l’étranger extra-communautaire qui se passe (pacte civil de solidarité) ou se marie seulement pour avoir des papiers. Depuis 2003, sont inscrits dans la loi les délits de mariage « blanc » et mariage « gris » : le premier se réfère au délit de mariage de complaisance, les deuxième concerne l’étranger extra-communautaire qui se passe (pacte civil de solidarité) ou se marie seulement pour avoir des papiers de séjour, c’est-à-dire, et selon le sens des personnalisations critiques françaises un escròc sentimental a but migratória ». Or, ce discours et les politiques d’immigration ne visent pas tous les couples de la même manière. La sexualité, la nationalité, la race, le genre, la classe ou l’âge de la personne étrangère sont des critères importants de la suspicion de l’authenticité d’un couple. À partir de mon travail de terrain effectué pendant trois ans auprès des couples binacionaux de même sexe et de sexe différent, il s’agira, dans cette communication, d’analyser la manière dont cette politique régle et contrôle la vie intime de ces couples par le discours politique mais aussi par l’application de la loi. Celle-ci varie lorsqu’il s’agit des couples où l’homme est racisé, n’origine maghrébine, ou musulman pratiquant, ou ressortissant d’Afrique subsaharienne ; des masculinités qui posent problème à la République. Celui-ci est vu comme un escròc, un danger pour la femme blanche occidentale : l’administration française régule ainsi la vie intime des couples en jugeant l’authenticité de leur lien. Dans quelle mesure les mariages gris ou blancs sont-ils des constructions générés et racées de la politique d’immigration ? Et qu’en est-il de ces constructions de la menace masculine étrangère lorsqu’il s’agit des couples binacionals gays masculins ?

An Experimental Study Of The Relationship Between Knowledge, Attitudes and Recycling Behavior In Iran

It is often assumed that knowledge and attitude about the recycling will engage in recycling behavior. We used data from a survey on Mazandaran province, Iran in 2013 to investigate this premise. A survey method was utilized to have their combination can better assess the contours of neighborhood change. The three central research questions are: 1) Do traditional demographic measures (i.e., race and class) adequately capture the phenomena of change? 2) Why do neighborhoods experiencing gentrification seem to look similar to each other and utilize the same semiotic tropes? 3) What are the physical indicators of neighborhood change and how are they involved in symbolic boundary construction between old and new residents?

Saldana, Nelson* (University of Michigan, Ann Arbor, saldanan@umich.edu)

Integrating Demographic and Visual Approaches in the Measurement of Gentrification

Approaches commonly used to describe neighborhood change such as in-vivo parastatic tipping, and lifecycle models rely on demographic data for measurement and insight into these processes. However, a limited amount of empirical data on microbehavioral factors overlooks other indicators that might precede the more macro-level demographic shifts usually employed to measure change. An assessment of the neighborhood change literature demonstrates two shortcomings: the tendency to focus on individual residents without attention to other neighborhood organizations and institutions such as businesses and the place-based mechanisms underlying changes in race and socioeconomic status. Most models of neighborhood change miss a deeper understanding of the social processes involved in the construction of value. These cultural practices matter because they lead to increasing values (both monetarily and symbolically) that ultimately fuel further demographic transitions.

Using a comparative and mixed methods approach, this project examines neighborhood change in New York, Los Angeles, Chicago, and Detroit. Data from a comparative and mixed methods approach, this project examines neighborhood change in New York, Los Angeles, Chicago, and Detroit. Data from this investigation and by employing cluster sampling, a total of 300 respondents were selected randomly. A self-administered survey was employed to collect the data. Finally, 286 valid questionnaires were obtained. The research was conducted during February and March 2013. The data was analyzed using SPSS. We examined two types of knowledge: knowledge new programs and knowledge about recycling process and both types of knowledge is associated with recycling attitude and behavior. We also hypothesized that attitude about the recycling would be a predictor of recycling behavior. The results showed a significant positive relationship between attitudes towards recycling and recycling behavior. The results also showed that knowledge new programs and knowledge about recycling process is associated with recycling attitude and behavior. The results also showed that knowledge new programs and knowledge about recycling process is associated with recycling behavior.

Sales Pereira, Verónica* (Unesp, versales@uol.com.br)

Between Market, Art and Politics: The Different Ways of Reinscription of the Old Industrial Spaces in the City of São Paulo

Since the beginning of this century, the old industrial buildings and spaces of the neighborhood of Monca, in the city of São Paulo, have been the subject of economic, political and social practices guided by a cultural sense with an increasing aesthetic relevance. Photography, painting, advertising, heritage practices, graffiti, have contributed to bring a new sense to these spaces, which goes from their private appropriability to real state market to the appreciation of public space by heritage state agencies. This implies in a redefinition of the relations between aesthetics and politics in a “postmodern” logic (Jameson, 2000; Harvey, 2000). One of the consequences of this process is the construction of “postmodern urban landscapes” characterized by gentrification and disneyfication (Zukin, 2000, Smith, 2000). On the other hand, according to Huyssens (2000), there is no pure space outside the market culture, which leads us to question the limits of these...
processes, namely to consider the “specific strategies of representation and com-modification and the context in which they are represented” (2000:21), or the crit-
ic to the regressive aestheticization of politics (and economy) by the politicization of art (W. Benjamin, 1985).

We will analyze the use of these strategies in the practices of artists, entrepre-
neurs, experts, dwellers and their conflictual context - involving real estate boom and heritage practices (Pereira, 2010; 2013); the formation of gated communities (Caldeira, 1997) and the resistance against them (ibid., 2012). How they give new meanings to identities, places, revealing the tensions and complementarities be-
 tween advertising-driven aestheticization and politicization of art and problematize the construction of a singular public space: a heterogeneous urban landscape and a democratic political sphere, both institutional and non-institutional (Arendt, 1991; Habermas, 1984) in the city of São Paulo. We will use the methodology of visual sociology (Ferro, 2005), problematizing it in an interdisciplinary approach.

Can Outsourced Workers Organize? a Case Study from the Philippines

This presentation will detail an attempt by outsourced workers in the Philip-
pines to form a labor union. These workers are in the “knowledge process out-
sourcing” sector, meaning that they possess significant human capital and do skilled tasks for firms of the Global North. The case immediately presents two puzzles. First, given the many structural barriers known to impede unionization by outsourced workers in the Global South, how did a union campaign emerge? Second, why did this unionization attempt ultimately fail? My ethnographic re-
search inside the outsourcing facility provides answers to these questions. Rep-
resentation struggles were initiated by highly-skilled workers and in response to new, driving tactics on the part of local management. The latter were reacting to pressures put upon them by their Western clients. The unionization campaign appeared to have caught local managers by surprise, and throughout it they were very concerned to keep news of it from reaching the government, the press, and Western clients. In short, employees possessed significant structural and work-
place power in their attempt to gain recognition. Ultimately, however, it was local management’s ability to harness greater associational power that led to the de-
feat of the union. One general implication is that studies of labor in global supply chains should theorize and examine empirically the vendor-client relationship. In these supply chains, vendor firms and client firms have different interests and resources.

Foxconning Science: The Globalization of Academic Publishing

This paper presents ethnographic work done inside an outsourcing firm in the Philippines. This firm is part of the emergent knowledge process outsourcing, or KPO, field. It contracts with publishers wishing to outsource such work as copy-
editing, typesetting, authorial communications, and more. Most major scientif-
ic publishers now contract with such firms. I present evidence that the nature of these outsourced suppliers is adopting despotic tactics for managing work. Suppliers lack basic knowledge of the overall field of production in this (case, academic publishing), and so judge themselves against unknown competi-
tors. They compete on price, rather than quality, and so continually engage in various “low road” techniques of management. Most notably: wage suppression, the “driving” of workers, and forced overtime. I conclude the paper by discussing at length one incident that provides a prism into the entire labor regime: a union-
ization dispute that took place at this facility. Global pressures induced worker
at length one incident that provides a prism into the entire labor regime: a union-
ization dispute that took place at this facility. Global pressures induced worker

employment status has been interpreted as a sign of distinction and prestige. Represented by the YIPS national union (YIPS-UN), created in 1947, the YIPS edu-
cators have cultivated this prestige by demonstrating their unconditional attach-
ment to the political purpose of their administrative agency: the construction of a justice model based on the rejection of youth imprisonment. However, in the 1990s, this model has been subject to a profound ideological shift, which requires the implementation of punitive-oriented policies. This has changed the interpretation of their employment status, less perceived as a sign of prestige, than considered as an instrument of subordination to these new policies. The le-
gal obligation for the unionists to intervene in new prisons for youths epitomizes this subordination. In this context, the YIPS-UN, remaining firmly wedded to the previous political identity of the profession, is progressively becoming marginal-
ized. A growing number of educators are turning to a more conventional trade union, attached to the promotion of working conditions rather than defending the previous political identity of the profession. By depicting the differences between these two forms of activism, which we name ‘identitarian’ versus ‘utilitarian’, we will analyze how a “new professionalism” has emerged among YIPS educators, and is symbolic of a general weakening in the symbolic status of this professional group.

SALLÉE, NICOLAS* (University of Montreal, nicolas.sallee@umontreal.ca)

Rehabilitation and Punishment, a New Model of Rehabilitation in the French Youth Justice System

According to recent research in policy transfer studies, youth justice systems across Western world are taking a “punitive turn” (Muncie, 2008), marked by the emergence of a new “culture of control” (Garland, 2001). This process is particularly significant in the United States and Great Britain, however it appears that other European countries are following suite (Bailleau & Cartuyvels, 2007). A closer look, however, reveals complexities: the level of youth incarceration, a commonly adopted indicator of punitive, differs considerably between coun-
dries. The French youth justice system, analyzed in this paper, does not escape these complexities: since 2002, the youth incarceration rate is decreasing, while the content of political discourse and legislative changes seems to fuel the in-
crease of a new punitive (Bailleau, 2008). To understand this apparent par-
adox, we will describe how political injustices are understood as “get tough” on young offenders, are translated and reworked, at a lower level, through the activity of the administrative agency responsible, in France, for the functioning of youth cen-
ters: the judicial Protection of Youth (JYP). This analysis will allow us to highlight the crystallization of a new model of rehabilitation under constraint. First, using quantitative data, we will describe the increasing use of semi-closed youth facili-
ties as an alternative to prison. Tied to the development of new prisons for youth, supposedly “rehabilitative” (Chantreille & Sallée, 2013), this evolution is changing less the level of confinement than its meaning. Formerly perceived as anti-rehabil-
itative, confinement is now legitimized as an inseparable feature of rehabilitative processes. Second, we will analyze knowledge production practices, particularly child psychiatric and psychological knowledge, mobilized by the JYP to support this legitimation process. This paper will defend the idea that this new knowledge underpins old disciplinary recipes, and symbolizes the growing concern surround-
ing, in France, the institutional fabric of socialized individuals.

SALLES MEDEIROS, MARCIO FELIPE* (Student, medeiros.mfs@gmail.com)

The Relationship Between First Principle Production in Brazil and the International Demand

The following research approaches the criticism of the production system of knowledge in Brazil, focusing on a laboratory of Theoretical Physics which works with First Principle Model (FPM), order to analyze the institutional dilemma and the relationship between the laboratory and the central spaces of knowledge production in Brazil. The production of science, how is the current in Social Studies of Science and Technology, demand an articulated network of elements which sustain and make circulate the knowledge production produced inside the area. In the FPM case, the space of production and circulation is very peculiar, since the production involves upgrades in the computers’ servers when a new program is released. The lab does not spend much money; on the other hand, the circulation occurs within the specific circle in physics, because the pro-
duction not necessarily will become a product since the experimental relevance does not always happen. And yet we have the relationship with central spaces of central places of knowledge production, understood basically by The US and Europe which influence the content and the decisions of productions inside the laboratory. The methodology of this research consists of an interview which re-
searchers and analysis of published material for one label of FPM which is related to a Brazilian University. With the following research, we aim to contribute for the debate about the production process of knowledge, bringing reflexive elements about the role of Brazil in the production of FPM knowledge.
The Notions of Otherness and Critical Construction Sites: Theorizing Professional Boundaries within

This paper is about social and symbolic boundaries (Lamont & Molnar 2002). The aim of this paper is to suggest a theoretical way to understand constructions of ‘Otherness’ within professional boundaries. I draw on the empirical case of the doctors with immigrant backgrounds in the Swedish medical profession and use the notion of critical construction site by Cornell & Hartmann 2007.

In order to bridge the gap between structure and agency the study started with a review of the Swedish research literature in order to see how ‘ethnicity’, ‘race’ and ‘Otherness’ had been received in research. In this review I found that ‘Otherness’ is often something that is ascribed to patients and not doctors. I then went on reviewing the professional debate around the issue of doctors with immigrant backgrounds in Sweden I found something what I theorized as underlying assumptions of ‘the Other’. This ethnic ‘Otherness’ was not about doctors’ ‘ethnicity’ nor about ‘race’ instead it had to do with that the doctors had immigrated and was perceived as something sable and predetermined.

This notion of ‘Otherness’ was later also found in interviews with doctors with immigrant backgrounds. In the interviews I expectedly found stories of discrimination, prejudice and even racism but I also found stories of agency, and coping strategies where the ‘Otherness’ they were ascribed with was used a way to construct their role in the Swedish health care system; to take care of patients with immigrant backgrounds.

The paper argue that as doctors with immigrant backgrounds seem to be using a primordial definition of the ‘Other’ in circumstantial ways in order to find their place within the Swedish medical profession which I argue, is a critical construction site.

The Other Doctor: When Professional Boundaries Conflate with Notions of Ethnic ‘otherness’

The paper suggests that field of Sociology of professional groups need to consider social position theory in order to theorize boundaries of ‘Otherness’ within them. The paper is based on some of my concluding remark from my dissertation where I interviewed medical doctor with immigrant backgrounds in Sweden about their feeling of belonging to the Swedish medical profession, among other things. The thesis is that the medical profession in general and the Swedish medical profession in particular have been successful in controlling the number of new doctors that are accepted to Swedish medical schools. Sweden has also experienced and increased in doctors with immigrant backgrounds working in the Swedish health organization. In my interviews with these doctors they often told me about something that could be understood as hierarchies within the profession on the basis of ‘race’ and ‘ethnicity’. I have chosen to theorize this as ‘ethnic Otherness’ as it seems to have to do more with that they are ascribed with ‘non-Swedishness’ than about what ‘ethnicity’ they have. These divisions I argue are linked to ideas that can be found in EU legislation, in the Swedish research on ethnicity and health as well as in The Swedish Medical Association and can therefore be a case of another ‘successful’ boundary making.

Set in the City: Condominiums As Settings of Technological Innovations Toward Sustainable Consumption

One of the tangible signs of growth in Metro Manila, a Philippine mega-city of about 11.7 million people, is the proliferation of condominiums. A condominium is a form of housing tenure whose cost of land is prorated due to multi-story structures that define interactions and images relating to inhabitants’ consumption of technologies in the home and consequent social constructions of sustainable consumption. The paper focuses on social practices relating to the use of information, communication and entertainment technologies as well as domestic technologies by condominium-household members. The take off point is a body of data and insights from key informant interviews, direct observations, and secondary data analysis.

Decent Work and Social Justice for Informal Sector Workforce in South Asia

The increased economic integration during the last decades of the twentieth century coincided with rising income inequality in some countries and increasing unemployment among the low skilled mainly on European continent. Community based schemes are springing up everywhere in the developing world, most frequently in Africa and parts of Asia.
The international labour Organization unanimously adopted the ILO Declara-
tion of social justice for a fair Globalization on 10th June 2008. The declaration expresses the universally of the Decent work Agenda. All members of the organi-
ization must pursue policies based on the strategic objectives, employment, social
protection, social dialogue, and rights at work.

This paper examines the present position of the informal sector workers in
South Asia. The study is based on information collected through secondary data.

At present, Multinational Corporations have entered in the global market; there-
fore, the nature of capitalist production has been changing. It is effect of
weakening formal and informal economy in developed and developing countries.

In the era of globalization, right to life and livelihood has become the central
issue not only for organized sector workers but unorganized workers also. South
Asian Association for Regional Cooperation (SAARC) is an economic and political
organization of South Asian countries, which includes India, Sri Lanka, Bangla-
desh, Pakistan, Afghanistan, Nepal, Maldives, Bhutan.

Informal workers include all workers in the informal sector as well as in
the formal sector performing informal jobs. Labour laws in the countries of the region
are not universally applied and excluded several groups of workers or groups of
establishments from their scope. It is generally the formal or organized sector
that is covered by labour laws. As a result many labour laws apply only to a small
proportion of the workforce.

There is a need to implement the ILO Declaration of social justice for a
fair globalization.

SAMSON, MELANIE* (Post Doctoral Fellow, samsonm@pari.or.id)

Wasted Opportunities - the Production of Power and the Challenges to Organizing Informal Reclaimers

Movements and organizations attempting to organize informal workers are
cornered and faced with the challenge of overcoming social divisions and power re-
lations between informal workers. And yet, the burgeoning literature on organiz-
ing informal workers pays curiously scant attention to the ways in which power
relations between informal workers shape the ways in which they organize and
circumscribe their terrain for political action. This paper explores how the infor-
mal labor process produce power laden social identities and relations that hinder
their ability to organize collectively to transform their place within the value chain.
Although grounded in an ethnographic study of reclaimers on a garbage dump
in Soweto, South Africa, it draws on comparative experiences in Asia and Latin
America in order to draw out the broader implications for the theorization and
practice of organizing informal workers.

Building Global Worker Communities: The Case of Filipino Migrant Workers

Building global worker communities: The Case of Filipino Migrant Workers Filipinos overseas are not wanting of associations or organizations to belong to wherever they may be. Commonplace are social organizations around common professions and geographic origins; also based on geographic regions or ethnolinguistic origins in the Philippines to name a few. These formations are meant to provide support to the members, enhance their profession, religion/faith, ethnolinguistic identities and the like. Rarely do they get in conflict with the laws and policies of the host countries; neither were they inclined to have sustained campaigns critical of policies in the Philippines.

Fastforward, 4 decades later, we see an expanded and varied landscape of migrant communities. In Hongkong, migrant domestic workers are joining and forming unions and merging into coalitions of different migrant nationalities. In the Gulf, faith-based organizations and country-based organizations have spread throughout the GCC countries where organizing of workers -local or migrants - in whatever form and orientation is almost a taboo, there is no stopping the migrant Filipinos from organizing cyber communities . Their "membership" knows neither boundaries nor time limits.

In other locations such as Taiwan, what is feasible are support groups such as Church/faith-based migrant formations that are spread out around the country. Every Sunday, these formations touch base with more than a thousand Filipino migrants who congregate in the churches for the worship service. Off and on the pulpits, migrant issues are raised, activities and campaigns are undertaken.

Increasingly, the networks and ways of organizing migrants pave the way for more direct involvement of migrants on issues that impact them; for more consolidated actions and responses and for support and solidarity between migrants of one country and with migrants of other nationalities. Indeed, migrant worker organizing is the future, once that challenges the boundaries of nation-states in more ways than one.

New Configurations of Informal Work in Brazil: Besides the Informal, Short of Rights

This work aims to examine the non-wage based labour relations and understand its implications for the State and Society. These kinds of labour relations have been referred to as "informal" or "non typical". In this sense, they have been viewed academically and politically as lacking or unviable.

However, if it is true from the perspective of the traditional labour institutions (Unions, State, and the juridical forms of labour regulation) these labour relations are aliens and cannot be characterized but for absence of the key attributes that traditionally have defined labour, in the context of political and economical changes that took place in the past decades, these labour relations are an important part of the accumulating history and have generated new fields of conflict and have been trying to get politically organized, building identity and pushing forward with their agenda.

The first part of the work focuses on understanding the theoretical and political implications of the non-wage based relations for labour relations in general. On the second part, we try to understand the emergence of this new reality and the development of new political subjects with their own agendas and identities. However, although these labour relations and its workers are not informal, they still not recognized in their relation with the State as having rights.

SANCHEZ, FÁBIO* (Universidade Federal de São Carlos, sanchez.fabio@uol.com.br)

The Solidarity Economy and the Social Struggles in Brazil: The Right to Associated Labor

One of the most important examples of a collective subject rising in the public arena in Brazil is the solidarity economy, which for several years has been sharin itself as an autonomous social movement. In this process, it has been trying to build new social rights for Associated Labor. It is a description and analysis of this process that this work intends to develop.

With this objective, it starts by rebuilding the history of the Solidarity Economy in Brazil, focusing on that despite its long history and connection with the Brazilian social struggles for more than a century, it is only in the last thirty years that it has assumed a new configuration and new meanings as a result of the social and political changes that took place in Brazil after the eighties. The second part of this work focuses on showing how the Solidarity economy today has become a new social, economical and political reality in the Brazilian society however; the subjects of the Solidarity Economy still lack the institutional recognition of its rights.

Lastly, we analyze how the subjects involved with the Solidarity Economy have been for years mobilizing and requesting the rights to Associated Labor and have achieved some successes in this process such as the creation of the National Secretariat of Solidarity Economy and the approval of laws for the Solidarity Economy. As a result, the analysis of this movement in Brazil demonstrates that there are no natural rights but rights are political constructions consolidated from processes of social struggles that aim to expand democracy and transform society. It is some of these political agendas that we try to explore in this work focusing on showing the arenas where the struggles and debate around the development the right to Associated Labor take place.

From Hara to Midam: Public Spaces of Youth in Cairo

After the revolutionary events it is possible to appreciate a transformation in the uses of public space in downtown Cairo. That is not longer surprising to see in public walls –even those of Cairo's administrative Mogamma building or public transportation- political graffiti presented this transformation, and convert the public space both as a site and instrument of revolutionary struggle. This transformation takes place against the backdrop of urban planning that sought to limit the availability of open spaces in which citizens might congregate, and the development of gated communities for the wealthy that, along with exclusive planning, have privatized the experience of public spaces. During last years, often these globalized spaces are remade by creating local and regional ties and design features that were not anticipated by the planners. The appropriation of public space –squares and streets–by youth groups for different uses that which it was conceived and planned, have become in physical manifestations of a different Egypt. This different Egypt had roots in the understanding, production and living experience of public space of the traditional cairennes hara and ashabyat –informal neighborhodds- where, also, the young people even has a significant role. Their living experience or urban space in the quarter permits to transform the public in a communal space in the cosmopolitan areas that they transit. In this paper, I try to present the different manners of living both, the cosmopolitan and traditional urban spaces by youth groups.

La Divulgacion Del Conocimiento a Traves De Lo Gadgets. Caso: Usabilidad Del Multimedia y La Hipermedia En México

El presente trabajo se sustenta en el desarrollo de proyectos de investigación desde 2004 a la fecha del Curso Académico Diseño y Cultura de la Universidad de Guanajuato, integrado por investigadores de diversas áreas (diseño, arquitectura, biología, educación, derecho) los cuales están enfocados a la divulgación del conocimiento en los niveles de preescolar hasta posgrado en el Estado de Guanajuato. Los productos realizados integraron el multimedia como punto de partida para ampliar la divulgación del conocimiento hasta interactivos como los PODCAST que se han convertido en objeto de uso común entre los estudiantes, así como la audioconferencia, que permite la estrategia educativa de paso propuestas de hipermedia con la finalidad de utilizar la cultura y tecnología para incrementar el número de usuarios.

La idea de implementar las nuevas tecnologías surge como respuesta a las modalidades de educación abierta y a distancia que actualmente se han constituido en una herramienta en la que no existe la coincidencia espacio-temporal entre alumno, contenido y profesor como tradicionalmente ocurre. Por tanto, dentro del diseño de los materiales de apoyo se considera el uso de los medios de comunicación alternos como los PODCAST que se han convertido en objeto de uso común entre los estudiantes, así como la audioconferencia, que permite la sincronía y el intercambio de imágenes para optimizar el logro de objetivos. La utilización de estos recursos tecnológicos aumentó el número de receptores significativamente en los años 2010 a 2012 situación que ha impulsado el desarrollo metodología que integra las fases de concepción de ideas, desarrollo de estrategias educativas en simuladores, determinación de parámetros multimedia, y desarrollo de prototipo.
Coffee, Certification Schemes and Standards in the Reshaping of Sustainability Markets, Tracing Global-Local Tensions

In the last fifteen years, certification schemes (and the standards they enact) for producing sustainable products have become one of the most important strategies for enhancing sustainability into commodities (such as coffee) market. Similarly, certification schemes are introducing important changes in the governance of agriculture systems. Such transformations have been the focus on a wide set of works that critically highlight how certification schemes are embedded into a neoliberal project as well as the moral dimensions of commodity production in the context of a moral economy. Although many of these approaches isolate technical and social dimensions as separated realms, relative less attention have been put on how certification schemes are enacting sustainability in terms of trust, a key element in the material shaping of any differentiated market. Following Busch (2011) contributions on standards, enacted in the Certification schemes (Van Der Kamp, 2012), and trust I explore how certification schemes can produce two version of it in two different locations. First, trust as consistency in the International Coffee Organisation (ICO). Here I describe how certification schemes are designed to produce trust in the market related to the transparency and the consistency of coffee production according to international environmental standardised criteria. This trust, then, is limited to the boundaries of a certificate. Second, I describe the experience of a small coffee roaster and retailer with certification schemes in the UK, J. Atkinson & Co. What emerges there is a concept of trust as trustworthiness. Certification schemes are framed in terms of coffee relationships, these involve a more emotional and sensuous experience of the market. I present how some standards can be harmonically integrated in these arrangements and how sometimes such integration cannot be possible. As a result, an alternative version of sustainability is produced.

Caring Responsibilities and Gainful Employment in Middle Age: A New Population Based Study in Sweden

The Swedish welfare model is based on the premises 1) the society, not the family, is the main care provider, and 2) all adults are gainfully employed, from the time of employment until retirement. Sweden has a high proportion of women in the work force, also in their 50-60ies. Nonetheless, it is estimated that about 70 percent of all elderly care is performed by relatives. This study is a mixed method study and focus on caring responsibilities for elderly parents of all family members. An enquiry was made during spring 2013, of a random sample of 6000 individuals 45-66 years old (61.1% responses) and interviews from 40 carers in various care situations has been made. It focuses the caring responsibility have any impact on paid work, maintenance and everyday life as well as their experience of public care, possibility to leave job and payment for care. Theoretically the study is connected to feministic welfare research. Of central value is to analyse gender, class, ethnicity and age. Early results shows that over 40% of the respondents give help and 30% of women and 27% of men, help and old, disabled or ill family member at least once a week and 15% of women and 12% of men help daily or several times a week. Care affects life in different ways: feeling mentally and physically exhausted, having difficulties to focus on work, less time for leisure. More women than men have made changes in their working life in order to manage the situation. Corresponding to 7% of women and 4% of men 45-66 years in population we can see that 100 000 women and 50 000 men has made changes in their working life; reduced working hours, stopped working, take early retirement as a result of caring.

SAND, ANN-BRITT** (Stockholm University, ann-britt.sand@anhoriga.se)

ANBÄCKEN, ELS-MARIE (Linköping University)

Work-Life Balance. Welfare State, Family and Caregiving in Japan and Sweden

Japan and Sweden share comparable situations. Both countries have a high and growing part of elderly in the population and high ambitions to handle the needs for care, even if they have different directions when it comes to organize and financing. Still the family is the main car giver for the elderly in both countries. This makes it interesting to compare and highlight the effects of care for family caregivers.

Until the early 1990’s the Japanese policy on eldercare was based on the family as the main caregiving unit. In 1989 a ten year plan for institutional and home care was marked a policy shift. Though family support was added into the Japanese system, cash reimbursement to family carers was not included, a deliberate decision when the National care insurance was implemented in 2000, to secure that municipalities would not choose to lean on family carers instead of developing formal care services.

SANCTON, ANDREW* (University of Western Ontario, sancton@uwo.ca)

Global Cities Making Policy or Policy-Making for Global Cities?

Everyone acknowledges that cities have become increasingly important in the world economy. But there is much confusion about what this means for how they are governed. A natural assumption is that the municipal governments of the central-city municipalities of a global city-region are becoming more important for urban policy-making. But, unless the boundaries of such a municipality corresponds to the entire city-region (however defined), which is highly unlikely, then the central-city municipality will be quite incapable of responding to the most important policy issues, especially those relating to urban sprawl. The result in many countries is a search for the perfect municipal structure to enable effective city-region policy-making.

But what is forgotten in this kind of analysis is that, if city-regions are becoming relatively more populous in relation to small towns and rural areas, then our national and sub-national legislatures are becoming increasingly dominated by urban voters. In countries with one dominant city (France, England) and in federations and countries with strong devolved regional legislatures, urban policy for city-regions will not be made at the municipal level, whatever the municipal boundaries and structures might be. We are used to hearing that “all politics is local.” What we need to consider is the likelihood that “all politics is urban.”

Although examples will be drawn from around the world, particular attention will be paid to the Toronto city-region (the Greater Golden Horseshoe) and Ontario, the Canadian province in which it is situated. Despite Ontario’s vast territory, two-thirds of Ontario’s population lives in the Toronto city-region (the Greater Golden Horseshoe) and Ontario is the most densely populated province in Canada. Indeed, many countries is a search for the perfect municipal structure to enable effective city-region policy-making.
Oil-Drilling in Arctic and Ecosystem-Management Plan of the Barents Sea

In the High North, The Barents Sea has large resources of petroleum and sustainable populations of fish. The international challenge lies in implementing the conservation of marine biodiversity, at the same time managing sustainable exploitation of natural resources in the Arctic region. The Norwegian government has tried to solve conflicts of interest by making a large scale ecosystem-based national management plan for The Barents Sea and Lofoten Islands. The national goals are sustainable use of petroleum, fishery resources and conservation of the structure of the maritime ecosystem. In this paper, I present an empirical case study of Norwegian national decision-making in ecosystem-based management of The Barents Sea. This new system of planning is implemented as the second sea area in the world. Australia has implemented a large ecosystem management plan at the east-coast with the Great Barrier Reef. In the paper, I discuss in a critical perspective of sociology of knowledge the social effects of the development of national planning of the sea ecosystems in the Arctic area. The question is: Does the government eco-system management planning of the Barents Sea provide a suitable institutional framework for solving the social conflicting interests between oil-drilling and conservation of nature in the Norwegian societies?

Integration and Belonging in Two U.S. New Destinations

The extension of border politics, and specifically, a politico-legal context characterized by increased surveillance of immigrant populations and the hardening of immigration controls, is concomitant with the emergence of new destinations (Massey 2008). In this sense, the border has been “pushed inward” (Coleman, 2007). Additionally, a growing number of state and local governments have proposed and/or enacted a wide range of policies with consequences for the lives of immigrants and their families. Some such policies are aimed at local policing and enforcing of immigration controls while others regulate access to jobs and housing, and more generally, the provision of services. This “variegated landscape” of local policies (Walker and Leitner, 2011) results in contexts of reception that vary significantly across U.S. spaces. From a research standpoint, questions about how the conditions of children’s upbringing affect their education, which in its turn affected other social resources and thus the income and living conditions of people. Gudmund Hernes (1941-) had studied under James Coleman at John Hopkins University and was heavily influenced by the latter. Hernes, who later on also led the investigation on power and democracy in Norway, became a great entrepreneur of clinical sociology in the world. The study on living conditions became the first of a number of large-scale, government sponsored research project, based on statistical models, large sets of data and an economic approach to sociology.

People Can’t Live There Unless There Is Economic Activity: Agriculture and the Structural Impediments to Groundwater Sustainability in the U.S. High Plains

The High Plains region of the U.S. is one of the most important agricultural regions in the world. Much agricultural production in this semi-arid region, however, depends on the consumption of nonrenewable groundwater from the High Plains Aquifer. Although the problem has drawn significant attention from policymakers and citizens for over 40 years, depletion of the Aquifer has worsened. Why does depletion persist despite widespread and ongoing concern? We explore this conundrum by placing the region into an historical, political-economic context. We argue that the contemporary problem is rooted in the ways in which the region was articulated into broader circuits of capital and exchange. Private capital and the state incorporated the region as a source of primary raw materials, mainly agricultural products. Water-dependent agricultural resource extraction opened up a metabolic rift in the hydrological cycle that has only been exacerbated over time through unequal ecological exchange with more politically and economically central places. These structural dynamics associated with political-economic incorporation have impeded efforts to develop more sustainable uses of groundwater consumption in the region.

Youth in Social Transformation Through Education

India, known as a country of youth, with the potential to help build a stronger democracy through social entrepreneurship. There is a need of enthusiastic and pro-active youth for any transformation. They need a balance while addressing country's growth and social issues.

Education is a progressive approach for transforming society. Existing education policies have many shortcomings. There are many discriminatory practices applied at ground level. However, despite this adverse situation the young generation is engaged in creating an atmosphere for change in rural Maharashtra, India.

Idea of bringing changes in the mainstream of education has been established. But, due to distress & seasonal migration of deprived sections of the societies with family, education of students gets affected badly. Some experimental learning centres such as SAKHARSHALA for sugarcane workers and PASHANSHA-LA for stone crusher workers have been started for the education of deprived communities.

In tribal area, language is a big issue which cuts masses from education. In Gadchiroli (Indian Village), youth started translating the formal text books in Gondi, a colloquial tribal language, which was successful, and tribal students continued in schools that there are three modes of moral reality that have various implications for charitable giving, moral obligations and civil society. First, moral conventionalists, who value familial and social networks, use charity events as an opportunity to socialise and to have fun. Second, moral individualists, who are strongly committed to work and career, view charitable practices as performative acts that demonstrate their knowledge and skills. Third, moral critics are deeply committed to charitable causes, motivated by strongly held values and beliefs, which offer alternative visions for society.

Everyday Morality and Moral Concerns and Their Implications for Charitable Giving in the UK

This paper examines how individuals are morally evaluative beings, who interpret the social world in relation to things that matter to them, and how charitable acts are embedded in their lives with different degrees of meaning and importance. The paper offers some criticisms of the Bourdieusian theory on giving, which depict individuals lacking reflexivity, emotions and disinterestedness. Drawing upon various literature that view individuals as evaluative beings, I will suggest that there are three modes of moral reality that have various implications for charitable giving, moral obligations and civil society. First, moral conventionalists, who value familial and social networks, use charity events as an opportunity to socialise and to have fun. Second, moral individualists, who are strongly committed to work and career, view charitable practices as performative acts that demonstrate their knowledge and skills. Third, moral critics are deeply committed to charitable causes, motivated by strongly held values and beliefs, which offer alternative visions for society.

The paper draws upon an ESRC-funded investigation into charitable giving that involved 41 semi-structured interviews with men and women of working and middle class social backgrounds, mostly white interviewees. Each interview lasted on average 2.25 hours, divided into two parts: the first part asked the interviewees to recount their life history, describing the twists and turns in their lives, their personal goals and their everyday practices, and in the second part, they recalled significant acts of giving and volunteering, describing their feelings and motivations.

SANGHERA, BALIHAR* (University of Kent, b.s.sanghera@kent.ac.uk)

Social Justice, Liberalism and Philanthropy in the UK

This paper examines how charitable and community foundations as normative institutions relate to issues of social justice, legitimacy and accountability. We will argue that grant-making foundations use their resources to support basic liberties and to assist the most disadvantaged groups in society, pursuing a Rawlsian liberal form of social justice, foundations have to change their institutional practices and routines, aiming for justice and a socialised and democratic production system, rather than regulating economic and social inequalities.

The paper draws upon an ESRC-funded investigation into philanthropy that involved 34 semi-structured interviews with executive directors or senior project managers of charitable and community foundations and grant-makers. Each interview lasted on average 1.5 hours, divided into two parts: the first part asked the interviewees to describe the history of their organisations, and to outline their current strategic themes and priorities; and in the second part, they explained the use of the concept ‘social justice’ in their organisation. In addition, further interviews were conducted with sixteen participants from the first round either via Skype or emails to collect extra information.

Becoming Kathoey Prostitute: Voices of the Excluded

Labeling as deviant has long been imposed difficulties on those who take up Queer gender identity in some ways depending upon to what extent they have technology of self. Even though rainbow movement strives and wins some social spaces for certain acceptance especially in terms of human rights, still discrimination is reproduced in both private and public spheres. The main argument in this paper is that vicious cycle of inequality prevails. This makes the issue of Queer identity complicated and chains it with an extended long winded problem arisen in their life and affects their identities and self-awareness.

But is the idea based on too archaic figure of immigration moving only between origin and host country? It is not unusual today that man has Networks among many countries; for example, a woman, who was born in Russia, lives now in Germany and whose daughter is in England. What means for her to learn German? Or those people, whom I define “mobility people”, who have Networks among plural countries?

According to Shansul, a Malaysian Anthropologist, identity formation takes place within what he would call “two social reality” context: first, the “authority-defined” social reality, and second the “everyday-defined” social reality. The former is one which is authoritatively defined by people who are part of the dominant power structure and generally with text recorded. Quoting his hypothesis, “Integration Course” is not only a German course but also a means of transmitting German “authority-defined” social reality and could be of creating German identity.

However does it work well as the government intended, especially to the “mobility people”? Based on my research, the biography interviews to the participants of “Integration Course”, I will consider the meaning of “national language” and “national identity” in the globalization era.

Increased Precarity and Widening Disparity of Youth Transitions, and Inclusion in the Labour Markets

The Youth Cohort Study of Japan (YCSJ) was a major programme of longitudinal research undertaken to monitor transitions from school to work in Japan from 2007–2011. The first survey was undertaken when respondents were aged 20. The respondents, who were selected nationally through random sampling, were
followed up annually for five years. The achieved sample size and response rates of the YCSJ are as follows: 1678, 40.2 % (2007); 1361, 82.0 % (2008); 1141, 86.2 % (2009); 1009, 90.7 % (2010); 891, 88.3 % (2011). Based on the datasets of the YCSJ, we explore four main topics in this paper.

First, we analyse youth transitions to work, documenting the increasing pecuniary of youth labour markets. Here we have used indices such as low income, irregular jobs, and unemployment, to examine the extent to which vulnerable situations in youth labour markets have expanded. Second, we investigate which cohorts are more likely to become precarious. Against precarity indices, we found key variables of disadvantage in relation to individual attributes, family socio-economic backgrounds, residential area, and current jobs were relevant to risk factors with statistical significance. Third, we consider forms of disparity in working conditions including work content and developmental opportunities. Here we find that there remains a significant structural disparity between genders and amongst transition types in working conditions.

Fourth and finally, we investigate the mechanism of inclusion in the labour market. We find amongst most of the transition types, irrespective of gender, that demands for high commitment to work – such as acceptance of long working hours and heavy responsibility – has increased every year despite an apparent disparity in many aspects. We propose two key factors to enable inclusion in labour with high commitment: discretion and participative involvement; and positive human relationships in the workplace.

Economic, Social Change and Son-Preference in Nepal

The purpose of this study is to clarify the promotion factors of son-preference, such as the neglect of female child, trafficking of girls and the interruption of the female fetus, in Nepal. According to UNDP (2010), the number of the "missing women" in Nepal is estimated to be about 0.1 million. Republica, local newspaper, on 29 Nov 2012 reported that the female population is 2.3 percent less than male in the 0-10 year age group in the latest census.

In this study, the findings of the ongoing research implemented in seven districts in Nepal, during March 2012 – March 2014, will be shown. The questionnaire survey of 1500 men and women both married and unmarried 18-80 year-old were selected based on a multi-staged random sampling technique. The data will be analyzed by modified framework of sustainable livelihood approach. This framework consists of three components such as livelihood assets, policy institution-process and livelihood outcome (Chambers and Conway1992). This leads to analyze consequences among these three components. Livelihood assets, furthermore, consist of financial capital, natural capital, physical capital, human capital and social capital.

Former studies reveals the correlation between the property (financial capital, natural capital), relatively high educational level (human capital) and son preference (Clark2008; Banerjee2012; Republica 2012). In this study, the correlation among social institution such as family structure, 5 capitals and son preference, will be analyzed, in addition to the former studies.

As the result, following three findings have been verified: (1) Even though lack of some of capitals, those who has variety of network does not tend to be son preference, (2) Even though abundant in capitals, those who live in extended family tend to be son preference, (3) Those who have female family member who of some of capitals, those who has variety of network does not tend to be son preference, (4) Those who have female family member who of some of capitals, those who has variety of network does not tend to be son preference, and discussing implications for immigrant integration policies and future immigration, home language, and experience of discrimination on the identity formation. This paper concludes by highlighting the impact of ethnic concentration.

Unequal Identities: The Attainment of National Identity and Ethnic Identity Among Children of Immigrants in Canada

Despite growing interest in “the new second generation,” quantitative analyses on the psychosocial adaptation among non-white offspring are limited, especially in Canada. This study addresses this gap by assessing the impact of ethno-racial characteristics among children of immigrants on the establishment of self-labeled national and ethnic identities using a nationally representative survey, the 2002 Ethnic Diversity Survey. Results from binary logistic regression suggest that while white children of immigrants are more likely to form national identity, ethnic identity is more likely to be established among their non-white counterparts. While this is consistent with the segmented assimilation theory, the study also reveals that the level of parental education does not explain the results, countering the theory. This frame-work includes by highlighting the impact of ethnic concentration, home language, and experience of discrimination on the identity formation and discussing implications for immigrant integration policies and future immigration research.

Married and Cohabiting Adults with Ill and Old Parents: Does Intergenerational Solidarity Change According to Family Conditions?

The objective of this paper is to compare the patterns of intergenerational solidarity and the changes in solidarity when children who cohabit or are married, with their own parents and those of their partners. To this aim, I report the results of qualitative research I performed in Italy, based on 50 in-depth interviews of cohabiting and married couples, with an age range between 26 and 56 years. The dimensions of family solidarity investigated, included the financial support provided by parents to their offspring, help in child-minding the grandchildren, the frequency of phone calls and visits and finally, the willingness (also in the past) of the offspring to look after one of their own parents or their partner's parents when ill and old. The analysis of the interviews has highlighted the varied types of interpersonal relationships established with parents by the cohabiting partners. While those who were married kept closer relationships and appeared to be more willing to help their parents and in-laws when ill and old, among those in cohabitation, only those who had a background of formation of a traditional family model, similar to marriage, adopted the same manner of solidarity. Those who had begun cohabitation, following separation or co-habited with a partner who was separated, felt less responsible towards their partner's family members, to the extent that they did not perceive any kinship ties nor obligations. Consequently, they felt that caregiving activities were not their responsibility. Finally, the length of the marriage or cohabitation was seen to have no effect.

Between Subordination and Protagonism: Violence Experience of Young Women through Biographic Narratives

The involvement of women in violent actions and criminal activities is growing in many countries. Even though, sociologists are not given an adequate attention to this issue. This paper discusses the relation between young women and violence in Brazil, stressing the main interpretations available in Brazilian sociology, which mostly emphasize, on the one side, the secondary position of women, dominated by their male partners and peers, and, on the other side, the structural conditions of the Brazilian society – for instance, inequalities, uncertainty in work market, drug use and school evasion – as the main reasons for this phenomenon. Besides this, the literature stresses the position of women as victim in violent actions, almost monopolizing the analysis when violence and women are connected. An approach seen in the biographical approach in Brazil is the approach that stresses the disruption of norms and legal rules, neglecting this way another component of the practice of violence, that means, a subjective interpretation of reality. Biographic narrative approach permits to offer other possible interpretations to the engagement of young female in violent and in criminal activities. Based on preliminary findings of a research that are investigating direct and indirect experience of violence of young females, the paper presents the main antagonists positions found, that means, between the subordination to dominant males and a more relevant and protagonist role played by women. The results show that using this kind of “insider” approach is possible to obtain new elements for the interpretation of the experience of violence in which the women role as victims and perpetrators are not always well defined.

Narratives on Violence and the Everyday Life of Children and Families Living in Favelas of Rio de Janeiro, Brazil

This paper discusses the everyday life experience of violence of children and families living in favelas - impoverished communities - of Rio de Janeiro, Brazil. This research was conducted during 2012 and 2013 and aimed to understand the different possibilities of biographical construction in social contexts marked by intense violence, perpetrated by the police, by drug dealers and by parents against their own children. For that purpose, it was conducted two different narrative research instruments: biographical narrative interviews with two generations of families, and biographical episodic narratives interviews with groups of special children. Even though the violence not put directly as a topic to be discussed by children and family members, the two instruments allowed the investigation on how violence is part of their everyday life, as well as the different

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
New model of “unequal inclusion,” is emerging. Privilege and deprivation exist side by side, ignoring each other and even tacitly accepting each other. Inequality has taken a qualitative leap towards fragmenting the social structure through spaces of inclusion that are not only unequal, but also socially and culturally distant. This paper will explore the contribution of educational segmentation to this broad pattern of social fragmentation. Access to education in Mexico has increased substantially in the past few decades. Between 1990 and 2010, basic education coverage became almost universal, and the average years of schooling of youth age 25 to 29 increased from 7.9 to 10.2. In addition, there were several constitutional reforms that extended compulsory education, most recently, in 2011, making it compulsory until the age of 12. But, parallel to this process, the educational system has experienced a deep fragmentation. Thus, privileged children and youth attend the same private schools, have more and better resources for learning at school and at home, and receive an education of higher quality and greater variety. Among poorer groups, children and youth also attend socially homogeneous schools, but with a more precarious infrastructure and fewer pedagogical resources to support students that come from homes with little social or cultural capital. The consequences of this segmentation are not limited to educational achievement; they extend to school experiences and the meaning of education. Transcending the conceptual framework of inequalities, this paper explores the consequences of this process in terms of social fragmentation. RC24-432.19

SARBU, MIHAI* (University of Ottawa, m.sarbou16@uottawa.ca)

Transcending Frontiers: A Contribution to Overcoming Instrumental Rationality in Our Relationships with Nature and with One Another

Environmental sociology is uniquely positioned to analyze the relationships between humans and nature and expose the societal factors that lock our civilization into carbon dependence; it can also analyze why the issue of climate change is becoming increasingly politicized and divisive. Moreover, it can examine how social inequalities—ubiquitous in this era of unemployment and economic decline—compound environmental crises and aggravate the suffering of the most vulnerable.

This paper argues that the social and environmental hierarchies prevalent in the world today can be meaningfully analyzed using the theoretical framework of instrumental rationality. In a nutshell, using instrumental rationality means applying the means of reason short-sightedly to solve a problem without considering the larger context—burning fossil fuels to fulfill most of our energy needs is a prime example.

Instrumental rationality has been linked to the drive for self-preservation and using this link as a conceptual tool can offer new insights: The first insight is that—paradoxically—we often hurt nature because we are (partially) from nature; the second insight is that our drive for self-preservation can be easily fused with an apparent and hollow (instrumental) rationality leading to a substantially irational state of mind which is very dangerous for nature as well as for other human beings.

The challenge then becomes to find ways to overcome instrumental rationality and this is the main purpose of this paper. It is an arduous task, one that needs to be assumed urgently to help us deplete the unsustainable path we currently follow.

*Between the Corporate and the Government Responsibility: The Livelihood Issues Experienced By the Local Community in the Surrounding Conservation Forest in West Java, Indonesia*

Until about ten years ago forest had ever been the primary source of income for the community living in the surrounding area of the Halimun-Salak mountain, West Java. This situation has been changing since the government launched the new regulation that prohibited people to get anything from the forest because the area was designated as forest conservation. Since that time the community has been experiencing a decline in their standard of living, especially who were only had the forest as their source of income. Besides, for many years, the community has only been provided by inadequate basic infrastructure (i.e. health, education, transportation) that supposed to be the government's responsibility. The situation becomes increasingly critical when the people knew that there was a multinational company that has been exploring geothermal energy within the conservation area which has further caused anxiety and uncertainty in local people livelihood. The latest development seemingly has been overlooked by the local government since it has not been taken any significant action to help the people. Moreover, the conflict between local people and the MNC sometime has been raised as critical issues for the economic or political interests of certain actors in the community. Pressures to the company have been increasing since the government regulation stated that the company should perform the social and environmental responsibilities. Based on the ongoing research in the area of Halimun-Salak mountain, this paper analyzes the relation between state, market and government regulation stated that the company should perform the social and environmental responsibilities. Besides, for many years, the community has only been provided by inadequate basic infrastructure (i.e. health, education, transportation) that supposed to be the government's responsibility.

*Comparison of Leisure Activities of Children of Tea Garden Community and Other Groups in Anganwadi Schools: A Case Study of Dibrugarh District, Assam, India*

Dibrugarh is an easternmost city situated in the Banks of the river Brahmaputra. The place has the highest number of tea gardens giving it the status of 'Tea Capital of Assam'. Though tea is a big industry, the children of the tea garden community do not get adequate facility of good education, health and leisure facilities. There are Anganwadi schools in the tea garden areas which look after the mental, physical, and emotional development of children between the age of 0-6 years. They also provide nutrition and value based education to children in the age group of 3 to 6 year. The conditions of these schools are not satisfactory to provide the pre-schoolers the pleasure of enjoying their childhood as compared to the Anganwadi centers for children in other parts of the city. The dropout rate from the schools in tea gardens is very high, as a large number of the children are engaged in child labour and some help their parents to look after the younger siblings or help in the household work. Some children, who go to school, go there for the food provided as the mid-day meal. The leisure time activities of these children include playing with other children or helping their parents. They play in groups but very few have access to playing equipments. The facilities provided at school are not adequate as compared to other Anganwadi schools and in some cases, the teacher do not come to school regularly. These children are thus deprived of quality education, satisfactory leisure activities etc. as compared to the schools and Anganwadi centers in the city.

The paper attempts to do a comparative study of education and leisure activities provided by Anganwadi schools to tea garden community and other children in Dibrugarh.

*Leisure, Tourism and Environmental Degradation—a Study Based on Assam, India*

Tourism in Assam holds large prospects as the land is bestowed with natural beauty and resources. Tourism in Assam is essentially nature based. Assam has a rich cultural and ethnic heritage that has also made it a favourite tourist-spot. It is counted as one of the prime Eco-Tourism destinations in India. The rich bio-diversity of the region encourages eco-tourism. But compared to some other states in India, eco-tourism is not yet developed in the real sense in Assam. A lot of tourists come to Assam for different leisure activities as the region is still less explored and provides for peaceful existence with nature. The eco-camps set up in areas like Nameri in Sonitpur, Tipam Phake village in Eastern Assam, camps set up in and around Kaziranga National park, famous for the one-horned Rhino, attracts lot of foreign as well as domestic tourists. They are provided with facilities like boating, fishing, trekking in the wild etc. and misuse of these can lead to severe environmental degradation. Illegal destruction of forests to set up hotels for tourists near Kaziranga, excessive boating and fishing etc. has also been increased.

The land has the opportunity to develop several leisure activities based on eco-tourism where the rich bio-diversity of the region can be explored without environmental degradation. But activities like using the areas as picnic spots and then leaving behind plastic waste has already destroyed some of the natural spots. A systematic development of tourism involving local population, who can look after the protection of environment, is needed to increase the inflow of tourists.

This paper attempts to analyse the tourism scenario, development of eco-tourism inspired leisure activities and how tourism can be used positively to lessen social inequality, and lead the way towards a more socially and environmentally responsible tourism practices.

*Meanings Of Friendships in Substance Abuse Clients’ Talk In The Probation Service*

Although several studies have examined the influence of friendships on clients’ substance abuse and treatment outcome, there is a paucity of research examining patients’ talk about their experience of the meaning of friendships. This paper explores the meanings substance-abusing clients attach to friendships during motivational treatment sessions in probation service. By using semiotic framework, this paper examines client’s change-related talk utterance about friendships as a symbolic sign. The analyses are based on videotaped data consisting of 98 motivational counseling sessions. The database involves the first two sessions of each client-counselor pairs. Sessions were videotaped in 12 Probation Service offices in Finland in 2007–2009. In general, the findings of this qualitative study indicate that the friendships play an important role in the substance-abusing clients’ motivation change. The results of the study display that the meanings of friendship were divided into four categories: a support to change, a reason to change, an obstacle or a threat to change, and a surmounted obstacle to change. The study also suggests that the personal meanings of clients’ utterances in motivational counseling sessions could be seen as potential predictors of their future behavior.

*What Was All That Growth for? Explaining Chinese Decreasing Well-Being in Times of Economic Growth*

China is one of the countries that experienced the most impressive and sustained rate of economic growth. Since 1990s its economy has been increasing on average by 9.7% each year. Arguably, economic growth allowed a general improvement of several social, economic and sanitary dimensions of people’s life. However, in the same period people’s satisfaction with their life decreased. What does explain this outcome? And who are the winners and the losers from economic growth? Finally, if economic growth did not improve the human lot, did it at least reduce well-being inequalities?

Using data from the World Values Survey, this paper identifies the determinants that shaped people’s life satisfaction in China between 1990 and 2007. Results suggest that the erosion of social capital and social comparisons are the two main factors explaining why economic growth did not turn into higher people’s well-being. Moreover, economic growth resulted in higher well-being disparities among people: those in the lowest three deciles and the middle-class experienced a significant reduction in well-being, whereas richer people substantially improved their conditions.
The aim of the paper is first to present the institutional framework concerning the role of participative action in Greece. The institutional foundation for cooperatives and unions is primarily set by Article 12 of the Greek Constitution, while specific laws provide the role of Social Cooperatives in Greece. After a short analysis of the legal framework the paper will examine the main sectors of activities of NGO’s and other bodies (organizations) that belong to the civil society, especially those acting in Athens.

More specifically this paper examines the schemes of the municipality of Athens to promote specific policies and volunteerism in order to contribute to the solution of problems that vulnerable social groups, who live in the city of Athens, face. An emphasis is given both to Law 4071/2012, which concerns the possibility of local authorities to set up social supermarkets, and the possibility of collaboration between local authorities and NGO’s. Structural impediments to such policy developments are also elaborated. Overall, the paper will attempt to answer the main critical questions of how the top-down and bottom-up models can co-exist in the implementation of public policies at a local level, and of how ways of cooperation concerning everyday problems can emerge from the economic crisis.

Micro-Motives and Collective Action: Measuring Individuals’ Reasons for Participation in the #YoSoy132 Movement in Mexico

Individual’s political mobilization has been explained by rational choice theory according to the general tenets of its approach to human behavior (Becker, 1968; Olson 1971). Following the well-known distinction between the narrow theory and the broad theory of rationality (Elster, 1988), this paper presents a more extensive view of political mobilization, considering the individuals’ strategic calculus for their participation in a contentious collective action (Tarrow, 1997). Following the broad theory of rational choice, the work incorporates cognitive, normative and emotive factors to the explanation. So, first we propose that the movement can be treated as a production’s function with two phases, where in each of them there are different mechanisms and games that help to explain the process of collective action. The first phase, which we call accelerative, is triggered by a political opportunity that incorporates elements such as coordination between groups, high expectations, and a focal point equilibrium. The second phase, called not-accelerative, arises once the election finishes and it is characterized by a lack of coordination, internal conflicts between groups, and lack of participation. From a set of thirty interviews to active participants in the movement #YoSoy132 Mexico City (14 women and 16 men), the findings show the variety of reasons present in the interviewees, and that some actors may have a predisposition to behave according to a kind of reason (i.e., instrumental vs. normative). The main conclusion we arrive is that the two versions of rational choice allow a better approximation to the individual and collective action in the movement #YoSoy132 in Mexico.

Clinicians in Governance: Evidence for Hospital Performance from the Italian NHS

The study explores the effects of clinicians’ involvement in governance on hospital performance through an empirical investigation in the Italian NHS. By drawing on the board human capital literature (Hillman & Dalziel, 2003; Kor & Sundaramurthy, 2008; Kroll et al., 2008) and the empirical evidences on clinicians in hospital governance (Dorgan et al., 2010; Goodall, 2011; Molinari et al., 1995; Veronesi et al., 2013), we develop our research hypotheses. More specifically we conjecture that hospital chief executive officer (CEO)’s: (i) clinical expertise, (ii) previous governance experiences in the NHS, (iii) public health specialization, and (iv) business/administration specialization, have individually a good effect on the organizational performance.

We find that, and it incorporates by: (i) the clinical expertise, (ii) previous governance experiences in the NHS, (iii) public health specialization, and (iv) business/administration specialization, have individually a good effect on the organizational performance.

We found that the latter three have a significant impact on hospital performance. By contrast, the non-clinical specialization (i.e., the work of general practitioners, nurses, and other non-clinical specialists) is not significantly related to hospital performance. The main findings report a positive (negative) effect of clinical CEOs on non-financial (financial) performance. By contrast, non-clinical CEOs negatively (positively) influence the non-financial (financial) dimension. Paper argues a differentiation in the provision of skills to the strategic process, as well as in the relationships with the clinical/non-clinical staffs. Findings also report good effects of CEO’s previous governance experiences and public health specialization.

Paper contributes to research in different ways. First, we corroborate the relevance of human capital in governance for the organizational performance. Second, we discuss the dissimilar effects of clinical/non-clinical expertise by arguing their reasons in setting peculiarities. Finally we investigate never explored effects of clinical/non-clinical specializations and experiential background.

For what concerns the practice, we suggest policy makers to pay more attention to the expertise legal requirements for CEO candidates.

Cultures, Strategies, and Organizations for Mobilizing Social Movements: Divergence and Convergence Between Social Movements and Labor Movements

There have been few comparative studies of social movements and labor movements. Social movement studies have examined the conditions, development, and outcomes of social movements using various theoretical frameworks. In contrast, largely driven by Marxist and post-Marxist theories, labor movement studies have often focused on whether and how workers have organized themselves as a coherent force—i.e., as a class. In brief, in labor movement studies, workers’ movements have often constituted a sub-topic of the study of class, and the ways workers have organized as workers. But how exactly do these two movements differ? Or what do these movements share? By examining a Japanese social movement, the protest against the revision of the U.S.-Japan Security Treaty (commonly referred to as the 1960 Anpo protests, named after the acronym of the treaty in Japanese), this paper explores divergence and convergence of movement cultures, ideologies, and strategies, and the organization of social movement and labor movement groups. I compare two groups that participated in the 1960 Anpo protests—the Bund, a new left student movement group that became prominent during the 1960 Anpo protests, and a new left faction of the Osaka Central Telegraph union that became prominent among new left labor unions in the 1960s. This paper argues that despite similarities in ideology between the two groups, external constraints on their organizations shaped different strategies for mobilization. Furthermore, the two groups never merged nor worked together, although they explored possibility, despite their common political goals and similar ideologies. This was due to intergroup culture differences, as well as problems with mutual trust acting as a wedge between them. The empirical data collected from interviews, for instance, show that while knowledge was a key issue for mobilizing student movements, trust was a key issue for organizing the workers’ movements.

Alternative Art-Production Networks in Lower Manhattan in the 1960s-1970s: An Organizational Account of the SoHo’s Gentrification

This paper deals with an early period of an artists-led gentrification in SoHo in New York City in the 1960s and 1970s, from the standpoint of alternative arts-production-networks in Lower Manhattan then. A couple of studies have already dealt with the gentrification in SoHo (Simpson 1981; Zukin 1982). Given roles of the artists in the SoHo’s gentrification, previous studies have shown that there are two issues: a creation of living spaces and a construction of symbolical and institutional boundaries of art districts. These former studies contributed to examined that the artists’ spaces and their aesthetic images, fortunately or unfortunately, contributed to the subsequent creation of a commercial and consumption district there. Although these findings are valid and quite important, this paper argues that there was another fundamental issue in the SoHo’s gentrification: alternative arts-production-networks in downtown also critically contributed to constructed physical and symbolical bases there.

In order to explore this issue, I will focus on artists’ activities and their networks from the standpoint of organizational sociology and production-of-arts theories (Becker 1982, DiMaggio and Hirsch 1976; Peterson and Anand 2004; White and White 1965). Some artists pursued alternative production and distribution systems against the backdrop of a flourish of art museums and commercial galleries in uptown. These alternative arts-production-networks in downtown also critically contributed to constructed alternative and symbolical spaces. These alternative arts venues were critical aesthetic bases in SoHo.

Historical Overview of Migratory Flows Between Brazil and Japan

This paper will present an historical overview of the migratory flows between Brazil and Japan. The first part discusses the immigration of Japanese to Brazil at the beginning of the 20th century. During this time, their presence in the country sparked a heated debate among the politicians of the Brazilian elite as to whether or not they should be accepted. The Japanese were labeled as “not white”, an undesirable state according to the eugenics policies of the time. At the same time, Japanese government closely accompanied the entire migratory process, helping to establish a network of Japanese immigrants in Brazil. In the second part, I will focus in the inverse route, upon the ending of the 20th century and beginning of the 21st century, when Brazilians of Japanese descent began to migrate to Japan. They were favorably contemplated in Japan’s 1990 immigration reform law, a factor which contributed to the increase of the population, especially during the first half of the 1990’s. From that time on, the Brazil-Japan link began establishing itself and consolidating social networks within the host country, losing sight of its original temporary expectations and intensifying the flow of people moving between Brazil and Japan. However, after more than two decades, the Brazilian population in Japan began decreasing in 2008. At this time, the world financial crisis resulted in a rising unemployment and one third of the Brazilians in Japan returned to Brazil. They are facing great difficulties as they try to reinsert themselves into a new or different social and cultural reality in their own homeland, encountering problems in linguistic and educational fields as well as the local labor market.

Hope or Fear? How My Voice Could be Represented – Public Understanding of Nationwide Electronic patients’ Records in the UK

This presentation is a response to the issues of citizen’s right arising from the emergence of IT technology vis-à-vis the former British national policies, information for Health and Connecting for Health. The main purpose of these British policies was to develop computer databases of patient records ‘from cradle to grave’ whereby clinicians and medical researchers could access patients’ clinical records and medical history. The anticipated benefits of accumulated data included enhancing both public health and the quality of medical services and research. Whilst it could be said that these policies have been aborted, the core theme has still survived vis-à-vis the Social Care Act 2012 and other policies. The downscaling of these policies could mainly be attributed to the shortage of financial and human resources, but certain issues arising from them contributed to the scrapping process of the policies, too. Specifically it evoked questions regarding, for example, citizens’ rights over their own medical data and the security of the e-database. The first issue deeply involves the matter of ‘informed consent’ in medical, specifically on what terms and in what ways a personal and anonymised medical record can be used for medical treatment and research. The second question is that current research has revealed this the first issue to be deeply entangled with public discourse over data security. Hence further consultation is necessary over the development of such electronic medical records. In view of this, the presentation explores in what ways and on what grounds these questions lie. To do so, we have mapped out the issues in this paper argues how those issues would have been encompassed within a range of other important sociological contexts of empowerment of citizens and communities - such as the representation of the voices of disabled and ethnic minorities, and of youth and the elderly.

Wandering Career Paths Among Japanese Youths: An Analysis of JGSS Life Course Study

In Japan, there had been a standard life model that many youths follow. Once students entered the labor force, their full-time employment was virtually guaranteed until retirement. Since the mid-1990s, however, many young Japanese did not (or were unable to) follow this standard life model. Increasingly, Japanese youths have started their careers as contingent employees. For many younger adults with unstable careers, incomes did not grow, and thus the gap between regular employees and contingent employees expanded. In addition, for many Japanese, marriage and childbirth became no longer an ordinary path of life. The goal of this study is to illustrate diversified career pathways of Japanese youths and investigate the causes and effects of the career paths. JGSS Life Course Study contains detailed life history, including educational background, work experience, marital record, with a national sample of men and women aged 28 to 42. Mixture modeling with longitudinal data was employed to classify Japanese career paths. In this model, retrospective data were treated as if we collected types of respondents’ employment each year.

The results show that there are clear gender differences in the career paths among Japanese youths. Younger men’s career is more likely to be unstable, whereas younger women’s career is more likely to be stable. Educational attainment does not predict career paths among men, whereas highly educated women’s career is more likely to be stable. Men whose career path was unstable are less likely to make money and get married, and more likely to be unhealthy and unhappy. Women whose career path was stable are more likely to make money but be unhealthy, and less likely to get married. Recent economic recession and the popularity of higher education are presumed causes of diversified career paths among Japanese youths.

The Meaning of the International Marriage in Korea

Nowadays in Korea, international marriage has increased since 2000 rapidly. Increase in this international marriage is not the change of the marriage from the influences of globalization. Because Korean people have protected their blood principle rigidly for a long time. It is a big change increasing to international marriage in Korea, and it is shaking now family value from the bottom. In this report I ask why has international marriages increased in Korea rapidly these days? Also, who and why do people choose an international marriage? I pay attention to the change of the marriage and the family in Korea today and intended to consider the meaning of international marriage.

This study developed the result of the data analysis of the census (1995, 2010) that I analyzed before. In the former analysis, I compared the change that was in the marriage form with the census of 1995 and 2010 according to sex, age, and educational background. The result implies from the rapid increase of international marriage today in Korea that it is due to the increase in high educational background and the woman from the 1990s and the economic power drop of the man from the late 1990s. Based on these findings, I will include variables such as economic activities state, occupation, occupational position and compare and contrast according to the man, woman and combination of couples who chose international marriage using census data. Furthermore, I will use the “dynamics statistics data” and cast the education level between the couples who married a person from a different nationality, the variable such as the nationality of the partner and consider the meaning of the international marriage in Korea these days by clarifying the sociodemographic characteristic of the couple who choose to international marriage.

Expulsions: When Complexity Produces Elementary Brutalities

The past two decades have seen a sharp growth in the number of people, enterprises, and places expelled from the core social and economic orders of our time. This tipping into radical expulsion was enabled by elementary decisions in some cases, but in others by some of our most advanced economic and technical achievements. I use the notion of expulsions to go beyond the more familiar notion of growing inequality, and get at some of the more complex pathologies of today’s global capitalism. It brings to the fore the fact that forms of knowledge and intelligence we respect and admire are often at the origin of long transaction chains that can end in simple expulsions.

The talk is based on Saskia Sassen’s forthcoming book Expulsions: Brutality and Complexity in the Global Economy (Harvard University Press 2014)

Food Sovereignty and the Solidarity Economy Alternative

This paper explores the relationship between food sovereignty and the solidarity economy. It brings out the extent to which food sovereignty as an attempt to address corporate control of food systems, engender adaptation to and mitigation of climate change and ensure popular control of food systems embraces and articulates with the solidarity economy. The solidarity economy in this paper is not understood as a codified definition but rather a transformative practice emerging from below with an emancipatory utopian dimension, a new conception of common property, power and a commitment to deepening democracy. This exploration is carried out through the prism of two case studies. The CECOSOLA worker cooperative movement in Venezuela and its attempts at popular control of a food economy and the emergent food sovereignty movement in South Africa.

Structure of the Issues Surrounding the Nuclear Accident Evacuees: What Has Been Seen While Supporting Town Meetings

Since August 2011, “Tomioka sub group” of the Sociology Study Group of Large-scale evacuation (representative YAMASHITA, Yusuke) has been conducting interviews with Tomioka town residents in Fukushima Prefecture that were forced to evacuate from their home town due to the Fukushima Daiichi nuclear accident. While supporting town meetings organized by stakeholders, we recognized the following issues clearly:
1) Problems that evacuees have faced are complex and very extensive.
2) However, those issues are not correctly recognized by policy makers.
3) Therefore, the present policy does not effectively relieve the affected people.
4) As regional restoration plans were decided hastily, the problems of the affected people deteriorated.
5) The problem of Japanese legal system which surrounds local autonomy is behind such issues.
6) In addition to these issues, it is not possible to deny the existence of public opinion to boost the seriousness of these problems.

Women’s Empowerment Beyond ‘Smart Economics’: A Transnational Feminist Perspective

Since the economic crisis of the last decade, integrating women into development has become the major ‘smart economic’ strategy. UN Women states that “equality means business” and the year 2012's World Bank report set gender equality as their top priority. Today, in the global South, Northern private corporations, like Coca Cola, aim to empower women in their value chains or at ‘the bottom of the pyramid’ by turning them into petty traders and vendors. Simultaneously, in the global North, corporations use cause-related marketing to empower privileged mothers to care for distant others by consuming ‘ethically’.

Critical feminist scholars separately argue that each approach may be functional to structural inequalities. However, from a comparative perspective, both approaches involve women in market-oriented activities, see women as caring mothers and responsible consumers and frame investment in women as ‘smart economics.’ In order to strengthen existing analyses, ‘ethical’ consumption and southern livelihoods, presented thus far separately by critical feminist scholars, should be studied together. Such a study will, necessarily, be transnational and will draw on the theory and methods of both those who study the Northern consumer society (e.g. lifestyles and marketing) and those who focus on low-income societies (e.g. sustainable livelihoods).

This paper uses a transnational feminist perspective to examine existing feminist literature in a comparative study of the practices through which women generate livelihoods and the lifestyles women produce through their participation in Northern corporation led market-oriented development activities. This paper links inter-related constructions of mothers in the North and South in order to generate and test the foundations necessary to later study empirically if and how market-led corporate sponsored ‘smart economic’ development approaches obscure and/or transform structural inequalities in the name of women’s empowerment.

Atypical Employment in Japan

The aim of this panel session is to outline the changing practice of the Japanese employment system. The Japanese system has been classified as “organization-oriented”, the key feature being the security of long-term employment within the same firm. The main feature of the Japanese industrial relations system is the enterprise union, which appears to have reinforced the employment security. The Japanese practice of offering new recruits work straight after completing their education enables students to immediately begin their work-life as ‘regular employees’.

The Japanese employment practice, however, is also faced with different employment practices of other countries due to globalization, and it is becoming more difficult to maintain the high level of job security for various types of work in Japan. The focus of this presentation is the recent increase of atypical employment in Japan.

Shifting Risk Perception after Shocking Events: Counter-Terrorism in the United States and Energy Policy Change in Germany

Risks are not objective “facts” that are directly experienced. Our risk perception not only changes in social and political contexts but is also mediated through pre-existing cultural patterns. By investigating an American and a German case, we would like to show how risk perception of nuclear energy in Germany and shifted from a minimal risk to a real “threat” which imposed a political “necessity” to act. After 9/11, the hypothetical “ticking bomb scenario” became a matter of national security that justified US-led wars, US detention and interrogation policies as well as extensive global surveillance. The anticipated threat of terrorists in possession of biological or nuclear weapons had to be averted – whatever it took. Similarly, the shocking accident at the Fukushima nuclear plant following the big earthquake of March 2011 had a profound impact on the risk perception and governance. This is not only changes in social and political contexts but is also mediated through national contexts that leads to shifts in perception and governance. This is particularly clear in the German case: the recent energy policy change was mediated through a discursive pattern of nuclear energy, which has thus far been regarded as controllable by means of science and technology, became an allegedly life-threatening danger to be eliminated at all costs. But these discursive and political shifts cannot be thought of as a direct consequence of these events. It is rather the specific framing of events in particular national contexts that leads to shifts in risk perception and governance.

Health Discourse, Ruling Relations and Work Knowledge

Research in Institutional Ethnography (IE) has increasingly shown how institutional discourse frames the way individuals think and act within their everyday practices. For example, Luken and Vaughen provide compelling evidence that state-affiliated organizations created a discourse about family housing that structured parents talk and actions concerning their living arrangements (2006, 300). This further highlights those ruling relations that served to organize parent’s daily family life.

This presentation will argue that an analogous case can be made in relation to modern discourses involving the use of health and physical activity. It focuses on the case of rural female workers who live outside the mainstream conceptions of health and physical activity. Very little is known about these rural communities and the kind of contributions that women make in these environments. My aim would be to show how the discourse of health and physical activity is generated and test the foundations necessary to later study empirically if and how women’s engagement with these discourses is influencing their daily life.
is to explicate some of the ruling relations that organize work activities in relation to women's health in these different cultural settings.

A key resource for this research is the concept 'work knowledge'. 'Work' in IE points to anything that requires time and effort, that is conducted under specific conditions with specific resources and which may need to be thought about. This view helps the institutional ethnographer stay focused on what people are actually doing and what it is that they need to carry out their work. I show how it is especially suited to examining how women in rural communities think, plan and feel about the kind of work and physical activity that they engage in. I further demonstrate how in these rural communities and the kind of contributions that women make in these environments. My aim will be to show how sport is largely absent from these females lives but that physical activity is central for how they conceive of their work and health.

A key resource for this research is the conception of 'work' found in institutional ethnography. In this research, robust ethnographic data is collected under specific conditions with specific resources and may need to be thought about. This view helps the institutional ethnographer stay focused on what people are actually doing and what it is that they need to carry out their work. I show how it is especially suited to examining how women in rural communities think, plan and feel about the physical activity and work that they engage in. I further demonstrate how in these rural settings, work, health and physical activity are interconnected and not isolated as in their urban counterparts. The importance of a healthy lifestyle is then a product of the physical activity that is part of their overall work life and is not derived from sporting activities or government policies and recommendations.

**Rural Life, Physical Activity, and Health**

It is often the case that sport and sporting activities are presented as preventing various health risks due to inactive lifestyles. This type of lifestyle is perhaps most readily seen in urban settings where both work and leisure can encourage a sedentary routine and an unhealthy life. This presentation examines the possible connections between sport, health and risk from the alternative perspective seen within rural communities. It focuses on the role of female workers living outside of the more mainstream conceptions of health and physical activity. Very little is known about these rural communities and the kind of contributions that women make in these environments. My aim will be to show how sport is largely absent from these female lives but that physical activity is central for how they conceive of their work and health.

A key resource for this research is the conception of 'work' found in institutional ethnography. In this research, robust ethnographic data is collected under specific conditions with specific resources and may need to be thought about. This view helps the institutional ethnographer stay focused on what people are actually doing and what it is that they need to carry out their work. I show how it is especially suited to examining how women in rural communities think, plan and feel about the physical activity and work that they engage in. I further demonstrate how in these rural settings, work, health and physical activity are interconnected and not isolated as in their urban counterparts. **Meta Rational Choice Analysis of Social Action**

Various behavioral models have been proposed to explain human behavior. However, it seems to be under way to create a general theoretical framework that deals with the models in a coherent way. This paper proposes a theoretical first step toward such a framework. More concretely, I propose a mechanism that shifts the two mode of rational action: Forward-looking rational action and backward-looking rational action. In conventional rational choice theory and game theory in particular the former model has been used. The model assumes that an actor chooses his/her action based on his/her calculation of expected utility. The backward-looking rational action model, in contrast, has been used in evolutionary game theory and assumes that an actor chooses his/her action based on his/her experience in the past. Although both of them are plausible models of human behavior, an actor uses both of them in reality. Suppose that a person catches a cold and needs to go to a doctor. Then he/she would visit his/her family doctor without serious consideration. Suppose, in contrast, that the person is diagnosed with lung cancer during an annual checkup. He/she would collect as much medical information on the cancer as possible and try to find the best doctor who would properly deal with the cancer. The same person uses the backward-looking rational action model in the first case and the forward-looking rational action model in the second case. In other words he/she swings between the two models. How do we explain this swing? My argument is that an actor chooses one of the two models depending on the cost of searching for the information and the benefit of the result of the search. I will try to generalize this idea and present a more comprehensive theoretical framework.

**Contesting the Uncertain Promises of Rehabilitation: Struggles and Coping Strategies Among Slum Dwellers in Ahmedabad, India**

The ‘slum-free India’ slogan that came to the fore in urban policy discourses in the mid-2000s has marked the draconian shift from in-situ slum improvement to slum relocation. Accordingly, the burgeoning literature on urban governance in India has portrayed slum dwellers as victims of such new, neoliberal forms of development. Despite its unique focus on the socio-spatial configuration of poor people’s exclusion, it has not paid due attention to their resilience to such processes. Drawing on qualitative data obtained from two slums in Ahmedabad, an India’s globalising mega city, this paper examines the manner in which some residents collectively negotiated with the local state either in defence of their housing rights and livelihood or in pursuit of personal gains through manipulating the compensation for relocation. This paper has three objectives. Firstly, it gives an overview of the Slum Networking Project (SNP), which was launched in 1996 through a partnership between aid agencies, local government bodies, NGOs and community-based organisations, as an example of in-situ slum improvement. Secondly, it portrays the process by which the SNP was replaced with some re-habilitation schemes as evident in the provision of dwelling units in multi-storied housing blocks, which are typically located in urban fringes. Thirdly, it presents the diverse strategies that slum dwellers took to claim their right to housing and livelihood. Some residents sought redress with an NGO and the opposition party. Some residents sought co-operation from their neighbors through coercive means and attempted to obtain more compensation than would be available to them by claiming fake figures on their households and neighbourhood. This paper concludes by stressing that the powerful in a slum can mobilise an ‘illegitimate’ means of survival when they find themselves at risk of eviction and deprived of access to ‘legitimate’ channels of claim-making such as NGOs.

**Japanese Climate Change Discourse Coalitions**

The presentation shows the Japanese discourse and discourse coalition on climate change based on the content analysis of main newspapers. For the analysis, our Japanese Compon team engaged in the following: (1) To follow historical changes to the discourse, we sampled articles from 1985 to 2006 from one of the largest progressive national newspapers, Asahi Newspaper. (2) To analyze in more detail the structure of the current discourse, we used two other main newspapers in addition to Asahi newspaper for articles published between 2007 and 2009, the Nikkei economic and Yomiuri conservative newspapers. The results of our analysis indicate the characteristic features of the Japanese discourse on climate change. The majority of articles do not cover the views of skeptics with regard to the existence of the climate change problem itself. In addition, there appears to be an overall agreement within Japanese society on the need to save energy. The main flow of the discourse is along the lines of how climate change is framed within the broader context and measures to be taken. One side of the discourse coalition, which is primarily led by the Ministry of Economy, Trade and Industry, and industrial sectors frames the problem in the context of energy itself. Accordingly, this coalition essentially pursues the improvement of energy use efficiency through voluntary action and the shift to nuclear energy sources. The other coalition, led by the Ministry of Environment, a progressive newspaper, and NGOs—though their coverage in the media is limited—recognizes the need for a more structural change toward a more sustainable market and industry. Historically, this coalition gradually imported policy ideas from other countries, such as green tax, emission trade, and Feed-in tariffs, some of which were introduced by the DPJ government between 2009 and 2012.

**Infrastructure for a Post-Nuclear Society: From the Survey on Japanese Civil Society Organizations in Nuclear Energy Policy Domain**

Despite the uncleanliness of the Japanese government's attitude toward the future of Japanese energy policy, I will argue in this presentation based on the empirical research results that the condition for the post nuclear society is emerging in the Japanese civil society.

Keiji Takeuchi, a journalist at Asahi newspaper, states in his book that in order to bring a nuclear society supports from both institution and public opinion are needed, and he continues, that of importance is the existence of the civil organizations which continually appeal to the publics and connect citizens with...
political parties. I will call those civil organizations here as infrastructures for a post-nuclear society. They were, however, rather isolated before the Fukushima Daiichi accident. Whether was the situation changed or not?

To analyze it, Study Group on Infrastructure and Society conducted a survey during February and March in the year 2013 on 904 civil organizations, and got 326 answers from them (the collection rate was 32.6%).

We find that firstly organizations which worked in the nuclear energy policy domain increased more than two and half times than before the Fukushima accident. Secondly, those new comer organizations handle new issues such as recover during the disaster and measuring radiation level. Consequently, they widened the context of the nuclear related issue and broadened the connection between civic life and policy. Thirdly, those organizations discuss the policy based on data and information and sometimes collaborate with public sectors, which are crucial criteria for the post nuclear society. Fourthly, however, a coalition between the organization of of stigmatized women when they succeeded to set a clear enemy such as the government and TEPCO, but they do not share the concrete image of post new nuclear society.

Handmade Housewives: Between Production Labor and Reproduction Labor

The aim of this presentation is to clarify and better understand the relation between production labor and reproduction labor. I focus on Japanese housewives who make handmade goods and sell these. Since enforcing Basic Law for a Gender-Equal Society at 1999, the Japanese Government switched a “kind treatment” policy to the housewife and has aimed at making women work force. But it is difficult to continue working due to not only the heavy burden of parenting but also the unsupport system of raising children.

Therefore women cannot help being a housewife through a birth. In other words women hold dilemma between the difficulty to participate in production labor by child care and the pressure which they should do production labor. In such a dilemma, what kind of compromise do housewives have? To clarify the question, I paid attention to “Sakka-san” and their group who are not only housewives but also making and selling handmade goods which are fabric accessories, leather crafts, woodworks, knits, etc. I investigated the reason of the act why they produce and sell goods through the field work to them. As it turned out, it might be the act from the gender division of labor at first, but they transcended that unawares and present the new way of labor to us.

The Influence of Drug Characteristics, Social Environment, and Personal Characteristics on Cognitive Enhancement Drug Use

Cognitive enhancement (CE) via pharmaceutical agents has been intensively discussed and controversially discussed by scientists and the media. We investigate several drivers of and obstacles to the non-medical use of prescription drugs to augment brain capacity (benefits) and a high probability of side effects, social recommendations about using CE drugs, and interesting findings on so-called ‘revolutionary women’ (also derogatively referred to as OBON - Otayab Bob Osobogo Nazachenio Women Units for Special Purposes), who have emerged as a visible and vocal political group, often engaging in protests and sit-ins. The study shows how this group of stigmatized women capitalizes on their limited symbolic capital as ‘elderly mothers’, class emotions (such as shame, anger and resentment) and moral worth and egalitarianism to counter the neoliberal policies and domination in all spheres of life. The paper argues that class and moral sentiments are an important part of human subjectivities that cannot be reduced to power or social conventions. The paper draws upon fieldwork data collected in southern Kyrgyzstan that includes 65 interviews with ethnic Kyrgyz rural migrants and urban middle class ethnic Uzbek and Kyrgyz residents during summer 2011 and spring 2013.

WONG, MELISSA (University of New South Wales, P.Saunders@unsw.edu.au)

Comparing Climate Policy Networks in the Germany and the UK

This paper compares, contrasts and accounts for the different outcomes of the climate policy networks of two western industrialised nations: Germany and the UK. Both are generally considered to have undergone changes in their environmental policy discourse from end-of-pipe solutions to more integrated forms of environmental management associated with ecological modernisation. Yet the two countries differ in terms of their climate policy networks. In Germany, the most influential policy actors are drawn mostly from policy arenas, industry and science. This is typical of what we might expect under conditions of ecological modernisation. In the UK, in contrast, the most influential actors represent either government or quasi-governmental institutions or the NGO sector. The UK has probably the most ambitious climate change legislation across the world, instituted in the Climate Change Act (2008), which calls for cuts in carbon dioxide of 80% on 1990 levels by 2050. However, little serious effort is underway to make headway towards achieving the targets. Thus, climate policy in the UK represents what one might anticipate given the nature of the policy network: the presence of strong advocacy coalition calling for large-scale cuts in GHG emissions, but one that has relatively little influence compared to climate policy network actors advocating business as usual. What is surprising, though, is the relative lack of influence of the energy giants. In Germany, less ambitious targets for reducing emissions and a set of more discrete concrete actions to address climate change could be considered the result of a policy network of ecological modernists, where pragmatic realism prevails.

The Changing Profiles Of Inequality and Exclusion In Australia

Despite evidence that income inequality has increased and is of community concern, Australian policy makers have emphasised their commitment to the fair go for all debate, and features in political debate, reflecting the fears of a voter backlash in the face of reforms that involve losers as well as winners. Both major parties favour ‘growing the pie’ over ‘dividing up the slices’ yet fail to recognize that even a larger pie must be distributed fairly. Establishing how inequality has changed is complicated by methodological changes that have undermined the comparability of income distribution data, and the confusing picture portrayed by public opinion data on attitudes to inequality provides little guidance about how much actual redistribution (as opposed to how little inequality) the community is prepared to support. The emergence of social inclusion as a policy priority has given new impetus to an evidential and methodological framework of inequality and social exclusion, although this relationship is poorly understood conceptually and inadequately documented empirically. This paper draws on a range of survey data to examine recent trends in different dimensions of economic inequality and social exclusion in Australia. Attention focuses on how the profile of social exclusion varies across the income distribution, on the extent and nature of exclusion inequality itself, and on the association between these measures (in isolation and in combination) and the subjective well-being of those affected. The paper will conclude with some reflections on the implications of the emergence of social exclusion as a policy issue on egalitarianism and the redistribution agenda.

ICT As a Communication Tool for Older People (aged 80) in an Urban Area

While ICT (Information and Communication Technology) has been spreading dramatically in Japan, little is known about how seniors use it as a tool to communicate with non-relatives. The authors conducted interviews with residents (aged 80) of Suginami City, Metropolitan Tokyo, in October and November 2013, regarding communication with non-relatives. A total of 513 people responded.

About 60% of the respondents met and spoke with “friends” and “people they have known from childhood”; men were more likely to do so than women. In all types of relationships, a conventional phone was the most popular choice as a usual communication tool, followed by “letter” for “people they have known from childhood”, as well as “face-to-face meeting” and “cell phone” for “friends” and “people in the group they are members of.” In all types of relationships, 10% of the respondents chose “e-mail.” Men were more likely to send e-mails from a computer, with women more likely to send e-mails from a mobile phone.

In North American urban sociology, there is great interest in how the faster communication, resulting from the increasing availability of affordable and efficient transportation and ICT, affects interaction among individuals. As the usage of ICT becomes more common among seniors, the ways the very old persons communicate with others are also expected to change.

Social Policies and Political Identity: Analysis of Bolsa Familia Program in Brazil

There are few studies analyzing how policies impact on political identity construction. Following the cognitive approach in policies, recent studies show that State actions creates new social actors: individuals that become beneficiaries but who didn’t constitute their identities in relation to the State before. Therefore the State is a space of cultural and symbolic production, where new identities are constructed and new political lessons are learned.

The social construction of target groups framework (SCTG), from Helen Ingram and Anne Schneider, brings a new element to the relation between policy and political identity analysis. It makes explicit the contents that occur in the definition of what are the social problems which will receive attention from the government, their possible solutions and who will be the beneficiaries. This framework allows us to understand the political and social consequences and motivations inside policy design. The social construction of target groups becomes an important attribute, because it affects the relation between beneficiaries, govern and political approval.

There are two main dimensions for SCTG: political power and image. Political power measures the organization and mobilization capacity of groups affected by policies. It can be high or low, depending on the group influence to bring their decisions into account. Image can be positive or negative, affecting the way beneficiaries understand themselves and their space in the political sphere.

This paper analyzes the social construction of image between beneficiaries from the national conditional cash-transfer Bolsa Familia Program in Brazil as a dimension of the political identity. It analyses the role of the State, the media and social visibility of the role and how they influence the relation between beneficiaries, government and political approval.

Family Structure, Socioeconomic Well-Being and Elderly Chronic Illness In Thailand

Thai culture which is related to caring of the elderly has been named as one of a very strong one in the world. The family, in general, has to look at their elder in every perspectives. This study focuses on Thai elderly ages between 65 and 84 years old quality of life, under the rapid changing of Thai society that moving from agricultural society to industrialize one. The research examines effect of family structure, household socioeconomic well-being on elderly quality of life that measured from chronic illness. The research employs a national survey of Thai elderly sport, exercise, and physical activity, and elderly quality of life in Thailand 2012 by the Institute for Population and Social Research Mahidol University. Finding shows that the elder who live in a nuclear family which is among them or a lone are more likely to have some chronic illness, and loneliness when compare to those who live in extended family. Family support is more likely depending on household well-being, and living arrangement of them and their children. Those who have some chronic illness and participating with elderly club are more likely to do some exercise, and some physical activities when compare to those who do not involving in the club. They are a person who is mostly living in a nuclear family where do not have household registration. Thai elderly who would to receive support from government need to have some household registration. This result suggests that, to reduce some inequality of elderly quality of life when having some chronic illness, there should be some policies and some social welfare to support the illness elder, even if they do not have any household registration. This people are not a homeless person. They are Thai. But they may lose their household registration form.
A New Middle Class? Challenges for Inequality in an Emerging Country

The changes in the contemporary world have been quick and frequent, particularly in countries considered as emerging nations. They have an impact on the living standards and consumption, creating new social groups, resulting from those dynamics. Recently in Brazil, the debate on the emergence of a new class “average” gained relevance and academic crossed the borders, having an enormous impact in the public arena. Some economists define this “new middle class”, from their income. While recognizing the importance of this element in the study of inequality, the concept of class demand more complex analyses that include socio-occupational factors, as well as perceptions, values, expectations and worldviews regarding personal projects and processes of distinction.

As the task of studying multiple and varied dimensions of social life cannot be restricted to a specific focus, either theoretical or methodological, we have been working with qualitative and quantitative methodologies. The lack of information to present it is based on the fieldwork we carried out in Rio de Janeiro with individuals who fall into the two groups that we are defining “traditional middle class” and “new middle class”. Our goal is to understand their trajectories, as well as, their projects for maintaining or improving their live conditions in the future.

Multiple Climate Governance In Europe: Are Cities Undermining Nation-States Role In Climate Policy?

Global environmental problems are increasingly showing the nation-states lack of will, as well as their inability, to take the path of sustainability. Climate change is probably the best example of the downizing role of the nation-state in the pursing and diffusion of environmental policies and actions. That’s the case in Europe, where the European Commission is becoming a global leader in this field, and, at the same time, an increasing number of cities and regions are getting involved in climate governance. Furthermore, climate initiatives like Covenant of Mayors are showing how sub-nationals and supranational institutions interact with each other by circumventing national governments. Starting from these considerations, this paper presents an empirical study on the involvement of Italian cities in the Covenant of Mayors. A multi-level governance perspective, its aim is to understand the role of the nation-state with respect to that of a supranational institution like the European Commission. Our results show that the inaction of the Italian government in the past years related to environmental and climate issues, as well the proactive role of the European Commission, explain the massive participation of Italian cities in the Covenant of Mayors. The Italian case is paradigmatic, to the extent that of 5000 signatories of the Covenant, half of them are Italian. However, even if the role of Italian cities in climate and energy sectors is shifting from that of policy-takers to that of policy-makers, and that what it means to be the “catalyst” is being reconfigured and contested, the nation-state remains a key actor, notably with respect to national policies that can foster and strengthen local and global climate actions. Nation-states scope and powers remain crucial in climate policy, and the day when local institutions take their place in the environmental domain still seems distant.

The Standardized Transition to Parenthood: How Standardized Practices Produce Gendered Subjects at the Transition to Parenthood

The transition to parenthood in Austria is constituted through a set of standardized practices that includes medical care, legal processes, public discourses on women’s health and decisions around public aid affect every pregnant women and most of their partners. In Austria the transition to parenthood leads to more traditional role configurations and to an increase in unequal distribution of labor. However, young women in Austria are on average highly educated, have full access to the labor market and value and demand gender-equality, it seems crucial that throughout all levels of education women experience a retraditionalization of gender roles during the transition to parenthood. A focus on standardized practices is a sufficient way to show how evolving highly educated, career oriented and breadwinning women become non-working mothers in a traditional relation of gender roles during the transition to parenthood. Standardized practices enforce and attenuate specific figurations of men and women. Since they are a major part of the transition to parenthood we suggest to pay closer attention to the sequence of those practices and the formations of men and women they seem to favor. Our questions are: How do standardized practices at the transition to parenthood produce gendered subjects? Which formations of women and men do they enforce? We answer those questions by deriving practices from 40 interviews with men and women during pregnancy and 40 interviews with men and women six months after birth. In addition we collected documents used in those practices. Within an ethnographic interpretation process lead by the theoretical principles of new materialism we derived sets of activities and participants, which later on where categorized into practices. The focus of our paper is on four processes of retraditionalization of the relationship between mothers and fathers during the transition to parenthood and how they are embodied into standardized practices.

Ethnic Inequalities in Educational Returns: Overeducation, Language Skills and Social Capital

According to existing studies, the persistence of ethnic inequalities on Western labour markets is largely due to ethnic differences in educational attainment. Empirically less important, but socially more relevant are differences in educational returns: why is education less beneficial for immigrant minorities in meritocratic societies? Apart from taste based and statistical discrimination, we argue that missing language skills and a lack of social capital could explain why immigrants and their children cannot make full use of their education. For income, we additionally analyse the consequences of lower employment returns to education: Because education is less useful in terms of finding a job for persons of immigrant origin, they are probably overeducated more often and in consequence their overall education has lower income returns.

Using data from the German Microcensus 2006-2009, we show lower educational employment and income returns for first and second generation Spätaussiedler as well as persons of Italian, Greek and Turkish origin as compared to native Germans. Results of simultaneous conditional quantile regressions show similarly stark percentile and median differences for first and to a lesser degree also second generation immigrants. Missing language skills and social capital seem unlikely candidates, given the equal pattern of differences for different percentiles. Yet, these differences in educational returns are largely accounted for by the larger degree of overeducation among persons of immigrant origin. The results also show that lower returns to education have two sides of a coin: The returns and future employment but lower returns to education are less disadvantagoudous. If education counts less, so does its lack.

The All-Pervasiveness of Racism in Germany: Difficulties and Challenges in Addressing Racism

Racism is a societal imbalance relationship which structures social order, with social practices of difference, the construction of social groups and social meanings and inclusions and exclusions.

When looking at the mechanisms, attributions and manifestations of racism in Germany, global, European and national "lines of tradition" and histories of racism have a powerful effect. If one speaks about racism in Germany, its specific expressions and effects, the history of racism in Germany needs to be taken into consideration.

Studies show that racism today is institutionalised. For example in state employment agencies with regard to social security allotment or in institutions of education and social work and in the actions of professionals (Melter 2006, Flan 2007, Gomolla/Radke 2007).

The focus of this paper will be on a reconstruction of a racist normality in Germany, constantly present as a societal relationship in the every day life of people to whom a migration history is attributed, as everyday occurrence and manifested in normalised practices of differentiation, isolation and exclusion. The analytic perspective of this paper will be on the subjective experience and interpretation and consequent strategies of action and negotiation of young people, whose everyday life is negatively impacted by racism.

In the international context of the conference it will be interesting to discuss with other researchers the different discourses on racism and their influence on todays understanding of and acting on racism in the world. The research presented in this paper is based on group discussions, and problem-centred interviews with eight young adults (age 14-20). Part of the data was collected during a 4-day workshop with young adults with a migration background, where reflections and discussion about experiences and strategies among participants took place.

Nonreligious Actors and Their "Others" - How Questions of Justice Become Matters of Identity

Whether in a highly secular context, as in Sweden, or in countries where religion plays a more influential role in the public sphere: Nonreligious groups, like humanist or atheist organizations, often construe "religion" and/or religious actors as obstacles to the diffusion of justice, equality, and ethics from a sociological perspective. In my paper I use the debate about religious education in Sweden as such an "entry point" for exploring those dynamics and relationships empirically in their cultural specific context. By looking at how humanists engage in such debates, the way they link ontological visions to normative orders, at how they position themselves in relation to religious actors – thereby navigating through the sometimes narrow path between mere advocacy for a secular state and social justice on the one hand and anti-religious criticism of faith communities on the other – the socio-political dimension of being nonreligious becomes apparent – a dimension which so far has been hardly scrutinized by social scientists.

The Belgian Health Care System. General Practitioners and Medical Specialists

9/30/2013
The Belgian health care state: general practitioners on medical specialists Prof. Dr. Rita Schepers, Centre for Sociological Research (CeSo), KU Leuven, Belgium.

Klein (2000) described the health care state as different from the welfare state because among other reasons, the medical professions are service professions with high specialized knowledge and also because of medical technology is advancing rapidly and creates demand.

In Belgium, the sickness funds play a crucial role. (In modern terminology, the purchase of care).

The paper will briefly introduce the role of the sickness funds in Belgian health care. Then, the attention will be focused on the professionalization processes of doctors in medicine, surgery and gynecology. (Original title in 1849). Specialization processes started already in the 19th century but the coming into prominence of medical specialists started after the second World War, together with the introduction of obligatory health insurance (1944). The already existing rivalry between 'general practitioners' and medical specialists became very prominent. A sort of solution was reached at the end of the 20th century. In the meantime the position of general practitioners has improved.
Many defense organizations are comprised of both military and civilian personnel working towards the realization of defense goals. Civilian personnel in defense organizations often work closely with their military counterparts. The issue of civilian-military personnel collaboration within defense organizations is an important issue that affects both operational and organizational effectiveness. Personnel collaboration also has significant impact on civil-military relations theory. Civilian and military institutional separations has been the hallmark of the civil-military relations field since the post-World War II era. Focusing on the need for greater collaboration among civilian and military personnel in defense organizations challenges the traditional focus on separation. Objective civilian control does not exist at all levels of the civil-military relationship spectrum. The reality is that civil-military relations may call for broad institutional separations as well as more fluid and collaborative roles within defense establishments. Personnel relationships in defense organizations, often warrant more integrative dynamics and directly affect the development and execution of military strategy as well as operational and organizational effectiveness. Enhancing collaboration between military and civilian personnel points to a theoretical model, such as concordance theory, which embraces broader institutional separations as well as cultural conditions requiring more flexible civilian and military relationships. This presentation is created within the context of a NATO Human Factors and Medicine Research Task Group (HFM RTG-226) and a cross-national survey initiative.

SCHINDLAUER, SANDRA* (Bauhaus University Weimar, sandra.schindlauer@gmail.com)
The Alienation of Public Spaces by the Homeless

Since the 1970s, German researchers have turned their back on the topic of homelessness. As a result, Germany has neither a universal definition, nor an official statistic on the amount of homeless people living in the country. Today, most German cities are facing a significant lack of affordable housing. Additionally, the borders of the EU have been opened towards Eastern Europe (2004 and 2007). In the hope of jobs and wealth, Eastern Europeans flock to Germany. However, a lot of them fail to fulfill their dreams and end up homeless as they are not eligible for German welfare. Hence, the number of homeless people being visible on the public spaces of German cities increased constantly in recent years.

As the cities are afraid that the ascending presence of homeless people constrains the consumer climate (especially in pedestrian and representative areas), they are seeing themselves forced to act. In contrast to the USA, where the cities usually form a containment strategy, the main choice of European cities is displacement and decentralization of the homeless. During my presentation, I would like to focus on one of the most subtle ways to achieve these goals: structural modifications and installations which aim to prevent the “alienation” of public spaces by the homeless and other undesirable groups. I would like to complement my remarks with a discussion on how these actions are being implemented and justified by the cities and why people who do not belong to the “target group” are not able to decode their function.

People say that public spaces are a reflection of the society. The stepwise exclusion of unwanted persons from public spaces not only creates a distorted picture of the reality; it also calls a fundamental characteristic of modern democracy into question. We are talking about participation.

SCHINDLER, SETH* (Humboldt University of Berlin, schindse@hu-berlin.de)
Governing CO2 Emissions in Delhi, India: The Clean Development Mechanism and the Informal Recycling Sector

There is a consensus among policy makers that climate change must be addressed through global governance frameworks based on the measurement and reduction of CO2 emissions. This ‘carbon control regime’ at the global scale requires control from municipal governments whose task is to enforce its implementation locally. Scholarly research on metropolitan and global South tends to focus on policies aimed at adapting to climate change, and this paper seeks to contribute to a growing body of scholarship focused on the efforts of municipal governments in the global South to mitigate CO2 emissions. I examine the impact of the UNFCCC’s Clean Development Mechanism (CDM) on solid waste management in Delhi, India. The main argument of this paper is that the CDM has contributed to the emergence of an environmental urban governance regime based on calculating and reducing CO2 emissions. This data fetishism obscures the relatively high recycling rates achieved by Delhi’s large informal sector, which is ubiquitous but difficult to measure. This has justified a dramatic shift in Delhi’s waste management strategy, as plans to build sanitary landfills have been abandoned in favor of waste-to-energy incinerators, three of which have been approved by the CDM. This policy shift has precipitated conflict over the ownership and control of waste between small-scale informal enterprises and large formal-sector enterprises, and it relocates value from the labor of informal-sector waste collectors to waste matter itself which is required for the operation of waste-to-energy plants. I conclude that the overriding principle of this emergent governance regime is capital accumulation rather than the mitigation of CO2 emissions, and its inability to incorporate extensive informal environmental management systems calls into question its overall effectiveness.

SCHINDLER, SETH* (Humboldt University of Berlin, schindse@hu-berlin.de)
Making Delhi world-Class: Relations Between Informal Service Sector Workers and the ‘new’ Middle Class

Governments at multiple levels have ambitiously committed to transforming India’s metropolises. In this context formal electoral politics increasingly favor the so-called ‘new middle class,’ while the urban poor are typically excluded from formal politics and the formal economy. While scholarship tends to compartmentalize the politics of the new middle class and the urban poor by focusing on how they interact with the state, little is known about inter-class relations. In this talk I present original research on relations between workers in the informal service sector (i.e. street hawkers and wastepickers) and associations that represent the new middle class (i.e. resident welfare associations and market traders’ associations). I show that in the case of Delhi, conflict between these groups is typically over the terms of use of urban space rather than zero-sum conflicts over space. Furthermore, the analysis shows that these classes are interdependent; the poor depend on demand for services from the new middle class for their livelihoods, and the lifestyles of new middle class are enabled by services provided by the informal service sector. However, both groups also require access to space; it is the most important means of subsistence for the poor working in the informal service sector, while members of the new middle class require the production ‘world-class’ spaces where they can practice cosmopolitan lifestyles that serve as the basis of class membership. However, because the new middle class has labeled the poor un-doubtedly enabled and participate in Delhi’s transformation into a so-called ‘worldclass’ city. However, the reconciliation of competing visions of urbanization – one geared toward subsistence and the other social reproduction – is what is at stake in contemporary inter-class relations in Delhi.

Climate (F)Acts. Climate and/or The Social

This paper investigates the ways in which ‘climate’ can be considered as social assemblage. It does so by showing how climate facts and factors have often been construed as climate acts and actors. This is illustrated by considering three ways in which climate has historically been construed in relation to the social. The first is to consider climate as a causal (f)actor. This has been prevalent from climate authors such as Hippocrates and Ovid to modern authors such as Montesquieu, and has persisted up until the origins of modern climate science. This is illustrated with historical examples. The second construes climate as an enrolment assemblage. Here, climate becomes an assemblage of various heterogeneous (f)actors working together with human actors to produce what we now call climate. This is illustrated in this paper using data from an ethnographic field study among paleoclimatologists. The third way to consider climate as a social assemblage is to construe climate as medium of relationality. In this view, inspired by authors ranging from Watsuji Tetsuro to Tim Ingold, climate is a relational web that is the space in which life unfolds. The paper concludes by illustrating climate as medium in a speculative way, arguing that this conception implies a significantly different social ontology from that which has characterized modernity.

The Art of the Other, the Paradox of University in Western Conceptions of ‘Japanese Art’ (1860-1940)

The era of the rise of modernism involved the emergence of art as an autonomous and universal category. This paper argues that, given the universal claims of the construction of art, it saw an expansion to Asia in general and Japan in particular. This expansion, shaped through various orientalist categories of ‘Asian’ or ‘Japanese’ similarity and commonality as juxtaposed to ‘the West’, helped to provide...
plausibility for modernist conceptions of art. It universalized the category of art by giving it a global meaning both in spatial and in temporal terms. At the same time, this universalization meant that cultural hierarchies formed by western hegemony were threatened. This paper looks at the ways in which influential western observers of Japanese art between 1860 and 1940 dealt with this by contributing to the simultaneous universalization of the category of art and the particularization of the concept of 'Japanese art'. This 'paradox of universality' involved a differentiation between on the one hand particular, local, traditional and most often historical realizations of what was nonetheless a universal category of art, and on the other hand its truly modern and advanced contemporaneous realizations of universality. At the height of the modernizing movements in the west, Japan proved to be the site of an 'exemplary expansion' of the concept of art. Sociologically, this expansion served to a significant degree to communicate an understanding of western art that was autonomous and potentially universal. WOC practically bounded the category, the emergence of which has been analyzed by, for instance, Bourdieu, Heinich and Luhmann.

SCHLEICHER, NORA* (University of Applied Sciences, nschleicher@bkf.hu)

Impression Management for Diverse Audiences: Identity Practices on Facebook

In my presentation, I pose the question: how can we apply the concept of impression management as outlined in Goffman's (1959) seminal work to the context of social media in general, and Facebook specifically? Goffman claimed that we perform certain roles for certain audiences and attempt to keep these audiences separate. However, on Facebook, audiences become mixed in the form of diverse 'friends' potentially consuming the multimodal messages users of the social media site share with others. How do these factors influence users identity performances on Facebook? What strategies they use to deal with this situation and how these strategies are reflected in their stance taking practices? Does the lack of physical contact with their audiences offer more freedom and agency in constructing their 'fronts' resulting in more diverse and potentially subversive identities or, on the contrary, self-censorship leading to more conformist, more socially acceptable identities on Facebook? The data I use to attempt to answer these questions come from a representative survey on Hungarian high school students (aged 14-18), from focus group interviews as well as from discourse analysis of Facebook profiles of members of the same nationality and age group. Preliminary analysis of the data suggests the existence of a variety of strategies used including the creation of double profiles, a control over the publicity and content of the posts, ‘defriending’ certain people including parents, deleting earlier profiles and leaving Facebook completely.

Analysis focusing specifically on gender identity performances on Facebook suggests, on the one hand, strong peer group pressure, but, on the other hand, affordances of Facebook are also used to break away from traditional constraints of femininity. As a consequence, since the 1980s, Western European trade unions lost members and faced increasingly complicated economic and institutional conditions. With the global financial crisis 2008, a new cycle of labor unrest has started, and the nature of social conflict has changed. First, the uneven and combined development of social conflict has changed. First, the uneven and combined development of social conflict has changed. Contacts to other fathers that are or have been in the same position play an important role for those "new fathers". Some fathers already have access to other caring fathers within their peer group. Some try to find contact to other fathers through the use of new and social media. They attend "new fathers" groups on Facebook, are members of bulletin boards that are crowded mainly by fathers, or use blogs and forums focusing on the fathering process. On these sites, they often share their opinions, the everyday obstacles they encounter being stay-at-home fathers, or happy times and events with their children. In our talk we explore how those communities help fathers to maintain their role as caring fathers, with sometimes hostile or non-encouraging environments. The ability to share their experiences interplays with their wellbeing, their persistence against structural disadvantages and adverse comments, and the quality of the father's relationship to the mother and the child.

Sociotechnics of Economy

Joachim K.H.W. Schmidt

Sociotechnics of Economy

Revisiting my sociotechnically informed economic theory on autonomous humans (Göteborg 2010), Onati and Athens (2B11), not any longer based on Capital, Market, etc., as done by mainstream economists who failed for several hundred years. Mainstream theories have been spatially based, time only occurred as space-time as well as properties as measurements within space and human only as objects like game pieces. - My present paper will enlarge the common Factors of Productivity, traditionally Land, Labor, and Capital, by Time. Autonomous humans are characterized by Time as duration of their life which they have again and again to invest in portions as resource for their reproductive survival. An economic theory ignoring real time must fail, cutting out some hours, being sold for inauthentic slavery work. Excesses of present financial markets condemn the inefficiency of traditional economic theories responsible for such perversity. - Sociotechnics as empirical science designs and implements institutions, and these going concerns are dramatically changing; we move out of an age predetermined by analogous Greek ideology focusing on the organization of respective closed spaces, cf. Plato's Parable of the Cage, without time and movement, becoming manifest in positions, prohibiting time and movement. Greek world: A GIVEN one circling around positions. In opposition to this autonomous humans succeeding to leave Plato's Cage of perverted life, see themselves confronted with a digital reality, and experience themselves as homeless, being asked to construct their own homes by way of computation. Greek-Western institutions must necessarily be replaced, since nearly all passed down institutions of analogous Greek-Western world prove inadequate in present digital age, including presently still prevailing economic theories. In digital age social life will not any longer turn around positions, but will happen in networks in which being will be replaced by relation.

The Cultural Influence on Social Intuitions

The Cultural Influence on Social Institutions

Joachim K.H.W. Schmidt

Berlin, FRG

Social institutions are culturally predetermined, the going concerns of people express beliefs in way of reality-perception. Cultures are different round the globe. Diversity of cultures contains a gigantic richness of human resources. Cultures actualize in human relations via common actions, and/or communication. Every culture has developed an own language for its communication. Western language, especially Anglo-American languages, have presently become globally dominant, including Western civilizing culture which they embody. - The powerfulness of Western languages is subject to Greek ideology, its assumed fictionally identity of thought and being, first expressed by Parmenides 2500 years ago. Greek ideology circles around an absolutely perfect and analogously conceived spatial Being, a fictive replication of an ideal world excluding change by Time and Movement. Greek ideology gets manifest in fictive positions: its operational base. All Western languages share the COPULA as constitutive element, expressing that everything will be defined either as this or that, e.g. either Greek or barbarian, or e.g. Nazis defined Jews as non-human and sent them into the gas chamber, or e.g. formerly Christians victimized heretics on auto-da-fé, and presently victimization of humans labeled terrorists by ObamaCare, using aerial drones as killing machines. And we should not forget the multiple bio-, culture-, and genocide committed by Western people under the influence of Greek ideology. As can be not overlooked by everyone, Western analogous civilization and culture is decaying with dramatic speed, getting its death-blow by digitalization of Western societies, and consequently all central institutions have to be redesigned, adapted to starting digital life of Western populations in the Third Millennium. My paper will create awareness of the problems to be faced in near future: A job for sociotechnicians.

SCHMIDT, LISA-MARIAN* (Alice Salomon Hochschule Berlin, schmidt@ash-berlin.eu)

Circulating Ideas and Visualizations in Educational Transition Discourses

Circulating representations of knowledge have been a central concern of Science and Technology Studies (STS). Depending on the conceptual approaches, they highlight either the stabilizing or flexible aspects of distributing and bridging knowledge through social worlds (e.g. Latour, Griesemer/Star). For conceptualizing the circulation and transformation of ideas and knowledge (Latour), I will focus on commonly used visualizing representations (maps, lists, graphs) and related practices that visualize and facilitate the transition from school to work. Visualizations can be conceived as mediators, instruments and symbols of specific social orders and related knowledge formations. They typically serve to stabilize the relationships in which they are embedded. As representations and material artifacts they enable and/or constrain the distribution of knowledge. For a systematic analysis and a deeper understanding of the relationship between ideas, knowledge, and their visualizations I will combine STS concepts (e.g. immutable mobiles and boundary objects) with a discourse perspective from the sociology of knowledge (Keller).

For conceptualizing German developing educational discourse there are typical ways to visualize the transition from school to work, which I regard as travelling ideas and symbols. On the one hand, these maps and charts represent specific theories and classifications of career paths, the function of school in society and classifications of the students and their skills. On the other hand, past negotiations and practices of sorting relevant and irrelevant aspects of transition knowledge are made invisible in these representations.

The study of the circulation of ideas, knowledge, and symbols needs to take these aspects into account. In addition, it should focus on the practices of translating and transforming the visualizations between different social worlds or the strategic use of certain communicative forms e.g. in arenas, where the constitution of relevant topics or problems are negotiated.

SCHMIDT, LISA-MARIAN* (Alice Salomon Hochschule Berlin, schmidt@ash-berlin.eu)

Producing Individually: How Occupational Trajectories Are Embedded in Educational Practices

Referring to the pragmatist process perspective of social order and the constitution of self (Dewey, Mead, Strauss) I’d like to propose a conceptual suggestion and present empirical findings, that combine this perspective with a socio-historical understanding of the subject matter (Foucault). The concept will be presented in interplay of theoretical considerations and empirical results that derive from a current research project about the transition preparations in school and mentoring projects (school to work transition). I will specifically focus on schools because they are major institutions for the organized production of subjects.

Mead and Strauss described the different processes, phases and social interaction relations that shape identity/the individual. On this perspective, identity is a constant course of action and interaction between different concerned actors, things and the work of the individual on the integration of the plenty “me” to a self. This process can be conceptualized as a trajectory of the subject that helps to study this ongoing transformation. The trajectory concept allows the analysis of two perspectives. On the one hand all the situated and participating actors (and other actions) come into focus. On the other hand the perception and experience of the subject in this process can be understood.

Interwoven with these practices of the self are typical historical knowledge formations of the subject itself. In contrast to the pragmatist process perspective Foucault offers such a historical conceptualization about the emergence of the individual. This includes sensitivity towards questions of power and their productive effects in specific institutions. Linking pragmatist concepts with a discourse approach will enable a balanced theoretical conceptualization of individuality in modern societies and elaborate analytical tools for research.

Do Tertiary Dropout Students Really Not Succeed in European Labour Markets?

Tertiary education has been expanding hugely over the last decades, so that tertiary dropout students will constitute a growing distinctive group in future labour markets. University dropout is regularly discussed as a ‘negative’ indicator in terms of reinforcing socio-economic inequalities and being a sign of university inefficiency. However, research on actual career trajectory of dropout students is virtually non-existent. Using data from the 2011 Programme for the International Assessment of Adult Competencies (PIAAC) this study first validates the uncommon self-reported measure of dropout used and compares the percentage of adults with tertiary dropout experience between OECD countries. Second, we examine whether tertiary dropout is a permanent decision as a considerable part of adults with dropout experience. Finally, we estimate the effect of dropout in terms of their employment status and success of entering managerial professions comparing results of logistic regressions and propensity score matching taking individuals’ socio-economic and demographic background, work experience and cognitive skills into account. Results indicate that consistently across countries dropout is repeatedly a ‘positive’ indicator in the labour market. This is first due to the fact that the dropout decision is often not a permanent one as well as that for those adults who do not reenroll into tertiary education labour market chances are better than for equally educated adults in about half of the countries examined.

How the Prison System Affects the Health Care System

United States incarceration rates have increased fivefold in the past four decades, placing untold pressures on other social institutions. Using state- and individual-level data, this article tests whether the number of former inmates affects the functioning and quality of the health care system. The aggregate-level results show that a within-state increase in the number of former inmates is associated with growth in the uninsured population, more frequent use of emergency rooms per capita, and a decline in the supply of hospital beds. Similarly, states that incarcerate more people also report fewer ambulatory visits per capita, fewer mammograms, and lower rates of essential diagnostic tests among diabetic Medicare enrollees, all indicators of a lower overall quality of care. Similar processes are evident even when examining behavioral outcomes in individual-level data. Results from a nationally representative survey show that individuals residing in states with a large number of former inmates report more unmet need, lower utilization, and lower quality care. These patterns are found even among those far removed from the prison system, including women, the insured, and the well-educated. The implications of broad spillovers from the prison system to the health care system are discussed.
Comparison of legal aid in Belgium, France and the Netherlands: do remuneration systems influence the evolution of contentious mass?
Frédéric Schoenaers, Kathleen Adelaire, Christophe Mincke, Laurent Nisen, Jean-François Reynaert

In Belgium, the current system of remuneration for legal aid causes dissatisfaction both among government authorities and lawyers. In addition, the adoption of the “Salduz law”, which allows any person heard for the first time by the police or a judge to be assisted by a lawyer, is going to weigh on the use of the legal aid. Legal aid has experienced strong growth in recent years in Belgium (+ 229.26% of closed cases between 1998 and 2011). It is useful to observe whether this growth is present in other European countries. We selected France and the Netherlands. This contribution presents a comparison of the modes of organization of legal aid in the three countries as well as of the modalities for financing it. Secondly this contribution aims to compare the evolution of the mass of disputes benefiting from legal aid. We see that beyond the differences between the three countries, the use of legal aid is constantly growing. We will attempt to provide an interpretation of this fact by mobilizing the following explanatory factors: higher income limits allowing more people to access to legal aid with a strengthening effect due to the current economic crisis in northern Europe, a better information of the citizens (by media or advertising by lawyers), a new “grammar of responsibility”, a phenomenon of juridicisation, the development of new public policies and the development of new “rights.”

Detainee and mother… what is the situation in Belgium?
Frédéric Schoenaers, Marie-Thérèse Casman, Stéphanie Linchet, Salim Megherbi, Laurent Nisen
University of Liège - Belgium

In recent years, the penitentiary institution seems to be changing. Following constant criticism from all origins (European Parliament, Council of Europe, European Court of Human Rights, International Observatory of Prisons), Belgium has adopted in 2005 a “Principle law” about the prison administration. The first goal of the paper is to propose a methodological approach to images as a symbolic strategy to confront and defer conflicts and discomforts in everyday life.

Detainee and mother… what is the situation in Belgium?

Labour Market Returns of Higher Education Drop-Outs: Human Capital or Signalling?

In Germany, around one fourth of all first year students leave university without a degree. While reasons for drop out are well examined, the consequences are rather unknown, especially in terms of labour market outcomes. This paper aims at identifying differences in school-to-work transitions between tertiary education graduates and dropouts as well as students who did not participate in tertiary education but completed vocational training after upper secondary education. Referring to Human Capital Theory and Signalling Theory we examine if additional years of tertiary education or rather credentials deliver higher returns to tertiary education non-completers. We also examine in which way the lack of formal qualifications can be compensated by alternative resources like social capital. In a first step we study the probability of entering the labour market. The further step comprises the close scrutiny of job quality (occupational status of the first job) and adds information about social capital to the analyses. Our results show that higher education drop outs in Germany do have difficulties entering the labour market but obtain a higher occupational status job than students with...
vocational training. Furthermore, for dropout students, years spend in education are important, especially in terms of occupational status. The acquired human capital however, can be better translated into labour market returns by those with better social capital. We therefore conclude that social networks are an important compensation strategy for a lack of credentials.

SCHOLTEN, MIRTE* (MZES/Mannheim University, mirte.scholten@mzes.uni-mannheim.de)
School-to-Work Transitions of Higher Education Drop-Outs: Human Capital or Signalling?

Graduates from tertiary education have good labour market perspectives but it is not well examined yet how the career perspectives of tertiary drop out differ from those of graduates. This paper aims at identifying differences in school-to-work transitions between tertiary education graduates and dropouts as well as students who did not participate in tertiary education but completed vocational training after upper secondary education. The focus will be on the different returns of different educational levels. Referring to Human Capital Theory and Signalling Theory we examine if additional years of tertiary education or rather credentials deliver higher returns to tertiary education non-completers. Especially in economic crises we expect that tertiary education drop outs will have huge difficulties in entering the labour market as jobs are scarce and the competition is hard. In a first step we study the probability of entering the labour market and job search durations of the different educational levels. The further step comprises the close scrutiny of job quality (occupational status of the first job) and adds information about economic crises to the analyses. Our results show that higher education drop outs in Germany do have difficulties entering the labour market but obtain a higher occupational status job than students with vocational training. Furthermore for dropout students, years spend in education are important, especially in terms of occupational status. In times of economic prosperity job search duration of tertiary graduates and non-completers are the same, while tertiary education completers fare better in economic crisis.

SCHOLTZ, HANNO* (University of Konstanz, hanno.scholtz@unikfr.ch)
Debating Alternative Conventions and Defying False Friends: The Concept of Crisis in the Rational Choice Theory of Institutions and Historical Social Change

Although the term „crisis“ seems to be ubiquitous, there are historical phases when it more abound than in others. For the years since 1989, or the 1930s, the term has (in most parts of the worlds) a higher importance than for the 1950s and 1960s. This can be understood from the fact that these times are phases in which institutional change is both going on and being prepared. In rational choice perspective, institutions are added game elements in the game structure of human interaction, and they have both conventional and normative aspects. This perspective allow to study institutional change as characteristically depending on the complexity of organizational interaction: Independent organizations allow for early and smooth institutional change, as in the case of changing family concepts. However, there are cases as economic regulation, where organizations act in strong interdependencies and finding a new institutional setting becomes a question of social debate while the performance of old institutions degrades: These are crises. In crises, many solutions are discussed, including those with biased consequences and ‘false friends’ for which lower adaptation costs go together with a lower long-run adequacy. Hence sociological imagination and the deconstruction of old norms and perspectives can be rather helpful in avoiding false friends and desastrous consequences for solving crises.

RC16-279.12

SCHOLTZ, HANNO* (University of Fribourg, hanno.scholtz@unifr.ch)
The Two-Step Nature of Modernity

Over the last decades, the discourse over the end of industrial society and the coming of a second modernity has found evidence in recent phenomena that resemble parallels between 1860 and 1945, as globalizations, economic crises, democratizations, violence, social inequality, and global shifts in resource distribution. An understanding of the mechanisms behind these phases of crisis would be socially helpful since it is rather probable that the current one has not yet ended. The rational choice theory of institutions offers the tools to do so, but has not yet been applied to this question. The proposed paper (part of a larger book project) intends to fill the gap.

The paper develops a model of the two step nature of modernity by concentrating on the following arguments: 1. Modernity increases the availability of resources. 2. This results in changes in information relations, i.e. between positional and situation-specific information. 3. Multi-actor decisionmaking has two focal points of either relying on positional (domination / authority) or on situation-specific (discourse / argument). 4. A rational-choice understanding of tradition and modernity hence equates the two with applying the two focal points.

5. Not all games of human interaction are created equal, since organizations offer social structure and the transformation of situation-specific in positional information.

6. Hence an intermediate phase arises, with authority within and argument between organizations. This modeled intermediate phase is equated with the historical phase “industrial society”.

Additional arguments analyze the nature of institutional innovations in the transitions between the phases, allowing for the confrontation with empirical evidence and for the prediction of upcoming institutional changes.
The paper first introduces the notion of sustainable development. Next, we discuss how we can enrich the conceptualisation of welfare sustainability by taking on-board a broader sustainable development perspective. In addition, we ask how we might transform this improved definition into operational indicators that enable cross-national comparisons. Third, in view of the framework developed we tentatively compare a set of European countries. In conclusion we address the implications our framework has for the question of intergenerational fairness, and we highlight avenues for future research.

Young migrants unsuccessfully claiming refugee status may be ‘tolerated’ in Germany. This specific legal status positions them in the host society nearly at the end of a vertical model of civic stratification, implying restrictions in accessing central institutions of the society such as the education system or the labour market. Besides, they are constantly facing a high risk of being deported to the country of origin.

However, the impending shortage of the skilled workforce in Germany enforced a new political discourse. As a consequence young tolerated refugees hesitantly have been re-defined as educational subjects and labour market resource. Despite the still persisting inequalities in the access to vocational training of tolerated youths as compared to young citizens or migrants being granted a residence permit, legal changes at the federal level have been introduced since 2009. They are to reduce vocational training boundaries for these residents with the highly precarious toleration status across Germany. But empirical evidence from our own research project reveals a heterogeneous approach to new regulations. Especially migration authorities may act as institutional gatekeepers either supporting or constraining their access to vocational training. This results in regionally unequal vocational training chances for tolerated youths that cause new inequalities within this group.

What does the twofold inequality regarding the access to vocational training mean for other spheres of the social life and future prospects of tolerated youths? This is the question we would like to focus on in our presentation. To outline it we outline the current legal framework and present central findings of our comparative regional case studies that are based on document analyses, semi-structured individual interviews and group discussions with experts. The findings argue for an enhanced consideration of institutionalised inequalities that are bound to a person’s legal status in the sociology of education.

(How) Does “Home Hospitalization” Transform The Relationship Between Patients and Healthcare Professionals?

“Home hospitalization” was officially instituted in France by an act of parliament in 1970. It has been largely developed over the last ten years.

Two major arguments are advanced in its favor of this mode of healthcare. The first, is that this form of hospitalization is chosen by patients who prefer to undergo long-term treatment (often with a fatal outcome, as many of those concerned are undergoing palliative care) surrounded by their families. The second is that of its cost-effectiveness. This factor is important in a traditionally public-dominated health setting, as it is currently under pressure to comply with managerial objectives more often found in private enterprise.

Our ongoing empirical study, carried out between 2012 and 2014, in a service of home hospitalization situated in a French province, has revealed the complexity of the situation which, among other things, transforms the domestic environment, exerts pressure on the carers (usually other members of the family) and transfers running costs to the home. As far as professionals are concerned, it is sometimes difficult to conciliate professional practice and the domestic environment. Various pressures on practitioners seem to reinforce prescription of this mode of care.

If home hospitalization does transform the relationship between healthcare staff and patients, this does not necessarily “empower” the latter or otherwise reverse hierarchical relations. As is usual in human relationships, inequality is not a two-dimensional phenomenon. On some counts home hospitalization may reinforce structures of inequality, whilst modifying them on others. With reference to interviews with professionals and patients and observations carried out in the home and the work base, I will show the complexity of the adjustments made by all participants whose actions respond to diverse and conflicting pressures; economic, moral and relational, among others.

Organized Movement or Moving Organization – the Case of the World Social Forum

Since the 1990s there has been a significant growth in the number of Non-Governmental-Organizations (NGO) operating on a transnational level. This was called “the NGO-Boom” and was largely considered as a positive sign towards an emerging global civil society (Keck und Sikkink 1998). Some of these ‘new’ transnational civil society actors organized themselves to influence the politics of international institutions and to challenge multinationals. Doing ‘lobbying’ requires an effective and efficient way of organization to compete with transnational companies. The organizational forms of these actors are often comparable to those of private business companies (Mintzberg and Westley 2000). Other civil society actors deny any form of hierarchical organization and experiment with horizontal ways of organizing themselves. One example is the World Social Forum (WSF) with its open space ‘organized movement’ (Whitaker 2007). In 2001 a transnational coalition of civil society actors organized the first WSF event. The last WSF took place in Tunis (Tunisia) in spring 2013. In this paper I will present some insights of an in-depth ethnographical research on the organizational forms of the WSF. I will present the major mechanism and structures which help to stick together the transnational coalition that organizes the WSF since 2001. By doing so, I will discuss the possibilities and limits of the WSF between organized movement and moving organization.

Legal Status and Inequality: Young Tolerated Refugees and Vocational Training in Germany

The paper introduces the notion of sustainable development. Next, we discuss how we can enrich the conceptualisation of welfare sustainability by taking on-board a broader sustainable development perspective. In addition, we ask how we might transform this improved definition into operational indicators that enable cross-national comparisons. Third, in view of the framework developed we tentatively compare a set of European countries. In conclusion we address the implications our framework has for the question of intergenerational fairness, and we highlight avenues for future research.

Young migrants unsuccessfully claiming refugee status may be ‘tolerated’ in Germany. This specific legal status positions them in the host society nearly at the end of a vertical model of civic stratification, implying restrictions in accessing central institutions of the society such as the education system or the labour market. Besides, they are constantly facing a high risk of being deported to the country of origin.

However, the impending shortage of the skilled workforce in Germany enforced a new political discourse. As a consequence young tolerated refugees hesitantly have been re-defined as educational subjects and labour market resource. Despite the still persisting inequalities in the access to vocational training of tolerated youths as compared to young citizens or migrants being granted a residence permit, legal changes at the federal level have been introduced since 2009. They are to reduce vocational training boundaries for these residents with the highly precarious toleration status across Germany. But empirical evidence from our own research project reveals a heterogeneous approach to new regulations. Especially migration authorities may act as institutional gatekeepers either supporting or constraining their access to vocational training. This results in regionally unequal vocational training chances for tolerated youths that cause new inequalities within this group.

What does the twofold inequality regarding the access to vocational training mean for other spheres of the social life and future prospects of tolerated youths? This is the question we would like to focus on in our presentation. To outline it we outline the current legal framework and present central findings of our comparative regional case studies that are based on document analyses, semi-structured individual interviews and group discussions with experts. The findings argue for an enhanced consideration of institutionalised inequalities that are bound to a person’s legal status in the sociology of education.

In The Shadow Of Alfred Schutz: Two “Ordinary” Sociologists In Extraordinary Circumstances

Peter Berger (interviewed at Boston 22nd October 2010) has qualified the three lecturers at the Graduate Faculty who most influenced both him and Thomas Luckmann as the “Holy Trinity”. The triumvirate was composed of Carl Mayer, Albert Salomon and Alfred Schutz. Though the latter has acquired a considerable reputation posthumously, Mayer and Salomon, apart from a short mention in the introduction to The Social Construction of Reality have been very little published and have remained almost entirely unnoticed. It is in this sense that they can be qualified as “ordinary” (that is to say not renowned) sociologists.

Their ordinarness contrasts with the extraordinary circumstances which affected their lives. Both Mayer and Salomon studied and eventually obtained positions in German universities during the first decades of the 20th century and both emigrated to the United States at the beginning of the 1930s to become members of the Graduate Faculty of the New School for Social Research (Salomon was Jewish and Mayer married to a Jewish woman). Archival material, the few published documents available and my interviews with Berger and Luckmann lead me to suggest that the reasons for the lack of impact differ. Though Mayer headed a research project on religion in Germany he never succeeded in publishing the results of his study. Salomon’s work was largely theoretical and did give rise to some results of his study. Salomon’s work was largely theoretical and did give rise to some publications; others were rejected as inappropriate for American audiences.

By contextualizing the production of these two men I will try to explain some of the reasons for their academic in-success. Where they really so “ordinary”? This will of course lead me to examine the criteria by which success is established in academia.

Breaking the Silence at Spanish Universities

This paper focuses on the impunity of aggressors in most Spanish universities and on the aspects that maintain these specific gender, power and knowledge dynamics and finally lead to the expulsion of the victims instead of the aggressors. Whereas VAW at universities all around the world is a recognized problem and most prestigious universities have implemented measures to combat this phenomenon, in Spain it is still silenced although first steps have demonstrated the need for researching this phenomenon. The project “Gender-based violence in Spanish universities” funded under the Spanish National RTD Program (Valls, 2006-2008) was pioneer. For the first time in Spain, a questionnaire with 1083 students, 13 in-depth interviews with professors and university staff, and 16 communicative daily life stories with students on this issue were conducted. The results, since the international numbers, show that a high percentage of the participants knew someone or have suffered some kind of situation of VAW at the university. Besides, it evidenced that people supporting the victims of VAW become “second order victims”. This research was crucial in breaking the silence on VAW in Spanish universities.

ish universities and has also suggested evidence-based actions to fight against it. Once the results had been presented on a national level, universities increasingly started implementing actions to address VAW, asking CREA research for support. As a result of this process some faculties have introduced protocols for cases of harassment. This is also due to the political impact of the results since the Law for effective equality between women and men (Spanish Government, 2007) obliges all public offices to establish procedures on cases of harassment. Even if there is still resistance to changing these dynamics, the article in the Spanish law for equality is an important step to challenging the dynamics of gender, power and knowledge at Spanish universities.

Preventive Socialization from Zero Years

In this paper, we present the violence prevention programs implemented in Schools as Learning Communities. These schools have been analyzed under the INCLUD-ED project (FP6 of the European Commission) and are outstanding for the great results in very diverse social areas going beyond positive academic results. Research on violence against women (VAW) highlights that patterns linked to it are included in the socialization processes. The results presented here stem from research on preventive socialization that emphasizes the social character of love and the attraction towards violence (Goméz, 2004; CREA, 2010-2012). According to this research line, the existence of a mainstream socialization that promotes the modern attraction linked to violence implies the need to socialize from early childhood in attraction to relationships that reject any kind of violence. Socialization in accepting violence that can lead to future VAW is prevented. According to a common analysis of violent actions in early childhood such as a bite is considered as an emotional expression and as a consequence the victim is forced to receive a kiss from the perpetrator as a sign of excuse and forgiveness. These actions socialize in the acceptance of the violence and set the bases for future gender violence. Zero tolerance of violence from zero years is the premise to socialize into relationships without violence and to ensure the development of childhood free of violence. In this line, Schools as Learning Communities any kind of violence is rejected and children are socialized in this general rejection of violence and learn to avoid violent behaviors. They also learn the values of respect towards others and to insist themselves in being treated with respect. Consequently Schools as Learning Communities contribute to preventing the mainstream socialization in attraction towards violence.

Globalized Management Practices and Local Cultures

The paper will give an overview of management practices in different world regions based on the existing literature in the social and economic sciences and case studies. One of the main questions will be: What is the future of “management”? The global discourse on management focuses on the principles of the market that have been introduced in all spheres of social life through university programs and discourses, organizational strategies, government policies, and personal counseling literature. This knowledge is produced, distributed, and consumed by social actors in the South, North, and East. These forms of disciplinary knowledge have contributed to the creation of a world controlled by managers and management technologies. One of the most important societal influences in the last quarter of the 20th century was this growing importance of the management discourse. There was a spread of the idea of management from large firms to the professions, NGOs, the public sector, and the daily lives of social actors. This management discourse consists of a language and practices that global players produce in the socioeconomic world. This discourse is so widespread today that it seems difficult to escape its grip. This paper gives an overview of its increasing propagation in non-western societies. One aspect of this research is: How do groups cope with the global discourse of management and its functioning in global companies in order to escape its grip.

Transforming Struggles: Organizational Modes, Mobilization Outcomes, and Occupy Wall Street

Encampments at Zuccotti Park and elsewhere have been violently dismantled, the mass media spotlight moved on, the spectacle stopped. Fissures between different tactical and organization approaches widened. Yet, the mobilization continued through manifold spin-offs, ranging from Occupy Sandy, which provided rapid relief in response to a devastating hurricane, to groups such as the Alternative Banking Working Group, which worked on new policy proposals, and Strike Debt, which developed new kinds of direct action. Although Occupy Wall Street inspired public debate and imagination, there are hardly any tangible policy achievements while recent data point to even further increasing socio-economic inequality. Assessments of the leaderless, General Assembly-based organizational form were divided over whether these were the essence of a prefigurative politics for real change and attracting participants or whether the lengthy, consensus-requiring deliberations prevented tactical efficiency, liaisons with large unions and NGOs,
and negotiations with the political establishment to win concrete legislations. What lessons can be drawn from the Occupy experience so far? How can social movement theory help to explain the rise, fall, or metamorphosis of the mobilizations? How do existing theories need to be revised in light of the new empirical experiences and the challenges ahead? Multi-method focus on the experience in select cities shows not only enormous local variation but also varied modes of connecting sites of struggle. The paper concludes with a discussion of options for future action.

Bothering Pays for Sociologists

Bothering pays.

Segmentary societies bear inequality. All of them. Urbanized even more. Cities have proven to be inequality carved in concrete and stone. The more abundance of material culture, the more inequality. Chiefs in tribes have to bother.

They remain chiefs only if they impress bothering and solving conflicts. Bothering glues even the smallest tribe.

Today large scale social units call themselves ‘modern’ to claim their qualitative difference to chieftoms and the like. Here, nobody even considers an end of inequality, it is purely unthinkable as necessarily linked with the total dismissal of the material abundance (which could and should be achieved, plans have been made).

More, bothering has become a specialized task, a branch, a profession. Clerics (clergy men and women), pedagogics, social workers, journalists – and sociologists compete here. People who have worked in the five groups can tell.

So does the author.

Empirical long-term analysis of inequality studies provide evidence that the inequality index in the researched areas and regions remain more or less the same. Meanwhile, research about the economical situation of the inequality-authors shows that more than a decent living has been possible due to the inequality studies.

Bothering thus provides access to the elites and enables a stable and good living for those who bother. This is why we bother about inequality – sometimes. Have a happy conference!

Social Movements and the Political Invention of Future. Considering Recent Argentina

During the 1990's, neoliberal policies drove Argentina to huge transformations of the state, economy and labour. The process left a large number of poor and unemployed people, and concluded with a monster crisis in 2001. During that time, there was a very important change in the field of social movements. As a consequence of the neoliberal policies, labour movement (which has been the most important movement in whole country contemporary history) diminished roughly its statistical presence in social mobilization. This happened in 1993 and in 1996 a new kind of movements grew up. That was the case of territorial movements, established in the poor neighbourhoods and small towns in a few provinces. They were composed mostly by unemployed, who asked for elementary rights to survive. By the end of the century these movements (often known as piqueteros) reached the main cities suburbs and constitute the most important social and political agent in the country. Since 2003, when a new President was elected, the country began its normalization. With the recovery of employment, Unions regained strength and power, but the territorial movements, even diminished, didn't disappear. They have been recognized by political agents, some of then entered the parties, other even the state and many of them still have the capacity to mobilize and defy political system, at the local, province or federal level.

In this paper we analyse this process and consider why and how these new social movements have emerged as political agents and what influence they had in the recent political period. To do that we use a data base of our own (created by the Grupo de Estudios de Acción Colectiva y Protesta Social, that I lead). It has 10,000 cases of contentious mobilization actions and goes from 1984 to 2011. The paper include statistical and qualitative analyses.

Culture and Morality: Intercultural Interactions during Military Deployments

In peacekeeping and training missions foreign soldiers come in close contact with the local population. How do they experience this intercultural contact? To what extent do they experience a conflict between their moral principles and the moral principles of the local population? To what extent are (some of) these principles culture specific or are universal moral principles violated? And what does this imply for military missions in different cultural contexts, such as the Kunduz Police Trainings Missions?

We focus on the close relation between morality and culture in military deployments. The main issue in this paper is twofold, namely theoretical and practical. The first one considers the relation between morality and culture according to leading theories on these concepts. The second one is about the extent to which military personnel experience the relationship between morality and culture (whether or not conflicting) during their deployments as described in literature. We study these issues on the basis of research data collected during and after military deployments.

‘Bastards’ in a Globalizing World: Subverting Ethno-Racial Hierarchies

Whether phenotypical or cultural, perceived human difference spawned boundaries of belonging and exclusion along hierarchical lines. The binary or rigid social categorization created through essentialist conceptions of ‘purity’ was and is still intolerant of intermediate forms. These are generally seen as subversions of the prevailing classificatory scheme. The ensuing defense of a rigid classificatory scheme, especially by authoritarian societies, range from nihilation to the enforcement and assignment of place to these ‘deviants in the existing hierarchy’. In a globalizing world of dense patterns of human communication, interaction and movements across geographical, social and cultural boundaries these schemes are manifestations of entrenched power relations that have lost their meaning. Hybrid humanity and immigrants who do not fit pre-existing categories are socially and legally forced into denigratory niches symbolic of their low status and diminished life-chances. The paper examines the resulting alienation of ‘misfits’ and the ways they resist and change authoritarian hierarchies in a globalizing world.

Global Garlic and Its Labor Consequences

This paper investigates the dynamics of China's integration into global commodity chains and a simultaneous race to the bottom. I explore this globalization-labor topic with a case study of garlic. Even in the garlic kingdom, the race to the bottom is visible.

1) China took off as the global exporter of garlic around 1982 and has been the dominant exporter since then. In 2009, 84 percent of the globally traded garlic came from China.
2) China's 2002 adherence to WTO allowed it to export to previously closed or high-tariff markets such as the United States. In 2002, China surpassed Mexico in capturing the U.S. market.

The race to the bottom began with North-South competition. As the U.S. economy continued to contract firms sought even cheaper labor, moving significant parts of the production process to Asia. Such moves threatened to undermine Mexico's payoff from NAFTA. This capital mobility unleashed a race to the bottom in labor standards and working conditions. It is not possible for every nation to be a net exporter: one country's gain is another's loss. Although they do not initiate the race, governments become complicit because they, as much as foreign investors, want to hold onto their “competitive advantage” of cheap labor, lax working conditions, and lenient environmental regulations.

The South-South competition is reflected in the shifts in trade and investment flows. China's export and foreign investment gains and Mexico's losses are not simply those of two nations acting independently. Labor conditions are oppressive, but firm owners, processors, exporters, and governments are not alone in their responsibility. 'Bottoming out' is a response to global importers who search for better prices.

In this research I investigate the conditions of garlic workers in China and Mexico as they relate to U.S. producers and the import market.

SCHWARTZMAN, LUISA* (University of Toronto, luisa.fs@utoronto.ca)
From Statistical Category to Social Category: Organized Politics and Official Categorizations of ‘People with a Migration Background’ in Germany

Social scientists disagree over whether it is acceptable for states to collect statistical data on the racial or ethnic composition of their populations and thus institutionalize these differences. Seeking to reconcile normative concerns with political desires to combat discrimination and reduce social inequality, some countries, like Germany, have chosen the ‘migration paradigm’ (i.e. using phenotypical markers and/or cultural and linguistic links to a particular national group) as a ‘color-blind’ measure of difference. However, while much attention has been paid to categorizations deriving from survey and census variables, debates about whether and how to measure immigrant established population differences often ignore other processes of categorization operating at the nation-state level, such as interactions in the arena of organized politics.

In this paper, we expand the terms of the debate by examining the relationship between statistical classifications and their mobilization in political interactions, in order to examine the validity of the distinction between the ‘migration’ and ‘ethnic’ paradigms in population statistics. The category of ‘persons with a migration background’ (Personen mit Migrationshintergrund), which was introduced in the German microcensus in 2005, serves as our case study. Drawing on a qualitative content analysis of 60 parliamentary documents originating in the years 2005 to 2013, we show that the way the migration paradigm is deployed by representatives of the state differs from the statistical categorization: it is implicitly saturated with stigmatizing public image, they may be of personal and material—not just statistical significance.

2005 to 2013, we show that the way the migration paradigm is deployed by representatives of the state differs from the statistical categorization: it is implicitly saturated with stigmatizing public image, they may be of personal and material—not just statistical significance.

Educational Policies and Questions of “Inclusion” in the Middle East: The Case of the Palestinian Refugees

Palestinian refugees are the only ethnically defined refugee group worldwide that has an UN organization dedicated exclusively at its needs: the UNRWA (United Nations Relief and Works Agency), whose mandate originally was limited to a three year relief program for the 750 000 Palestinian refugees who in 1948 fled the territories of pre-state Israel. By now, UNRWA has evolved to the agency for the third generation of those refugees, which, due to the demographic development, today comprises almost 5 Million persons.

Regarding questions of inclusion and educational policy, UNRWA represents a unique case: financed by Western governments, the agency has set up 700 schools in the West Bank, Gaza, Jordan, Syria, and Lebanon, thereby providing free education to almost 500,000 children and youths separated from the respective national school systems, and drawing on a staff of 22,000 teachers who are mainly refugees themselves. The international debate on inclusion has also had its repercussions in UNRWA, and in January 2013 the agency presented its own concept of inclusion. However, because UNRWA is officially an aid organization without a political mandate, the paper does not explicitly broach the issue of the social exclusion (and victimhood to violence) of their clients in the “host states”.

This presentation aims at depicting an outline of the paradoxes of UNRWA as an organization when it comes to “inclusion”; excerpts from interviews will illustrate the biographical relevance of UNRWA education and the exclusion of Palestinian refugees.

SCHWITTEK, JESSICA* (University of Wuppertal, j.schwittek@uni-wuppertal.de)

Submit, Exit or Change: Strategies of Coping with Generational Order(s) in a Transition Society

This paper aims at conceptualizing problematic conditions of transitions to adulthood in the Central Asian country of Kyrgyzstan. Previous research in Kyrgyzstan has revealed that the social order in this society comprises a strong age and gender hierarchy. Such restrictive generational order shows as well in my qualitative study of young Kyrgyz adults. Respondents describe experiences of inter- and intrapersonal conflict when their freedom of choice (concerning study subject, marriage partner, lifestyle) is confined by their parents. While this can be said to match Kyrgyz traditions and notions of “collectivistic” culture, this strong power asymmetry is by no means taken as a matter of course by the interviewees. My study shows that young Kyrgyzstani cope with such conflicts in a variety of ways which I divided into three categories: “submit”, “change” and “exit”. The first category refers to strategies which imply the submission of the young generation under the rule and decisions of the elders (mainly parents or parents-in-law). “Change” subsumes all those strategies with which the young manage to follow through with at least part of their personal aims, engaging in compromises, trade-offs or negotiations. With the last category “exit” I labeled attempted full or partial escape from institutional boundaries set by the existing social order. Furthermore, my analyses indicate, that certain narratives are used to legitimize the respective strategies: While people who engage in “change”-strategies (paradoxically often relate to traditionalized narratives, those who submit under others’ demands in most cases deploy an individualized and self-related explanation. In the paper I wish to present the above concepts more closely, and to discuss the seemingly paradox patterns of applying and legitimizing solutions of intergenerational personal conflicts. Beyond that, I would like to discuss which implications such patterns have for the potentials and barriers of social change in a so called “transition society”.

The lack of research into fathers on holiday is a reminder that understandings of masculinity and gender relations in tourism are absent compared to other areas of the family. There has been whole-family research highlighting the role of fathers in taking on primary responsibilities as entertainer of the children and facilitator of mothers’ own interests (Schanzel and Smith, 2011) which requires further inquiry. However, research into fatherhood also needs to be more inclusive of diverse family forms and a range of fathering experiences, such as, solo-fathers, non-resident fathers and gay fathers. This study extends previous research into nuclear families and focuses on the family holiday experiences of fathers travelling with their children without the mother. The research is semi-structured, using a range of solo and non-resident fathers in Auckland, New Zealand and conducted after the summer holidays in January/February 2014. Because of the explorative nature of this research an interpretative paradigm and in-depth interviewing is chosen. The aim of this study is to understand the experiences and meanings gained by single fathers travelling with their children. The findings of this research and comparisons to earlier research on nuclear families will be presented.

The Tourist Experiences of Fathers

The lack of research into fathers on holiday is a reminder that understandings of masculinities and gender relations in tourism are absent compared to other disciplinary areas such as family studies. Research on family holiday experiences is largely informed by feminist gender representations rather than examinations of femininities and masculinities. Previous studies highlight the never-ending physical and emotional work of motherhood both at home and when travelling with little acknowledgment of any gender-related constraints that fathers might face. True gender scholarship requires a more critical appraisal of gender relations that is inclusive of the male voice in family tourism. There has been whole-family research highlighting the role of fathers in taking on primary responsibilities as entertainer of the children and facilitator of mothers’ own interests (Schanzel and Smith, 2011) which requires further inquiry. However, research into fatherhood also needs to be more inclusive of diverse family forms and a range of fathering experiences, such as, solo-fathers, non-resident fathers and gay fathers. There has been whole-family research highlighting the role of fathers in taking on primary responsibilities as entertainer of the children and facilitator of mothers’ own interests (Schanzel and Smith, 2011) which requires further inquiry. However, research into fatherhood also needs to be more inclusive of diverse family forms and a range of fathering experiences, such as, solo-fathers, non-resident fathers and gay fathers. This study extends previous research into nuclear families and focuses on the family holiday experiences of fathers travelling with their children without the mother. The research is semi-structured, using a range of solo and non-resident fathers in Auckland, New Zealand and conducted after the summer holidays in January/February 2014. Because of the explorative nature of this research an interpretative paradigm and in-depth interviewing is chosen. The aim of this study is to understand the experiences and meanings gained by single fathers travelling with their children. The findings of this research and comparisons to earlier research on nuclear families will be presented.

Concerning stratification realities, gender, age, education and (subjective) socio-economic status prove to be significant predictors. On the country-level, the objective socio-structural shape (income-based percentage of lower, middle and upper class), the GDP per capita and social expenditure (as a percentage of GDP) turn out to be relevant. With regard to stratification aspirations results indicate that respondents in the majority of countries under study opt for a society with a broad middle segment – in fact, irrespective of any stratification realities. Thus, context effects impact solely on perceptions of stratification realities, whereas we observe a universalistic preference for the ‘middle class society’.

In our view, the choice towards the middle class in developed countries may improve the comprehension of mental mechanisms and orientations in developing countries.

Le “Libre Choix” Des Patients Dans Une Relation Plurielle Et Diachronique

Le droit des usagers au « libre choix », tel qu’il est formulé dans la loi du 2 janvier 2002 en France, semble sous-tendre que les patients s’inscrivent dans une relation duale avec les médecins au sein de laquelle ils seraient des sujets singuliers, ratés à la fois en termes économiques et dans leurs décisions. L’analyse diachronique cependant montre d’une part que la réalisation de ce modèle bête contre des obstacles notamment liés à aux positions de classe, genre et âge des patients et aux situations de crise qu’ils rencontrent ; d’autre part que les malades sont rarement seuls dans leurs parcours de soins mais souvent aidés par des membres de l’entourage. Quant aux décisions des médecins, elles sont de plus en plus fréquemment prises en équipe pluridisciplinaire. Nous faisons donc l’hypothèse que les décisions de soins doivent être analysées dans le cadre d’une relation plurielle autour du patient, qui questionne la voix au chapitre de chaque acteur. Par ailleurs, ces décisions sont théoriquement révocables à tout moment, ce qui invite à les analyser de manière diachronique.

Notre recherche porte, dans ce cadre, sur les décisions de primo-entrée en hospitalisation à domicile (HAD) et de sortie du dispositif. En fort développement en France sous l’impulsion des pouvoirs publics, l’HAD est censée constituer une solution économique pour les finances publiques et répondre au souhait des patients. En fort développement en France sous l’impulsion des pouvoirs publics, l’HAD est censée constituer une solution économique pour les finances publiques et répondre au souhait des patients. En fort développement en France sous l’impulsion des pouvoirs publics, l’HAD est censée constituer une solution économique pour les finances publiques et répondre au souhait des patients.

Border Regimes in the European Neighbourhood: Is Their Multilevel Negotiation Possible?

Tensions between securitisation and cross-border interaction have been a major concern of European border studies - particularly as a result of human suffering and deaths of immigrants “sans papiers” attempting to enter the EU from the South and East. Perceptions of a Fortress Europe and a unilateral imposition of border security regimes in many ways challenge the European project of cross-border and regional partnerships with its neighbours. As part of the negotiation of such regional partnerships (e.g. within the scope of the European Neighbourhood Policy - ENP) security and border management have been defined as policy areas conducive to “co-development” and, to an extent, “co-ownership.” Yet it is unclear to what extent a true multilateral and multilevel process along these lines has materialised or is indeed possible under present circumstances. The paper will explore the evolution of new border regimes between the European Union and its eastern neighbours. It investigates the negotiation of border regimes between the EU and Russia, Ukraine and Moldova, we will identify to what extent the co-ownership and/or co-development of border policy has been possible. Do EU and its neighbours indeed share common interests in terms of border-related issues, including security? We will also investigate the extent to which local development concerns have been considered as part of negotiating such border regimes and the possibilities for greater local participation in future.

In the Middle or in a Muddle: Socio-Cultural Politics and the Indian Middle Classes

The state of middle class culture and politics in India is complex and often contradictory. While many among the estimated 200 million middle class have enjoyed upward economic and social mobility over the past 20 years, large numbers of salaried professionals in government service and small companies have seen their status and incomes decline relatively over the same period of time. As such, we see notable schisms within the middle class: the new rich and the entrepreneurs as compared to traditional salaried workers; the middle classes in India’s many regional towns, as opposed to those residing in vast urban metropolises; and differing cultural outlooks from generation to generation, region to region. Interesting political differences are also evident with many of the “traditional” middle classes, for instance, exhibiting a cultural conservativeness while holding politically progressive views. Based on extensive research among the Indian middle classes over the past 15 years, I contend in this paper that the middle classes are not homogenous, are deeply divided politically and culturally but nevertheless they remain significant as brokers of political and cultural change within India. Examples drawn from Kolkata and Darjeeling in West Bengal will be the basis for the discussions in this paper.

The Paradoxical Politics of South African Labour: Unions and the Fight Against Precarity

As neoliberalism has undermined formal wage work across the global South, labor scholars have increasingly turned their attention away from organized and formally employed workers and towards the growing sections of the “precariat”. A large literature has blossomed examining the politics of precarious, informal, and unorganized workers. Behind this precarious turn in labor studies is an assumption that these workers will be the primary source of a new labor politics that looks beyond issues of wages and working conditions and towards broader questions of livelihood and social reproduction. However, in South Africa, while precarious workers’ movements have remained disparate and unorganized, formal workers unions have taken up a range of issues—such as a universal national health insurance, a basic income grant, and land reform—that constitute a new politics of the precarious. This is surprising given that many of the policies that unions advocate would involve the subsidization of precarious workers’ livelihoods by the minority of formally employed organized workers. In order to explain this paradox the paper draws on nationally representative household survey data as well as one year of field work in three rural areas and one major urban center. The data show that the decline of formal wage labor has led to an increasing social and economic interdependence between large sections of South Africa’s precarious and formally employed workers. The case shows the importance of understanding the ways in which the rise of precarity has reshaped not only work, but also workers’ house-
holds and broader social lives. It also shows the role that "old" organizations can play in the "new" politics of labor.

1980s are also well documented (Webster 1985, Sitas 1983). However, what most analysts have failed to capture is the shift from this highly formalized and disciplinary migrant labour regime, historically framed through government-to-government agreements, to the current reality of deregulated labour migration to South Africa. Following restructuring in the mining sector and political pressure to recruit locally, the share of contract workers plummeted in the early 2000s while at the same time, emerging sectors such as outsourced construction, hospitality, and domestic work started relying increasingly on foreign labour. This structural shift largely caught South African unions unprepared and very limited organisation has taken place. Drawing on research undertaken within MIMORC (www.miworc.org.za) over the past two years, this paper explores more specifically the mobilization challenges posed by this regime shift and strategies developed by both unions and migrant workers. While some micro-local experiences of mobilization point to unions’ ability to conceptualise new forms of transnational solidarity, the study shows overall that current fragmentation in the South African union movement is a major obstacle to migrant workers’ organisation, particularly in those critically precarious sub-sectors of the economy. In this context workers develop multiple solidarity networks (ethnic, religious, and at times political) and strategies to circumvent exploitative and discriminatory practices, albeit in a fragmented and mostly underground manner, including through deliberate avoidance of the historical unions.

Maintaining Identities of Distinction in Taiwan through the Foregrounding of Linguistic Abilities
In his seminal work Distinction: A Social Critique of the Judgment of Taste, Pierre Bourdieu demonstrates how the cultivation of taste serves to reproduce class and status hierarchies. Arguably, while class divisions are similarly being reproduced today based on proficiency in languages of wider communication – particularly English. After discussing the mechanisms by which identities of distinction (or any identities, for that matter) are produced in interaction, I will present interview data from a longitudinal multi-case study illustrating how this process of practices and performance indexing dominant ideologies plays out in Taiwanese society. The study’s multilingual Taiwanese participants repeatedly point out instances in which they have distinguished themselves from those around them through their use of and (relative) proficiency in English (and to a lesser degree, French). For these participants, images of themselves as more worldly and sophisticated than their peers started to be nurtured quite early in life through tuition classes and private tutoring, and from that point on, they continuously struggled to maintain these identities of distinction, often resorting to performativity to foreground their linguistic practices. These participants, however, viewed their differentiated status as somewhat precarious, for accompanying their repeated reports of attempting to stand out through English use was a frequently expressed anxiety about the fact that their English abilities alone might not continue to adequately differentiate them from others, particularly in the employment arena, as more and more Taiwanese gain English proficiency.

A Paradox of Coercive Power: Institutionally Founded Power Relationship and Rationality of Action
Reviewing the literatures on social power, it is found that so many different kinds of power concept as well as measures of magnitude of power have been proposed. Hence, without an appropriate specification of power concept, no meaningful analysis is possible. This research focuses on the coercive power which is defined as follows; an individual A is wielded a coercive power by B when A is forced to choose an action x which she/he would not choose if B’s action following A’s action were somehow different. In other words, B forces A to choose x by preparing a punishment to A’s non-x choice. (Strictly speaking this is “negative” coercive power. There is also “positive” one in which B prepares a positive sanction to A’s choice of x.) This concept of coercive power involves individuals’ rational choice, A is forced to choose x because it is her/his rational choice under a given situation. It is frequently supposed that a power relationship is asymmetrical in which the power holder and the power subordinate are fixed. If A is the power subordinate in relation to B in one situation, this asymmetrical relationship applies to other situations. Especially, if the relationship is institutional, that is, if it is institutionally stipulated that B is entitled to control A’s action by preparing a punishment to A’s normatively deviant action, B is identified as the power holder in relation to A. However, there are paradoxical cases in which the presumed subordinate A can control B’s sanction schedule in such a way that B is forced to choose a sanction which does not punish A’s deviant action. This happens because B also has to choose the sanction rationally. This study shows the mechanism of this paradox and analyzes mathematically the conditions that this paradox emerges.

Income Disparity Among Elderly People in Japan: Life Course Factors on Retired Life
With societies being increasingly aged, the inequality among the retired population should be more focused in stratification study. My previous study (Seiyama 2009) had analyzed, using 1995 SSM data, the reason for the larger income disparity among the elderly in Japan to some extent, but there were two serious defects in the data: that is, people aged more than 70 were excluded and the information on income sources including pension were not available. This is a new analysis on the income disparity among the elderly, based on a new nation-wide survey conducted in 2010, headed by Shirahase, with effective 6,442 respondents from unions have learned to incorporate environmental concerns in their campaigns. This presentation describes some successful red-green alliances in Latin America, exploring the implications for labor strategies more broadly.

The Partner’s Role in Immigrants’ Labor Market Outcomes: Explaining the Mechanism
This paper explores why and how partnership impacts labor market outcomes of immigrants over the life course. Drawing on household specialization and social capital theory I first state hypotheses about whether and to what extent a higher educated and/or native spouse has a positive impact on immigrants’ occupational trajectories. I then explore the specific resources spouses provide differentiating between instrumental support and emotional support. Instrumental support refers to the provision of labor market information, ability to employ own spouse and help with the application writing. Emotional support implies willingness to discuss important matters and encouragement of the spouse’s career. Second, I assume that instrumental support has a stronger positive effect on occupational outcomes than emotional support. Lastly, I argue that partnership also has an indirect effect on occupational outcomes by facilitating important immigrant-specific processes such as recognition of foreign credentials and post-migration investment into education.

Trust and the Problem of Boundaries

50 to 84 years old population, comprising various stratification variables such as income source. The main results are: (a) in Japan the income of the male elderly is mainly composed of working income and pension, while capital income is quite negligible. (b) Gini coefficient within age group is larger for the groups aged 60 or more than for two groups of 50’s, mainly because of the fact that for the elderly the proportion of those with only meager income is large. (c) After 65, the main source of income becomes pension (more than 2/3 of total income), though exceptional cases are blessed with significant amount of working income (mainly administrative or self-employed.) (d) The overall income inequality among the retired reflects the inequality in pension. (e) The main factors on the pension inequality are education and occupational career characteristics at working age, but controlling for the latter the effect of education is largely reduced. (f) The important occupational career characteristics are the size of company and the experience of executive post. (g) Because the single earner family model had been prominent for the cohorts of our survey respondents, a basically similar conclusion is derived for household income.

Labor Relations, Neoliberal Agri-Food Policies and Disasters in Japan

This paper probes the issue of changes in the agri-food labor structure under neoliberal globalization. Employing two cases from Japan, the paper documents the coexistence of independent farmers and their replacement by hired labor. This process, it is argued, was accelerated by the implementation of neoliberal policies and by the effects of natural and human made disasters that affected Japan in recent years. More specifically, this work illustrates: 1) the manner in which neoliberal agri-food policies engendered changes in agri-food labor relations, 2) the characteristics of new forms of labor relations under neoliberalism and 3) the specific alterations of labor relations that occurred in the aftermath of recent disasters in Japan. In the first of the two cases presented, labor relations in farms controlled by the transnational corporation, Dole Food Company, are illustrated. The second case analyzes the neoliberal agricultural reforms introduced in the aftermath of the March 2011 earthquake. Also considered in this case are labor relations in the fishing sector and the responses of fishermen to the neoliberal reforms of the sector.

CEDAW As an Instrument to Foster Women’s Political Equality in Central and Eastern Europe?

All countries of the Central and Eastern European region adopted the Convention for the Elimination of All Forms of Discrimination Against Women. Its implementation in these countries can be seen not only as a fulfillment of social justice but also as one of the mechanisms of democratization. Based on the comparative analysis of the official country reports and information delivered by non-governmental organizations the impact of CEDAW on the implementation of gender equality in new European democracies will be assessed. The special attention will be devoted to the problem of the enhancement of women’s political rights in Central and Eastern European democracies. What it means to implement the provisions of the CEDAW concerning political and public life in these countries? Can there be seen progress in their implementation? Is the Convention (and if yes, in what ways) used by women’s organizations in order to demand institutional measures to strengthen women’s representation in political institutions? Is CEDAW a point of reference for those who argue for legal changes – including gender quotas and zipper system? To help women in their representation in political institutions?

Modernity As Tragedy. Adam Ferguson on the Decline of Community

Adam Ferguson was one of the major figures of the Scottish Enlightenment. And he has been rightly credited as a precursor of modern sociology. For instance, Ferdinand Tönnies famous distinction between “Gemeinschaft” and “Gesellschaft” strongly resembles passages from Ferguson’s seminal “Essay on the History of Civil Society”. The difference between a German and an Anglo-Saxon semantic of community in mind, it seems paradoxical that especially the romantic German idea of community has been heavily influenced by Ferguson. His conception of an authentic civic life had a high impact in the German tradition of social thought and social criticism, and it is only a slight exaggeration to say that he was one of the inventors of an emphatic idea of political community. Ferguson also anticipated central features of the critique of modernity known by Karl Marx and Max Weber. In contrast to his contemporary friends, most notably David Hume and Adam Smith, he emphasized the political perils and the dangerous dynamics of modern market society. Modern society rests, according to Ferguson, on an increasingly powerful state, the expansion of the division of labor and a weakening of the public spirit in favor of self-interested behavior. Consequently the public sphere and the sense of political community dissolves. The paper will examine Fergusons concept of community, his conjoined critique of modern society and its semantic of alienation. The tragedy of modern society lies in its dialectical process of liberation. This process leads to individualization and it has an alienating tendency: in the name of individual freedom, people become “gear wheels in the machine”.

RC26-459.2

SELKE, STEFAN* (Furtwangen University, ses@hs-furtwangen.de)

Foodsharing - A Contemporary Way Of Converting Perishable Food Into a Common Good

The paper discusses foodsharing as an controversial issue and thereby focusses on the role of a smartphone application which has recently been launched in Germany.

Foodsharing seems to fit perfectly into the sharing economy. A debate about food waste in affluent societies has created a new public mood concerning the discussion about the ethics of food thrown away. A foodsharing app has been introduced in 2012. The app is sponsored by the German Federal Ministry of Food, Agriculture and Consumer Protection (BMELV) and promoted by the prominent filmmaker Valentin Thurn (“Taste the Waste”). It enables consumers to announce surplus food to be shared with others.

Several paradoxes appear by analysing this idea. Firstly, a foodsharing app is an example of what Guy Debord calls the “Society of the Spectacle”. It is becoming fashionable to receive public approval for symbolic solutions instead of executing sustainable politics (e.g. against food waste). Secondly, a foodsharing app is an example of de-skilling people in modern societies, who have forgotten basic abilities, like asking their own neighbour if they need left over food. This reveals the main social mechanism of the app: It serves to re-skil people about cooperation and sharing.

Some more questions arise from this perspective. If foodsharing transforms food into a common good a new informal consumer market emerges in which trust is privatised. New solutions for domestic consumer concerns have to be found and requirements and responsibilities have to be balanced out.

The paper discusses the example of foodsharing focussed on its social impact. It is a contribution to the discussion about social sustainability in the form of a (national) case study. However, the findings can be generalised for similar fields of practise.

SELKE, STEFAN* (Furtwangen University, ses@hs-furtwangen.de)

Lifelogging – Consequences Of Tracking The Self and Transforming It Into a Digital Self

Today life data is archived and presented publicly in networked digital media. The term “lifelogging” subsumes digital media systems that document, comprehensively as possible, traces of human behaviour and put them into long-term storage. Four types of lifelogging can be distinguished: 1. Health Monitoring, 2. Human Tracking, 3. Digital Memory and 4. Sousveillance. Lifelogging is a marked attempt to break the boundaries of human existence by means of digital media. According to the most prominent advocates in this field it demonstrates the increasing belief in numbers and data and therefore could be called a neo-empiristic movement.
However, the complete recording of one’s life brings up new questions about personal information management and emerging inequalities. Cases studies of methodological, epistemological and social aspects of lifelogging already show fundamental concerns about the relationship between one’s own life and the data set created by liflogs. Critics warn that people using lifelogging and producing large amounts of information may become unwitting subjects of surveillance.

The critical discussion of lifelogging refers to the theory of ‘shifting baselines’. Three main shifts have to be considered: 1. From subject to object (loss of individualism). 2. From action to function (loss of autonomy or agency). 3. From privacy to post-privacy. ‘Technoapartheid’, ‘over-diagnosis’, the standardisation of human behaviour, the emergence of new social norms and the shame punishment of deviant people are examples of new inequalities caused by extensive lifelogging. Against a background of research projects on media of the future and empirical data, this paper discusses lifelogging as a controversial issue, focusing on the role of recently developed digital devices. Even if related developments in the area of lifelogging are not yet in the public domain, important questions about shifting boundaries are emerging and need to be discussed.

SELLAMUTHU, GURUSAMY* (Deemed University, sellagurusamy@yahoo.co.in)

Aged Population and Social Disability in Rural South India: The Social Exclusion and Inclusion Perspective

Ageing is a natural process that begins at birth, or to be more precise, at conception, and a process that progresses through one’s life and ends at death. With prolonged human life, reduced mortality and fertility rates due to recent developments in science and technology, ageing has become a global phenomenon in the 21st century. World Health Organisation (WHO) views ageing as a privilege and a societal achievement. This process started in developed countries and slowly shifting to developing countries like India with increase in number of graying population. Elderly life is considered or assumed as a burdened life, full of struggle, illness, depression, exploitation, abuse etc. Traditionally, the joint family took care of the aged but rapid urbanization and the migration of persons from rural to urban areas have created a vicious situation. In the absence of the ability to earn, and without social security support, in the form of kinsmen or the extended family, the aged are rendered destitute. It is also evident from Indian data that 40% of the elderly live below the poverty line and 90% are neither covered by any state pension nor have any family to take care of them. Increased rate of survival beyond 60 years have implications for financial burden from both family as well as state. Social disability is the unproductiveness, redundancy and social maladjustment to the environments. This paper aims to underpin the socio-economic inequality that exists among the elderly population and causes social disability. Also it exposes the determinants of poverty and discrimination among elder people in the study area. And analyze about the social, economic and psychological problems experienced by old persons and advocate an action plan for effective implementation of welfare, care and support of the aged populations in the study area as part of social intervention.

SELSTAD, LEIF* (University of Stavanger, leif.selstad@uis.no)

International Tourists at a Japanese Festival

The paper concerns the experiences of international tourists visiting a traditional festival in Japan. The festival, Tsukuda Ōmatsuri, is a shrine festival held every third year in August in an old neighborhood in Tokyo, and attracts thousands of spectators and tourists. I have had the privilege to observe this festival for thirty years. Over the years the festival’s relationship with tourists has changed. At one time during the 1990s, when the local area was threatened by urbanization, tourism was encouraged to boost political support and protection. Once the area avoided demolition, the crowds of tourists were seen as disturbing to festival performances, and the festival was no longer advertised for tourism. In spite of this, tourists continue to visit the festival in great numbers, mostly Japanese, but to some extent also international visitors. Contrary to expectations the decision not to promote the festival or encourage tourism has not diminished its value as a tourist experience. People appreciate the lessened crowds and heightened authenticity of getting closer to local performers and events. Also the few international visitors who come feel that they get a better understanding of the festival than visitors of lesser crowds. This raises the question if tourist events such as festivals have to be completely adapted for tourism in order to be enjoyable for tourists. It is often forgotten that small banter and incidental events may be as memorable for tourists as well rehearsed performances. As long as safety is preserved and conflicts are avoided, tourists can relate to limited information about an event and still see it as a good experience. In fact, such partial and ad hoc knowledge may be the norm rather than exception when tourists take part in special events; matters may still run fairly smoothly and provide good experiences.

Construction of Solidarity through Language Mode: Sociocultural Approach to Internet Discussion Forum

The situation of social inclusion could be considered as situation of ‘entering’ into community that brings the sense of individual/collective solidarity. The virtual community and internet forums could serve as example to follow and investigate that mechanism as the Internet provides a social space in which people can construct participation in different types of social groups (Mann and Steward 2000). These groups could construct sub-cultures (Williams, 2006) or small cultures (Holliday, 2004). The culture of each community is based on members’ lived experiences in various communities. Digital community has some specifics in forms of participation, social status of participants, modes of identity and behavior, etc. (Mann and Steward, 2000). Researcher do not have any cultural means to make real identity reveal. Nevertheless these disembodied forum participants pass their subjective meanings and solidarity moods by digital texts as cultural markers and construct different forms of social (virtual) solidarity. So the mechanism of forum solidarity could serve as a source for analyzing the nature of solidarity through linguistic approach.

This empirical research was based on the discourse features of messages post-ed to several internet discussion forums (mainly ‘knowledge of practice’ forums – medical, tourism forums and political solidarity forums in Russian-language blogs). The message texts were classified into three types (Morrow, 2006): – medical, tourism forums and political solidarity forums in Russian-language blogs. The message texts were classified into three types (Morrow, 2006): – problem messages, advice messages and thanks messages, and salient discourse features of each message type were described and analyzed in terms of discourse function. “Thanks messages” in this case were interpreted as the first linguistic sign of virtual solidarity.

That result turned author to the discussion of the notion of ‘emotional climate’ in new social media as the ‘intermediary between social structure and agency’ and as ‘a deeper structural reaction on political and social inequality’ (Alice Baker, 2013).

Facing Inequalities: Internal-External Labour Market Interplay

From the theoretical perspective the paper aims to revisit the traditional theory of labour market segmentation and its key model based on insiders-outsiders divide. The development of a new paradigm supported by original empirical evidence of
an increased interdependency and competition between external and internal labour markets is proposed. More than forty years later we reconsider the relevance of Internal labour market theory (Doeringer, Piore 1971) from a contemporary perspective. The strategic use of core-periphery has shifted towards market-mediated employment relationships and affects indifferently high and low-skilled sectors. This issue is part of the wider socio-economic debate on inequality associated to labour and ranking and sorting process in labour markets (Granovetter, Tilly 1988). Many European countries have undertaken reforms in order to increase flexibility. From this perspective the framing refined by Varieties of Capitalism (VoC) literature has been evolving, as companies situated in different countries facing the global competition seem to be adopting similar employment practices. Recent studies (Herrmann 2008) showed the ways by which firms can compete circumvent pragmatically their own rigidities though functional equivalent practices, by using standards or demanding skills or implementing the requirement of international labour markets. Firms seem to be doing what their institutional contexts do not encourage. We consider new forms of division and distribution of labour between firm-based and market-based labour force and their social implications, from the key point that skills and competences are crucial factors of productivity and competitiveness. Following Streck's contemporary Durkheimian interpretation that “economic efficiency is to an extent conditional on the effective enforcement of social constraints” (Streek 1997) we aim to better understand if there is a sort of collective awareness of the reduced social value of work or if, in alternative, companies are implementing new and still unclear cost-effectiveness strategies.

Gender Justice in the Global Manufacturing: Where Does It Stand? an Evidence from Garment Industry of Bangladesh

Globalization of production has yielded contradictory consequences to the lives of women workers who question about gender justice. Supporters argue that globalization ensure gender justice because it brings positives changes to lives of women workers in various forms, like, expansion of employment opportunities leading to income earnings (Barrientoes, 1995; Razavi, 2001; Kabeer, 2004), breaking patriarchal bond (Lim, 1997), growth of self-awareness about rights and duties and participation in collective bargaining association (Gills, 2002), shifts in gender roles and value structure, reconfiguration of the public-private and production-reproduction dichotomies (Unni, 2002). On the other hand, critics reject the claim of economic benefit of women; rather state that it is pushing women into more vulnerable situation than they were before (Boserup, 1970; Elson and Pearson, 1981, 1997; Nash and Fernandez-Kelly, 1983; Acker, 2004; Caraway, 2007). They argue that working conditions and labour rights in global factories are characterized by unjust labour practices, such as insufficient wages, extremely long working hours with minimum compensation, lack of occupational safety and health, little access to maternity and childcare benefits, arbitrary punishment and workplace harassment, absence of union and low workers' participation, presence of forced and compulsory labor, and long working hours. Consequently, this paper proposes here is based on a double fieldwork in two neighborhoods of Toronto, Italy, known as Quadrilatero Romano and San Salvario, that have been facing gentrification from the early Nineties up to recent times, following one another as subsequent targets of public interventions and market dynamics. The time-span of more than ten years allows us to highlight some major conclusions on the overall regeneration of the city of Toronto, the role of gentrification in the remaking of the central city and the effects of the financial crisis on households, commercial activities and the image of the city. The data are qualitative, mostly fieldwork notes, interviews and observations. The contributions of this paper are both theoretical and methodological. On the one hand, it offers new understandings of fourth-wave gentrification phenomena in a peripheral Western country such as Italy, on the other hand, it adds further knowledge on multi-site longitudinal and qualitative analysis. Moreover, we will provide evidences from a city that have long been the one-company town of Italy, hosting FIAT and IVECO industries among others, and it is now betting on cultural economy, tourism and entertainment as new path of re-development after hosting the Winter Olympics games in 2006.

Do We Stay or Do We Leave?: The Views of UJ Students with regard to Living in South Africa

This paper focuses on UJ students’ views on remaining or leaving South Africa. This is based on the degree of trust students perceive the government of being worthy of and the degree of engagement in the affairs of the country students are prepared to expend in the context of perceived threats to SA citizens. A survey was conducted in 2011 on the basis of a stratified random sample of 1214 undergraduate students on all four UJ campuses. The data is analyzed in terms of a typology that considers the extent to which people either respond to real or perceived threats on the basis of trust in the government’s ability and willingness to protect their interests as citizens and the derived trust in the future of the country or from a position of distrust in the government. On this basis they could furthermore either engage the threatening reality or disengage from it altogether. The paper analyses the extent to which patterns can be identified among different groups of UJ undergraduate students with regard to the four possible responses that emerge: Trusting engagement, trusting disengagement, distrusting engagement and distrusting disengagement. The paper concludes by briefly considering the possible implications of the four responses for the long term stability and prosperity of South Africa.

Mediating Workplace Bullying

This paper will be exploring the nature and dynamics of workplace bullying with a view to identify important requirements for mediatory interventions to resolve bullying related issues within the workplace. In order to achieve this, an analysis of the characteristics of the workplace bully, the impact of the bullying behaviour on the victim and the organization, as well as the enabling organizational environment will be done. Possible mediatory interventions in this context will be explored in terms of the following dimensions: On a micro-level, requirement of constructive mediation between the bully and victim will be analysed. On meso-level, bullying awareness workshops and skills developing workshops to deal with workplace bullying will be explored. On macro level, management participation and policy related interventions will be analysed. Reference will be made to the South African situation.

Future Urbanisms: Technology, Science Fiction and Extrapolated Cities

An unavoidable dilemma of looking into the future is demonstrated by our pondering whether to filter reality through Google glasses (smart phones, tablets etc.) - providing data about location, proximity and resources - or to resist this new temptation to stream information and explore the reality of our environment. Technology has two sides, providing new social possibilities such as digital art and communications, while taking away the need to go shopping in person. The importance of science fiction in our consideration and construction of futures is illustrated through E.M. Forester’s short story titled ‘The Machine Stops’, written in 1909, which describes a future for humanity based upon a complete reliance on technology, and predicts the internet. The story serves as a warning of a future so completely reliant on technology that humanity is disabled. Science fiction utilises technology, and predicts the internet. The story serves as a warning of a future so completely reliant on technology that humanity is disabled. Science fiction utilises technology, and predicts the internet. The story serves as a warning of a future so completely reliant on technology that humanity is disabled. Science fiction utilises technology, and predicts the internet. The story serves as a warning of a future so completely reliant on technology that humanity is disabled.
as in science fiction the methodology is based on empirical socio-spatial findings (knowability), technological projection, epistemological growth and speculation regarding potential tangents and tipping points. The ability to act positively towards desirable futures is deeply embedded in possibilities of change, identifiable trajectories and an acknowledgement of the fact that cities and society continually transform. Parapoising urban change in context of resilience (Walker et al., 2004)(Holling, 1996), adaptation and assemblage (DeLanda, 2006), potential urban futures become the space of socio-spatial speculation and resultant action.

“What I Want to Do” As a Form of Strategy to Survive on the Job-Hunting Process: The Case of Japanese University Students

In Japan, university students are facing challenges to get a job today. For example, only 60 percent of university graduates can find a full-time job now. Many quantitative researchers conducted researches on job-hunting for university students to understand how social structure impacts the job-hunting process. These studies pointed out that the labor market requires university students not only to have a better educational background but also to have higher motivation, like “yari-taiko” (what I want to do), because the labor market requires them to work for other reasons besides money. However, no one has analyzed how the word “yari-taiko” has been used by students.

My research aims to describe the job-hunting process for Japanese new graduates by analyzing the use of word, “yari-taiko.” I conducted interviews with 11 students who were in the middle of job-hunting activities. Each person was interviewed two to four times during February to July in 2012. Using Goffman’s “warm-up” and “cool-down” theory (Goffman1952) as an analytical framework, I shall raise the following points. First, they used the word “yari-taiko” to warm themselves up to get into job-hunting mode; however, many of them failed in job competitions. Second, they let themselves cool down their “yari-taiko.” Third, I changed the meaning of “yari-taiko”, reinterpreted it and warned their “yari-taiko” up again for the next competitions. Therefore, students have to continue to change their “yari-taiko” during the process until they get a job. It is hard for them, however, to deny their “yari-taiko” and adapt to the job market. Students need the opportunity only to survive the job competition but not in their real lives, which means, interestingly, that they are not able to meet the expectation that the labor market has for them as long as they use the word.

Consolidating Patients’ Rights in South Korea: The Case of the Breast Cancer Patients’ Movement

The promotion of patients’ rights and quality care have been rapidly spreading in South Korean hospitals since the 1990s. The most conspicuous method of spreading these two concepts has been the breast cancer patients’ groups. This paper will treat the evolution of the breast cancer patients’ movement since 2011, focusing on an organization that claims to represent female breast cancer patients in South Korea, the Union of Korean Breast Cancer Patients (hereafter UKBCP). Established by Korean women with breast cancer, the distinctive characteristics of the UKBCP will be presented and analyzed; these characteristics derive from the birth of patients’ self-help groups promoted by biomedical professionals in university hospitals.

My theoretical approach is indebted to the present scholarship on the sociology of individuals, particularly Danilo Martuccelli’s work on subjectivity(2002) and the theoretical framework of Health Social Movements (Brown, Zavestoski et al. 2005). In my analysis, I will refer to materials collected from different sources: web information provided by the UKBCP; participant observation and in-depth interviews.

The study will lead to a better understanding of objectives and strategies of the UKBCP. My hypothesis is that the heteronormative femininity has developed with the current regime of breast cancer. In this perspective, I will further examine the impact the regime has had on the biomedical world and the life of patients. I will also explore actions specifically concerning the rights claimed by patients with breast cancer. This paper will discuss the regime of breast cancer, which resonates with the cultural and political characteristics of reframing a South Korean welfare state and particular elements constituting the subjectivity of breast cancer patients.

Youth Work in the Context of a Global Sociology of Youth

This paper explores how modern youth work has arisen through the social construction of “youth” as a delineated category of adults through a range of key processes. The youth category is created through the exclusion of this group of (biological) adults from the workforce and their incarceration in age-streamed cohorts in educational institutions. This is systemically supported by a scientific discourse of adolescence that resides clearly within a deficit paradigm with a wide range of associated cultural artifacts to disempower young people. The elimination of relationships with older adults and the exclusion of young people from economic life feeds and maintains youth cultures while simultaneously marking young people out for prejudicial and discriminatory treatment. The resulting economic dependency in young people, their incoherent social role, the emergence of distinct youth cultures and the generation gap provides the ground for disproportionate public fear rooted in young peoples’ “otherness”, and the “social problem” of youth is created and maintained.

This leads to simultaneous and contradictory pressures for the control and containment of young people and for their social and economic participation and agency. This occurs in a social context by class and other contradictions, the technological and industrial transitions involved in the collapse of ‘heavily’ modernity and the emergence of more ‘liquid’ forms, and by globalization, including global modernisation and the globalisation of capital. Youth work emerges in the flux of these contradictions. The paper explores the responsibility for youth workers to partner with young people to be managed and challenge the conditions of their disenfranchisement and to find compensatory processes which facilitate young people’s renewed agency.

New and Old Path to Economic Power: Social Origins and Recruitment of Managing Elites

The transition to the new century in Latin America display several changes and challenges. Democratization processes had to overcome multiple economic and political crises, left turn over and new economic grow cycle. Despite of Uruguay is a small country has high human development and outstanding democratic legac in Latin America. As well as many countries during the last decades had many political and economic changes.

Economic globalization in the last two decades modifies the structure of economic power and impact into business elite integration. On the one hand, the increasing influence of the transnational companies rose to new managing elites. Corporate elites are based on cultural capital background, abilities and specialized knowledge, university management professions, social global networks. On the other hand, the traditional entrepreneurs recruited through family prestige and inherited capital, exclusive business membership and local networks linked to political power.

Moreover, the left turn over in Uruguay had several consequences on recruitment of management elites based on trade union and political capital background.

The study inquires about recruitment processes and careers of senior manage rs (CEO, MD). The paper identifies business elites’ relationships (social origins, and specialized knowledge, university management professions, social global net-works). This study has looked at social networking profile pages as a single text including iconic, audio and textual elements.

We analyze two strategies of networking which are characterized of senior users. The first important characteristic of old people sites is the way personal identity is subsumed within the sense of being historical generation. The second strategy shows contradictory intentions of elderly who play with time changing the personal contemporary image. Deep interviews with senior users help to reconstruct some practices in situation if the profile owner died.

We discuss inequality problem in terms of “digital divide” and “power over time” between elderly who use new technologies and non-users.

Crisis and Challenges for Families Facing Global Diversity and Inequality - Can Families Still Function As Educators in Multicultural Societies?

The paper presents a research study on the sociological and educational impact of global cultural diversity on the role of families as educators. Specifically, it presents the field work and findings of qualitative research, involving educational settings in which innovative methods have been developed to include families from diverse cultures as educators in their children's educational process. The study's outcomes include methods of facilitating an authentic dialogue between families and educators, a creative model for the incorporation of family traditions and narratives as enrichment resources for the school curriculum, developing curricula, developing and conducting educators training sessions. The study's findings demonstrate that an effective partnership forming between the family and the educational framework, which relates to the child's cultural world improves the learning process. It is enhancing the children's scholastic achievements, building families' resilience thereby promoting equality among families, helping the family to regain its leadership role and culturally assigning responsibility for strengthening their cultural identity and their self esteem. The study's conclusions show the contribution of families' multiple intelligences to the child's development and to the school's success in achieving its goals and the educational agenda. Therefore, such school-family collaboration has the potential to minimize the risk of crises in the family's structure which commonly include social changes such as the loss of parental authority, the man/father changing status in a democratic society, children acting as the parents' translators, different social norms, conflicting values with society, adaptation of migrating families to new realities etc.

It also encourages acquiring formal education as a vehicle for minimizing inequality and enabling social mobility. The paper will present studies conducted in a widely diverse type of families and schools in Israel along with innovative educational programs developed, tested and implemented during and after the study.

Strategies of Mobility Among Romanian Roma and Its Contribution to the EU Citizenship

The Spanish RTD project “TRANSROMA. Strategies of mobility, return and transnational practices between Romanian Roma people” funded by the Spanish Ministry of Science and Innovation from 2012 to 2014, is aimed at analyzing strategies for mobility and return and transnational economic and political practices developed by the Romanian Roma in Spain and Romania. While the EU is defining a common political strategy for their inclusion, the Romanian Roma population has been involved in episodes of European history have deeply questioned the effectiveness of anti-discrimination legislation and the preservation of freedom of movement among EU citizens, as well as basic principles of living together and social cohesion. The economic recession and the scarce scientific knowledge about this group have reinforced the stigmatization and infringement of fundamental rights, ignoring their contribution to the societies of origin and destination. From a transnational vision that goes beyond methodological nationalism, this paper aims to present some of the results obtained by this RTD project. Specifically it aims to provide new scientific knowledge on migration processes such as circular migration and transnational spaces of the Romanian Roma, and analyze how they contribute both to origin and host societies and the process of construction of a Union from the bottom up where the basic rights and living a reality for all its citizens.

Managerial Doctors: Medical Technocracies Revisited

Across European countries, the relationship between professionalism and managerialism indicate new emergent configurations of hybrid professionals and mixed forms of governance in health care. Studies concerning Portuguese case (Serra, 2010; Carvalho, 2012; Correia, 2012; Kuhlmann, et al. 2012) show a specific situation due to the power the medical profession stills to exert over health regulation. Definitely, doctor's influence on state regulation seems to counter the specific situation due to the power the medical profession stills to exert over health regulation. From the notion of medical technocracies (Serra, 2010) the whilst also allowing the organisation to attract investment that brings greater financial sustainability . From the notion of medical technocracies (Serra, 2010) the

their degree of skill and qualification.

- economic, effectiveness and efficiency (Rhodes, 1994) and, simultaneously, boost the self-regulated professional power, defined as medical technocracy. To a certain extent, it is the increasing introduction of NGP criteria that strengthens medical technocracy.

This article presents a study on the Movimento 5 Stelle (M5S), founded in Italy in 2009 by the comedian Beppe Grillo. The elections of February 2013, established the success of this movement that with a result of 25.5 per cent, has placed 163 members in Parliament between Deputies and Senators. The Movimento 5 Stelle promotes initiatives to bring citizens at the center of public life through practices of direct democracy, while underlying the crisis of representation of the traditional political parties.

The study is aimed at understanding the political, social, cultural meanings of this movement and in particular it examines the way in which its members oppose to and are distinguished by the traditional parties, in facing and developing interventions through participation and direct democracy in the fields of interest of the movement, namely energy, water, waste collection, connectivity, social services.

The Movimento 5 Stelle will be analyzed through three dimensions: the space represented by the online Beppe Grillo's blog, the online and offline meet-up tools and the institutional places. The work is also interested in showing the controversial elements of the movement in relation to the presence of a charismatic leadership, the intolerance towards dissenting voices, the emphasis on the democratic nature of the network, as well as some populist features such as the opposition people versus elite, the simplification of the social and political reality.

This study suggests an interpretation of the Movimento 5 Stelle as a controversial political and cultural movement that in some ways can be considered populist.

Privileging the Postcolonial: Emerging Epistemologies in the Sociology of African Religions

Privileging The Postcolonial: Emerging Epistemologies in The Sociology Of African Religions

(Religious Migrants and Marginality in South Africa)

For more than a decade South Africa has seen an enormous influx of migrants from across the continent. Significantly, these migrant communities have visibly infiltrated the fabric of South African public culture through language, economy, ritual and religion. In the context of South Africa, Ethic Orthodox Christians and Nigerian Pentecostals have respectively devised strategies for navigating their distinct national and religious identities. These strategies offer a lens through which to examine how such groups variously mediated their distinct transnational identities through the reconfiguring ritual and liturgical practices. Thus I ask, to what extent do such practices reduce the migrants' marginality. In particular, I am concerned with how migrants' religious practices produce new forms of knowledge.

In examining how the embodiment of ritual practice relates to the everyday experience of the migrant, I propose that we turn our gaze and our method to...
the reading of the migrant body as site of knowledge production in the African context. Situating my sociological practice in the context of postcolonial theory, I draw on the work of Donna Haraway (body in performance and resistance), Bryan Turner (corporealization) and Frantz Fanon (lived experience of the black body) to analyse the various ways in which bodies are regulated, managed and disciplined. This way in which migrant bodies also serve as sites of resistance – sites for the production of new epistemologies. Quiet significantly, the case studies of the Ethiopian Orthodox and Nigerian Pentecostal migrant communities, point to the multiple ways in which the religious body in ritual performance also act in resistance to the muting and governing practices of social exclusion, xenophobia and nationality, while simultaneously forging transnational identities.

Redefining Gender Reform in Indonesia: Oligarchy and Exclusion of Marginalized Women

Gender reform is regarded as a precondition for democratization since it results in women's empowerment. In Indonesia, gender reform implicated in gender mainstreaming policy and affirmative action policy which assure women across classes and ethnicities as significant beneficiaries of democratization that is currently taking place in the country. This study examines the impacts of gender reform policy toward marginalized women. Using Banten, a province headed by a women governor, as a case, this study employed a qualitative method (i.e. FGD and in-depth interviews) for its data gathering strategy. This study indicates that gender reform policy has benefited women in the community. They have captured local discourses on women political participation and gender mainstreaming programs, through the practices of oligarchy and control over resources in various domains. Moreover, the elite women have used their access to political power for continuing practices of nepotism, corruption, and the accumulation of the ruler's wealth. As the consequences, marginalized women, particularly the poor, have been excluded from the access to political and economic resources. Gender reform policy has not yet contributed to the transformation of marginalized women to have a better living. This study contends that women are not a homogenous entity. Their gender identity intersects with class, ethnicities and other identities. Accordingly, women have various interests and regard gender reform as opportunities in different ways. Hence, the practice of oligarchy done by women elites has confirmed the heterogeneity of women based on their intersectional identities. Therefore, gender reform policy promoted by the Indonesian government, does not necessarily benefitting all women citizens in equal basis.

The Limits of Ethnic Politics in Indonesia: A Case Study of Riau Politics

Revitalization of ethnic identity has signified the implementation of Indonesian decentralization and democratization. It is marked by competition over political and economic resources among ethnic groups at the local level (provincial and district levels). The dominant ethnic group utilized ethnic politics to control over political power. This study examined the impacts of ethnic politics in Riau-Sumatra, an Indonesian province, after more than 10 years decentralization. The Malay as the dominant ethnic group exercised ethnic politics through various channels including in the political, economy and socio-cultural domains. The study employed a qualitative approach. The results found that cartel politics, fragmentation of Malayness, and the weak of local activism in Riau has weakened the strategy of ethnic politics that previously promoted by the Malay ethnic group. Thus, local politics dominated by coalition among elites regardless their ethnicities. Political party and access to economic resources became the main influential factors in Riau politics. This coalition was caused the gap between elite and non-elite groups. Hence, political activism involved only the elite and excluded non-elite citizens (both Malay and non-Malay). Meanwhile, heterogeneity of Malayness has fragmented the ethnic group and caused the lack of solidarity among Malay in employing the ethnic policy strategy in local politics. This study illustrates class as an important dimension in the way the ethnic politics work at the local level. Thus, ethnic politics has benefited elites regardless their ethnic background and been positioning the lower class at the margin. The findings argue that political cartel, fragmentation of Malayness, and the weak of local activism have caused the limit of ethnic politics.

Knowing Society through Literature

It was in the 19th century that novelists such as Honoré de Balzac and Émile Zola, two leading figures in French and European realistic-naturalistic literature, saw their own literary creation as an imaginative or “experimental” way of studying society. At this stage, sociology - literature’s competitor in the field of social knowledge - was a dawning discipline whose position in the academic world was insecure. At the beginning of the 20th century it became a legitimate discipline, still it would not gain a monopoly in relation to questions regarding societal knowledge.

In addition, literature offers insights into society. In his Temps et Récit (1983), Paul Ricoeur speaks about triple mimesis. In their social interaction people create institutions, rules, common meanings, myths, and representations of the world (mimesis 1). At the next level (mimesis 2), popular stories, literature and other arts describe the first level and take material from it when creating fictional or alternative worlds. Thus, these cultural products give us representations of society and a more or less critical sense of alternative worlds, whose order differs from the normal societal order. Finally, readers or receivers (mimesis 3) recognize that these products function simultaneously as representations of the real world and as critical deviations from it.

Pierre Monbeig: Les Différents Traits D'Un Entrepreneur Scientifique

En 1957 la création à l'Université de Paris de l'Institut des Hautes Études de l'Amérique Latine visait à donner plus de visibilité scientifique aux études sur cette aire culturelle jusque-là peu développée. Depuis sa création et jusqu'à 1977, cet institut a été dirigé par Pierre Monbeig. Géographe des francophonies, il a été ensuite future Directeur Adjoint pour les Sciences Humaines au CNRS et créateur d'une importante plateforme institutionnelle pour les études latino-américaines en France, le Centre de Recherche et Documentation sur l'Amérique Latine. L'analyse de la trajectoire de Pierre Monbeig est particulièrement révélatrice des dynamiques, à la fois sociales et scientifiques, visant à développer les échanges entre la France et le Brésil. Notamment lorsqu'on se penche sur sa participation dans la création des institutions responsables pour des échanges scientifiques et universitaires. D'une part, son rôle précurseur pour la géographie humaine au Brésil grâce à son séjour avec la mission française ou encore son mandat comme président de l'Association des géographes brésiliens entre 1936 et 1946, sont révélateurs d'un projet qui visait le rapprochement scientifique et institutionnelle entre les deux pays. On peut s'interroger également sur son rôle particulièrement actif en tant que maillon fort d'une « chaîne de savoirs » de toute une génération des géographes brésiliens et français et « patron » d'une école de pensée sur les franges pionnières qui est loin d'être négligeable. D'autre part, son séjour au Brésil ne le permet pas de participer activement dans le processus d'autonomisation de la géographie en tant que discipline universitaire vis-à-vis de l'histoire. Or, l'hypothèse est qu'en occupant une position marginale dans le champ en raison de cette expérience à l'étranger, Monbeig s'est orienté vers l'international. L'analyse de sa trajectoire offrira l'occasion de saisir les mécanismes institutionnels à l'œuvre dans la création des nouveaux réseaux scientifiques.

Model Of Happiness In The Former USSR Countries

The phenomenon of happiness being studied by scientists from different fields of science, the concept of “happiness” is multifaceted and polysemantic. Happiness is determined not only satisfaction of primary human needs for food, clothing, shelter and security, but also in meeting the spiritual needs, the internal state of the person. At the same time happiness can be characterized by opportunities for citizens to participate in public and political life of their country, attached to the masterpieces of world culture, the possibility of complete rest.

In this work will be presented comparative data from sociological surveys conducted in framework of the project HITT-CIS - Health in Times of Transition, it is an international research project supported by the Seventh Framework Program of the European Union (FP7-Health). Field works were conducted in 2010, across nine former Soviet Union countries, including Kazakhstan, Turkmenistan, Georgia, Belarus, Russia and Ukraine. The objectives of this research were to study the conditions of lifestyle, health, social well-being, political views and their relationship. A total 18,000 respondents were surveyed by standardized personal interview. Sample represents the population at the age of 18 years old.

Results of the regression analysis will be presented, where the dependent variable is subjective feeling of happiness, measured on a ten-point scale, as well as influencing variables - number of variables, including not only the socio-demographic characteristics, but also the level of satisfaction with various aspects of social and political development of countries.

Hoping for More: Renewing and Redeveloping Public Housing without Marginalizing Low-Income Residents

Since the 1980s, politicians, government officials, and real estate developers have popularized the strategy of building mixed-income housing to replace troubled public housing projects in the United States. Although the term is used to describe a growing number of developments, “mixed-income” has never been officially or consistently defined. Drawing upon a newly-constructed database of income-mixing in projects completed under the HOPE VI program since 1993, as well as on other initiatives, this paper investigates selected public housing sites that have been redeveloped into so-called mixed-income housing in order to understand what qualifies as mixed-income and to develop a more analytically precise way of describing these projects. We reveal that the mixed-income label is applied to a wide range of income mixes, from projects that try to minimize the presence of low-income housing (less than 1/3 of total units), to projects that attempt to preserve a substantial majority of units for low-income households. Implications in South Asia

Changing Nature of Conflict in Post 2014 Situation and Its Implication in South Asia

Pakistan emerged as the frontline state during the Cold War era and especially Afghan conflict (1979 – 1988). Pakistan remained the focus of attention during this time. After the 9/11 and later in war against terror, Pakistan again became part of this new war. But the nature of country’s involvement in both wars was totally different. In the mean time during 1989 to 2001, Pakistan developed its own parallel agenda to play at different fronts simultaneously. But that policy miserably proved faulty, resulting killing of more than 45,000 civilian and 3000 soldiers and police officials. Despite that,

This paper analysis Pakistan’s future policy in the post 2014 scenario and how it plans to move forward. Will this policy be helpful in resolving conflict or it would further sharpen the existing conflicts. Paper also focuses how regional and international figures may play their constructive role to help Pakistan to get out of the crisis and how much Pakistan itself tries to pursue the agenda of global and especially regional peace.

War, Conflict and Human Rights Violation: New Debates and Discourses in Pakistan

Eventual aim of human beings is to have a peaceful society where human dignity and human rights are well respected. But during the war and conflict times situation totally rejects the concept of the such values and norms and especially in situation where conflicts persist for decades on asymmetric pattern. Situation becomes more complex in those cases where states provide covert support to the non-state actors to further toe their agenda. Pakistan’s military developed nexus with the jihadist with the financial backing of other countries, but eventually the jihadists are now haunting the patron itself.

Now conflict between militant and state has turned to situation that where the level of violence has reached to new zenith. In this situation, abuse of human rights from both sides becomes a very common issue. But due to protest of civil society bodies and judicial activism at least debate on human rights violation is being taken place on paper. Human rights organizations and judiciary are pursuing the agenda of missing persons and other sensitive situation vigorously. Who Participates in Encompassing Protests and Why Does It Matter? Israel and Spain in 2011

In Spain and Israel in the spring and summer of 2011, multiple demonstrations each mobilized hundreds of thousands of participants in the framework of Occupy-type protests. The Spanish Indignados (15M) and Israel’s social justice movement were instances of an unusual variety of protest, labeled “encompassing” because it combines massive mobilizations with high levels of public support. Such encompassingness does not necessarily imply society-wide solidarity, but may instead be based on what are in effect multiple parallel protests in which some social sectors are under-represented or even altogether absent. This paper reports analyses of national sample surveys carried out in both countries, showing the effects of political cleavages and other social divisions on the passive and active engagement of individuals in these instances of encompassing protest. For Israel only, these conventional sources are supplemented by data collected via mobile phone signals, which make it possible to paint a reliable portrait of the social, cultural and political characteristics of demonstrators.

‘to Foster the Spirit or to Secure One’s Future’: Competing Models of Field of Study Choice Among Middle-Class Students

The growing interest in horizontal stratification has led researchers to recognize qualitative differentiation in the choice of academic fields of study (FOS), mainly along the lines of professional and non-professional fields. Still, adopting either rational action theory or Bourdieusian perspective, most researchers still evaluate FOS through their future utility, and accordingly assume a calculative or strategic choice process. This portrayal may reflect the stratifying effect of higher-education, as models of choice are associated with autotelic and expressive cultural ideals, such as the ideal of ‘pure knowledge’, the model of liberal-arts education and models of choice as an expressive action. To date, these ideals and their relationship with FOS choice have been mainly overlooked.

Drawing upon ‘culture as tool-kit’ perspective, I argue that when choosing FOS, students use dominant cultural perception of higher-education, as models through which they make sense and assign value to their choice. Accordingly, I show how the choice of professional or non-professional fields, reflects two distinct cultural models of higher-education and choice.

This paper is based on in-depth interviews of middle-class students from professional and non-professional fields. In light of a review of cultural representations of higher-education, two ideal-types of FOS choice are elucidated. The first, draws upon the ideal of acquiring knowledge as a tool for the future; characterized by a calculative FOS choice; and a utilitarian approach towards studying. The second, draws upon the ideal of knowledge for its own sake: characterized by an expressive FOS choice process and an autotelic approach toward studying. Moreover, all students experienced their choice as a tradeoff between the two models - between success and personal authenticity. These findings support recent challenges to current line of explanations, and their implications for present and future research are discussed.

**Religious Capital and Addressing Latino Immigrant Health Inequalities in the U.S.**

**Background:** There is much evidence linking participation in an organization with health outcomes, more than the relationship of faith outside of a religious organization. For example, church attendance is the measure of religiosity most often linked with better health outcomes. While some attribute the religion-health connection to social capital, there is insufficient attention to how aspects of religion itself can also be a resource contributing to the health of members of a religious community through religious capital. While it has primarily been used in other contexts, religious capital can be an important resource for health. There is a paucity of both theory and evidence, however, in understanding how religious capital may be related to positive health outcomes and, in particular, how it can affect inequalities for vulnerable populations such as immigrants.

**Objectives/results:** To fill this gap in the literature, this study draws from theoretical concepts in the field of sociology to examine whether religious involvement is associated with better health status and health behaviors among Latino immigrants, with potential to reduce health inequalities through increased religious capital. The study will describe in detail the theoretical framework for religious capital, with relevant constructs explained. Quantitative evidence supportive of the theory will be brought from multivariate analyses the author performed of over 1000 Latino immigrants from the randomized New Immigrant Survey (NIS), controlling for demographics, as well as from a review of the literature to support the study’s theses.

**Conclusion:** Religious involvement can be related to better Latino immigrant health because of religious capital found among churchgoers. As a result, opportunities may exist to leverage widespread church-going already taking place by Latino immigrants to reduce inequalities by creating faith-based interventions which draw upon this religious capital.

**One Country Two Realities: Work Values of Jews and Muslims in Israel**

This study examines work values of 909 Jews and 219 Arab Muslims, (or Palestinians that have Israeli citizenship). It is a unique study since there are very few studies on cultural values and no studies on work values, which compare between different ethnic/religious groups who have been living in the same country/land for more than century and shares a long ethnic conflict. The findings reveal a significant difference between the two ethno/religious groups regards the importance of all life domains and in most of the preferred work goals and the regression analysis of the main demographic variables cannot explain these differences. The MDs of Jews and Muslims also demonstrate different perceptions and internalization of work values among the two ethno/religious groups. The value gaps can be explained by the cultural differences (individualistic Jewish culture vs. collectivist Arab culture), by high degree of segregation, by the employment discrimination and primarily by the Israeli-Arab/Palestinian conflict.

**Global Dis-Connectedness of Labour: ‘Living Well for Less’, Class, Race and Trafficking in Human Beings in the UK**

By reflecting upon the impact of the current recession on the continuing commodification of migrant labour in Europe, this paper will contribute towards the sociological exploration of the re-emerged tensions and ‘dis-connects’, along the lines of race, class and gender, between people who produce and people who consume, between those who profit and those whose reward for their back-breaking labour is just enough to get going. It will question how the neoliberal order of production, circulation and consumption operate within the context of inflated racist, sexist, islamophobic and anti-immigration rhetoric, and how they serve to legitimise and normalise the continuing dismantling of the welfare state and labour market de-regulation to accommodate the governing ideology of our times: ‘living well for less’. This paper is based on the current research exploring the links between anti-trafficking policies in Europe and public knowledge and understanding of human trafficking. It will focus on the role of current anti-trafficking policies in the UK in reducing the complexity of human trafficking to the issues of illegal immigration and criminality. In describing human trafficking as ‘modern slave trade’ with the blame firmly placed on ‘ruthless criminal gangs’, the current UK government approach reduces the problem to the individual behaviour of devious criminals and of naive and passive victims. Within this context, any suggestion that human trafficking remains epiphenomenal to class, race and gender, and directly responds and responds to the growing demand for exploitable and disposable, usually immigrant, labour to satisfy the appetite of Western consumers to ‘live well for less’ seems so hard to fathom, so ‘not-Wilberforce’ and ‘not-democracy’, yet so close to neoliberal reality.

**Categorical Divisions: The Hostilities Between ‘Indigenous’ and ‘Immigrants’ As a ‘State Effect’**

Nationalist politics has increasingly become one of the main ways that people constituted as ‘natives’ have attempted to overthrow colonial domination. Together, the state language of “sovereignty” and the national language of “self-determination” have shaped notions of identity and have tended to anchor such identities to particular places. All this has figured into how contemporary “indigenous” nationalisms have staked their claim to a place within a global system of national states. Over time, a stark delineation between “Natives” and “non-Natives” has been asserted. Today, a growing number of scholars who identify as indigenous, as well as those who position themselves as their allies, portray all non-Natives as colonizers. In this paper, I examine how a nationalized politics of decolonization has come to mark “Natives” and “migrants” as mutually antagonistic positions. Focusing on such politics of place in the national states of Canada and the United States, I question the conflation of processes of colonization with those of migration. I historicize such politics within their social, political, economic context by looking at the continuation between colonial state practices and contemporary indigenous nationalisms. I also contrast contemporary indigenous nationalisms with other political strategies of decolonization, particularly politics...
that have refused the differentiations of "race" and "nation" and the Leviathan of national sovereignty.

Making Housing Affordable for Urban Poor- Approaches Adopted in India

Housing is one of the basic necessities of an individual. However, the dream of having a house remains distinct for one-third of Indian population. They remain marginalised in terms of civic services, housing and other socio-economic parameters. The cost of this marginalisation is often very high and many studies have shown that it may be up to 2-3 times of the formal system.

By 2030, an estimated 5 billion of the world's 8.1 billion people will live in cities. About 2 billion of them will live in slums, primarily in Africa and Asia, lacking basic services, insecure tenure, congestion and surrounded by degradation and crime. In India, the urban housing shortage has been estimated as 18.78 million, of which almost 96 per cent pertains to urban poor. Affordable housing has been considered as the only option to meet this challenge. A Task Force on "Affordable Housing for All", constituted by the Government of India, Ministry of Housing and Urban Poverty Alleviation, defined affordable housing in terms of (a) multiples of household income; (b) size of the tenement; and (c) percentage of household income, in case of rented accommodation.

3.0 Approach of This Paper

This paper will address the following issues, in the perspective of earlier discussions:

1. The need for a multi-pronged strategy for housing delivery to all sections of the society. This includes housing delivery system, target group and housing typology.
2. Incentives and subsidies to make housing within the reach of target group and mechanisms to retain the ownership. Right policy instruments for subsidy transfer are needed to make people shop for their dream house, without any restraint on size or location.
3. The access of urban poor to sources of institutional lending.

SHARMA, VEENA* (Indian Institute of Advanced Study, vsharma136@gmail.com)

Equal Leisure in an Unequal World

Equal Leisure in an Unequal World Though the globe today is characterized by deep and different layers in terms of capital accumulation and resource appropriation, the leisure experience may display a different type of demarcation – one that may have the possibility of enriching different social groups if they drew from each other. Societies in which leisure has come to be characterised by the consumption of the fruits of production individuals may appear to be bound by a stimulus-response mode of leisure behaviour. What should be done during 'leisure time' is fed into the psyche through media pressure and socialisation resulting in activities that may or may not be self-enhancing even thought they feed into the leisure industry. In conventional understanding of leisure, there continues to be a simplistic dichotomy between work and leisure and 'free' and 'occupied' time as though these were easily separable categories. In this same layered global society there are groups of people who still live with values that recognize the organic unity of all things, are aware of a sense of continuum, as a movement from matter to spirit and vice versa, and see an interconnectedness of all things. As a result there arises a tendency to respect the environment and other beings. The 'leisure' of such societies need not be time abstracted from other day to day activities but a mindset that characterizes the whole. The presentation will look into the possibility of interaction of these segments on each other so as to enable a more holistic attitude to the environment and to other existents on earth.

SHARONOVA, SVETLANA* (St.Tikhon's Orthodox University, s_sharonova@mail.ru)

The National Russian Model of University in the Era of Academic Capitalism

The transformation of the national model of Russian university is under the influence of academic capitalism. The very same academic capitalism born in the depths of the neo-liberal capitalism. The basic principles of the neoliberalization fully implemented within the transformation of national educational systems:
- the creation of conditions of accumulation of capital and power of the economic elite;
- the denial of a nation, and therefore the promotion of the idea of the dangers of government intervention in the economy (in this case is to minimize the interference of the state in education);
- promoting free and stable functioning of the education system is not in general, and of its individual elements (schools, institutes, universities, etc.).

In Russia, and in other countries, this leads to the destruction of national educational systems. Yet Durkheim said that in society there are many cultures of each of them has its own education system. Simmel argued that cultural diversity enriches the world community. However, the implementation of neoliberal policies in the field of education under the slogan of "globalization" ignores the laws and seeks to simplify the interaction between the educational systems in order to achieve clarity and transparency of market exchange. Author analyzes the existing Russian movement of "University against the modernization of the education system that implements neoliberal principles and creating academic capitalism. Virtually all non-liberal utopian promises of the project, in practice, lead to quite the opposite of the expected results.

SHARONOVA, SVETLANA* (St.Tikhon's Orthodox University, s_sharonova@mail.ru)

The Spiritual Capital As a Fundamental Element Of Cultural Capital

Cultural capital is usually regarded as a mechanism of influence on personality. Largely contributed to this study Coleman, although Bourdieu introduced the concept of a theoretical understanding of capital varieties. He was interested in the convergence of social, cultural and economic capital. We propose to focus on the cultural capital of both the qualitative characteristics of the state of society. The problem is that in the presence of cultural capital as a funded system of values enriches the form of works of art and science, society degrades morally. Any cultural capital based on traditional religious values. This does not mean the broadcasting of religious themes in works of art, although it excludes, but rather a philosophical position of artists and researchers, through which the public receives the interpretation of events, their assessment of a certain value-regulatory system of coordination. The element of the spiritual capital expresses the perspective of the state of society, its morality depends on the amount of spiritual capital, which he occupies in the field of cultural capital. A striking example of how the degradation and spiritual revival of capital in society can serve as the processes that took place during the last century.

SHAW, VIVIAN* (University of Texas at Austin, Vivianshaw@utexas.edu)

Energy and Identity: Women, History, and Anti-Nuclear Social Movements in Japan

Since March 11, 2011 (3/11), some Japanese citizens have responded to the ongoing Fukushima nuclear crisis by staging large protests against the use of nuclear energy in major metropolitan areas. Within this revulsion of anti-nuclear collective action, scholars and global news media have argued that the prominent role of women, who have been observed leading "tent city" occupations in Tokyo and organizing rallies in other cities, signals an important evasive with potential implications for the changing status of gender in Japanese public politics.

Applying a historical frame to the contemporary case of women's leadership in post-3/11 activism, this paper challenges a simplified narrative of feminist emergence, instead arguing that contemporary anti-nuclear politics must be read as part of a larger context of women's organizing in Japan throughout the twentieth century. Moreover, this history of social movements also reveals important divisions within Japanese women's movements across lines of race, coloniality, and citizenship. In this paper, I deconstruct the concept of "anti-nuclear" and examine how this politics converges with other histories of post-war women's collective organizing, particularly examining the roles of Japanese women in the related histories of peace and anti-militarization social movements.

In arguing how gender has politically and rhetorically functioned as a method of organizing Japanese public politics, I challenge notions that Japanese women, in the context of social movements, should be viewed simply as a formation of collective identity. Rather, the different meanings of women's identities within these cases suggests the importance of reading Japanese women's social movements in relation to various political contestations at the "local" and transnational levels and moreover, in terms of what they are able to signify about race, coloniality, and citizenship.

Nationalism in the USSR: Historical and Comparative Perspective

The late 1980s and early 1990s were characterized by the sudden rise of nationalistic movements in almost all Soviet ethnic regions. It is argued that the rise of political nationalism since the late 1980s can be explained by development of cul-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
tural nationalism in the previous decades, as an unintended outcome of commu-
nist nationalities policy. The Soviet political and cultural nationalism is studied in
historical and comparative perspective. All ethnic regions are examined through-
out their entire history of the Soviet Union (49 regions, 1917-91), using a structural
equation modeling approach. This paper aims to make at least three contribu-
tions to the field. Firstly, it is a methodological contribution for studying national-
ism: a ‘quantification of history’ approach. Quantitative values are assigned to
historical trends and events. Having constructed variables from historical data, I
use conventional statistical methods like SEM. Secondly, this paper contributes to
the theoretical debate about the role of cultural autonomy in multiethnic states.
The results challenge the concept of ‘cultural autonomy’ as solution to intereth-
nic conflict. Cultural nationalism matters, it indirectly reinforces political national-
ism. Concessions in the cultural domain failed to stop the growth of political
nationalism in the late 1980-s. Finally, the paper statistically proves that the break
between early-1990s Soviet and Stalinist nationalities policy explains the entire Soviet
nationalities policy. In fact, the late Soviet nationalities policy was inherited from
the Stalin’s rule period. This finding revealed in other studies now gets statistical
evidence.

RC34-598.2
SHEN, JIE* (Chinese University, jie.shen@hotmail.com)
Chinese Youth’s Post-Materialist Values in an Era of Multi-
Modernity

Today’s China’s society is in a compound of multiple dimensions of time and space.
China’s modernization are late and exogenous onset. When the mainstream direction of
China’s social development is manifested as the transformation from traditional society to modern one, the developed Western
societies that have completed the modernization goal constitute the envi-
rionmental conditions affecting the development of China’s society. As a conse-
quence, China’s society more clearly than ever in the history is at the same time
being affected by three dimensions of time, or, put another way, in the present
there are three dimensions of time – traditional, modern, postmodern – coexist in the
same space.

If so, although the total direction of social psychological changes in the course of
China’s modernization is the transformation from the tradition to modern-
ity, this is not intended to preclude the possibility that the present Chinese social
psychological changes will present a more complex pattern than in any previous
eras and societies.

Just as using Inglehart’s two important theoretical tools – scarcity hypothesis,
socialization hypothesis can attest that when China entered the take-off stage of
its modernization, changing from a society of scarcity to one of prosperity, the
spiritual world of the social members is undergoing rapid and profound changes,
along with gradual improvement of their hierarchy of needs. It is Chinese youth
who first shows these changes. In China, the post-materialist values have begun to
emerge in these people born in the 1980s, and have further manifested by
these groups born in the 1990s.

Occurrence and development of the post-materialist values among Chinese
young people will definitely lead to changes in their activities of daily life and ways
of social participation, and to affect the appearance of China’s society especially
when they enter the society in an all-round way.

SHEN, JING* (University of Toronto, jing.shen@uleth.ca)
The Value Of Mixed Methods: How Does Certifiability Of Job
Requirements Determine The Channels Of Job-Person Matching?

Using qualitative collected in three representative Chinese cities and quantita-
tive data drawn from the 2003 China General Social Survey, in this study I have
built up a theoretical framework to understand the interdependence of formal and
informal employment channels. I argue that a job-person matching process
should be understood from a dual perspective of the employer and the job ap-
plicant. From the employer’s perspective, requirements for certain job positions
are composed of two parts, namely, certifiable and uncertifiable qualifications.
The variation in the relative importance of these two types of qualifications deter-
mines how employers’ recruitment strategies vary from formal channels only, to
formal-informal joint-channels, and then to informal channels only. From the job
applicant’s perspective, quantitative analysis shows that an applicant’s pre-hiring
resources—human capital, political capital, and social capital—match up with the
targeted employer’s expectations of both certifiable and uncertifiable qual-
ications in a successful job-person match. By articulating the three typical sce-
narios of employment activities, I highlight the great importance of joint formal
and informal employment channels. I argue that studies on employment need to
formal-informal joint-approach, instead of focusing on formal or informal
employment channels alone.
“Need-based distribution” and “fairness in the long run” were characterized as innovations by some teams and enacted under certain conditions. Secondly, I examine three organizational factors that contribute to these differences: the incentive system of each organization, the hierarchy of each team, and finally the constraints and opportunities each team faces inside and outside of the organization. Depending on the organizational circumstances of each team, certain discourses about authorship prevailed while others were impeded, generating systematic difference at the organizational level.

Exploring Reactions to Risk and Uncertainty in the Context of Smoking and Lung Cancer

Research examining the sociology of diagnosis has demonstrated how the provision of a clinical diagnosis from a health professional can promote identification of illness or disease, facilitate behaviour change, and enhance adoption or resistance of illness identities (Jutel and Nettleton, 2011). Further examination of such frameworks could contribute towards achieving a richer understanding of health communication complacency, thus enabling better management or avoidance of ill health and disease.

The current study examines such frameworks within the context of a Stop Smoking Service (FagEnds, Liverpool) and the study has been designed to replicate a recognised model of diagnosis. However, rather than a clinical diagnosis, smokers receive a personalised lung cancer risk assessment – essentially providing them with a diagnosis of uncertainty. The primary aim of this study will be to ascertain whether provision of personalised lung cancer risk information alongside health advice, will enhance smoking cessation.

This mixed-method paper will disseminate the findings of a randomised controlled trial consisting of ~300 smokers, in which the control arm receive generalised lung cancer risk information and the intervention arm receive a personalised lung cancer risk assessment, using the Liverpool Lung Project risk model (Cassidy et al., 2008). It is anticipated that provision of personalised lung cancer risk information may encourage behaviour change i.e. smoking cessation and long-term maintenance of this change at six-month follow-up. In support of the aforementioned quantitative survey, qualitative interviews will also be conducted with a selection of participants (N=30), which aims to provide further explanation as to the impact of receipt of a diagnosis of uncertainty and the subsequent behaviour and attitudes of which it may entail. Overall, it is anticipated that the findings will contribute towards our understanding of the sociology of diagnosis and may help to inform the development of future health risk communications.

SHERWOOD, JUANITA* (University of Technology, Sydney, Juanita.Sherwood@uts.edu.au)

Complex Trauma a Conduit for Inequity

Over the last century we as citizens of a united world Nation have been appalled by the atrocities that have been meted out to our brothers and sisters living in all corners of the world by their enemies or colonisers. Similarly we have been moved by the grief and loss of survivors of climatic disasters that frequent this planet. The mental health profession has sought ways to assist those who have experienced these deep life-changing traumas. Trauma has been an event and part of every cultures story line. The recovery and healing from such traumas has been dealt with successfully over a millennium by Indigenous communities with their ways of knowing. However the dominant culture’s exclusion other cultural and societal standpoints is to the detriment and wellbeing of those they seek to help. In Australia most Indigenous Australians have been prevented from receiving culturally appropriate healing in a manner that would meet their needs. The western oppressor uses many strategies to thwart healing and resilience of Indigenous peoples while simultaneously rolling out colonial policy targeted at causing harm, injury and genocide. The legacy of traumas has reverberated along many generations and the ongoing emotional costs to the community have not been met.

The numbers of Indigenous Australians in places are prisons, keeping westerners safe and further punishing those already deemed not quite human and criminal. The legacy of traumas has reverberated along many generations and the ongoing emotional costs to the community have not been met. The numbers of Indigenous Australians in juvenile and adult detention centres under the auspice of corrections is escalating each year, especially the juveniles and women. This is the story of the journey and pathway to prison for Aboriginal Australians.
expanding or dismantling redistributive social policy and social service: Central government tends to claim credit by setting up social policies whose financial responsibilities rest on the shoulders of local governments, or avoid blame in case of dismantlement by passing the buck to local cadres responsible for implementation. Local governments, by contrast, avoid blame by either delaying or selecting implementing policies dictated by the center. They can also claim credit by experimenting with new policy models that may find nationwide application later. Health reforms and social service for migrant workers are used as two examples to illuminate the driving force behind the politics of social policy in China.

Forced Migrants and Their Connection to Their Homeland: A Case Study of Inter-Country Adoptions and Cultural-Discursiveness in Second Modern Transformation in East Asia

The forced migrants, as Castle (2008) noted, have dramatically grown in number in addition to the changing global order. One of the causes of forced migration we should take note of is the trafficking of people across international boundaries for the purposes of exploitation, which includes the children expected to fill the “vacancy in a family” through inter-country adoptions. Meanwhile, human security counts on culture as having an initiative role in establishing the stability of permanent peace. The Hague Convention insists that it is in the best interest of the “child” to keep the inter-country adoptees in touch with the culture of their origin. However, some Korean adoptees have found themselves in another situation. Their culture transformation has been such that they perceive themselves as having been “forced to be separated from their biological mothers and relinquish their Korean nationality.” This had led them into forming a global movement that demands legislation of the Dual Citizenship Act and rights for unwed mothers in Korea.

The objective of this research is to show the process how the forced-migration groups that here will be referred to as inter-country adoptees from East Asia, came to be the subject in a cultural-discursiveness of “second modern transformation (Han and Shim 2010),” which incorporates global risks, individualizations and cosmopolitanizations. In particular, I will examine the reasons why the adoptees can be counted as forced migrants while referring to the Korean adoptees’ statements in the movements. I will also draw attention to their values and social capitals acquired in the Western countries and their influence on Asian traditional cultural beliefs through the movements, which could be a potential to reform the social structure. Based on this discussion, I will make an implication on their leading roles in the second modern transformation in East Asia.

Gender Inequality in Indian society: A Study of Women Police in Hubli-Dharwad

Women police in Hubli-Dharwad have a sense of satisfaction of serving a society by joining this service.

Power Asymmetry and Resource Use Conflict Between Farmers and Pastoralists in Northern Nigeria

Northern Nigeria can be described as a “zone of instability” in Nigeria. Since the country’s independence in 1960, Nigeria has witnessed a myriad of conflicts ranging from religious, ethnic to political including a brutal three year civil war. Though many of the conflicts are widespread, the northern region appears to have been the epicentre of several interlocking conflicts. The north of Nigeria is characterised by three major types of conflict, which are different but interrelated in nature, namely: inter-ethnic, religious and resource conflicts. This paper focuses on resource use conflict between farmers and pastoralists which can be explained by a variety of factors including scarcity of resources, growth in the population of herds and humans, the political economy of land use and asymmetry in power relations between the two resource users. The paper argues that historically the control of political power has vacillated between the two resource users. In the past, pastoralists were politically powerful in many states in the African savannah and Sahel including northern Nigeria; and hence, had access to land and land based resources for their livestock. In the contemporary dispensation, sedentary crop farmers are the politically dominant and “landed” group, and have often made it difficult for the pastoralists, the “landless” group, to access land and land based resources for their livestock. There is thus a fierce contest for environmental resources between the two resource users, mediated by power relations, and often resulting in violent conflict. The paper concludes that though scarcity of resources is often considered as a key explanatory variable in resource use conflict between farmers and pastoralists, the effects of scarcity are unevenly distributed in the “unequal world” of farmers and pastoralists in Northern Nigeria.

"Japanese" Approaches to the Music of Frédéric Chopin

The paper examines the "Japanese" understanding of the music of Frédéric Chopin and appears in the narrative discourse of Japanese pianists who have studied in Poland and France.

The works of Chopin occupy an undoubted position in Japanese music institutions for their accomplished artistry in piano techniques. Musicological studies show that having quickly appeared as crucial in concert repertoires of the first years of the twentieth century, Chopin became an icon of "Western" culture to which the "civilized" Japanese should aspire. Japanese music universities came to emphasize the importance of his technically demanding works, e.g. Etudes, Ballades and Scherzos while mostly neglecting Mazurkas and Waltzes.

The paper sheds light on critical thoughts regarding "Japanese" education held by some of the country's contemporary musicians who have formulated their professional identities vis-à-vis "French," "Polish," or "European" traditions of Chopin's music. Semi-structured interviews with Japanese pianists who underwent studies in France and Poland are put through a method of critical discourse analysis that draws upon structuration theory and allows effective inquiry into an agency's narrative in the face of established institutional discourse.

What is the general view on the teaching of Chopin's music nurtured in Japanese music institutions? How does it affect individuals' approaches to Chopin's works? How do pianists confront or develop the "Japaneseeness" of their performances after education in France or Poland? What are the renovated "Japanese" elements in the understanding of Frédéric Chopin's music after study in Europe? Analysis conducted under the umbrella of such questions attests to several things including pianists' recognition of "delicate" Japaneseess resonating with Chopin's works, notable critique on the "Japanese" pursuit of sophisticated techniques extracted from the fuller universe of Chopin's music, and the unique refurbishment of a sense of nature through the performance of Mazurkas.

Intimate Economies of Rehabilitative Work: Policing Sexuality through Wage Labor and Re-Education through Labor in China

This paper begins by theorizing the intimate labor regimes of the "rehabilitation industry" in China. It examines the collusion between transnational interests, the state and the market through two types of vocational training programs for sex workers in China. In China, state-sanctioned rehabilitation through labor (RTL) programs serve as mandatory sanctions for prostitution offenses. At the same time, American evangelical Christian missionaries recruit sex workers to work as jewelry makers, and label them as victims of human trafficking to transnational consumers and activists. These programs aim to generate economic alternatives to labor migration and sex work. However, the focus on labor training and re-education as the animating force of social mobility ignores the complex labor, gender and ethnic hierarchies that exist within the intimate labor industries. Opening the black box of this new industry, my work will investigate the connections between the local and global and question the optimism around the transformative potential of "good work."

This paper is based off 28 months of ethnographic participant observation at an evangelical Christian vocational training center in Beijing, China, and pairs this with preliminary analysis into the historical and contemporary practices of rehabilitation through labor in China.

Culture As the Parenting Toolkit: Class and Globalization in East Asian Families

By using ethnographic documents in Taiwan, this paper aims to examine how three different formats of local and global cultural capital are constructed and distributed unequally between the middle and working class families, particularly via their management of afterschool activities for elementary school children. I use interviews with family members (N=72) to examine how parents' cultural capital is transmitted through the popular routines of Taiwanese children: the afterschool activities, such as piano playing, English lessons, or math lessons, or through the fabric of their family life. Lareau and P. DiMaggio both employed Bourdieu’s “distinction” approach to childhood inequality: the former derives from Melvin Kohn’s theory on child-rearing values and treats art participation as part of the middle class “concerted cultivation” pattern; while the latter pinpoints children’s art activities as a form of status culture participation. In this paper I imply culture without national boundaries and present the Taiwanese case to show how global/western culture are adopted and embedded in contemporary Asian parenting, which intersects with the local structure of class reproduction.

I find three fields of child-rearing: Educational achievement, talent development and the western cultural capital. These fields are closely related to parental class variation in a univore-novivore spectrum. All families emphasized core-value on academic success; the middle class and upper class families focused on talent development and the upper class families emphasized “being international.” This paper further reveals that, in East Asian societies, the local families are adopting western culture in their child-rearing, which further generates “western cultural capital”, a rising field of distinction for upper class children in Asia. With lowest fertility rate in the world at 2009, Taiwan is a unique case to understand class variation of child-rearing.

Current Crimes and Major Issues of Policing in Japan

The number of reported crimes has been decreasing since 2002 in Japan. However, the Japanese society faces to some new crimes, including cybercrime, domestic violence, and stalking. The Japanese Police are now struggling with these new crimes and constructing new rules and practices to deal with them. Current policing and countermeasures against these new crimes in Japan will be illustrated.

«Cellular Globalization» and Communicative Inequality

In view of high speed of development and inculcation of the new informational technologies, growth of consumerism, space globalization in the contemporary societies the high level of social dynamics remains. At present the world community experiences increasing influence of the informational and communication technologies. At the beginning this changes weren’t very visible, but now we already don’t imagine our life without social networks and connection which is available constantly. Our friends are increasingly not real people, but simulacrum. New trends of world development, their orientation on an innovation and modernization create the conditions for new social phenomena formation, one of which is communicative inequality. Communicative space is constantly changing, and with the emergence of advanced communicative technologies new vectors of its formation appear. Between those who have the technical capacity and the necessary educational level for using the Internet and those who have no such possibility the border lies. The new mobile communication potential influence the individuals’ behaviour. Communicative inequality develop in the new telephony using and in obtaining information from a variety of sources including the media which price isn’t available for wide range of customers. Recently that gap between rich and poor in the sphere of information has become more and more conditioned by the technological characteristics, when the rapid expansion of communication tools covered only some of the users layers while other should be satisfied with a rapidly aging equipment. New digital communication medium created by mobile operators, Internet companies, state programs on providing the necessary equipment to the Internet connection and telephones, prepared a real geographical revolution. At this moment we can speak about the overcoming of the regions informational lag. But communicative inequality between the regions and between them and the Federal center are still remains.

A Sociological Approach to Varying Treatment Outcomes of Complementary and Alternative Medicine

Social sciences of medicine have not given much attention to the variations in the real-world treatment outcomes of CAM situated in different social contexts yet. This neglect is surprising, because the wisdom has long existed in social sciences of medicine that the effects of medical interventions are significantly influenced by social and cultural circumstances. Along with this neglect, a problematic view seems to be revived and reproduced among the medical science community that any deficiency or efficacy in the treatment outcomes of acupuncture and herbal medicine is attributable to the characteristics of the treatment in itself detached from its medical and social environments. However, the limitation of this view becomes clear when acupuncture or herbal medicine of the identical quality and design leads to varying treatment outcomes in different trial sites. As a way to consider these puzzling variations and to propose a sociological explanation of the varying effects of acupuncture and herbal medicine, this paper examines systematically how divergent treatment outcomes are in acupuncture and herbal medicine in Japan, U.S., and how they are related with the social environments of these medical interventions. In particular, this paper highlights the significance of coordinating these CAM treatments with the mainstream biomedicine at multiple levels in order to get tangible health care benefits. It concludes with reflections on the limitations of the current discourses on the social determinants of the effects of medicine and the inter-cultural medicine and cultural competency.

Family-Related Risk Perception and Individualization in East Asia

Based on a survey research conducted to citizens of three capital cities of East Asia, Seoul, Beijing, and Tokyo, this paper is aimed at comparing the family-related risk perception in the three cities with a perspective of individualization theory and a typology of risks developed for East Asia. More specifically, it is aimed at revealing how the citizens of the three cities feel about the recent changes in the family such as divorce, low fertility, decrease in the parent’s role in home education, isolation and suicide of the elderly, individualist tendency, decrease in mutual help in the family, and conflict in the property distribution. The research questions are as follows: First, how do the citizens of three cities perceive about the various family-related risks? Second, what influences the family-related risk perception? As to the first question, it turned out that perception of the first modernity-related risks are higher in Beijing, while that of the second modernity-related ones are higher in Seoul and Tokyo. As to the second question, it turned out that not only the family-related macro changes as revealed in law and policy changes and statistical indices in the area of fertility, divorce and marriage, but also individualization turned out to be significant. This suggests that the three cities seem to be in different stages of development and that the three cities have both the first modern and second modern risks.

Invisible Population: the Place of the Dead in East Asian Megacities

Funeral ceremony is one of the institutionalized social facts in each society. It can be carried out with family, relative and community members in the traditional societies. But in the modernized society, funeral services tend to be held only by family and closer friends. We compared the East Asian funeral ceremonies in Invisible Population: the Place of the Dead in East Asian Megacities (ed. N. Aveva, & M. Lovagia), and found the great changes of funeral customs in Japan, China and South Korea. The undertakers became the new actor of the funeral services and we can’t conduct it without them in the urbanized cities. We can call that tendency as “the commercialization of funeral ceremony”. Now the funeral service can be served only by the professional undertakers.

Estimation of Hedonic Single-Family House Price Function Considering “Scenes”

In this study, hedonic house price functions are formulated using the single-family house market in the 23 wards of Tokyo as the subject. In the formulation of factorial models, the identification of omitted variable bias is thought to occur in cases when, in addition to locational factors (i.e., factors involved in decision making when buying a property) and building structures which affect the house prices, local environmental variables or “scenes” and the individual characteristics of house buyers, such as their income, are not taken into consideration. However, since it is difficult to obtain such information as the individual characteristics in a small neighborhood unit or “scenes” and to observe individual characteristics of house buyers in the property market, these variables have not been sufficiently considered in previous studies. In the current study, I aim to improve the hedonic model by incorporating local environmental factors or “scenes” and data on family income in a small neighborhood unit using a geographic information system (GIS). I demonstrate that, without considering these variables, non-negligible levels of omitted variable bias are generated in the variables that are major factors in determining house prices, such as ground area, front road width, distance to the nearest station, and the travel time to the central business district. Results showed that, in the model considering neighborhood effect variables or “scenes”, the explanatory power was improved compared with the simple linear model. At the same time, each of the neighborhood effect variables or “scenes”, which served as subjects of urban policies, was adopted with statistical significance.

Medication and Demedicalized of Mild Depression in Japanese Occupational Health

From 1999 to 2008 the number of patients with depression in Japan is thought to have increased by 2.4 times. Overdiagnosis of depression has attracted much attention both from the health professionals and the public. Previously, the concept of mild depression did not even exist until the 1990s in Japanese psychiatry. Some experts argue that the introduction of the DSM and ICD as a diagnostic tool is a possible factor in increasing depression in Japan. In this study I analyze the conflict between the medicalized and demedicalized views of mild depression in Japanese occupational health from the viewpoint of conflicting diagnostic contexts in Japanese psychiatry.

I conducted several interviews with physicians and psychiatrists active in the field of occupational health and attended various conferences and meetings of experts dealing with mild depression in occupational settings. Two findings are especially of significance to understand the current trend of depression epidemic. 1) There are double contexts in which depression diagnosis is made. Whereas the DSM or ICD is used as a tool to diagnose depression, they do not explain any etiology of the disease but just provide the criteria of the symptoms. Thus in those cases for which the explanation of the disease causes is needed, conventional Japanese psychiatry is referred, in which depression is modeled by major depression rather than by mild depression. 2) Major depression model in Japanese psychiatry includes the judgment about the “industrious” personality of the patient. As this aspect does not coincide with the mild depression patients, there is a strong tendency to demedicalize the mild depression on the side of psychiatry.

The same tendency is also found in the media coverage of the disease. Thus the status of mild depression patients especially in occupational settings is unstable and vulnerable to the moral criticism on them.

Daniel Bell As Post-Cold War Intellectual: The Idea of Trinitiy Beyond the Cognitive Frameworks of the Cold War

Interpretations of Daniel Bell’s works are typical cases of cognitive bias in Cold War social sciences. Bell has been regarded as an anti-communist ideologue, a conservative sociologist, and a neoconservative intellectual. Today, therefore, his works are not discussed in earnest. This study reevaluates Daniel Bell by clarifying that he held post-Cold War perspectives. As Bell himself noted, The End of Ideology is better known for its title than for its content. During the Cold War era, attention was paid not to what he said but the sensational title. Because readers took “the end of ideology” to mean that all ideologies would vanish despite severe ideological conflicts, Bell was considered an anti-communist. Similarly, in The Cultural Contradictions of Capitalismhe took an anti-modernist position and placed value on religion, many scholars have regarded him as neoconservative.

Certainly, he criticized Stalinism and the Communist Party of the United States. He recalled that members of the Communist Party did not know about Kronshtadt in which Trotsky shot rebels in 1921. His criticism was based on experiences from his youth.

About World Championships in Athletics and TV Broadcast

This study examines changes in the nature of Japanese TV broadcasts of the World Athletics Championships from 1997-2013 using a qualitative methodology. Specifically, the study examines the changes in the Tokyo Broadcasting System coverage between the 1997 Athens event and the 2013 Moscow event. The results indicate that TV broadcasts became more professional from the point of the Berlin event in 2009. Up until the 2009 Berlin event, broadcasts featured much screaming-like behaviour from television commentators such as Yuji Oda. However, the screaming-like broadcasts decreased after the Berlin event and the screaming of Yuji Oda was not seen in Moscow in 2013. In addition, the nicknames of the players were not used in the Moscow TV broadcasts. This may be due, in part, to the request of the Japan Association of Athletic Federations to the Tokyo Broadcasting System to eliminate the use of nicknames. The nature of live coverage of sports events varies according to different events. In addition, they are different depending on whether or not they are foreign involved, and depending on whether or not there are star “foreign” players. Based on the results the paper highlights implications for future track-and-field and other sport broadcasts.

Why Does Inequality Keep Rising In South Korea?

This paper explores the rise of economic inequality in South Korea, focusing on changing income distribution of individuals and families after financial crisis in 1997. In South Korea, the great U-turn of inequality was observed since the early 1990s. Both Gini coefficient of household income inequality of household and Gini coefficient of individual's wage inequality had decreased commonly until the early 1990s. They have kept rapidly rising earlier than financial crisis in 1997. The financial crisis in 1997 has exacerbated the tendency of the rising income inequality as neoliberal economic reforms, policy measures to resolve the financial-cum-economic crisis, were implemented by the Korean government. Another financial crisis in 2008, triggered by the crisis of the subprime mortgage in the USA, made it harder to roll back the rising inequality. In addition to impacts of economic recession under the post-crisis ordering, and the rising social changes such as fast aging of population and family dissolution, partly associated with neoliberal economic reforms, have contributed to the drastic rise of family income inequality in the 2000s.

Rethinking “Medicalization of Death and Dying”: Explications through Examining Japanese Case

What does “medicalization of death and dying” precisely and really mean? This paper tries to focus on the medicalization of death and dying, and tries to show 1) the historical processes of the social transformations surrounding death and dying in Japan, and then 2) theoretical reconsiderations concerning the concept of medicalization itself.

Medicalization of death and dying has been customarily and representatively meant to be “hospitalization”. The radical change in the place of human death recalled the sense of something familiar being lost, and the medical-hospital environment coupled especially with the high-tech medical treatment in the 1970s have long been viewed as something unfamiliar, unhuman, and even anti-human. Cultural interpretations regarding this process as “denial of death” or “pornography of corpses” have been presented, and prepared for the seemingly backlash movement tentatively called the de-medicalization. However, what does these medicalization and de-medicalization really mean?

Japanese situation could present strategically suggestive one, partly because it is the healthiest aged society and partly because it is also the most densely crowd-ed society with medical facilities. It seems that to follow the medicalization of death and dying would advance most in Japanese society. The situation is complicated. The health policy have tried to de-medicalize/de-hospitalize the aged, and promote nursing home care and community care ever since 1980s. The people in general wish for sudden death, or for natural death in home, and both of them share in common one element: with lesser medical interventions. It is both interesting and somewhat paradoxical. Interesting, because the directions aimed seem to be converged/medicalized. Paradoxical, because the intentions fundamentally diverge between the two.

This paper tries to contribute to broaden the scope of the discussion of medicalization empirically, and to enrich it theoretically by reexamine the validity of the concept of medicalization.

Human-Billboards: The Commodification of Invisible People

According to Zygmunt Bauman, since mid-20th century modern society has been experiencing a gradual shift toward a “consumer society”, whose main characteristic is the transformation of consumers into commodities. In this context, the objective of consuming is to grant social status to individuals, who worth as much as they are able to consume. Bauman posits that people consume to invest in their own social affiliation. By consuming, individuals become a more valuable commodity, recasting themselves as products capable of drawing attention and standing out from the monotony and dull invisibility of ordinary things. Those who do not have enough resources to consume are considered invalids, commodities that will never be noticed or coveted, and that can only resign themselves to their invisibility. However, by analyzing Brazilian human-billboards, this study intends to show that even those individuals are salvageable in the world of consumption.

In the city of São Paulo (Brazil), legislation has established several restrictions on advertising placement in order to avoid visual pollution. The real estate sector has circumvented that legislation by using the so-called “human-billboards”: men and women from under-age to elderly who remain standing for periods up to 8 hours without breaks and regardless the weather, in corners of upper middle class neighborhoods with signposts hanging in their necks. For this job they are paid under 10 dollars a day, with payment discount if their supervisor finds them sitting.

In principle these people would be considered “invalids” in the society of consumers. Nevertheless they end up being “recycled” and become functional to it. The case study intends to reflect on how the society of consumers absorbs the dysfunctions that it produces itself. In this case, people’s invisibility is not equivalent to death: it is also turned into merchandise.

Healthcare Work and Cross-Cultural Understanding in Globalization: Social Issues and Responses in Indonesia and Japan

The Economic Partnership Agreement (EPA) has initiated healthcare worker migration from Indonesia to Japan since 2008. Issues and challenges concerning regulations and cross-cultural understandings of healthcare have emerged around such EPA healthcare work and workers in both societies. What issues have arisen and been reported in Indonesia and Japan? How do the media, policy makers, healthcare institutions and workers themselves, professionals’ contributions to the care worker shortage in Japan. In contrast, Japanese are more likely to respond negatively to these issues; yet, they intend to face cross-cultural challenges, although slowly, making revisions in the language and license examination policies. We pay particular attention to social issue construction and policy institutionalization processes around EPA healthcare workers in Indonesia and Japan. Our study contributes to our sociological understanding of healthcare worker migration, cross-cultural understandings of healthcare and related concepts, and how national contexts and globalization construct and re-construction social issues and policies toward a new social change.

Discourses in the Magazine “Keisetsu Jidai”: The Popularization Process of Higher Education in Postwar Japan

At a time when it was called the “examination hell” in postwar Japan, the magazine KEISETSU JIDAI was popular among students that take the entrance examination in higher education.

It has a history of more than eighty years, but this time, how the magazine has changed?

The purpose of this study is the analysis of magazines in the 1950s-1960s. I would like to declare that KEISETSU JIDAI has a function of career guidance through the late 1950s. The tendency changed subjects, contributors, quantities of the magazine, and their consciousness. It’s mean to liberate students from some superstitions. A practical learning and a scientific method was directed to solve problems. In particular, the issue was a difference between urban and rural areas, which have dates and skills of an entrance exam. Some difficulties confronted them, conflicts and barriers surrounding the higher education, such as gender difference and economic issue.

This study may suggest a new history about the severe competition in school entrance exam.

The Effect of Environmental Education at School and Home on How Students Behave Towards the Natural Environment in Japan

Several studies on the factors that promote pro-environmental behavior have found the importance of educational environment. A number of environmental educational programs that aim to nurture ethical behavior towards the environment have been developed worldwide. For example, in Japan, some students in a junior high school take part in diving programs to study marine environments.

The aim of this study is to examine the effect of environmental education on school and home on students’ pro-environmental behavior. In November 2010, we conducted a quantitative survey of all third-year students and their parents at all the junior high schools located in the city of Minamata, Japan. Pollution has had a severely detrimental effect on the health of the residents of Minamata since the 1950s, and the disease caused by pollution has come to be known as Minamata disease. The negative experiences with pollution have led to the implementation of various interesting environmental education programs in all the junior high schools in the city.

The analysis of the results indicates the important factor that effects on the pro-environmental behaviors of students: It was their perception of the contributions their parents made to address environmental challenges, instead of the actual contributions or behavior of the parents. The pro-environmental behavior that students took a mediating effect on the way students’ perception on their parental contributions to the environment. The results also indicate that experience-based environmental education, such as related volunteering activities at school, promoted students’ pro-environmental behavior significantly more than classroom-based environmental education that focused on knowledge creation, however, classroom-based environmental knowledge creation remains critical.
Career Strategies and Spatial (im-)Mobility Among Skilled Migrants: Between Asia and Europe: The Role of Gender Power Dynamics in the Work-Family Interaction

This paper aims to unravel the gendered career strategies of skilled migrants in Germany's financial and academic sectors, which are being developed not only in tandem, but also often in negotiation, with gender relations in the family. Much of the current scholarly effort in the field of skilled migration and mobility has concentrated on the principal migrant and work-related context, treating the family as a rather secondary, separate and essentially ‘female’ terrain. Drawing on participant observation and interviews with highly skilled mobile workers from Asia, this paper shows that these two terrains, work and family, are closely interrelated in building skilled migrant workers. Germany has lately joined the “global war for talent” to seek out highly skilled migrant workers, but although the number of skilled women entering through Germany's skilled migrant regime may in fact be small, the experiences of migrant, dual career couples show that their transnational career strategies have a strong bearing on the fine balancing act and negotiation of gender relations in the family. The overall aim of this paper is to show the contrasting -- and often gendered -- strategies devised by highly skilled couples, which can widen our understanding of the role that the family plays in international skilled mobility.

Conceptualizing Spatial Ambivalence Among Migrant Academics: The Dimension of Temporalities in Understanding Career Strategies

Highly skilled migrants are often deemed to have ‘mobility capital': extant studies have shown that for career advancement they mobilize the capacity to spatially mobile across borders, drawing on their cultural, social and economic capital. In policy, too, the debate around “gain and retain” has popularized the construction of mobile skilled migrants. In fact, Germany, the country which this paper focuses on, has been widening its channel for skilled and highly skilled migration streams and opened a route for long-term and permanent settlement for migrants entering through its skilled migration regime. This new, skill-biased migration governance radically rewrites the established understanding of German citizenship, based on “Selecting by Origin”.

Recent scholarship has brought about a nuanced understanding about spatial mobility capital and its negotiated nature, by considering the work-family interaction. While these studies put forth ambivalence and gendered power dynamics in realizing career aspirations among highly skilled migrants, I argue that less attention has been paid to the temporal dimension in capturing spatial ambivalence and career strategies. By focusing on migrant academics in three German cities, this paper conceptualizes their temporal orchestration, which is influenced by three temporal points in their own and family lives: past, present and future. However, rather than treating these three points in isolation from one another, I want to make sense of them in a continuum, that would together affect migrant academics’ decision/orientation to stay, move on, or both. Drawing on a quantitative survey and problem-centered interviews, I aim to demonstrate that the temporariness intersect with, and give meaning to, locally specific experiences along the social division of race/ethnicity, gender, country of origin, and age in the workplace, family, neighborhood and local administration. In addition, I will discuss the strengths and challenges in using these methods.

Dynamism Among Japanese Railway Fans: Transition of Taste in the Dimension of Hobby

In this paper, I intend to examine “shumi” (Japanese word for “hobby”) in contemporary Japan, revealing its mechanism and dynamism. “Shumi” is composed of three aspects: “onomuki”, taste, and hobby. “Onomuki” is a Japanese word for a concept of aesthetics in the nature. Taste is a concept of value judgment. Hobby is a concept of enjoyable activities. In sociology, taste and hobby have been researched. I am focusing on depicting how the concept of taste has been redefined as a new concept of hobby in a class society. However, it is necessary to study this matter from the perspective of hobby. Railway fans have been chosen to conduct the survey for the purpose of this study. This is because they participate in activities that are rich in variety, as well as complexity. According to some surveys, there are around 20,000 serious railway fans and roughly from 1.5 to 2 million casual fans. A distinguished characteristic is that although the age distribution is widely covered from under 10 to over 90, at least 80% of them are males. Also, based on my field research related to railways, conducted from July 2009 to October 2012, railway fans have been found to enjoy various kinds of activities, which are not limited to competitions, such as “Agor” that Gallois refers to. Focusing on Bourdieu’s theory of “champ”, or “distinction”, I examine the new framework to analyze the conceptual interaction between taste and hobby. Specifically, I introduce “games” as the sub-concept of hobby, revealing that each fan transitions between values to different realms within the dimension of hobby. Thus, I aim to show the possibility that interaction taste and hobby takes place in a non-class society.

Between Freedom and Neglect: Community-Based Approaches and Neoliberalism In Policies For Asylum Seekers In Australia

Policies regarding asylum seekers in Australia have changed frequently since the late 2000s. The federal Labor government that came into power in 2007 decided to abolish the notorious policies of the former conservative government, namely, the “Pacific Solution” and Temporary Protection Visa (TPV) scheme, both of which aimed to reduce the numbers of Irregular Maritime Arrivals (IMAs) and violated their human rights. On the other hand, the Labor government maintained the problematic policy of mandatory detention for asylum seekers, and therefore sought to develop “Community-based” approaches for asylum seekers to argue that the government guaranteed their human rights. Thus, the Labor government developed the Community Detention program and expanded of the number of asylum seekers who were issued a Bridging Visa E (BVE) and released into local communities. While human rights lobbies and refugee service providers tended to welcome the policy change because it released asylum seekers from detention, the advancement of the Community-based approaches was also a response to the need to bring down the high costs of the existing asylum seekers policy. In other words, the Community-based approaches for asylum seekers can be recognized as a segment of the neoliberal reforms of Australian social policy. In this paper, I will examine the details of the Community-based approach to asylum-seeker policy in Australia from 2007-2013, using policy and discourse analysis from a sociological point of view. I suggest that the policy aimed to promote freedom for ethnic minorities can result in their neglect when the discourse of neoliberalism and spatial management are utilized to justify the policy.

Fundamental Paradoxes of the Theory and Practice of the Criminal Law

The “crisis of punishment” as well as negative phenomena of the modern system of justice determines to the ideological handicap. Let’s focus only on two mainframe ideas.

Understanding of the social justice

Social justice is a measure of public benefits from laws and other regulators based on an agreement which establish and maintain the life order of individuals and institutions. This order promotes the survival and development of the society, as well as provides integration and decent life of its members. The “decent life” is a compilation of all the benefits proclaiming in modern society: freedom, equality, social security, etc. Therefore the justice system should be aimed primarily at preventing crime, restoration of the rights and rehabilitation of the victims, and only then – on the prosecution, punishment and / or rehabilitation of criminals.

Economic pragmatism of the “social protection” concept

The concept of punishment stakes on the state control based on a quality management underlining efficiency and effectiveness. In this regard, in Western societies are widely discussing concepts of “safety” and “protection”. However, they are discussing without an analysis of what, in fact, should be protected. So “reliability” becomes symbolic notion and goes back to the “retribution”.

In this research, I shall expect the analysis of the structural system, it is necessary to decide from which perspective we should evaluate its quality. From producer’s perspective? But what exactly it produces: improvement of criminals, retribution, or citizens’ safety? From consumer’s perspective? But who is consumer? prisoner, society, State? From market’s perspective? But what are the objectives of the government regarding to prisoners, actual and potential victims, or crime policy? These estimates could differ, as well as the answers to the questions.

The elimination of these paradoxes could fundamentally change the concept and practice of the law in modern society.

Intergenerational Transfer within Families from the Perspective of Social Inequality in Japan

As in Europe and the US, Japan's ageing population, and the accompanying generational imbalance, has become one of today's most pressing social policy issues. My paper principally examines the relationship between social and private intergenerational transfers in Japan. I will discuss how intergenerational transfer within families takes place, and whether this process contributes to expanding inequality between families.

I focus on three kinds of private intergenerational transfer: co-residency, remittance, and asset inheritance. In particular, I intensively discuss different directions of transfer, both from parents to children, and from children to parents. The aim of my research is to identify similarities in determinants of all three types of intergenerational transfer, and in both directions. In conclusion, I explore whether the relationship with macro-level intergenerational imbalance is consistent with the one at the micro-level.

I will analyze data from two sources: the Comprehensive Survey of People's Living Conditions (CSLC), conducted by the Ministry of Health, Labour and Welfare, and the 2010 Panel Survey of Living Conditions among Middle-aged and Elderly People (PSMEP). The former presents cross-sectional, detailed household income data, with a sample size of 26,115. The latter is first wave of nationally representative panel survey of people aged 50 to 84. The survey, with a sample size of 6,442, includes detailed information on financial and care support between parents and children, and on household assets and savings.

According to my preliminary results, the meaning of co-residency has changed. The elderly are no longer always the beneficiaries of co-residency; rather, they retain the role of household head that provides basic economic support to younger family members. Private transfers divide society rather than redistribute resources, since the older generation provides more than the younger, and intergenerational imbalances in private transfers become more obvious as the population ages.
winmer models of employment and (2) well established occupational segregation of work by gender. As a result, class-based inequalities have become more salient, though these were considered less relevant in the coordinated market economies. In Japan, the expansion of temporary and part-time labor over four decades has exposed women and less educated youth to market-based employment systems at a time when the employment conditions of better educated employees and older cohorts of the male core workforce. German policies and practices designed to protect skilled male workers in manufacturing have failed to transfer to occupations performed mainly by women, while sub-forms of part-time and temporary work have deepened the divisions between men and women in non-standard employment.

SHISHIDO, KUNIAKI* (Osaka University of Commerce, kuniaki@daishodai.ac.jp)
IWAI, NORIKO (Osaka University of Commerce)
SASAKI, TAKAYUKI (Osaka University of Commerce)

The Japanese General Social Surveys project conducts a nationwide social survey every two years since 2000 to study the attitudes and behavior of Japanese people. As the U.S. GSS, the JGSS questionnaire covers a wide range of topics including family issues.

Working with Korean General Social Survey, Taiwan Social Change Survey, and Chinese General Social Survey, JGSS shares some modules of questions with East Asian Social Surveys (EASS). The theme for the first EASS (EASS 2006) is Family, for the second (EASS 2008) is Culture and Globalization, for the third (EASS 2010) is Health and Society, and for the forth is Network Social Capital, and for the fifth (planned in 2015) is Work and Life. EASS aims to continue valid and reliable cross-national surveys by using repeated research that has already generated robust results.

In this presentation, we will illustrate the change in Japanese family and capture the above picture based on the results of cumulative JGSS data. The overall trends between 2000 and 2012 will be described. While swayed by unstable job climate, both individuals and families suppress dissatisfaction and come to grips with reality. The number of unemployment and contingent employment among youths has been enlarged, the percentage of unmarried people has increased, and unmarried children have increasingly been living together with their parents. A growing number of women in all ages entered into labor force and the bottom of the M-shaped employment rates among women have become shallow. Following favorability towards socialization of livelihood security and care of the elderly, increasing people favor socialization of childrearing and education. The changes in employment among youths and women should have a strong impact on Japanese family in the future, and thus a whole picture of the reform in taxation system, employment policy, and social welfare should gain attention.

SHIVELY, KIM* (Kutztown University of Pennsylvania, shively@kutztown.edu)

Investing in the Afterlife: Inequality, Charity, and Hopes for Salvation in the Hizmet Movement

As Turkey’s economy has liberalized over the last 20 years, economic inequality has intensified and become a major focus of public concern and discussion. A response to this inequality has been an increase in the number of charitable non-governmental organizations, including faith-based benevolent groups spearheaded by upwardly mobile, pious Turks who seek to “do good” for society as a form of religious devotion. One such religiously oriented Turkish philanthropic association, the Hizmet (“service”) movement, is organized by followers of the influential Turkish preacher, Fethullah Gülen.

Based on ethnographic research among members of the Hizmet movement in Turkey and the United States, this paper will demonstrate how Gülen’s teachings on economic activity and social responsibility suggest that a path to salvation for the wealthy emerges from the plight of the poor. More specifically, the movement has promoted an idea that individual charitable acts may serve as a type of worship, in which the believer gains God’s reward in the afterlife. However, this conversion of economic success into religious merit depends on the believer’s intentions (niyet), in that economic activities are recognized as worship only if the believer maintains the proper spiritual disposition toward God. This includes the acknowledgment that a person’s economic attainment is only partially attributable to the individual’s own efforts, but ultimately it is God’s blessing (ihlas) that is responsible for success. Reciprocally, an affluent individual should repay God’s beneficence with material beneficence to society through zakat (alms-giving) and other charitable activities organized by the Hizmet movement. These charitable acts will potentially earn that philanthropist a place in heaven. Such a notion that the wealthy rely on God’s blessing to safeguard their wealth has exposed Turkey’s rich, citizens, conquered the globe with their enterprises of ‘one share, one vote’ principle, guarded by their absolutist and nation states, and colonized the most parts of the world. On the other hand, these citizens were forced to open the door by the American and French Revolutions, and to concede repeatedly by the universal suffrage movements of workers, ethnic minorities and women, to enlarge democratic societies of ‘one person, one vote’ principle. The paradigm has been formed and reinforced in this process. The colonized peoples, resisting this forced paradigm, have transformed it to open perspectives toward truly democratic societies, though being troubled by dictatorships caused by development and the military. Most peoples have now the sovereignty, although Western citizens who have an interest in progress of Westernization from their standpoint, the people’s will has not been rightly reflected on the governments even in advanced societies because of their imperfect election and party systems, while the world economy has been controlled by their corporate and globalized enterprises. The advanced societies have not been sufficiently democratized, so that most of the citizens still remain actually substantially as subalterns. Rejecting any academic imperialism and not being afraid of multi-versalism, we must create a sociology to democratize all national societies and the international society. For this, we need not only a political sociology to promote the right reflection of the people’s will on the government, but also an economic sociology to facilitate people’s non-profit enterprises and organizations such as co-operatives, trade unions and others. A cultural sociology, integrating these political and economic ones meaningfully, will sublate the old paradigm onto a new highly qualified democrat-society paradigm.

SHOJI, HIROSHI* (National Museum of Ethnology, hirshoji@idc.minpaku.ac.jp)

Is a Multilingual Mind Possible for the Japanese?

Japan has been conceived as a highly monolithic and monolingual society by both the Japanese and others. Monolingual policy was strengthened particularly after the WW II, when Japan was forced to abandon all its overseas territories. Ignoring the existence of indigenous Ainu and migrant language speakers, Japan has been devoted, by means of educational and administrative institutions, to integration of its people around the national language, Japanese, and Japanese culture. Mass media played equally important roles. The myth of Japanese homogeneity has probably helped to create and reinforce the national feelings, and was supposedly advantageous for Japan’s economic development in recent decades.

Japan’s monolingual regime was thus brought into being, through political, social and ideological circumstances. One could get by with Japanese language only in almost all places and situations. No one had to worry whether a customer, authority, employer, employee, neighbor or even stranger on the street might understand Japanese.

Dark sides of monolingualism began to reveal themselves with growing globalization, particularly since the 1980’s, although some were already recognized before. One of the most familiar examples has been the modest English capacity of the Japanese. It was widely believed that with an almost absolute lack of contact with foreign languages, learning foreign languages was not simply realistic. Yet, even now, in the midst of globalization with many contacts with foreigners, and many reasons to communicate with them, the people’s perpetual efforts to learn English have not brought notable results.

The problem perhaps is more deep-rooted. Does a conceptual monolingualism underly the Japanese mind? In the presentation I will relate Japanese conceptual monolingualism to linguo-behaviorist phenomena, and consider if there are any signs of breakthrough in the present society out of the monolingual cul-de-sac.

Policies That Shape How Australian Patients Navigate the Healthcare Maze: A Critical Discourse Analysis

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
Governments around the world are endeavouring to work out how to meet patients' expectations regarding universal health coverage. Even wealthy nations such as Australia that formally enjoy universal health coverage experience gaps and inequities in access to health care. Not all patients enjoy an equal capacity to choose. Inequities in access to care, long waiting times for surgery and increasing out-of-pocket expenses are creating a divide in healthcare between those who can afford to pay either out-of-pocket or via private health insurance, and those who cannot. The aim of this project is to advance policy-relevant sociological knowledge about the factors that shape and constrain patient choice as a basis for transformative healthcare professional education and evidence-informed policies.

The study is informed by a critical discourse analysis of selected Labor and Coalition Federal policy texts to examine how patient choice is spoken about, shaped and enacted at the federal level in Australia. The content of speeches and statements pertaining to health policies made by Prime Ministers, Ministers of Health, and Opposition Leaders and Health Spokespersons.

Critical discourse analysis reveals the core policy messages that emerged during the Howard Coalition (1996-2007) and Rudd/Gillard/Rudd Labor (2007-2013) governments. Our study compares and contrasts Labor and Coalition policies in relation to access to health care in order to explicate the underlying assumptions regarding patient participation and choice within the context of universal health coverage.

Education Reform in Lebanon: Nationalism Versus Social Justice As Means for Building Social Cohesion

The paper will examine education policies in Lebanon post the civil war period (1989) up to 2010. This period witnessed two education reforms: 1995 and 2010. The main priority for these two reforms was building a sustainable peace and cohesion amongst the various sectarian groups. A nationalistic citizenship education was proposed as a means for building social cohesion in 1995 reform. The importance of social justice as a means for promoting democratic citizenship was overlooked. Twenty years later, this approach proved to be of limited effect as sectarian fractions in Lebanon continued to grow while school drop-out rates soared particularly amongst disadvantaged groups. In 2010, a new education strategy was developed. Promoting Lebanese nationalism again occupied the priority. However, access to education featured too in this strategy. My analysis will focus on the current understanding of equity and equality of education in this new reform plan and its consequences on the disadvantaged and marginalised groups in Lebanon and consequently on the social cohesion of Lebanon. In the paper, I criticise the neo-liberal and distributive notion of social justice which characterises the new education strategy in Lebanon and argues for a transformative concept of social justice.

SHUCKSMITH, MARK* (Newcastle University, mark.shucksmith@ncl.ac.uk)

Crofting Is the Future: Small Farms after Agricultural Modernisation

This paper discusses crofting reform as an instance of the emergence of locally-rooted alternatives to agricultural modernisation and neoliberal crofting. Crofting is a distinctive and highly regulated form of land tenure specific to the northern half of Scotland; it is also a cultural heritage of major international significance, under threat from marketisation. In 2007-8 an independent review of crofting (which I chaired) proposed a major reformulation of government policy. Instead of agricultural modernisation, this proposed an approach based on concepts of neo-endogenous rural development and place-shaping, with local mobilisation encouraged by the generative power of the state and other actors, harmonising managerial technologies, addressing the challenges of scalar governance and vertical integration, regulating land occupancy, and releasing new potentials. Using the neo-endogenous approach, this sought to build the capacity of crofting entities to mobilise strategically and collaboratively, empowering communities at various levels. This approach was broadly adopted by the Scottish Government, with new legislation in 2010 leading to tighter regulation of land use and absenteeism, a map-based land register, and local elections for the regulatory body. Finally the paper considers what wider relevance this case might have, given that the Crofting Inquiry report was recently translated into Japanese.

Is There an Emerging Transnational Advocacy Network in Opposition to Weaponized Drones?

The use of unmanned aerial vehicles (UAVs) or drones by the United States for carrying out targeted killings in territories throughout the Middle East, South Asia and Africa has by now become a routine, but controversial, American count-terrorism practice. In recent years, these drone strikes have been regularly denounced by human rights organizations and have also drawn the critical attention of United Nations special rapporteurs on account of the civilian casualties such attacks frequently cause in apparent violation of international norms governing the use of extra-territorial force. Perhaps just as significant, however, in continuing to resist the normalization of drone warfare, has been the increasing activism of a variety of like-minded norm entrepreneurs involved in the production and dissemination of knowledge about its legal aspects and realities created on the ground. Volunteer lawyers representing victims/survivors of drone attacks have been pursuing litigation in different national jurisdictions, most notably in the United Kingdom and in Pakistan, to identify liable parties and publicize their alleged complicity. Concurrently, the epistemic community of international law scholars and practitioners has been engaged in public intellectual debates concerning the legality and morality of drone warfare, while investigative journalists have (often at their own peril) continued to document attack incidents and play a significant role in bringing these facts to public attention. This paper explores whether, and to what extent, these separate, yet complementary, initiatives may be indicative of an emerging transnational advocacy network opposed to the use and proliferation of weaponized drones.

The Democratic Peace Debate: Theory and Fact

The concept of a Democratic Peace (DP) is a major theoretical strand within International Relations (IR). Depending on precisely how democracy is defined, the number of wars between such states over the last two centuries varies from zero to a handful. Moreover, democratic states have never fought on opposing sides in a general war involving all, or nearly all, the great powers. Such a record cannot be claimed by any other form of government – monarchies, Communist and authoritarian states have all fought against one another. The only zone of peace that is grounded in a shared political system is that of liberal democracies. In a field in which there are relatively few empirical regularities of even modest strength, scholars were energized to validate or invalidate the findings. Thus, DP provides an almost perfect focal point to grapple with contentious issues involving theory in IR. First, DP will be differentiated from the liberal (or Kantian) peace, a concept with which it is often conflated. Second, the main debates about theory within IR that DP helps to illuminate will be discussed. These debates can be categorized as follows: 1) Rationalist vs. Reflexivist (paradigm debate); 2) Quantitative vs. Qualitative (methodology debate); and, 3) Methodological Unity vs. Methodological Pluralism (philosophy of science debate). Hence, concerns about theory-building in IR (as reflected through DP) are delineated: defining variables, confounding of variable effects, and fleshing out causal mechanisms that connect the variables to each other. The position taken here is that methodological pluralism is a pre-requisite and, furthermore, such a flexible and wide-ranging approach should also prove highly beneficial for delineating real-world connections.

Gender Inequalities and Socio-Cultural Themes of Leisure in Contemporary Societies: Illustrations from Pakistan

This paper takes into account the cultural and social themes of leisure that explicate how women’s leisure has been marginalized in a contemporary society. It is our aim to understand and contextualize leisure experiences of women and men in Pakistan with respect to leisure and social transformations. Reflecting the intersection of social and cultural themes of leisure, and progress towards the Millennium Development Goals, this paper views gender disparity paradox and contradictions within the gender segregation and disparity is found in hetero-social dimension in Pakistani society. Equal rights to leisure are given in a range of UN declarations even if it is frequently viewed as less important than basic human needs of food and shelter. Its purpose is to suggest how women’s participation and perceptions have been impacted by concepts like centrality in life and social settings as well as gender dynamics may alter and enrich analysis and characterization of contemporary global society. The studies on gender inequalities have given theories and methods; therefore, this paper argues that women have developed different educational and organizational talents and have the capacity to make a distinct and positive contribution to contemporary global societies. The paper will try to narrow down to types of theories, methodological and ethical challenges and present a model for more equitable
leisure policies and new resolutions for more leisure opportunities for women that enable leisure to serve as a force for human growth. Finally, in drawing together some themes of leisure and education equality, the paper will indicate how these realities have the capacity to add to our understanding of the complexity of contemporary global society. Leisure and gender equality will be seen in a socio-cultural framework.

Inequalities of Gender, Violence and Dehumanization in Multiple Forms in a Conflicting Cultural Values Outlook in Pakistan

This paper provides a theoretical framework of understanding, experience and struggle of gender and pursuit of women rights concerning inequality, violence and dehumanization, and how multiple forms of such disparities overlap and interrelate with social categories and cultural values. The paper’s main theme will be a theoretical inquiry into the way violence is conceptualized in relation to the conflicting cultural values in traditional and modern theories. Theoretically and methodologically the paper will be designed so as to allow the interpretation of maltreatment of women with reference to sexual and gender options concerning violence, class, and discrimination in the background of conflicting cultural values. It will focus on Pakistan society since it got its independence in 1947 and build its argument on previous research conducted among indigenous groups in Pakistan. It will be discussed here that an examination of multiple forms of inequalities of gender, violence and dehumanization in the lives of women in Pakistan, the interpretation would be that of a society surrounded with violence. Central to this theory is the idea that violence accounts of the ways Pakistani women find themselves between being modern women and traditional women to illustrate the limits of the dichotomy of the theories of traditionalism and modernism. This paper will focus on the rights of the women who suffer from violence and dehumanization. These rights will include socioeconomic rights of getting jobs, social security, health facilities and shelter. In the end the paper will give a model of gendered approach for rehabilitation of the women who have faced such inequalities considering into view the legal Act against women victimization in Pakistan.

Crisis of Labour: Macro- and Micro-Level of Social Analysis

The report focuses on the phenomenon of labor crisis and its macro- and micro-level analysis.

At the macro-level labor crisis is a transition to a post-industrial society; one of its features is a weakening of the need for hard work for industrial production. Labor in its classic sense is a thing of the past. Due to globalization, the processes of labour mobility across countries and the emergence of the international labor market play an important role in the contemporary world. And at this level the study focuses on the problems of the prospects of labor as an activity, changing the nature of work, etc. Therefore a researcher faces new challenges such as: identification of new labour types that replace labour in its classic sense; changes in the organization of the living space of people; career opportunities; a change of priority in the lifestyle and day-to-day activities.

At the micro-level, labor crisis can be described as a particular person and/or a family living in terms of increasing tensions of life and the growth of its pace. With changing strategies in the field of labor and employment on a global scale and due to the prospect of joining the conditions of flexible/part-time/freelance job the real work schedule of large numbers of people is becoming more and more intense. An Individual still, if not more, values their work, willing to work the real work schedule of large numbers of people is becoming more and more intense. An Individual still, if not more, values their work, willing to work overtime. Labourholism is becoming a common disease.

An examination of the real work schedule of large numbers of people is becoming more and more intense. An Individual still, if not more, values their work, willing to work overtime. Labourholism is becoming a common disease.

The real work schedule of large numbers of people is becoming more and more intense. An Individual still, if not more, values their work, willing to work overtime. Labourholism is becoming a common disease.

The real work schedule of large numbers of people is becoming more and more intense. An Individual still, if not more, values their work, willing to work overtime. Labourholism is becoming a common disease.

In this case, the concepts “collaboration” and “negotiation” have become much more vital to manage the intercultural process effectively, to prevent some misunderstandings and create a better information sharing between the partners.

The research questions of this study are:

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
How diverse military groups in a multinational military operation are united under one umbrella to achieve a better information sharing?

What are the similarities and differences in definitions of "negotiation and collaboration" across different cultures?

How to create a "third-hybrid culture" in multinational military operations?

The methodology of the study is based on qualitative research methodology. An interview to explore these research questions -designed by the writer while he was the Chief of Capacity Building Department at EUFOR in 2012- was applied face-to-face to 55 peacekeepers of 13 different countries within EUFOR Peace Operation in Bosnia and Herzegovina between April-October 2012. The gathered data will be analyzed by "content analysis" method to find out the answers to research questions and to propose strategies on a better information sharing within the light of the findings.

Police and Excessive Use of Force in Mexico City

In Mexico City, excessive use of force by police officers from different police forces is a problem acknowledged by the public and some political actors. This concern resulted in the enactment of a 2008 law governing the use of force by police forces of the Federal District. However, there is little research and systematic information about situations in which police abuse is concentrated. In developing democratic societies civilian control agencies has been one of the most important efforts to constraints police abuse and achieve a better level of compliance of basic rights. The main mechanism is the assessment of complaints against illegal police behavior. In Mexico City this responsibility lies with the Federal District Human Rights Commission. Since its founding in 1993 around a fifth of all registered complaints involve policemen (either from the Secretary of Public Security or the Attorney General of the Federal District). Based on the analysis of 600 complaints regarding police abuse between 2007-2011, this study describes the main characteristics of abuse in the use of force, and accounts for its severity by looking at social, spatial, situational, and individual factors. Police abuse is concentrated in a limited set of situations linked to the specific functions of each corporation, the motives and interests of police officers, as well as in spatial patterns.

Questions, Answers and Pleas in Portuguese Exams during Seven Decades

Keeping in mind the central part national exams have been performing in the design and implementation of learning and curricula, the analysis of the evolution of the Physics and Chemistry national exams shows the dynamic implications between the exams (different contents and learning) and the curricula, in the realm of the curriculum reforms that happened in Portugal.

The paper reports and provides examples of questions, answers and pleas in Portuguese exams from 1940 to 2010. As it is never too much to highlight, it is not possible to reflect on the exams focusing exclusively around the students and the technical concern of measuring their performance without keeping in mind the factors in play regarding learning, such as curriculum, Portuguese cultural characteristics, the organization of the School Community, and the educational legislation driven by several national and international historical factors.

This approach does not aim at showing a compilation of the negative moments of the reforms throughout those decades, but to show that nowadays our school system has a higher demanding level, both at the teaching level and at the curricular level, highlighting a higher level of competence in abstract thinking.

“If You Were a Man, You Would Be a Captain”: Observations, Strategies and Experiences Of a Woman Anthropologist Among The Military In Brazil

This presentation aims to explore the relationship between the researcher and the research perceptions in ethnographic approaches of the military in Brazil, showing methodological features and general practices in this field, together with observations from my own background and experiences of research in military organizations from southeastern and north of the country. The way the military reality is classified and arranged, is to some extent, revealed in contacts between anthropologists and military personnel which are initially marked by the experience of the anthropologists’ perception as “civilians”, i.e. “outsiders” of the “military world/environment”.

There are a lot of positions and relations being built and acquired in the development of research, that refer to the poles “military / civilian”, and that, from being fixed categories, reveal themselves as relational and contextual regarding the observer researcher (Castro & Leirner, 2009). By addressing issues such as women in the Armed Forces and military families in my studies, this paper aims to compare the entry in the fieldwork into units that are military academies in relation to other garrisons, as border platoons in the Brazilian Amazon. I will present the strategies for approaching and contact, positions acquired in the research context, experiences as a researcher (and ‘friend of the Army’) and extend the reflection to the gender issue that permeates my research trajectory.
How Is Time Organised By and for Babies?

By and large, time studies have been carried out in the sociological area, converging in theoretical as much as methodological aspects when analyzing time use by adults in contemporary western societies. However, research on time use by children is still incipient and until now the main topics addressed refer to daily socialisation experiences (Larson and Verma, 1999), the differences in time use considering social class and gender differences (Carvalho and Machado, 2006), childhood life in urban and rural areas (Christensen and James, 2008) and the comparison between activities developed over different decades (Cruz and Teixeira, 2008). It is important to emphasise that such research only considered children over 6. For this reason, the present undertaking seeks to understand time use by and for babies under 12 months old, and hence complete the gap found in studies based on this age range. Firstly an instrument to record daily time use was elaborated, for completion over 24 hours in observation of both baby and parent. This instrument was used twice - once on a weekday and the other on a weekend. Interviews were later carried out with the parents in order to further explore the information recorded. The sample comprised two babies - one girl and one boy and their respective parents. If on the one hand, babies receive recurrent external determinations leading us to understand time as an instrument of social regulation (Elias, 1998), despite such implications they also determine their own time use on the other.

Sweeping Floor and Building Identities: Centrality and Contradictions of Paid Work for Women in Brazil

The XXI Century Brazilian Society has undergone several transformations, whether in the political, economic, technological or social aspects. This new situation has led to changes in gender roles and labor relations, including women’s work. Inserted in this context, this research presents a retrospective of Brazilian women’s struggle for the conquest of their labor rights and interprets these changes empirically. We conducted a comparative case study on two organizations - one public another private- of Higher Education in the South Region of Brazil, with women that work in a cleaning sector for at least five years. We sought to understand how these women construct their identities at their social space of work and at home, as housewives. The data were collected through semi-structured interviews and focus group. It was found that for these women, the paid work has a centrality that builds contradictory feelings and actions. At first glance, the work promoted financial independence and increased self-esteem of these women. On the other hand they have experienced an invisibility as citizens and a lack of recognition of their activities in the organizations and at home. The consequence of this process was a conflict in the construction of their identities as workers and as housewives.

The Role of Small Cooperatives and Communitarian Agents in Brazil: Strategy of Action to Sustainable Food Security and Struggle Against Poverty

Food security understood as a process that goes beyond the production and access to food, has been an important topic of discussion in the Central Countries as well as in the Developing Countries. FAO, UNESCO and Local Governments have priorities to guarantee the right to food security and a sustainable development. However, many of them has not been succeeded because of the disregard for local knowledge, great bureaucracy and a lack of involvement by the local population. In order to face this reality in Brazilian Society on XXI century, this proposal aims to identify, disseminate and replicate possible actions undertaken by organizations and agricultural cooperatives, and local agents and leaderships who are focused on the preservation of food traditions and enhancement of capabilities and local knowledge. These possible actions can create a favorable environment for the use of social technologies, with low cost and community management. This proposal is part of the study of how the food security in Brazil, through a qualitative perspective, using the techniques of interviews, workshops and participative diagnostics including visits to cooperatives and small towns. The data will be systematized in the form of booklet, video and articles in order to stimulate new actions in other regions and countries.

A Spatial Analysis of Residential Segregation By Race and Income Gap in a Brazilian Metropolitan Area

Inequalities between White and Black people are known in many countries around the world. It affects, for example, the income, educational and health outcomes having multiple causes, as discrimination, composition variations and forms of segregation. Therefore, this paper proposes to analyze the residential segregation pattern by race and income gap in Metropolitan Area, the third biggest in Brazil, and its variation related with racial income gap. The choice for this Metropolitan was made, once bigger Metropolises, as São Paulo and Rio de Janeiro, was already analyzed; but the techniques used here is not generally applied, due to being the first time that racial information are in universe questionnaire of census. Then, to this goal, data from 2010 Brazilian demographic census are analyzed through spatial analysis techniques, as “spatial lag” and “spatial error”, adding a spatially lagged variable, differently of some “aspatial” indexes currently used - as Dissimilarity Index, for example. The main goal is to show that residential segregation by race exists on Brazilians Metropolises, unlike the greater part of the literature claim the opposite, pointing socio-occupational status as unique cause of segregation. The results shows a large concentration of White people in the center of Metropolis, while Black people are in the periphery. Indeed, there is some overlap between household income and racial distribution on urban space, but is not only this that explains the existing segregation. Therefore, the proposal is to discuss how residential segregation conforms this Metropolitan Area, and how it is related with income gap between White and Black. The conclusion shows that residential segregation by race exist in this context and has relations with racial inequality in Brazilian Metropolises.
workers in various parts of the world. I deploy a theoretical perspective that sees historical capitalism as a system characterized by ceaseless change—“all that is solid melts into air”—and therefore as a system that is recurrently making, unmaking and remaking working classes on a world scale. The paper traces how various capitalist “fixes”—spatial, technological, product and financial—reshaped working classes locally and globally in recent decades: strengthening, weakening labour, creating challenges and opportunities. The paper develops several arguments that can be found in embryonic form in Forces of Labor. One, the combination of technological and financial fixes has been destroying livelihoods faster than it has been creating new livelihoods, leading to a generalized crisis of subsistence for workers, and a crisis of legitimacy for capitalism. Two, the profitability of the financial fix results almost entirely from the redistribution of income from labor to capital. Redistribution was key to resolving the 1970s crisis of capitalist profitability, but at the cost of an intensifying crisis of legitimacy. Three, financialization, crisis of legitimacy and hegemonic decline go hand-in-hand. We are at the end of the neoliberal era and of the era of US world hegemony. Thus, the geopolitical terrain is critical for understanding ‘what is to be done’, including the prospects for labor solidarity across borders and status divides in the very unequal world bequeathed to us by centuries of world capitalist development.

New Experiences of Inclusion: Affirmative Action for Blacks and Natives in Brazil

After several decades of black social movement struggles for rights in Brazilian “racial democracy”, it was recognized by the nation-state the practice of racial discrimination in the country, as well as affirmative action as a policy to correct inequality. In this scenario, the passage of Law 12.711 on Affirmative Action, in 2012, presupposes a set of substantive changes that alters the access to public high education in Brazil. To understand the social context that has led to the implementation of affirmative action, the combination of black and indigenous legislations as well as the African and African-Brazilian history and culture for school system requires analysis of the democratization process of the Brazilian State. This paper focuses on three aspects: 1) the change in state policy related to inclusion of blacks, native population, and poor people; 2) the impact of these actions in the academic debate; 3) the role of black social movement in this process. The research fieldwork gathers the legislation that have changed the normative field in relation to the ethnic and racial issues after the Constitution of 1988; collects official data on the expansion of blacks, natives and poor people to public high education; and review the literature on racial affirmative action and black social movements producing a typology of the arguments.

Filial Piety Expectations of Older Adults in Urban and Rural China

Due to declining fertility rates and growing life expectancy, China will have one of the world’s oldest populations by the middle of the 21st century with more than one in three individuals over the age of 60. Reductions in family size—the result of the one-child policy in urban areas and 1.5-child policy in rural areas—will also decrease the availability adult children who currently serve as the backbone of the elder-support system. Although China’s older population is still predominantly rural, little is known comparatively between urban and rural elders in terms of filial support expectations and the factors that may differentially drive the strength with which filial piety is valued and expected by older adults. This presentation will make use of 2012-13 pilot data from the Chinese General Social Survey of Aging, a national study of older adults (60+) in China that yielded 1,126 individuals about evenly divided between urban and rural locations. Questions in the survey about filial expectations concerned whether children should be financial providers to their parents, whether children should live close to their parents, whether children should live with their parents, and the special obligation of sons to assure the old age security of their parents. Descriptive and multivariate statistics will be presented to determine if aging in urban and rural China is truly a tale of two family types and identify the social, economic, and health factors that may be responsible for any differences detected.

Placing Panethnicity: Performing Arab Space on Sonnenallee

The multicultural Berlin district of Neukölln is home to a large number of very diverse foreign-born and migrant-background residents. Some 140 nationalities make up 40% of the population in 2010. Among the migrants least welcome by the asylum-seekers from the Middle East. Unlike their Turkish neighbors, the Arabic-speaking refugees from Lebanon, Egypt, Syria, Afghanistan, Iran, and other countries in the region have a precarious foothold in Berlin. Establishing a small business, even if it is unprofitable, demonstrates self-sufficiency to the authorities. Ironically, immigration laws partly account for the “parallel societies” so deplored by the likes of Thilo Sarrazin, who characterized Turkish and Arab immigrants as lacking “a productive function, except for running fruit and vegetable business.” This research looked into the ethnic enclave of distinctively Arab businesses and institutions clustered around a segment of the five kilometer long artery, Sonnenallee. These businesses do not sell fruits and vegetables, but rather goods and services that are formally excluded. The Arab businesses are frequently engaged in the development of capital mobility and new working class formation. These writings focused on the “active industrial army”. Another important dynamic underlying the contemporary reshuffling of the proletariat is the secular trend toward increasing capital intensity, and thus the growing mismatch between global labor supply and demand. As such, a deep re-theorization of the concept of the reserve army is imperative—a concept which is both critical to but distressingly unelaborated in volume 1 of Capital. This paper seeks to contribute to this task by theorizing (1) the distinction between, and the relative historical weight of, exploitation and exclusion in the development of capitalism; (2) the ways in which capitalist accumulation has depended historically on the externalization of the costs of reproduction of labor and nature, and therefore some of the ambiguities of ‘exclusion’; (3) the unevenness of these processes in time and space, and the resulting deep divisions within the world proletariat along lines of gender, race and citizenship; (4) the ways in which this unevenness is reflected in the patterning of world labor unrest in recent years; and (5) the implications of all this for moving toward a post-capitalist world system which guarantees a decent and secure livelihood for all.

Crime Control in São Paulo/Brazil: Military Police and Criminal Justice System

This paper discusses the State actions of crime control in São Paulo State/Brazil in the last decade. We seek to analyze how institutions and State agents engaged to crime control and criminal justice management are affected by the emergence of new “criminal organizations.” An expressive growth of the incarceration rates, an increase on number of prisons, is linked to the emergence of the “Primeiro Comando da Capital – PCC”, bringing a new dynamic to the relations inside the ‘world crime’. Research (under data collection) has identified two main strategies of crime control to face the new crime dynamic: i) a militarized combat based on lethal confrontation led by the Military Police against supposed criminals and ii) a classic judicial control producing both imprisonment for specific population and low rates of punishment, especially for homicides and police violence, showing the high selectivity of the penal system. Two empirical cases exemplify each strategy mentioned, and allowed to describe some of their characteristics. First data indicates some affinities between classic crime control and police violence.

Slow Birth and Fast Growth of a World-Class Post-Secondary Education in Singapore

* denotes a presenting author.
This paper examines the background and strategies behind the slow start but fast expansion of a world-class post-secondary education in Singapore and presents an overview of its current trends and future directions.

When Singapore gained its sudden independence with its separation from the Malaysian Federation in 1965, one of the legacies of the British colonial heritage was its low investment in its social infrastructure of schools and teacher training. This is reflected by the low literacy rate of 73% in 1970, and a high 83% of population aged 25 years and above having qualifications below secondary level even in the year 1980, based on data released by the Department of Statistics.

However, as the small city-state transforms itself from an entrepôt to an industrialized economy, rapid school construction and large scale teacher development were initiated to meet new socio-economic needs and to provide education to all. These efforts bore fruitful results within a short quarter century, as evident in the following figures: by 2000, the proportions of 25-34, 35-44 and 45-54 years-old with at least education were about 56%, 32% and 21% respectively and the figures rose to 82%, 64% and 36%, in the same order, in 2010.

Apart from expanding enrolment at the post-secondary level, Singapore also had to shift its efficiency-driven education to an ability-driven one in the past decade, to respond to growing educational aspirations among the young and the deep impact of the digital knowledge-based era. This paper will conclude with a discussion on the new challenges, opportunities and measures to adapt to the ever-changing landscape of post-secondary education.

The Forbidden Discipline: The Impact of the Pinochet Dictatorship on Chilean Sociology and Sociologists

In 1972, during the height of Allende's presidency, Santiago de Chile hosted the Conference of the Latin American Sociological Association (ALAS). The conference would not return to Chile for 41 years, until September 2013.

At the time, Chile was the Latin American center of social scientific exchange and collaboration (Franco, 2007). Besides, Chile's path towards socialism and its changing society attracted many sociologists from Latin America and overseas.

This golden era of Chilean sociology immediately came to a halt with Pinochet's coup d'état on September 11th, 1973 and the seventeen years of dictatorship. As in other authoritarian regimes the dictatorship not only deeply altered and affected Chilean society (Fleck, 2007), but had major impacts on sociology and the humanists, resulting in the closure of sociology departments and the persecution of sociologists and sociology as left-wing ideology, with many migrating to save their lives (Barrios and Brunner, 1988; Brunner, 1988; Garretón, 1997, 2005). At the same time, with the forceful implementation of neoliberalism in all areas of life under the guidance of the Chicago Boys, neoliberal economics became the queen of the social sciences, leaving little space for what seemed to be 'ideology' and thus for the spreading of accepted knowledge in the social sciences.

This paper studies the fundamental transformations of Chilean sociology and sociologists' lives during the Pinochet dictatorship (1973-1990). Based on qualitative interviews with Chilean sociologists who either experienced the dictatorship as students, academics or professionals, this paper explores three dimensions in which the dictator altered sociology and sociologists' lives: 1) biographical ruptures and transformations, 2) institutional changes such as department closures and the subsequent impact on employment opportunities for sociologists, and 3) epistemological changes within sociology as a discipline, and changing epistemological orientations of sociologists.

SIMON, KARL-HEINZ* (University of Kassel, simon@cesr.de) 

Referring Actors in Change Processes

From the very beginning the role of the actor was an important concept in cybernetics. Whereas classical approaches, first-order cybernetics, kept up to externalize the actor, second-order cybernetics tries to include the actor into the (material or epistemic) feedback loops. In first-order cybernetics the definition and adjustment of goals in control behavior is not part of the control structure. Only the activities of the actor in changing the actuating variable (stelldrage) are included. Second-order cybernetics a much broader picture of the interactions between problem, feedback loop, and goal-seeking processes is drawn. In social system theory the concept of the observer plays a similar role. Complexity is increased by introducing 2nd and 3rd order observers when trying to explain social situations.

The role of actors is an important issue in sustainability research and politics. Suggestions for agency alternate between appeal to individual, concerned people, and attempts to design new technical and social frameworks. Change agents, for example, are addressed as those to have the crucial influences on future strands of development. To show how these conceptualizations are conceptualized in a first-order mode, reflecting neither the origin of their ideas nor the function they have for adjusting social systems to changing framework conditions. A second-order perspective could contribute to approaching these questions in a wider perspective.

There is an important, yet widely ignored, report by Y Dror on the Capacity to Govern. Cybernetic theory and epistemology does not play an important role in his conceptions. However, it seems helpful to re-interpret some of his suggestions applying cybernetic concepts. Especially the differentiation of actors and their role in change processes will contribute to a better understanding of sustainability strategies.

Informal Community at the Workplace As a Defense Strategy in the Situation of Emotional Dissonance or Emotional Alienation: Sociological Study of Emotional Labor of Cardio-Surgical Nurses in Today's Russia

The paper based on the results of the pilot study into the peculiarities of emotional labor of hospital nurses at the cardiac surgery departments in Moscow and Rostov-on-Don in the framework of the sociology of emotions of Arlie Hochschild. The analysis of 15 semi-structured interviews with female professional nurses aged between 25 and 40 showed that emotional work was the essential part of their job, they were conscious of the need of expressing special emotions for patients and their relatives. It was discovered that due to rigid professional hierarchy and hard working conditions the nurses perform autonomous emotional labor (term used by Martin Tolich). Such labor is not regulated by the hospital management, but it is consistent with the norms of general emotional culture requiring nurses to express care, sympathy, empathy, etc. The nurses of the cardiac surgery are not specially trained for emotional labor, so they have to develop these skills on the job. It's possible to say that the nurses present philanthropic emotion management (according to classification of S. C. Bolton). They are persuaded of understimation of their labor by doctors in particular and by patients and society in general (via the social crisis in Russia). Hence the nurses are faced with the syndrome of emotional burnout and emotional self-alienation. They try to control negative emotions (annoyance, anger, despair) and to “humanize” the relationships with patients, but it is very difficult for them. In these circumstances the nurses form a close-knit community, whose members support each other. Such informal community incorporates the following features: openness, humor, talking about colleagues and patients, solidarity. This community helps neutralize the emotional tensions, dissonances and supports the emotional balance. So the nurses rather try to adjust to requirements and problems of their profession and maybe therefore they don't experience bitter emotional self-alienation.

Understanding the Market: An Ethnographic Exploration of the City of London

Reflecting on the role markets play in shaping the interests and actions of social life, this paper presents the argument for how institutional ethnography furthers our understanding of the discursive creation and enactment of markets as part of daily life. Drawing on data emerging from an ethnographic study of financial institutions within the City of London, this paper asks how markets are created, maintained and ideologically positioned though the everyday actions of economic actors located within key financial institutions.

Informed by Goffman's (1961; 1963) work on the body as a site of cultural inscription, it is argued that markets are essentially constructed and managed through the production of dominant cultural sensibilities. This blended approach of cultural economics identifies the market as an enacted phenomenon, bounded socially and spatially within institutions of finance. By focusing on the embedded cultures, enacted through the daily practices within the City's financial institutions, we can explore how the market operates in terms of its agenda, practices and conflicts with the outside world.

Through exploring the lived experiences of those working within the City of London, light is shed on the unfolding effects of a deregulated economic landscape that exalts the principles of the market which legitimises the production of social harm through its own unique set of experiences and ideologies. As a result, this paper explores the way in which managers and traders, in their daily capacity as market actors, seek to utilise existing technologies, architecture and habits to create a more efficient market - one where individuals are better placed to draw profit from their own financial acumen whilst insulated from the broader, social costs of economic decision. Refocusing the study of the risk management, institutional ethnography serves to ameliorate our understanding of how embedded cultures of finance actively create and manage markets.

Remote Management as Risk Management: Enclavisation in Afghanistan

The paper presents an analysis of 'state-building' intervention and civil-military practice in the context of global terrorist-related and conflict-related risk. The paper is based on qualitative field research conducted in Afghanistan, and in particular focuses on the international intervention as 'transfer management', at two levels. The paper first considers 'state-building' intervention as management of the global risk of terrorism, or of conflict-related regional instability as continuous with global terrorism. At the level of everyday practice, the paper considers the intervention operations of both civil and military organisations as in part driven by management of the risks of operating in a high-risk environment. In this paper brings together Shaw's concept of risk warfare (2005) on the military side with Duffield's concept of the fortification of development aid (2010) on the civil side. Practice in both cases converges on a risk-averse model of intervention emphasising the potential of risk and remote management, with extensive and expensive devolution of implementation to local and private contractors on the civil side, continuous with use of private contractors and local proxies on the military side. Evidence for egalitarian distribution of risk, a condition central to sociological models of risk such as 'risk society', is limited. Risk-averse 'enclaved' intervention operates as a potential risk to local and civil populations, whether as inadvertent civilian casualties of military operations, or as populations excluded from, or marginalised in, urban spaces that have become enclaves for international organisations. This model of intervention is potentially counter-productive, as it increases local concentrations of poverty and instability of fragility and circumscription, contributing to the significant expense of the apparatus of 'enclavisation' and remote management, notably for infrastructure and private security provision. The paper concludes by considering possibilities for a less risk-averse and more locally owned model of intervention in conflict-prone spaces such as Afghanistan.

Self, Otherness and the Israeli Sociology

The paper concerns the question of identity construction in Israel and offers to regard the early Israeli sociology as a source that articulates and reflects its transformation. By focusing on the late Prof. S. N. Eisnestadt's sociological language, its use of myths and prevalent national narratives, the paper examines 1. how self and otherness are formulated 2. how the academic study of society had become an advocate of a specific discourse in which Zionism – the main ideological framework of the time - had enjoyed a hegemonic position. The paper therefore underscores how ideological knowledge, built from this ideological ground, projected the ideal image of society and propagated the notion of a collective “we”. To illustrate the centrality of this identity politics in the Israeli sociology, the paper discusses the relation of the early Eisenstadt sociology to the question of the Arab-Jews as its study case. It argues that the sociological view of Arab-Jews of the early 1950's was crucial in shaping the ideal border of identity. Given that the Arab-Jews ( Mizrahi) were not seen, from the hegemonic view, precisely as “Israelis” (a coherent part of the in-group) and not exactly as Arabs (the ultimate “other” in the Zionist discourse), a new barrier-category had been created - that of the
"Other within", Seen from an orientalist perspective, the sociological description of the Arab-Jews had engendered a negative reflection of these communities. At the same time it paved the way for a contrasting and a more "legitimate" model upon which the ideal Israeli archetype could be defined. The main endeavor of this paper is to show how an Israeli "legitimate" identity has been constructed in the context of the sociological analysis in a way that strengthened the political legitimacy and bolster its national inner logic.

**SINCLAIR, GARY** (University of Stirling, gary.sinclair@stir.ac.uk)

**Music As Leisure in the 21st Century: The 'sportisation' of Music Fandom**

The term 'sportisation' (Elias and Dunning, 2008) is used by figurationalists in a general sense to document the development of rules and regulations for previously chaotic games (e.g. boxing and football) into the commercialised, controlled 'sports' that occupy such an important position in modern society. King (1997) focuses on the role that commercial forces, in particular the introduction of modern all-seater football stadiums, have had on the emotional management and masculine identities of sports fans. This paper readdresses the focus on leisure (in this case music fandom) in the figurational sociology of sport and leisure, charting the impact that 'sportisation' processes and marketplace influences have had on the live music experience of heavy metal fans.

Drawing from a three year study of heavy metal subculture which incorporated data from participant-observation and interviews, this paper examines how transformations in modern music 'arenas' has significantly diminished the quality of the live music experience. This is encapsulated by the problematic issues raised in terms of emotional management and identity projection that that fans have experienced in the context of such transformations. In particular, focus is attributed to the importance of the heavy metal rituals (moshing, crowd-surfing) which have previously been facilitated in 'controlled' environments that allowed for the 'de-controlling' of emotions and exaggerated displays of masculinity. Following the changes in such subcultural spaces, particularly the increased seating in large music venues, the strategies used by fans to reconceptualise 'established' notions of masculinity within the scene and to demonstrate their heavy metal identity are explored.

**Role of New Communication Technology Initiatives (NCTI) in Bridging the Digital Divide: The Case of a North Indian State**

Communication technology includes the hardware equipment, organizational structure and social values by which individual collect process and exchange information. The new communication technology (NCT), such as satellites, cable, television, wireless telephony, the internet, computers, laptop, iPod, have certain characteristics that are similar in some respect of those of both interpersonal communication as well as of mass communication. This NCT, also called as new media, it modifies the characteristics of both interpersonal controls. Information exchange via the new media is interactive, meaning that the participants in a communication process control over, and can exchange roles in their mutual discourse. The present paper is aimed to explore the role of NCT in bridging the gap created by the forces of globalization in developing countries like India by focusing on a NCTI launched recently by the state government of Uttar Pradesh i.e. Scheme of distributing laptop to every undergraduate student who took admission in the year 2012 or later in any college/university of the state irrespective of their social background. A cluster sample (N=399) drawn from a PG College of Western UP includes both the males and females. The study aims to understand the effect of the state government of Uttar Pradesh in bridging the gap created by the forces of globalization in developing areas and to ignore external factors for certain socio-spatial formations. Drawing on extensive fieldwork in a Romanian Danube-riparian port city, I argue that it was the contingency of the 1977 earthquake that turned the city and the surrounding region into a laboratory for a new kind of developmental logic. After the downfall of the socialist regime in 1989, the very same region became yet again part of a new understanding of development. In accordance with pre-accession criteria for EU membership, Less Favored Zones have been established in 1998 in order to attract foreign direct investment through long term tax exemptions.

Instead of seeking to establish path-dependencies linking state socialism with its aftermath, I conceptualize ‘contingent development’ as a way to look into improvement schemes that result from the arbitrariness of a natural disaster in relation to local changes that result from the dynamic of global capital since the 1970s.

**SINGH, JAGSIR** (CSSS/SSS, JNU, jagsirbrar1@yahoo.co.in)

**Urban Inequality and Health**

This paper is a modest attempt to underline the urban inequality and its impact on health. It describes the health implications of social inequalities within city. It also describes the health problems from which low-income groups in urban areas suffer more than richer groups including those that are not linked to poor sanitary conditions and those that are more linked to relative poverty (and thus the level of inequality) than to absolute poverty. Study on the health of rich and poor households within cities show the much larger burden of disease, injury, and premature death that low-income groups face. Most of this burden is easily prevented because it is a result of their unequal access to homes which have provision for piped water, sanitation, drainage and garbage collection, and adequate health care. Thus with this we can say that health inequality never been an independent phenomenon. By using health and social impacts of urban inequality as a focal point of the discussion, the paper also intends to provoke thought on some of the fundamental issues of human development trajectories.

**Developmental Logics Beyond the Divide**

Developmental projects have been the common denominator of the post-1945 global order irrespective of political divides and divergent economic systems. Whether we look at the emerging postcolonial states of the South, state socialist Europe or any other type of state, the development projects directed at industrializing ‘homogenous’ national spaces were adopted across the globe. However, by the 1970s this model showed signs of exhaustion. At the time when ‘Limits to Growth?’ came out in 1972, the Romanian state was implementing a new strategy for economic progress: it had negotiated with IMF and EBRD the ‘developing country’ status in order to facilitate foreign-debt financed investments and embarking on export-led growth.

This paper aims to shed new light on a particular kind of developmental continuum in an effort to question the wide-spread assumptions about the relationship between local variations and global structural constraints, namely the tendency in terms of explanatory frameworks to emphasize only particular local specificities, and to ignore external factors for certain socio-spatial formations. Drawing on extensive fieldwork in a Romanian Danube-riparian port city, I argue that it was the contingency of the 1977 earthquake that turned the city and the surrounding region into a laboratory for a new kind of developmental logic. After the downfall of the socialist regime in 1989, the very same region became yet again part of a new understanding of development. In accordance with pre-accession criteria for EU membership, Less Favored Zones have been established in 1998 in order to attract foreign direct investment through long term tax exemptions.

Instead of seeking to establish path-dependencies linking state socialism with its aftermath, I conceptualize ‘contingent development’ as a way to look into improvement schemes that result from the arbitrariness of a natural disaster in relation to local changes that result from the dynamic of global capital since the 1970s.

Critical Policy Studies: The Contribution of Basil Bernstein’s Knowledge Code Theory

Critical policy studies adopts a discourse analytic approach to policy research, drawing specifically on the Foucauldian concepts of discourse, regimes of disciplinary power (bio-politics and panoptic surveillance principles), and subject positions; and the Bourdieuan concepts of field, capital, and habitus. A core aim of critical policy studies is to analyse the ways in which supranational organisations, such as the OECD, increasingly regulate official national curriculums given their role in the development, administration and reportage of tests which are ‘closely linked with the debate about national standards’ expressed as comparative performance on basic mathematics, scientific and literacy skills (Tyler, 2010: 145). However, drawing from such theoretical work is a modelling of the production, recontextualisation, and acquisition of knowledge codes from the macro level of supranational organisations to the local level of school practices. This was the focus of Basil Bernstein’s sociological theory of education. This approach, Bernstein (1995) maintained, distinguished his ‘particular corpus of work from that of Foucault, Bourdieu.’

This paper undertakes three tasks. Firstly, it critically reviews the literature that has compared and contrasted the sociological approach of Bernstein to Bourdieu (Maton, 2008; Harker and May, 1993, Hasan, 1999) and Foucault (Diaz, 1984; Tyler, 1998). Secondly, it presents a theoretical framework that specifically the knowledge codes underpinning supranational, national and local school curriculum models, and the potential consequences of such knowledge codes on different groups of students. Secondly, it explores Bernstein’s claim about his distinctive contribution to modelling knowledge codes (the structuring of curriculum). Thirdly, it tests the usefulness of Bernstein’s theory of knowledge codes to analysing policy enactment around standardised national testing drawing on examples from two contexts, namely Queensland, Australia and Newark, New Jersey, USA.

Globalization, ICT and Professional Education in India

The process of globalization has posed new challenges in every sphere of social, economic and cultural life of both the developed and developing societies. The transnational mobility of professionals has been increased in last two decades throughout the world. The professional education in India is also under process of transformation as a result of the pressing demands of globalization of professions. Apart from the existing professions, new categories of professions with new work ethos and work atmosphere have emerged. The professional education in India also needs to transform in order to compete at the global level. It also demands the homogenization of certain basic elements of the professional education on the one hand and a thrust to include the context of the socio-cultural milieu of the given society on the other. As the professional education requires huge financial resources, the quality of professional education and institutions varies between and within the developed and developed societies. The poor countries have invested more on the expansion of basic professional manpower rather than on the post-secondary professionals particularly in the field of education and health looking into their pressing development needs. The rich developed countries, however, have focused more on the expansion of post-secondary professional manpower in order to stop outsourcing from their countries. In India, however, there have been expansions of both the basic professional training as well as of the post-secondary professional education. E-learning technology is an essential component of professional education in the globalized unequal world. The present paper analyses the various dimensions of intricate relationship between globalization, ICT and professional education in post-globalization era.

Institutional Conflict Settlement Field in Brazil: Four Levels of Justice System

The paper proposes an interpretation of the operation of the State conflict settlement field in Brazil. It takes the perspective of disputes among corporations, knowledge and practices that take part of this field. A reflection on the Brazilian case proposes the coexistence of at least four conflict settlement logics (or four interaction levels) to which correspond hierarchies of rituals, proceedings, persons, types of conflict and places. The study is based on eight years of ethnographic approach in courts and State informal services of justice. The observation on ordinary courts proceedings, informal courts, extra-judicial techniques, formal and informal police proceedings (including illegal ones) leads to an analysis of the coexistence and disputes in a field that produces unequal treatment of the citizens.

**Intergenerational and Life-Course Determinants of Upward Mobility**

Offspring originating from families with fewer socioeconomic resources are in a disadvantageous position relative to those from families on a higher social rung, and attaining lower educational qualifications. Also life events in early adulthood may have an effect on socioeconomic attainment. These effects, however, may be weaker among those with higher compared to lower parental background.

This study examines the intergenerational and life-course mechanisms of upward mobility. We observe which life-course characteristics in early adulthood (such as educational attainments, unemployment, living arrangements, marital status and health) decrease the risk of entering upper non-manual social class among those who originate from other social classes. Second, the contribution of factors indicating parental resources is analyzed in order to find out whether higher parental background protects from the effect of risky life-course characteristics.

The longitudinal register-based data-set used in this study are a representative 11 % sample of the whole Finnish population. We follow a birth cohort born between January 1977 and December 1977. Follow-up starts from adolescence through 20-year follow-up from adolescence till the age of 30+ offers a chance to estimate the processes of accumulating disadvantages among individuals and households. Analyses will be conducted in event history model framework. Our objective is to broaden the perspective on intergenerational transmission of inequalities by describing the life-course mechanisms of occupational attainment in more detail.

SIROTA, RÉGINE* (Université Paris Descartes, regine.sirota@parisdescartes.fr)

**Childhood Inequalities in French Speaking and Anglo-Saxon Sociologies**

Childhood inequalities in French speaking and Anglo-Saxon sociologies according to academic traditions or sociopolitical context, the issue of inequalities in childhood has been addressed in different ways. The French speaking sociological discussion has been quite specific compared to the Anglo-Saxon. Those differences will be presented and discussed. Paradoxically, it is in putting aside the question of democratization and inequalities of opportunities that the child emerged as an actor in French speaking sociology, on a first step. As in the French context, the “Republican Universalism” has been the main reference, childhood inequalities have been mainly studied in terms of social stratification. On the other side, in the Anglo-Saxon context, diversity has been the main reference, priority being given to problematics as gender or ethnicity. We intend to examine how those differences influence the way childhood inequalities are studied and how these categorizations are transformed, and their intersectionality addressed.

La question des inégalités de l’enfance s’est posée de manière différente suivant les traditions académiques et les contextes socio-politiques. On s’interrogera sur la spécificité du contexte francophone, par rapport aux contextes anglophones. Paradoxalement, c’est dans un premier temps en se dégageant des problématiques de démocratisation et d’égalité des chances qu’est apparu l’enfant comme acteur sur la scène sociologique francophone. Le poids de l’universalisme républicain a amené à reposer la question des inégalités dans un régime d’interprétation différent du contexte anglo-saxon où les questions de la diversité s’imposent pour penser ces inégalités, qu’elles soient posées en termes de classes sociales, de genre ou ethniques. Dans quelle mesure la prise en compte de l’enfant remet- elle en jeu ces problématiques ? En quoi penser les inégalités à cet âge de la vie oblige à affronter certaines catégorisations et inversement en quoi penser les inégalités donne une vision différente de l’enfance et des enfants ?

Architects and Urban Planning

This presentation discusses to what degree the architect profession is able to define what counts as relevant knowledge in urban development and urban planning processes, based on material from Norway. Urban planning is a field constituted by numerous actors/stakeholders representing different knowledge traditions implying that they do not always speak the same language. However, in order to handle environmental problems, transport and other infrastructure and land use, multidisciplinary knowledge and cooperation between different sectors are required. In Norway, the architectural profession has long had a key role in urban planning and positions as heads of urban planning administrations have been a power base for architects. However, architects' judgments and forms of knowledge are no longer hegemonic and their power base is thus weakening. This is partly caused by an increasing proportion of planning propositions (like zoning plans) prepared by private actors. Moreover, local authorities increasingly seem to depend on private funding to accomplish housing and infrastructure projects.

RC52-833.9

SKOGHEIM, RAGNHILD* (Inst Urban & Regional Research, ragnhild.skogheim@nibr.no)

Architecture As a Hybrid Profession

Hybrid organizations and professions are characterized by conflicting goals, which may cause tensions. For architects, such tensions are typically between art and market, and between ideal ideas and conceptions of design, and preferences and claims from clients/principals and others. Although market dependence is intrinsic in the role and history of the profession, this still joins tension for architects. When dealing with this tension, some architects are quite pragmatic and accept and adjust to prevailing conditions. Other architects are more uncompromising and insist that creativity requires freedom from external constraints. Particular architect “heroes” espouse autonomy and distance from the service part of the profession. This may seem like a paradox as architects more than most other professionals depend on, and have to adjust to, the power, wealth, favor and money of their clients.

SKOVJASA, MAREK* (Charles University Prague, marek, skovjasa@soc.cas.cz)

Rockefeller Foundation’s Role in Promoting Social Sciences in Interwar Czechoslovakia

This paper discusses the place of geopolitical concerns in the policy of the Rockefeller Foundation towards social sciences in Czechoslovakia between the two world wars. The RF provided scholarships for Czechoslovak social scientists (around 35) and sponsored social science work at various Czechoslovak institutions. The scholars supported by the RF were sociologists, lawyers, and economists, both German and Czech-speaking. Their individual fates display wide variation: several perished during WWII, others escaped and became recipients of discipline in the role and history of the profession, still others were exiled after 1948, a handful joined the Nazi and later the Communist structures. Only those who chose emigration produced academic work of some importance. The dominant geopolitical concerns were reflected in the effort of the RF to maintain a balance between German and Czech scholars and institutions supported or in promoting research in areas that were expected to contribute to maintaining the stability of the Czechoslovak state or Central Europe such as unemployment and social welfare, interethnic relations or the so-called Danubian studies. Key among Czechoslovak institutions in social sciences that received support from the RF was the Social Institute, affiliated with the Ministry of social welfare, the incubator of innovative ideas that directly influenced Czechoslovak social welfare legislation and policies. RF also funded a large research project on the suburbanization of Prague that became the first major empirical study in Czech sociology while another study on German-Czech relations could not materialize due to the dismemberment of Czechoslovakia. The RF made significant contributions to the development of empirical social research and social policy in Czechoslovakia, but the overall impact of its funding was virtually erased by adverse geopolitical conditions and turbulent political developments in the period 1938-1948.

The Elusive Code: Anomalous Cultures of Civil Society

This paper attempts to add new evidence and theoretical insight to the literature on the roles of civil society in urban spaces within cultural sociology by Jeffrey Alexander and Philip Smith. It argues, first, that unlike the US case, the codes of civil society in ethnically heterogeneous places are the product of multiple external oppositions which can, in certain cases, result in alternative or contrary codings. For instance, some currents in the Czech, Polish and other Slavic nationalisms in the 19th century construed the Germans, their principal “other,” as rational and efficient, taking pride in the contrary in being emotional and unpractical. Second, the paper shows that civil societies are fragmented and the general code of civil society is appropriated differentially by different social groups whose interpretation of the basic binaries is dependent on their particular social experience as well as their relative position to other groups. For example, as pointed out by Marada, Buchowski and other authors, the cultural codings characteristic of the heirs of the anti-Communist dissent in East Central Europe are in some aspects, including the role of formal procedures and professionalism, completely at odds with the codes, especially by Western-style social movement organizations. With its roots in a conspirative underground community this dissident culture doesn’t code personal ties and secrecy as counter-democratic. On a general level, the paper argues for a more historically-oriented approach to the study of cultural structures of civil society that recognizes that the generalized codes are embedded in congeneric transformative traditions and, as such, are unstable, contested and often ambiguous.

Medical and Legislative Gatekeeping in ART: Narrow Trajectories in the Realm of Miracles

The techniques of assisted reproduction have the potential to free us from the bodily limitations and open the physical reproduction to people who would not conceive without medical intervention. The access to this type of treatment is regulated in numerous ways, both formally and informally. Reproductive medicine, seemingly firmly anchored in scientific objectivity, and often presented as a revolutionary or miraculous cure for anyone, in its praxis works as a controlling mechanism over bodies and the reproductive capacities of citizens, differentiating between the categories of patients.

The Czech Republic, with its long tradition of infertility treatment, wide network of infertility clinics, competitive success rates and liberal regulation of the ART regarding the range of procedures allowed, became one of the most popular destinations of reproductive tourism. On the other hand, there is a strict regulation of the access to the ART based on the characteristics of patients such as their age, family status and partnership. The paper will focus on the process of the legislative and medical gatekeeping as a genuine example of the Foucauldian biopower, as a control over bodies, interaction and norms of population performed by the medical professionals and by the administration and regulation of treatment. The paper is based on the two sources of data: interviews with 15 medical professionals working in the field of ART and the analysis of the Czech parliament debate over the new legislative limits of ART (2011). The analysis focused on the following questions: what is the position of various actors in the process, how is nature and normality, in the context of ART, discussed, what kinds of citizens/patients are defined by the clinicians and parliament members as deserving candidates for infertility treatment, and, how these regulatory mechanisms can be reflected in the context of “biotech age” and globalized biopolitics.

Causes and Consequences of Time Investment in Friendship Networks: A Dynamic Analysis of the Polish Panel Survey Polpan 1988-2013

Time investment in one's friendship network depends on the utility function U = dlog(yi(−1)−dlog(yo)) that people maximize, where o is the social tie parameter (between 0 and 1) measuring the ith actor’s taste for bonding with friends, and O refers to other leisure-time activities. In the theoretical part of the paper, we connect this utility function with time investment in friendship network (I) assuming that the numbers of friends and the density of their contacts are crucial for the amount of time that people actually spend with friends. The Polish Panel Survey POLPAN 1988-2013 contains information on how frequently respondents meet with friends (I), our main leisure-time variable, numbers of friends (N), density of their contacts (D), and several socio-demographic characteristics of respondents for the period of measurement (t) and earlier periods (t-1, ... , t-5, where the period-units are 5-year waves of the POLPAN study). In the empirical part of the paper we examine main determinants of time investment in one's friendship network, focusing on family formation processes. We show that time investment, as well as the change in number of friends and the change in density of contacts among friends, depend on marital status, number of children, and number of people in the household. In addition, we confirm previous findings that having friends with entrepreneurial experience increases people's chances of establishing their own businesses, independently of the number of potential bridges between friends. The paper concludes with a discussion on meeting friends as a form of leisure activity that plays a significant role in the formation of social capital, and has important implications for generating social inequality.

Hazard Vulnerability and Housing Inequality after the Tuscaloosa, Alabama Tornado: A Critical Analysis of Rebuilding Efforts

The tornadoes that struck Tuscaloosa, AL and surrounding areas on April 27, 2011 caused tremendous destruction to both residences and businesses. The highest levels of damage occurred among low-income residences, both single and multfamily. In this paper, we apply hazard vulnerability theory to the rebuilding of homes in Tuscaloosa. Hazard vulnerability theory focuses on how social factors, including race, gender, place, and socioeconomic status, affect a population's preparedness for a natural disaster. We extend this perspective into the recovery process, particularly on the availability of low-income, multihousing approximately two years after the storm. Data from multiple sources, including professional knowledge, including city planning resources, apartment websites, and interviews with city personnel, indicate that multifamily residences that have been constructed to replace destroyed or damaged housing complexes generally demand higher rents and have fewer units available for rent than the complexes that existed before the storm. Additionally, even as a residential construction boom has occurred in Tuscaloosa, the following storm would have further market-ed to the college student population, even though none of the multifamily housing complexes destroyed in the storm solely housed college students. Although low-income populations were more affected than student populations, the economic advantages of building for student populations (i.e. “disaster capitalism”) have outweighed the social responsibility of rebuilding residences for low-income individuals. We conclude that low-income residents of Tuscaloosa were doubly vulnerable to natural disasters; not only were they more likely to be living in structurally flawed housing before the storm, they were also left out of the rebuilding process after the tornado. We discuss some of the potential consequences of the reconstruction of Tuscaloosa, and propose suggestions that can limit social inequality in the rebuiding process for Tuscaloosa and other cities that have been harmed by natural disasters.

SMEBY, JENS-CHRISTIAN* (Oslo and Akershus University College of Applied Sciences, Jens-Christian.Smeby@hio.no)

Professional Knowledge and Expertise

Professions are according to Abbott the most important way expertise is institutionallised in modern societies. Sociologists have studied the characteristics of professionalism as well as the role of professionals in society. Even though an abstract knowledge is considered a core if not the core characteristics of professions, sociologists have examined the characteristics of professional knowledge used in occupational practice only to a limited extent. In my paper I discuss professional contributions within the literature on expertise and argue that some of these perspectives are highly relevant to complement sociologists understanding of professional knowledge.

While sociologists have emphasised that abstract knowledge acquired in higher education is an important characteristics of professionalism, practical training and professional knowledge is found to be the most important precondition in the literature on expertise. Sociologists do not deny the need for practical training, but tacit knowledge is a somewhat mysterious term often considered as opposed to abstract explicit knowledge. Based on questioning why knowledge is tacit, Harry Collins (2010) distinguishes between three types of tacit knowledge. This distinction opens up for a more nuanced perspective on the relationship between tacit and explicit abstract knowledge. His perspective also imply that explicit knowledge play an important role in the development of expertise and transmission of knowledge.

Professional work is characterised by uncertainty. Inspired by Collins different types of tacit knowledge, I distinguish between three types of uncertainty that have significant importance for the reliability of professional expertise: 1) Explicit uncertainty related to uncertain knowledge; 2) Cognitive uncertainty related to
We consider democracy as an instrumental value. It appears to be effective and naturally arises when society reaches sufficient consent in regards to basic values (one God for everyone, nation, person, society, etc.). When such agreement not exists, a dictatorship provides the minimum order in a society. For example, dictatorships of Cromwell, Napoleon, Stalin, Pinochet, etc. There is no consent regarding basic universal values in the modern world. Hardly a man and his rights will be recognized as the highest values by billions of people in the near future. The policy of Western countries aimed at their promotion, leads to anarchy and violence. Therefore it is difficult to expect peaceful expansion of democracy on a global scale. Today’s biggest task for social scientists to reveal basic values in regards to which mankind can come to the consent.

Tap Water and the Public Policy

Water is the source of life on the earth and the driving force of human development. The diamond-water paradox presented by A. Smith shows the underestimated economic value of water. However, it has its social value that can be viewed from human dimension perspective.

The knowledge of how citizens perceive the drinking water is essential to understanding the political, economic, technological context of the public policy. According to sociological survey, 82% of citizens in Saint-Petersburg are not satisfied with the quality of tap water. These figures demonstrate, that despite the fact the city water is cleaned by ultraviolet and has biomonitoring system to meet the high requirements of international water standards, there are some hidden issues explaining this situation.

SPb water is a nexus of generations inhabiting this place: it keeps the memory of past times, preserves the spiritual fabric of the society and gives an incentive to new generations for further development. However, the industrialization has destroyed this consciousness. The growth of scientific knowledge has enabled experts to make a strict distinction between bad natural water that had adverse effects on people health and good filtered water that had the status of paid public services.

It is believed, SPb water is rusty and dangerous to drink, because city officials take bribes and do not provide the modernization of water infrastructure system in time. Public dissatisfaction takes the form of disagreement with the public policy. It prompts citizens to buy bottled water sold by water transnationals, although it is the same tap water, in fact. As a result, SPb water market is showing 12% annual growth.

Basing on the citizens' concerns on the water problem, one can construct the Index of tap water as an indicator of the level of public confidence in the public policy.

Daily Pracitives of Home Making and Belonging Among Owner-Occupiers and Tenants in a Disadvantaged Neighbourhood in the Netherlands

In this period of globalisation daily practices of local home making and feeling at home are considered important. In order to illustrate such practices the focus of this paper is on a street in a disadvantaged neighbourhood in a Southern city in the Netherlands. In this street tenants and owner-occupiers with a different ethnic background – including native born - are interviewed and observed.

In this natural laboratory, the street was divided into clusters; those with only political representation of different living spaces, territory-making activities, and micro-settings and its impact on physical and social practices of home making spaces and what impact their transnational experiences have on their relationship with their wives/partners and children. Moreover, attention was paid to the role high-speed information and communications technology (ITCC) play in maintaining family relationships and acting transnationally in a digital age. In light of the challenges these Zimbabwean men face on a daily basis in South Africa, where there are xenophobic sentiments and a relative high unemployment rate, the attention also fell on how these men view their multiple family commitments and the significance of remittances in maintaining a sense of self within the ambit of the family. The respondents' reflections on family dynamics across transnational spaces show a variety of experiences and their narratives provide a window into their different lived realities as migrants with family ties across borders.

Emotion Work in the Practice of Medicine: The Case of Physician Assistants of Color

We focus on the concepts of emotional labor or emotion work and white racial framing to describe the experiences of Physician Assistants (PAs) of color as they navigate racialized barriers in the medical field. We first present results from a nationally representative sample of 15,275 PAs and then examine the more detailed personal experiences of PAs of color from an online survey. Finally we use the personal narratives of ten African American PAs. We identify and analyze emotion themes resulting from work-related experiences and stressful encounters that arise from interactions with faculty, staff, nurses, physicians, and patients in the workplace. Odds ratios from the online survey show that African Americans experience more emotion work than other groups. African American PAs were 26 times more likely than white PAs to report patient refusals to treat them. When we examined only Black women PAs, they were 46 times more likely to report patient refusals. Other ethnic groups experience elevated levels of emotionally negative experience, but they were not always statistically significant when other variables were included in the analysis. Women in general experienced a variety of discriminatory behaviors. Narrative accounts exhibit large amounts of emotion as the African American PAs detailed their encounters with patients and medical providers.
incite these practices; wills to discern and direct consumption habits; ambitions to inscribe structured meanings upon somatic territories; and desires to better identify, verify and assess corporeal components. An emerging confluence of bio-visual imperatives, practices and flows are placing unique demands on embodied subjects, specifically concerning (a) the control, ownership and arrangement of personal data arising from bodily interference, and (b) the types of performative exertions and authentication protocols that are now routinely requested and indeed expected at various visualization contact points (McGrath 2004; Andrejevic 2012). In an age of somatic magnification and scrutiny (Monahan and Wall 2007), where flashy topographies are considered as stable sites for truth adjudication and as volatile sites for correctional modulation, the sociological imagination can help excavate several resonances attendant on the proliferation of biocapturing mechanisms and on concomitant conditions of bioasylia. As I will argue, repetitive bioexposure, as both involuntary dictate and volitional act, generates de-contextualized knowledge streams, the channeling of which can assist experts in sharpening their diagnostic definitions and honing their prognostic interventions. But it also produces curious subjectivation effects at the phenomenological level. Subjects become accustomed to exteriorizing interior confidences and revealing subjective states in the form of informatic particles (Foucault 1988). In this process, personal intimacies become public property, a situation inducing social harms and igniting insurgent possibilities. A critical consideration of these issues, specifically their interconnectedness and biopolitical significance, occurs in the paper as it focuses analytical attention on the types of subjectivity being fashioned from bodily transmissions and transitions.

Understanding the Impact of Major Life Events on Young People's Academic Achievement and Post-Schooling Careers

Instability and conflict are pervasive features of the transition from adolescence to adulthood, as young people learn to manage an expanding array of academic, social and familial commitments. Recently, theorists of inequality have suggested that young people's exposure to such uncertainty during this time is potentially exacerbated by broader processes of individualisation and social change, placing them at heightened risk of marginalisation. In this paper we test this assertion against high school students in Australia, participating in the Our Lives research project. We do so by assessing the impact of a range of major life events during high school, such as changes in familial, social, or romantic relationships, on students' academic achievement at the end of high school. Our results indicate that such events had a negative influence on young people's secondary school exit scores which, at a time when university participation has become the norm in most Western societies, can adversely impact the quality and scope of young people's post-schooling career options. We also find that this cost is distributed unevenly across the student population, with the performance of (typically wealthier) private school students, and students living in urban areas, less affected by such events than the performance of public school students and those living in non-metropolitan and regional areas. Finally, we review the implications of these findings in light of the contemporary debates about individualisation, uncertainty, and inequality in young people's educational and occupational futures.

Sexually Explicit Material, Scripting, Simulacra, and Sexuality - Theorizing the Changing Landscape of Learning about Sex

This paper explores the relationship between the marked increase in availability of sexually explicit material in the U.S. that accompanied widespread high-speed Internet, sexuality, scripting theory, and the concept of a simulacrum. The data are from open-ended interviews with 51 young adults about their experiences as adolescents learning about sexuality in the United States. Participants reported viewing sexually explicit material online as adolescents to learn about sexual behaviors and sexual interaction, often before participating in those behaviors. The ways adolescents referenced sexually explicit material, both amateur and professionally produced, in order to learn about sexual behaviors represent a significant departure from historic means of learning about sex. This development is best understood as presenting a new level of sexual scripts, intermediate scripts, within the model developed by Gagnon and Simon (1973). Participants' descriptions of viewing video example of sexual behaviors revealed they provided themselves with a moderate script that was more specific and personal to the participants than a cultural scenario, yet did not involve direct interaction as with inter-personal scripts. This learning by viewing sexually explicit material prior to engaging in sexual behaviors approximates the concept of a simulacrum. Adolescents referenced representations of sexuality and then modeled their own behaviors on those representations. These theoretical concepts of an intermediate script and simulacra, are useful for understanding of the shifting landscape of adolescent sexuality. As all aspects of our sexual world continue to be increasingly recorded, viewed, and represented, these concepts may contribute to developing theories of sexuality applicable to other populations.

Cumulative Disadvantage and Gender Differences in Early Career Earnings: Evidence from Canada's National Graduates Survey

Over the last several decades women have entered educational programs in lucrative fields like law and medicine. England (Gender and Society, 2010) has argued that, in the US, the effect of this has been to narrow the gender earnings gap in the upper part of the educational distribution and to reduce the aggregate gap. Women in Canada have also entered the legal and medical professions in large numbers. On the other hand, in a study of college graduates at approximately five year intervals and, then on labour force status, earnings, and family status two and five years after graduation. This makes it possible to i) determine the raw gender differences in pay both across cohorts (the

* denotes a presenting author. Abstracts are organized by first presenting author's last name. 911
first cohort analysed graduated in 1986, the last in 2000) and, within cohorts, the changes in the differences after graduation; ii) to determine the extent to which field of study continues to cause a gender difference in pay; iii) the factors other than field of study that cause a gender difference in pay, including family responsibilities. The paper reports i) analysis of the effect of gender on labour force status, focusing on the social - physical - palpable, maternal, mute - fabric of the city to the social and political. Broken windows are a poor model, in some ways, for what it is to have broken down and need repair as a person. Sociology has been here before, yet Thrift's thesis neglects this history.

SMITH, MICHAEL* (McGill University, michael.smith@mcgill.ca)
Did Rising Inequality Cause the Recent Financial Crisis?
One of the possible explanations proposed for the 2007-2008 financial crisis is rising inequality in the United States. Rajan (Fault Lines, 2010) and others proposed the following explanation: i) associated with rising inequality, incomes stagnated or declined in the lower half of the earnings distribution; ii) this provoked distributional conflict; iii) the US political system prevents a response to this that would involve taxing the better off to provide income-supporting transfers to those experiencing stagnant or declining incomes; iv) but the political system has allowed a response to distributional conflict through a liberalization of access to credit including, in particular, access to mortgages for those with relatively low incomes; v) the financial crisis was caused by a boom in house prices caused by house purchases by those ill-equipped to make mortgage payments and this, in turn, caused a wave of mortgage defaults which provoked the crisis; vi) the aggregation of default-prone mortgages into securities (especially collateralized debt obligations) held by financial institutions ratcheted up risk in the financial system which, in turn, exacerbated the financial problems caused by defaulting mortgage holders. Rajan provides little evidence in support of this interpretation. This paper addresses the following questions. i) Did incomes stagnate or decline in the lower part of the income distribution in the decades leading up to the crisis? ii) Did distributional conflict cause the liberalization of credit in the form of sub prime mortgages? iii) Was it the provision of mortgages to low income house buyers that caused the boom and subsequent bust in house prices. iv) To what degree was increased risk in the financial system caused by policies encouraging the issue of sub prime mortgages? On the whole, the evidence raises doubts about the rising inequality account of the financial crisis.

SMITH, PHILIP* (Yale University, philip.smith@yale.edu)
On Dry Othering
Existing theories of Othering can be thought of as 'wet Othering'. They focus in metaphorical and material ways on the slime and ambivalent. In such theoretics Othering is associated with intense emotional reactions. Those perceiving the 'Other' feel intense hatred, disgust and dread. This paper introduces the new concept of 'dry othering'. This involves a completely different logic. Those doing the Othering feel - or are believed to feel - nothing at all. The victim of Othering is a mere object to them - one that does not evoke emotional responses. The logic of action is not symbolic as in wet othering but rather purely-instrumental. Victims of this kind of Othering are traumatized not by an awareness that others think they are disgusting and enjoy their humiliation (an emotional response) but rather by realizing that they are mere objects to the Otherer (who has no emotional response). Social theory on the gaze is used to make sense of this situation. The theory is illustrated with reference to accounts of unethical medical experiments, Alien abduction narratives, animal attacks, torture and serial killing.

SMITH, ROBIN* (Cardiff University, smithrj3@cf.ac.uk)
HALL, TOM (Cardiff University)
The Urban Fabric, Repair and the ‘Good Enough’ City
This paper considers the work that repair might do in mending and smoothing over matters of survival and the physicality of the city. Small acts of material care can seem inconsequential in the face of the global risks that menace the modern city and the brutal conditions, exclusions and exploitation that some of those cities are home to. Yet a humanist sociology might be sympathetic towards piecemeal and everyday activities which aim to put right, one step at a time, things gone wrong – deviant occurrences, ugly moments when life in the city breaks down or does not play out as we might want it to. Ken Plummer’s recent call for a sociology of hope takes this line, insisting on the need for ‘a down-to-earth pragmatism of empathy, justice, kindness and care’ and inviting sociologists to ‘think small in a big way’.

Something similar – thinking small, in a big way – can be found in the writings of human geographer Thrift, though differently inflected. Thrift directs attention to mundane activities of urban care and maintenance – street cleaning, roadside repair, emergency call-out – and invites us to take these unremarkable, everyday activities as a template or spur for thinking about the social and political life cities. Similarly down-to-earth or at least anti-utopian, he suggests that thinking about repair might be a way in which to think about the good city, or a good enough city. Our paper contends that arguments about urban repair do not extend so very easily from the physical – palpable, maternal, mute – fabric of the city to the social and political. Broken windows are a poor model, in some ways, for what it is to have broken down and need repair as a person. Sociology has been here before, yet Thrift’s thesis neglects this history.

Methodological Complexities Involved When Using Visual Methods in Dementia Research
Methodological complexities involved when using visual methods in dementia research Sarah Kate Smith & Gail Ann Mountain, School of Health & Related Research (ScHARR), University of Sheffield
In our study of the subjective experiences of older people with dementia when interacting with others and with technology, we have used video recording as a key method. Dementia impairs verbal communication, and this can have significant impact on how researchers may explore individual’s subjective experiences. Non-verbal communication such as gestures, body language, facial expression and posture therefore has greater significance when creating this understanding. The benefits of using video based methods in dementia research are two-fold, these methods are key to the faithful representation of non-verbal behaviour. Second, these methods can overcome some of the communication issues that can be encountered when interacting with people with a dementia diagnosis.

We report how our use of video recordings has provided us with important data to make sense of people with dementia’s interactions with technology, the challenges of visual data analysis, and how the project has led to new understandings of how such data can be analysed and represented. Data will be presented and discussed, providing an arena for methodological discussion and debate. Second, the methodological issues to be discussed include the need for greater focus on the processes of visual data analysis (Schnettler and Raab, 2008); whether more rigorous approaches to visual data analysis will lead to objectification, generalisation and loss of quality and expressivity (cf. Pink, 2011); and ethical issues in the use of visual data.

KEYWORDS: dementia, visual methods, qualitative, touch-screen technology.

SMITH, TOM W.* (NORC at the University of Chicago, smitht@norc.uchicago.edu)
The Origin and Diffusion of Comparative Survey Research
Cross-national, survey research emerged out of and developed along with many seminal megatrends of the 20th century including globalization and decolonization. It was also shaped by such major historical events as World War II, post-bellum collective multilateralism, and the spread and collapse of Communism.
The development of cross-national, survey research is an example of what Rogers calls the diffusion of innovation. Public opinion polls were created in the United States in the mid-1930s and spread to other countries. Like all diffusions, its development was innovation specific and was both aided and hindered by particular characteristics of survey research.
Its expansion was part of the general process of globalization. For survey research, globalization involved considerable interaction between the global product (survey research) and the local markets and cultures. Additionally, as Oberschall has noted “the expansion of surveys in general and public opinion polling in particular was part of the general growth of democracy within and across societies.” Surveys in general and public opinion polls in particular typically develop and only thrive in open, democratic societies. Democratisation in general and decolonialization in particular opened up more countries to surveys.

Besides being shaped by these megatrends, the development of cross-national, survey research was influenced by historical events such as World War II, post-war collective multilateralism and the founding of the UN, and the Cold War.
This paper examines 1) the emergence of cross-national, survey research including the role of early adopters (e.g. survey-research organizations), 2) the initial diffusion of survey research, 3) foundational survey-research meetings and associations, 4) the impact of World War II, 5) the role of the UN and other international organizations including the International Sociological Association, 6) initial comparative surveys, 7) the contributions of international exchanges, 8) later developments, and 9) impediments to development and diffusion.
of such individuals. This method also enabled comparisons and similarities when attaining, using and maintaining AT and its contribution to the quality-of-life at home for their AT use for personal care ADLs. Furthermore, the study examined care services, or sourced by themselves, and utilised whilst they lived at home in their familial carers were provided with AT for personal care ADLs by formal social care. Services in the UK. This research aimed to determine the extent to which PWD and tasks. Examples include: brightly-coloured raised toilet seats, easy-use tap heads for personal care ADLs and after taking time out overseas.

The Role of Assistive Technology for Personal Care Activities of Daily Living to Enable Families to Care for Relatives with Dementia in Their Location of Choice

The UK’s National Dementia Strategy objectives include: i) ensuring that people with dementia live well (whether in their own home or in a care home) and ii) a call for more research on the role of Assistive Technology (AT) to address the social care needs of people with dementia (PWD) and their carers. This research focussed specifically on AT for personal care Activities of Daily Living (ADLs); bathing and washing, dressing and grooming, toileting and continence and feeding tasks. Extrinsic constraints included raised toilet seats, easy-use tap heads, and easy-grip cutlery. Such AT is now provided by some Local Authority Social Services in the UK. This research aimed to determine the extent to which PWD and their familial carers were provided with AT for personal care ADLs by formal social care services, or sourced by themselves, and utilised whilst they lived at home in the community. The same individuals were also assessed whilst living in a care home for their AT use for personal care ADLs. Furthermore, the study examined the role AT can play in enabling those caring for a relative with dementia to make choices about their location of care (particularly, whether the use of AT could delay an institutionalisation decision).

An in-depth multiple contrasting case study design explored perceptions and experiences of formal (care home keyworkers) and familial carers of care home residents with a clinical diagnosis of dementia on AT use for personal care ADLs. The results are based to assess the difficulties and preferences carers of PWD have when obtaining, using and maintaining AT and its contribution to the quality-of-life of such individuals. This method also enabled comparisons and similarities between individuals residing in different geographical locations to be compared and establish whether inequality in AT provision exists in the UK.

Rising Class Conflict, Resilient Communist Party-State: Explaining the Chinese Puzzle

After the collapse of Maoist socialist regime in 1978, China has experienced rising social equality and class conflict. Within a short span of 40 years, China has transformed itself from one of the most egalitarian to one of the most inequitarian societies in the world. With the rising social inequality, it is only natural that rising social inequality is accompanied by rising class conflict. The number of "mass incidents" has skyrocketed from 8,700 in 1993 to more than 200,000 in 2011.

What is surprising is the fact that despite the explosion of class conflict and civil unrest, the Chinese communist party-state is highly resilient and is not under any threat of regime change. There is no large-scale national labor protest, no violent peasant rebellion, and no robust democracy movement to challenge the legitimacy of the communist party-state.

The aim of this paper is to interpreting this Chinese puzzle of resilient party-state in the midst of rising social conflict from the workers, peasants, and the middle class. Why the rising social conflict and civil unrest did not lead to any political instability and regime change, like it did in other post-socialist societies? This paper argues that the Chinese communist party-state has done an excellent job in managing the class conflict among the workers, the peasants, and the middle class in the Chinese society. Indeed, the Chinese party-state not only wanted to stay in power, but it also was able to formulate and implement all sorts of developmental policies propelling the rise of China at the turn of the 21st century.

Why Should I Trust You? An Empirical Investigation of Determinants of Trust and Distrust in Romanian Post-Socialist Urban Society

Trust is a key factor in the development of collective action, and thus in the performance of communities, institutions and society. Seminal scholarship has given rise to the social virtues of trust and to a lesser degree those of caution. Consequently, scholars have expressed concerns regarding the social 'legacy of distrust', which have negatively influenced processes of democracy and development in the post-socialist states. While quantitative measurements of trust have become standard in cross-national surveys, in depth qualitative research has been largely exceptional but helpful. By employing a mixed-method design of cross-national analysis of secondary data and qualitative examination of 69 in-depth interviews in a post-socialist city, this paper investigates the determinants of (dis)-trust in post-socialist Romania. The analysis draws attention to the entwined social and rational origin of trust and distrust. Findings show that institutional trust has risen from post-socialist Hungary to the current political and cultural freedom to express opinions. However, institutional trust has remained low due to perceptions of widespread bribery and favouritism – not necessarily experienced but reinforced through social learning and the media – and to a general discontent with some institutions, particularly the police, the political elite and the judiciary. Conversely, interpersonal trust has been rapidly declining though
it had not entirely vanished and has remained generally confined to families and bounded groups. By growing social distrust, people have reacted to the increasing social inequality during the post-socialist transition and its associated figures of the insular individualist and predatory capitalist. This does not invalidate the thesis of socialist ‘legacy of distrust’, but significantly adds to it. Data quantification suggests that the impact of increasing social inequality during transition is six times stronger than the effect of persistent communist legacies on current levels of social distrust. This has important policy implications, which are outlined in this paper.

Relations Between Individuals at Work in a Contemporary Context: Necessary Changes in Communication in Organizational Context

Companies organize themselves around objectives that seek the maximum return to its shareholders or founders. However, when forming the individuals in a group to which these goals are achieved, dreams as well as desires and ambitions emerge.

Typically, subjects align with organizational interests in the expectation that their own goals are also achieved, existing three important issues in these working relationships. The first question relates to the symbolism of the “notion of work”. The second issue reinforces the role of work in social relations. Despite all the discussions involving the centrality of work (OFFE, 1989; BAUMAN, 2008), it still remains one of the central points of life. The third issue concerns the lack of work, the possibility of unemployment and frustration as reality (BALDISSERA, 2010). These subjects experience these conflicts and tensions of force paradoxically (BALDISSERA, 2010; KUNSCH, 2012).

Some factors explain this movement transformation in communication directed to employees: a new technological context (social networks); new relations between people and organizations, caused, for example, a new employee profile and fewer permanent links with companies, besides the existence of an internal environment of conflict and tension.

Employees need time to develop relationships and coherent narratives in their experiences within the organizations, but in a world where the future is already the day after tomorrow, in a fragmented environment, focused on project execution and flexibility, employees are not allowed to develop strong relationships (SENNITT, 2009). Communications directed to employees will be impacted.

The safety at workplace, employment and career in one organization is replaced by employability. The needs of the organizations are more important than the needs of its workers. The imperative of aligning organizational strategies can find counterpoint in the desires of the individuals in the organization. As professionals working in this field, communicators must understand those changes and challenges.

Gender Attitudes in the World of Work: Cross-Cultural Comparison

The paper deals with factors determining work-related gender attitudes. With the spread of emancipative values the difference between gender roles becomes vaguer but is still strongly dependent upon country characteristics. While values are usually regarded as factors impacting socio-economic behavior, my research underlines a less explored aspect: they are themselves formed and changed in the process of economic interactions. The objective is to assess the role of education and job characteristics among factors determining gender attitudes in different types of countries. More specifically, I focus on the interaction effect between education and employment characteristics on micro- and macro-level. Female labor force participation rate and ratio of female to male tertiary enrollment are used as the indicators of female involvement in labor market activities. The 5th wave of World Values Survey (2005-2008) serves as empirical base. The targeted group of population is the employed. Multilevel regression modeling is used. Accordingly to the results, work-related gender attitudes vary considerably by country. Education is a stronger predictor of gender attitudes than occupation and job characteristics. At the same time the higher occupational status and intellectual jobs and jobs with higher independence lead to more egalitarian gender attitudes. On the one side, the higher the labor force participation rate and ratio of female to male tertiary enrollment, the more egalitarian are work-related gender attitudes in the country. In the countries with the higher women’s involvement in education and labor market activities education and job characteristics impact gender attitudes to a lesser extent. Furthermore, there is less difference in female and male gender attitudes in such countries.

Rethinking Citizenship in a Post-National Constellation

Classical citizenship was understood as a status attributed to all those who are full members of a national state. Around the inclusion in this status and its expansion with new rights many social movements have fought their struggles. However, internal inequalities that have survived in many countries led some authors to suggest the existence of a hierarchy of citizenship. In other contexts, the mobility of people has reinforced fears and xenophobia, and consequently the citizenship is becoming there increasingly the legal basis for demarcating boundaries of inclusion and exclusion. New discursive semantics, such as communitarianism and postcolonial studies, react claiming for singularities on community bases to define belongingness previously expressed by citizenship and nation. The text deals with the question how the notion of citizenship could be extended to maintain its relevance today.

Ribeirinho Communities: Identity and Social Cohesion in the Brazilian Amazon

This article aims to observe the general processes of identity construction and social cohesion of the ribeirinho communities of Combu Island, an Environmental Protection Area, located on the left bank of the Guama River near the city of Belém, in the Brazilian Amazon Forest. These populations are concentrated along the rivers due to the lack of means of rail and road transport, using as a primary means of travel inland waterway vessels. In this sense, they are considered part of the so called ribeirinho communities, descendants of indigenous people and also the region of northeastern migrants coming from the great drought in the Northeast in the late eighteenth century and large integration projects in the Amazon from the twentieth century. This indicates that the interaction between ethnicity and multiculturalism is that this migratory movement qualify as social construct, in other words, individuals are not the region’s natural, but are adapted to the conditions and integrate historical, social and cultural inheritances with indigenous, colonial and migratory people. Thus, we propose to present some reflections on identity and social cohesion present in this part of the population of the Brazilian Amazon. Ribeirinho Communities are a blend of simplicity and complexity and based on social characteristics and demographic dynamics, we present the way of life of these different communities, through the relationship between territory and identity. The intention of this paper is to open a range of new interpretative possibilities on these communities, with no claim rule out pertinent analysis or establish universal truths.

In this paper we focus on recent attempts of the international community to help African nations to professionalize their armed forces towards proper and effective capacities in dealing with new security threats all over the continent. One of these programs is the US-led African Partnership Station. In the framework of this program, the Netherlands Navy has launched a project called African Winds 2013, in which seven West-African countries were visited to train themselves and host-national militaries, particularly marine and navy forces, in: diving, hydrographic research, amphibious landing operations, illegal fishery policies, boarding procedures aimed at anti-piracy measures, economic development, etc. In this paper an assessment will be given of those activities, based on field work at sea and evaluations by the participants themselves. There will be a connection with previous research on training and educating young African cadet-officers in Western military academies. Both endeavours will be analyzed on the basis of mixed-methods military sociological research.

**Röyama Masamichi’s East Asian Cooperative Community Theory**

Röyama Masamichi’s East Asian Cooperative Community Theory. While I was conducting the long-term project “Northeast Asia's Transnational Space”, I was interested in the problem of when and how East Asia became identified as a unit. Soon, I became interested in the way that ‘East Asia’ is called and requested. To approach the task, I have been interested in East Asian Cooperative Community (EACC) theorists such as the philosopher Miki Kyōshi, economist Kada Tetsu, and international politics scholar Röyama Masamichi, and I will mainly talk about Röyama Masamichi in the presentation.

The core of Röyama’s EACC Theory is a region or regionalism. I would like to talk about the issues related to regionalism in the relationship between East Asia and the world, which is the relationship between particularity and universality, speaking in the abstract. I will divide Röyama’s regionalism into three aspects based on universalism.

First, it is the attempt to escape from the international universal order caused by the Manchuria issue.

Second, it is the attempt to make ‘East Asia’ into a meaningful region, emphasizing the special identity of East Asia.

Third, it is not that the regionalism of the EACC is a particularization of the world order but that the EACC itself constructs a universal world order.

Lastly, I will wrap up my paper by discussing following 3 topics. 1)Japan’s leadership position 2)Horizontal regional order vs. Vertical intra-region order 3)The fact that the vertical intra-region order, which was attempted by Japan through the war, was realized by the U.S. after Japan’s defeat.

**Women, Disaster and Challenges: A Case Study from Iran**

During the past decades, Iran’s natural disasters such as earthquakes, droughts and floods have caused a considerable loss of human lives and livelihoods, environmental damages and the destruction of economic and social infrastructure. Although 49.6% of Iranian population are female but gender analysis has been ignored in the most national reports and surveys related to different aspects of disaster management. This study aimed to highlight the challenges of women before, during and after natural disasters and to investigate the capacity of Iranian women to reduce the consequences of natural hazards. Data collection was done by the interview with affected women of Varzaghan and Bushehr earthquake (2013, 2012), field observation, and review of related documents as well. The findings indicated that although the investigated women were affected more than men but their needs and problems were not identified sufficiently. On the other hand, women vulnerabilities were highlighted more than their capacities and capabilities in handling the disasters. In conclusion, it is important to consider women participation in all phases of disaster management (mitigation, preparedness, response and recovery). Gender analysis with localized/standardized analytical tools can be suggested for future studies.

**A Comparative Approach on Migration in Post-Communist Societies; The Case of Albania in East-European Context**

The post-communist transformations in Central and Eastern Europe represent an interesting example for comparative studies: a number of countries began this transformation from the same starting point (1989), following more or less the same common goal of moving towards democracy and liberal market economy, and EU. Based on the comparative method Brzezinski predicted twenty years ago (as it was later confirmed with surprising accuracy), the historical calendar of those countries (the article “The Great Transformation” 1993), given an example of ‘thinking comparatively’ and foreseeing the future.

This paper is regarded with the hypothesis: Albania is an excellent laboratory for studying comparatively the new migratory process. The collapse of the socialist system was viewed with concern by many policy-makers in Western Europe who expected their affluent countries to be flooded by immigrants. Yet, this fear did not materialize and post-communist East-West migration was rather moderate. The only exception is Albania, whose emigration displayed features of an exodus. No other country has been so affected by migration, in such a short period of time like Albania has. It is confirmed that 34.2 percent of the Albanians have immigrated in more than 30 other countries, while the world migrant average is about 2.7 percent. And including the migrants that have spent 3 considerable lengths of time abroad, and have made their return back to the country, than we have a country in which more than half the population has experienced migration in the last two decades. This paper is an attempt to give a comparative answer to the question: “Why so many Albanians have migrated in such a short time, quite different from the other ex-communist countries, i.e. the countries with the same historical fortune?” In Albania, quite different from other countries, migration is shaping the society...

**The Strange Case of Soviet Sociology: A Goffmanian Analysis of a Failed Discipline**

History of the Soviet sociological movement is an intellectual puzzle. Sociology of science routinely identifies success in academic world with gaining intellectual recognition (Meritorian version) or boosting credit through manufacture of “facts” (constructivist version). Soviet sociologist enjoyed enormous popularity at the time of its emergence (1960s), survived political prosecutions, and continued its expansion after Perestroika with its leaders attaining status of disciplinary cult figures. A commemorative tradition developed with most prominent figures leaving autobiographies. A whole industry of hagiographic literature emerged. All evidence of success was present; at the same time, Soviet sociology left no intellectual legacy: neither theories nor empirical findings from the Soviet times are circulating today, the only book from this period still in press and widely cited is a methods textbook (by Yadov), and authority of its leaders has been never translated in practical politics. Yet, this fear did not materialize and post-communist East-West migration was rather moderate. The only exception is Albania, whose emigration displayed features of an exodus. No other country has been so affected by migration, in such a short period of time like Albania has. It is confirmed that 34.2 percent of the Albanians have immigrated in more than 30 other countries, while the world migrant average is about 2.7 percent. And including the migrants that have spent 3 considerable lengths of time abroad, and have made their return back to the country, than we have a country in which more than half the population has experienced migration in the last two decades. This paper is an attempt to give a comparative answer to the question: “Why so many Albanians have migrated in such a short time, quite different from the other ex-communist countries, i.e. the countries with the same historical fortune?” In Albania, quite different from other countries, migration is shaping the society...

The (Im)Possibilities Of The Politics Of Solidarity: Human Rights Defenders Discourse, Humanitarian Aid Dynamics and Transmigrants Experiences In Mexico’s Transit Assistance-Based Places

Mexico has the most transited migratory corridor in the world. The complex migratory flows transiting the country—mainly Mexican, Central and South American—have historically been perceived as economic and male. Scholars have noted as problematic the categorisation of the ‘labour migrant’ as being exclusive-ly voluntary. It has been demonstrated that framing agency through simplified understandings of ‘voluntary’ and ‘involuntary’ movement cannot easily capture the realities of movements along the Mexican corridor. Identification using legal categories such as ‘illegal’ migrant end up demarcating and ‘invisibilising’ individuals eligible for protection. The securitisation of borders and criminalisation of migration throughout the 20th century, led by the global north, has intensified and has added further fuel to the fire. Protection has still not been clearly delineated for the undocumented and seems to be eclipsed through the criminalisation of migration. Incidents such as death, rape, kidnappings and other types of abuse faced by transit migrants have opened up the debate among key human rights stakeholders on solidarity and protection. Human rights defenders have established shelters, humanitarian aid, led manifestations, caravans and campaigns ‘in solidarity’ with the migrant among other activities and services. These forms of solidarity have been predominately presented by human rights actors to the Mexican government through human rights and humanitarian visa appeals for migrants to transit the country. These appeals and other forms of emerging humanitarian aid dynamics are occurring outside the refugee protection regime. Also the majority of human rights defenders are non-state actors—albeit there is reliance on states for the implementation of human rights. The purpose of this paper—based on extensive qualitative research in transit-assistance based places—is to explore what kind of contribution the politics of solidarity has in (re)shaping the transmigrant subject; focusing on key human rights defenders discourse, humanitarian aid dynamics and transmigrants experiences.

Involvement in Physical Leisure Activities in Low Income Households

In Norway as in most other Western countries, the research body on involvement in physical leisure activities like sports and fitness activities indicates a strong connection between high involvement, good health and social inclusion and well-being. However, this connection detects an involvement pattern shaped by social class and social exclusion. Families with low economic, cultural and social capital have the lowest involvement in physical leisure activities as well as the biggest health problems.

The paper will focus on: (1) how parents in low income households conceive, experience and handle their possibilities to participate in physical leisure activities and sports in their local communities, and further 2) what impacts these conditions may have on children’s participation in physical leisure activities.

The data material consists of qualitative interview from a strategic sample of 141 households belonging to low income households. Both Norwegian and non western immigrant households are represented in the sample.

The overall findings showed that the involvement in physical leisure activities was strongly restricted by lack of economic capital both for the parents and the children. Most of the informants were single mothers and they had no resources to give priority to their own wishes for participation in fitness- and leisure activities. The children were also deprived of the opportunities to participate and thus less included in the peer groups in their neighbourhood. Even though the studied households possessed low economic capital, they differed in cultural and social capital. Those with the highest amount of cultural and social capital were also those who were able to articulate and claim their needs for finance support for leisure activities from the municipal social service.

Women’s Work and Reasons for Absence from Work

The equal opportunities for women in the Scandinavian labour market have been improved the last decades. But in terms of caring tasks in domestic life there is still a way to go, and therefore it is a challenge especially for women to combine the two spheres. During the period 1980 to 2009 the sickness absence among men in Norway has been relatively stable while the sickness absence among women has increased 70%. Women’s higher sickness absence rate is not exceptional. Comparative studies show that women had a higher rate of sickness absence than men in most countries. But they also found that there is lacking knowledge about the reasons for women’s higher sickness absence.

This paper will focus on a) women’s self-reported reasons for their sickness absence, and b) the importance of social capital at the work place and in their domestic life.

The data material is responses from a postal questionnaire sent to Norwegian long term sick listed women with mental illness or musculoskeletal diagnoses, and in-depth interviews with a sample of long term sick listed women with the same diagnosis.

The overall findings showed that women’s sickness absence has to be understood as a combination of demand, control and social capital both at the work place and in their private lives. Persons with high social capital both at the work place and in their domestic lives have the best prospects to return to work. Single mothers often have low social capital in both spheres, and they are the most vulnerable group. The political consequences for reducing women’s sickness absence will be that it is urgent to focus not only on measures at the work places, but also at women’s burdens in the private sphere.

SOLIS, PATRICIO* (El Colegio de México, p.solis@colmex.mx)
Socioeconomic Background, Education, and Youth Work Transitions in Mexico City

Recent research in Mexico shows that the risk of suffering precarious work conditions is significantly higher among the youth. This situation has aggravated after the economic recession of 2008-2009. On the other hand, educational research indicates that the returns of education have decreased, thus rising labor market vulnerability even among those highly educated, who used to have a secured access to top-level occupations. These trends might suggest that labor market hardship has emerged as a widespread phenomenon among the Mexican youth, irrespectively of socioeconomic background and educational attainment.

Bus is this actually the case?

In this paper we explore this question by analyzing the early occupational transitions of a representative sample of 2,900 men and women between ages 18-19 who responded a retrospective survey on educational and occupational trajectories in Mexico City. We focus on the effects of socioeconomic background, educational attainment, and family events on four occupational transitions: the entry into the labor force, job shifts between jobs, exits from the labor force, and reentries into the labor force. Using event history analysis models, we devote special attention to the competing risks of entering into service class positions, intermediary occupations, and what we define as "low quality" occupations.

Results confirm, as earlier research has suggested, that a significant number of young individuals initiate their occupational lives in "low quality" occupations, and many stay there in subsequent job shifts/reentries. Also, risks of labor disqualification are significantly high among those with higher education. However, these risks remain closely associated to socioeconomic background and educational attainment. In this sense, far from replacing or blurring traditional inequalities by socioeconomic background and educational attainment, the rising labor market vulnerability of the youth in Mexico mounts onto these inequalities, reinforcing their negative effects.

RC34-602.9

SOLIS, PATRICIO* (El Colegio de México, psolis@colmex.mx)
Youth Parental Emancipation in an Unequal Society: The Case of Mexico

The paper analyzes the housing transitions of young Mexicans from a social inequality perspective. Mexico is the most unequal society among OECD countries. The calendars of marriage and childbirth are significantly different across socioeconomic strata, with surprisingly low ages at marriage and first child among those coming from disadvantaged families. Migration (both internal and to the United States) has become a frequent event in the lives of young Mexicans seeking job opportunities. In this context, residential emancipation may follow very different patterns among youngsters coming from different social backgrounds.

The paper will look at these differences by characterizing emancipation in association with marriage and childbearing. Although these transitions are obviously related to emancipation, the association is not universal: many newly-wed sons and daughters remain living with their parents. Others move out before entering into marriage. Thus, a proper characterization of emancipation must take into consideration the different life course pathways that emerge from taking into consideration the occurrence, timing, and sequence of this transition in combination with other family events.

Once these patterns of emancipation are identified, I will analyze their incidence and determinants among socioeconomic strata, taking into consideration the association with trajectories in other domains, and specifically with occupational events/trajectories. The aim is to explore whether early occupational uncertainty relates to different emancipation pathways.

The analysis will be based on data from the EDER 2011, a recently released retrospective biographical survey that covers the educational, occupational, residential, and migration histories of 2,900 Mexicans of three birth cohorts. The survey reports the ages of occurrence of all the events considered in the analysis. It also includes a full module on family background, thus allowing a thorough exploration of the association between socioeconomic origins and emancipation.

PLANTER PÉREZ, KARLA* (Universidad de Guadalajara- Centro Universidad de Ciencias Sociales y Humanidades, karlapanter@yahoo.com.mx)
Modernidades Múltiples: La Experiencia Tapatía De La Modernidad Del Fin De Siglo

Modernidades múltiples: la experiencia tapatía de la modernidad del fin de siglo. 

Responsible: Héctor Raúl Solís Gadea y Karla A. Planter Pérez

De carácter diacrónico intentará captar, a través del análisis de la memoria, la forma en que se ha modelado la experiencia de la modernidad en Guadalajara.

Objetivo general del proyecto: llevar a cabo un análisis, entre distintos grupos y sectores sociales, de la forma en que los tapatíos asumen las transformaciones de la vida moderna, se adaptan a ella, o las asimilan, entablando procesos de negociación del orden social. La perspectiva de trabajo parte de la premisa de que no existe una ruta única, ni una forma única, de entender la modernidad, sino múltiples posibilidades para definirla y dotarla de sentido. Cada grupo social tiene distintas opciones a mano y las aprovecha o construye dependiendo de una serie de condiciones de orden material, cultural y político. Aspectos como la religión, la educación, los valores heredados, la clase social, el grupo de edad, la situación de generación, etcetera, son clave para determinar el tipo de adaptación/negociación con respecto al proceso de modernización que se vive.

Método, el proyecto pretende utilizar diferentes técnicas analíticas, entre las que se encuentran la encuesta, la entrevista a profundidad, los grupos de enfoque, el análisis de los lenguajes, la observación, el análisis documental y la exploración fotográfica.

Normalmente, los estudios de valores no logran captar aspectos más profundos de la vida social, como los comportamientos reales y los sentimientos, los cuales son elementos cruciales para una adecuada interpretación de los valores y su significado. Un abordaje como el nuestro es más útil para lograr una comprensión más cabal de este tipo de fenómenos sociales.

Gender Bias in Higher Education - Study on Indian Universities

Owing to higher priority assigned in successive Five Year Plans, Higher education in India has witnessed phenomenal expansion, with establishment of number of State and Central universities, Institutes of advanced studies, and numerous private and deemed universities. Pay scales revised to bring them on par with other prestigious services in public and private sectors, rendering it highly sought after sectors of employment. It encompasses graded disciplines and positions with differential status, recognition and rewards. It is hypothesised that, distribution of academic positions and allocation of disciplines could be determined by the social forces and extraneous considerations among which gender is an important variable. The paper addresses this issue in the context of Indian universities in which the number of women faculty is on the steady rise in the last two decades. Data collected through interview of 362 women faculty members from 23 South Indian Universities reveals that, gender segregation of academic disciplines and positions are discernible with concentration of women academicians in soft disciplines as well as at lower academic positions. The hard core applied disciplines, being where the faculty could be more visible, receive more research grants, claim consultancy and patents have predominantly male faculty. Even in terms of cadre composition, the proportion of women faculty decreases with successive higher academic position. Study further reveals that, even among women academicians religion, caste and rural urban background are pertinent in determining the patterns of segregation subjecting women faculty to double discrimination.

Limitations of ICT in Inducing Inclusive Growth

India has been viewed as a leading player in the field of Information and Communication Technology (ICT) and as an emerging economy wedded to the policy of Welfare State has been adopting and harnessing ICT for inclusive growth through diverse policies and programmes. Education, health, agriculture, transportation, production, government and such other sectors that facilitate empowerment of masses have come to employ ICT for enhancing their efficiency and performance. However, the inherent socio-cultural milieu and demographic constraints that have been the bane of development process in India is assumed to have come in the way of successful implementation of these ameliorative schemes. The so-called "digital divide" that gets accentuated by the preponderance of rural masses, the information "haves" and "have nots", lack of ICT infrastructure in far flung and remote rural areas, hesitancy among the masses in adoption of new technology coupled with aspiration deficit, have rendered these schemes exclusive, rather than inclusive in impact and as such its vision of emerging as a vibrant knowledge society appears to be a distant reality. Emphasis on application and adoption of ICT in the process of development appears to have divisive and polarizing implications, leaving the people for whom the process is meant even more excluded. The paper seeks to analyse these developmental efforts in India based on the analysis of evaluation reports on various welfare and amelioration schemes submitted by evaluation and monitoring agencies.

Correlates of Prestige Grading in Medical Profession

Professions come to be arranged in a hierarchy based on their functional importance in the society, which in turn determines their prestige, authority, rewards and sometimes even their autonomy. Traditionally, professions represented homogeneous groups of people sharing common traits in terms of knowledge, skills, values, status and rewards. But of late, owing to growing complexity of professional knowledge systems, increasing specialization, adoption of advanced technology in their practice and ever increasing diversity of services expected to be delivered by these professions, intra-professional heterogeneities and as such distinctions appear to be on rise with professionals coming to be graded within professions on professional and non-professional considerations. The paper explores these developments in medical profession in India, wherein medicine as a profession has made significant advances. A survey of 550 medical professionals in South India reveals that medical profession is a highly stratified entity with practitioners being segregated and graded on the lines of specialization, level of specialization, branch of medical practice, sector of employment, size and technical sophistication of hospital, institution from where professional credentials are obtained, length of practice and the like with rewards and recognition in commensuration, giving rise to inequities and exclusions within medical profession. Further, non-professional variables such as class, caste, religion and gender, by themselves, are not as much responsible as the professional variables stated above for professional differentiation in medical profession although they appear to be associated with opportunities for entering into high prestige sections within medical profession.

Technology Driven Inequities at Work Place in India

Indian work organizations, both in service and manufacturing sectors, have brought about significant restructuring and refinement of operations through adoption of new technologies that has become imperative and indispensable for survival in the highly competitive globalizing world. These developments are assumed to be having significant long term implications for the work organisations reaching in terms of skill up gradation, composition of workforce, restructuring of organisations and work process involving huge capital expenditure. This rationalisation process has also implications for workforce in terms of increased wage differentials owing to emphasis on skill, absorption or replacement of workers with skills no longer required as well as adjustment with changed work culture. The findings based on a study of 41 service and 36 manufacturing establishments across three States in India indicate that higher skill requirements have rendered a significant proportion of workforce obsolete and their tools redundant. The adoption of the so called "skill biased" technology is found to be having significant implications for variations in wage inequality both within and between industries. While workers with higher skills obtained through formal courses are being inducted, the older obsolete workers are on the verge of being expelled through diverse schemes of compensation or are being absorbed in the barely required unskilled cadres at considerably lower wages. This phenomenon is more marked in private sector service industries compared to public sector manufacturing establishments. As a result of disappearance of moderately skilled workforce, these organisations are found with skill polarisation and heightened wage inequalities.

Value Systems in Transformation: Changing Values in Relation to Changing Societies

Changes in the value systems are usually studied by comparing some values, value types or value orientations and their estimates over time or between generations. With few rare exceptions, there are practically no studies concentrating on the transformation of the value structures or on the changing relations between different values. Associations between values are being seen as stable and universal between both countries/societies and over time. This is an assumption that cannot be defended in a world that is more and more characterized by cultural and social pluralism as well as alteration of traditional cultural templates, communication technologies, economic systems, political ideologies etc. All this necessitates the usage of methodological and theoretical approaches that are enabling to recognize the heterogeneity in the value structures within societies and between different time points. In order to compare value systems, they must be equivalent in their structural formation. If this is not the case, then diverse value structures must be distinguished and structural differences (between societies and over time) that arise, must be explained by the variations in the socio-economic or other settings and by the developmental trajectories of those settings.

Current paper intends to fill this cap. Using value questionnaire developed by Shalom Schwartz (PVQ21) and data from European Social Survey, present study argues that the assumption of homogeneity of value structure does not hold. Using latent class modeling framework, diverse value structures are being discussed in three European countries and in different time points. These value systems are being compared between societies and over time. Culture-specific aspects of them are being allocated and related to wider socio-economic contexts. Finally, the temporal dynamics of those cultural specificities are explored and further related to the historical settings of their development.

Current Attitudes of Supporting Older Parents in Asia: Korea, Malaysia, Hong Kong, Singapore, and Japan

This paper presents the attitudes change for supporting older parents according to social changes. In Asian countries, it has been said that elderly people are taken care by their families and it is the Asian-cultural tradition. Therefore, this research investigates attitudes change in accordance with social changes such as pensions, social services, guaranteed incomes, etc.

(Methods)
Since caregiving has been heavily considered as women’ role, surveys were conducted on female university students in Seoul, Kuala Lumpur, Hong Kong, Singapore, and Tokyo from 2011 to 2013. Around 200 questionnaires were gathered in each area.

(Questions)
1. To investigate changing attitudes toward supporting older parents in each countries.
2. To find out female caregiving roles by generations and countries.
3. To find out interrelations between social changes and attitude changes.

(Findings)
Similarities 1. As for Korean and Japanese students, both female students wish to live with their own parents but not husband's parents. 2. They are willing to live nearby their own parent's houses but not those of husband's. 3. Mothers wish to live with and have supports by daughters in later years.

Differences 1. The majority of Korean mothers wishes to have financial support and the majority of Japanese mothers wishes nothing. 2. Both mothers expect support from their own daughters more than sons. 3. Employing caregivers at home are not an option in Japan but in Korea, Malaysia, Hong Kong, and Singapore. 4. The majority of grandparents are likely to live with children in Malaysia, Singapore even in Hong Kong but not in Japan and Korea. 5. Attitudes of supporting older parents are highly related to social policies and the financial independency of elderly people.

Transmedial Discourses. New Forms of Public Spheres?

Public discourses in general are determined by media, since they are not only distributed through media, but also constituted by them. Public discourses are typically conceptualized as part of mass media. With the so called social web, new discursive practices are constituted, which make it possible for different groups of users to participate in public discourses. Debates that are discussed in the mass
media can cause responses in segmented public spheres of the World Wide Web. Vice versa, content that is produced in blogs, wikis or social networks can become part of news coverage in the mass media. In addition to the public of mass media, some authors argue for the existence of a ‘personal public’ constituted by the World Wide Web. In the personal public sphere, actors use different rules of production and distribution compared to the public sphere of analog offline media. Both forms of public sphere, however, are connected with one another. It is therefore reasonable to describe today’s public discourses as transmedial discourses.

The concept of transmedia requires a change of perspective from single media and their use for social processes, to communicative networks consisting of different media in convergent, networked arrangements. It would be unreasonable to assume that discourses are only constituted through the web; this would not correspond to media practices in everyday life and would give the impression that there is a gap between online and offline media practices. I narrow my focus to online discourses as a way to investigate more thoroughly a highly important part of media practices. In my paper I place my focus on digital network media, first and foremost on the Internet, which can be characterized as a central point of reference for media convergence. I would discuss if and how public spheres are changing through the Internet.

Decline, Crisis or Change? Professional Status and Knowledge Authority Among Danish Doctors and Teachers

A common way to address the poor outcomes of public policy, for instance in areas like health care and education, is to blame policy failures on the loss of respect for professional authorities. No one today respects a primary school teacher as they used to do fifty or sixty years ago, and patients now focus on their own rights and google searches rather than the doctor’s orders. If not more, these are at least common narratives in public debates about professionals and why the decline – or even crisis - of professional authority is at the root of present problems. This paper aims to go beyond the narratives and investigate decline, change and restructuring of professional status and knowledge authority since 1950. Taking the Danish primary school teachers and medical doctors as cases, we explore how the status of the professional groups are changing (or not) over a sixty year time span. More precisely, we explore both the development of professional status in a general sense of a societal status hierarchy, and in a more narrow sense, understood as the professional authority vis-à-vis other professional groups, clients and the state.

While notoriously difficult to measure, not least going back in time, we hope to be able to assess possible changes through a combination of various data sources. Besides socioeconomic data about salaries and education, we mainly analyze status and authority through a comparison of professional selfperceptions and narratives as presented in magazines distributed within the professions.

Explaining the World of ‘Big Data’: Global IT Consultancy and Reshaping of Policy Knowledge in South Korea

This analysis of the process through which South Korean government produced policy knowledge for ‘Big Data’ policy demonstrates a certain actor’s - global IT consultancy - intervention upon it. The gap between an actor’s cognitive capacity and the complex, thus unobservable world gives birth to a number of institutions producing knowledge, which either describes the world, but perform as the inter-subjectivity among actors for their reflexive adjustments, thus have ‘performativity.’ Given this, the article explores how the knowledge offered by global IT consultancy converted the Korean government’s attempt to describe the sociotechnical world of ‘Big Data,’ and examines how the intervention persisted. The precedent STS scholars’ arguments on performativity starting from Callon’s analysis of economic interactions have demonstrated how a certain way of explaining the world forms the frame among actors while overflowing from the outside of the frame is pervasive. The performativity scholars emphasized continuous maintenance and re-arrangement of the explanatory devices, and successively showed how actors support and reproduce the world. Nevertheless, this article suggests that the knowledge from global IT consultancy can still be performative even when the devices and their arrangement are increasingly deemed questionable and replaced by other ways of explanation; overflowing does not necessarily mean the weakened frame. At first, as Korean government introduced IT consultancy for the first time, changes of statistician, and examples of global IT consultancy to explain the changing sociotechnical environment, the concept of market transactions gradually substituted in the policy knowledge the past concept of cooperative relationship for contriving creative usage in which citizen take the lead. Even though such explanatory devices were questioned for their naive worldviews and once having excluded concept of ‘citizen’ overflowed, market model still persisted and ‘citizen’ was only taken as potential sources of lucrative data. The finding suggests our understanding of performativity of knowledge can be extended.

Social Conditions for Japanese Immigrant Attitudes Toward Institutional Elder Care

Although elder care remains within the family sphere in Japan, Japanese immigrants in the U.S. are bound to have distinctive pathways to determine whether to utilize formal care services from the native-born. Japanese immigrant women who are inter-racially married to American husbands experience complex adaptation processes throughout their lives as they encounter social conditions that differ from Japan. This research investigates of their attitudes concerning institutional elder care utilization as they relate to social conditions.

We conducted and analyzed in-depth interviews with 31 immigrant Japanese women between the ages of 40 and 84. We found that these women had acquired the norms of independent living through cultural acculturation, ultimately leading to their preference for non-family-based care. This paper focuses on the social structural conditions that facilitated this choice. We found four factors influenced the women’s attitudes toward the utilization of institutional elder care: 1) family living arrangement discouraging family care for elderly, 2) potential family conflicts between the caretaker and the elderly relative, 3) economic class, and 4) supportive cultural attitudes towards formal elder care and institutional availability. These factors tend to influence immigrant Japanese women’s preference for institutional elder care over familial care.

“Rubber Rice Bowls”: Work and Family for Women Entrepreneurs in Post- Socialist Rural China

The three decades of China’s market-oriented reform since 1978 have brought about an increasingly deregulated and privatized rural economy, which posed new opportunities and challenges for women to balance work and family. This study focuses on a unique group—women entrepreneurs—who were neither the Maoist “iron girds” nor the cheap laborers in capitalist workshops. Drawing on interviews from two coastal villages in Jiangsu and Zhejiang provinces collected during the years 2004-2010, while rural industries and petty entrepreneurship had become an important economic engine, this study finds that women, although underrepresented compared with men, had played an active role as entrepreneurs. Based on the life histories of 8 women entrepreneurs, this study finds different ways to balance work and family, whose strategies changed as the reform unfolded. In particular, women entrepreneurs described their employment as “rubber rice bowls”, in contrast with “iron rice bowls” of urban workers and “mud rice bowls” of peasants. Contextualized in the reshuffling of job hierarchies and the restructuring of social welfare institutions, women entrepreneurs found their “rubber rice bowls” satisfying due to its flexibility and potential rewards, but also challenging because of the increasing risks and competition. Such entrepreneurial dynamics led to various patterns of work-family balance among women entrepreneurs, which could not be summarized under the traditional gender norms or the socialist egalitarian ideology.

The Korean Webtoon As a Reflection of Society

Since 1990, the technology of digital media has been constantly developed in Korea, and the digital media became popular among the general public. With the emergence of the social network service(SNS), people increasingly expressed themselves with visual images, such as photos, icons, animated characters, etc. The new digital media expanded the scope of communication between people and visual images. Webtoon is the new genre of cartoon as the result of digitalization. Webtoon enables readers to easily access and to even participate in the process of webtoon making. The stories of webtoons show social experience in ordinary people’s daily lives. Webtoon readers become participants who share their own thoughts with webtoon artists and also create amateur works. Thus, the familiarity of webtoon increases. It is a remarkable big change in the history of Korean cartoon; thus, this research will discuss how webtoon influences people’s experience of seeing and interpretation. To do so, this research will study webtoon making process of webtoons by the artist, Pui Kang who is the leading webtoon artist in Korea, and analyze how the artist communicates with readers. Also, this research will show the different responses caused by media switching...
from webtoon to film. Today, webtoon makes changes on the ways of storytelling and positioning visual images and of interacting with readers. Also, the Korean webtoons are more broadly spreading overseas, such as France. With its increasing popularity and easiness to reach the public, webtoon is regarded as a driving force to boost the field of Korean cartoon industry.

The Impact of Adult Children's out-Migration on the Elders’ Psychological Well-Being in Rural China: Does Gender Matter?

This study examined the impact of adult children's out-migration on the psychological well-being of older Chinese parents left behind in their rural villages. Using data from two waves of the Longitudinal Study of Older Adults in Anhui Province, China, analyses showed that, controlling for personal characteristics and resources, the out-migration of children reduced the psychological well-being of their parents, particularly among older fathers. However, the transition to coresidence with an adult child buffered the negative impact of daughters' out-migration on the psychological well-being of older mothers. These results suggest ambivalent feelings on the part of older parents when their adult children migrate out of their home villages for work or marriage. However, there is an important gender difference in the adaptation to the out-migration of children. Mothers benefited from entering into a traditional multi-generational living arrangement when their daughters migrated; comparable fathers suffered from worse psychological well-being following entry into such an arrangement, presumably because living with children increased their dependence. It is concluded that a complex gender interaction needs to be considered when examining the consequences of dynamic intergenerational family processes in China.

Use It or Lose It? the Impact of Grandchild-Caring on Grandparents’ Cognitive Functioning in Rural China

Using the data from the waves of the survey “Well-being of Elderly in Anhui Province, China” conducted in 2001, 2003, 2006, 2009 and 2012 respectively, this study examines the impact of grandchild-caring on Chinese rural grandparents’ cognitive functioning through constructing multi-level growth curve models. The results show that, comparing to the low intensity care for grandchildren, high intensity care has protective effect for the grandparents’ cognitive aging, however, the effects of high intensity care depend on the age and gender of grandparents. The grandfather’s cognitive aging are protected by the high intensity care for grandchild whereas the cognitive functioning of grandmothers are suffered from the intensive care; and this gender difference tends to be widened as aging. These results support the hypothesis of “use-it-or-lose-it”, and imply the significance of gender roles and norms in the Chinese rural families.

Multiracial Parents and the Intergenerational Transmission of ‘Race’ and Belonging

In both popular culture and academic discourses, being ‘mixed’ is becoming increasingly ordinary in Britain. While there has been growing research on mixed race children and young people, very little is known about how mixed race people racially identify and socialize their own children. Many adult mixed individuals have now become parents - prompting the fascinating question of how they, as parents, think about the racial identification of their own children. Parenthood engenders questions about one’s ancestry and the ‘right’ socialization of children: What may such racialization bode for the future and significance of racial categories/terms, but also trends reported about multiracial people in large scale data sets, especially those in the US.

Educational Mobility in Three Generations: Single-Parent and Grandparent Effect

This study examines the educational reproduction of American families in multiple generations. The key question is how grandparents’ education contributes to the educational success of grandchildren, and how the grandparent’s effect differs for single- and two-parent families. The grandparent effect works through both demographic and mobility processes because grandparents’ education first affects whether parents have any children and how many children they have, before grandparents proceed to influence the educational mobility of their grandchild. Analyses build upon the mobility and demography model used in Mare and Song (2012), and draw on empirical evidence from the Panel Study of Income Dynamics. Recent researchers and policymakers alike have expressed a growing concern that single-parent family is responsible for the growth of an "undereducated class" in America. This study investigates whether or not grandparent effect contributes to the growth of the undereducated class from single-parent families in the grandchild generation.

Through Thick and Thin: Ecological Modernization in Thailand's Electronics Industry

Electronics manufacturing in Thailand has undergone substantial transformations over the last two decades, including with respect to technological environmental innovation. Business conditions in Thailand have been highly challenging during this period, as the country has weathered multiple changes of government, mass mobilizations, torrential floods, and uncertain institutions. Societal attitudes at the lower end of global supply chains, electronics manufacturing in Thailand has persisted through this period, even if not entirely thriving. Driven by growing international regulation of hazardous materials and waste electronics and the greening of global supply chains early in the new millennium, technological environmental innovation in these two decades? What has changed and not changed in electronics manufacturing in Thailand as a result? In what ways has electronics manufacturing in Thailand become more environmentally friendly since the beginning of the new millennium? The paper contributes to a discussion of the implications of the experience of Thailand’s electronics industry for social theories of technological and environmental change, including Ecological Modernization Theory.

Is Improvisational Theatre Really Improvised?: The Inherent Structure in Improvised Performances

The purpose of this presentation is to clarify the meaning of “improvisation” in modern society and the function of “formats” in improvised performances, and also to discuss the significance of improvisational theatre in modern society. Improvisational theatre, often called impro, is a form of theatre that has no scripts or pre-planning. It was systematized in Britain and the United States in the 1950s and used to train actors, and also developed as a performance genre in its own right. Gradually, it spread to various countries and is now used in various other fields such as school education, business, and community development. Today, the concept of “improvisation” in itself attracts considerable attention, and there is a tendency for people to regard it as a panacea for various problems. For example, it is viewed as a way of heightening our ability to live through unpredictable circumstances and of changing roles in social life.

In our research, we first investigated discourses about “improvisation” in books and websites to clarify the meaning of “improvisation” in modern society. This revealed that “improvisation” is explained using highly positive concepts such as...
as “freedom”, “flexibility”, and “resilience”, which are contrasted with the concept of the “structure” of society.

Secondly, we did fieldwork in The Laboratory School of Improvisation, which is an impro group that carries out impro performances and workshops in Japan, and interviewed its members. We found that when improvising on stage, the performers don’t express ideas freely in their own separate ways. They embody and share “formats” which constitute the explicit/implicit manners and rules of impro.

In short, “Improvisation” has paradoxical properties. Though “Improvisation” is represented as a concept that frees us from social “structures” and enables us to create stories with others flexibly, performers in fact acquire freedom by means of “formats” when practicing impro.

Is Rise of China a Threat or a Chance? a Comparative Analysis of Determinant of Perception on China in Korea, Japan, and Taiwan

The rise of China has been discussed in different area of social sciences, but it is still rare for sociologists in East Asia to address this issue. International dimension of social development in East Asia is, however, necessary and indispensable part in sociological argument and the recent rise of China is one of the core parts of such international dimension.

Comparison of Korea, Japan, and Taiwan in terms of their attitudes toward China provides us with a lot of sociological insights. Comparative analysis of expatriates’ guanxi-building in China tells us that Korean expatriates are more aggressively extracting guanxi mechanism than Japanese and Taiwanese counterparts. Our recent international collaborative research suggests that perception of “political risk of China” is different from Korean businessmen and Japanese/ Taiwanese businessmen.

This paper tries to conduct exploratory analysis of Korean, Japanese, and Taiwanese perception of the rise of China in comparative perspectives. More concretely, two research questions will be approached in this paper; namely (1) How people in three societies evaluate influence of China, and (2) Who are most concerned about the influence of China on their society, by using AsiaBarometer 2006, which is the only one dataset that enables us to compare Korean, Japanese, and Taiwanese views on China in connection with other important socio-economic variables.

Our data analysis reveals the fact that it is only in Taiwan that household income of the respondents has negative correlation with evaluation of the influence of China. Why is there such a difference? This paper, by answering this question, tries to argue that “perceived” relation is important in discussing the issue of the rise of China.

The Nexus Between Collaboration, The Internet and Productivity: An Empirical Study Of South African Science

Prior research has investigated the relationships between collaboration, connectivity and the publication productivity of scientists. Most of this research has been conducted in either the developed or developing countries where internet connectivity has been either well advanced or at the other end of the continuum. Investigations in countries that fall in between these two extremes are rare. Conducted among scientists and academics in South Africa, this study is aimed at filling this gap. Interviewing academics and scientists (n=204) from the sampled institutions, the paper presents details of how the above three variables are interfaced with each other in the South African scientific system which has become a strong contributor to science. The study also, from the policy point of view, brings out the features of scientific collaboration that exists in South Africa with its variations between the two sectors—academic and research.

Cultural Capital In Movement: On The Dissolution Of Traditional Educational Codes By Educational Policy and Social Movements Among First Generation Academics In Germany

Barriers to educational advancement are often described in the literature. In this connection, authors mainly refer to Bourdieu's concept in which a lack of suitable cultural capital is often a barrier to the educational advancement of children from non-academic families. Acquiring such capital, in accordance with this theory, is an essential prerequisite for success in an advanced educational career. Bourdieu paints a rather pessimistic picture of the chances of acquiring such capital. Codes of the milieu of origin survive, mediated through habitus, and continue to hinder educational advancement.

This paper, having conducted educational advancement in three generations in Eastern and Western Germany — that is, first-generation academics in the 1950s, the 1960s and the 1970s — a total of 89 biographical narrative interviews were conducted. Many cases were found to corroborate the Bourdieusian concept. At the same time, however, it was also apparent that there are also many kinds of mechanisms that contribute to the dissolution of culturally transmitted codes, and thus modify the “value” of the hereditary cultural capital in a given social stratum. To illustrate this, we will present a hermeneutic case reconstruction after Rosenthal that can be attributed to the type “social movements”. This case study will serve to illustrate the extent to which reforms in society and educational policy have led to a shift in cultural codes, and how such reforms can favor educational advancement.

The Growing Women’s Labor Market Participation and the Persistence of Inequality Between and Among Gender in Brazil

The last decades of development in Brazil have fostered a significant increase in women’s participation in paid work in both the formal and informal sectors. Looking into the significance of women’s growing labor force presence, this paper raises a number of questions to investigate to what extent women’s paid labor impacts inequality between gender (men and women) and among gender (women on the basis of class). We address that main issue by looking into the connections between women’s paid labor and unpaid labor and two main factors - the sex ratio in the labor market and the family, and the labor legislation and social policies concerning maternity leave and child care. Analyzing data from the 2012 national survey data (PNAD) from the Brazilian Census Bureau, we show that women’s transition to paid labor in Brazil has been taking place without a) significant changes in unpaid labor related to the persistence of the traditional sex ratio in the labor market and the family, and b) adequate policies geared to socializing responsibility for child care. We argue that a more equitable division of domestic work and children rearing in the family, as well as more inclusive social policies on parental leave and child care provisions are crucial to improve the balance between work and family (benefitting not women only, but men and children as well), and to foster equality between and among gender in the labor market and in the national sphere.

The Right of Women to a Free Violence City. a Case Study about Public Transportation in Mexico City
According to Women Human Rights, the government of the Federal District has
made significant efforts, particularly recognizing that gender violence hurts the
principle of respect to human dignity, makes difficult the participation of women
in similar conditions and slows down the whole development of countries in po-
litical, social, economical and cultural life, on January 29th 2008 the "Law Access
of Women to a Violence Free Life" is approved for the Federal District, through
which it is agreed that women have the right to live a life free from any kind of vi-
olence. In the framework of this law, the Institute for Women designed a program
to prevent, support and punish sexual violence against women traveling on public
transport in the city through actions aimed at promoting the rights of women, law
enforcement and citizen oversight. This program includes various activities such as:
Modules Care and Reporting Sexual Abuse cases in the Subway Public Transport System, Program "Athena" which is an exclusive service for women and
separation of men and women in the Metrobus, Light Rail and Subway Public Transport System.
In this way The purpose of this paper is to analyze the effects of actions to
prevent sexual violence that have been in public means of transportation: in the
practice of daily mobility, in the perception of transport security, and feminine
representations are built from this policy of gender equality.
The main hypothesis suggests that government actions in public transportation
contribute to the generation of spatial justice, and with it in the exercise of
the right to the city as a human right for women. Nevertheless, on the other side
we hypothesize that the program intervention has generated paradoxical effects
because they help to reproduce traditional representations of feminine and mas-
culine in the city.

Women’s Work and Family Life. the Case of Micro- Enterprise for Rural Women in the Central Zone of Chile
Among the most significant changes that have occurred in recent decades in rural areas in Chile highlights the increasing visibility of women in the labor mar-
et, which from our perspective is key for the effects it has on a personal level,
quality family life and living arrangements of rural families. In this context, the
exercise of an independent activity or the creation of a microenterprise is a pathway
for personal and family subsistence for an ever wider rural woman. Therefore,
from a perspective that combines quantitative and qualitative methods, the pur-
pose of this paper is to analyze specific cases of micro-enterprises rural women in
Central Chile, examining three specific dimensions: empowerment process, family-
ly restructuring and meanings built around productive activity.
The paper is part of a broader study held in the province of Nuble, Central Chile,
concerning with female work in different social and geographic spaces and the
effects of paid female work at personal and family levels and in local and na-
tional development (Proyectos DIUBB 133524 2/R).

Le Travail Migrant Temporaire: Une Nouvelle Figure Du Paternalisme Gestionnaire Dans La Division Internationale Du Travail? Le Cas Du Canada
Les flux migratoires ont historiquement accompagné les mutations du travail. Depuis quelques années, la transformation qualitative et l’expansion de ces flux
tendent à réorienter les politiques publiques en matière d’immigration et d'em-
ploy. À l’échelle internationale, le phénomène migratoire a laissé progressivement
place à celui de la mobilité professionnelle temporaire, notamment à la faveur
de la financiarisation de l’économie et de l’externalisation croissante des activités
dans le secteur tertiaire. Au Canada, cette transition, se traduit par la mise en place et
le développement de programmes de travailleurs étrangers temporaires qui drainent
une main-d’œuvre présente dans plusieurs secteurs, de la transformation indus-
trielle aux services comme l’héloterie/restauration et les télécommunications.
Elle provient de divers pays du Sud, dans le cadre d’accords commerciaux ad hoc
afin d’assurer un apport de main-d’œuvre qui s’inscrivent dans une dynamique transnationale, redéfinissent-ils certaines figures de la division inter-
nationale du travail? Dans cette étude, l’examen des discours et des pratiques des
entreprises engagées dans ces programmes montre à quel point leurs stratégies de
gestion sont imprégnées par un paternalisme managérial omniprésent dans l’ensemble de
l’ensemble des chaînes de valeur des secteurs affectés par ces flux (hôtellerie,
télécom, agroindustrie notamment). Ce paternalisme se distingue de celui qui a
caractérisé l’histoire de la relation salariale en ce qu’il semble relever d’une figure
nouvelle de la division internationale du travail. Cette communication dresse un
bilan critique de ces programmes en s’interrogeant sur la logique de leur gestion
de l’entreprise pour se référer à une figure de la division internationale du travail.

Digital Citizenship and Equal Access to Democracy
Democracy, as says the German philosopher Stephan Kirste, is a fundamental
human right. Every person needs to have space to public manifestation, to get
respect even this person belongs a minority group, to participate in political de-
cisions that regulate and define its own life. Without these guarantees it will be
unviable develop citizenship in front of majority groups and also State. Albeit this
concern there isn’t new, it became urgent when digital technologies expanded
themselves in the world. Safety, recognition, privacy, information, all this subjects,
and rights too, turn into the center of debates about social inclusion in a digi-
tal world. And to promote people inclusion one must to guarantee individuals
equality, what it will be facilitated by legitimate democratic regimes. Two issues
have to stay in the spotlight nowadays: how to organize popular participation in
digital Societies and, also, how to empower citizens to ensure their regular and
equal participation in the political decisions. Without inclusion policies by govern-
ments it will be very difficult do get it. Citizens must to have "access passwords", as
Brazilian social scientist Eugênio Trivinhão, to use digital systems, like specific
hardwares, updated softwares, domain specific language of digital media, adapt-
ted theirselves to speed web interaction that he calls "dromocracy"; and others
abilities needed in digital times and not ever available to everyone. This type of
exclusion, and also discrimination, concentrate power in some hands, what caus-
ing democracy imbalance. Solve these issues presented is the only way to people
inclusion and it’s a democracy essential condition too

Clean Energy and Political Stability: Challenges for International
Cooperation within the Union for the Mediterranean
The challenges represented by "global warming" and "energy demand" have
contributed to insert the environmental debate among the main topics of interna-
tional cooperation agreements. The Union for the Mediterranean (UfM) – an institu-
tion which comprehends forty-three countries in Europe, North Africa and Middle
East – has developed ecological projects which were also designed as a strategy
for strengthening the political and economical ties between its members. Within
these programs, the targets defined by the Barcelona Declaration (2008) are aimed
to enhance the visibility of the UfM, two were clearly based on ecological criteria:
the de-pollution of the Mediterranean Sea and the installation of solar power
plants in desert regions. Precisely the discussion on the political conditions for
the implementation of the Concentrated Solar Power (CSP) in the Sahara Desert is intended to support our reflection about the potentialities and contradictions of such initiative. Once these solar plant projects are destined to provide not only Middle East and North Africa (MENA) with "clean energy", but also approximately 16% of the European energy demand by 2050, it seems urging to consider the geopolitical transformations that "desertec project" could unleash. We are inclined to think that such enterprise would indeed change the geopolitical meaning of the Sahara Desert and thus contribute to balance the political relationship between European and MENA countries. Although it is not likely that the marginal gains of the CSP will be equal to "equivalency" of its European counterparts, it is probable that the export of solar energy can diminish the political asymmetries between North and South. It is also crucial to reflect whether the "political instability" of the MENA countries can impose barriers to the accomplishment of the idea, especially because "Desertec" was conceived before the so-called "Arab Spring".

Global Environmental Change: Environmental Policies in China with Reference to Brazil

The environmental issue has assumed the status of global problem, mobilizing civil society organizations, media sectors and governments around the world from the last two decades of the twentieth century. Among global environmental changes, climate change has proved to be structuring the debate in recent years, characterized as one of the main challenges of the global society at the entrance of the XXI century. Although called "Diaspora" and "China" still have many challenges to be addressed with respect to the set of problems that make up the environmental issue in a world characterized by high modernity, by the risk society and by the context of global environmental changes. These two countries have been noted for their international importance and, above all, the importance of environmental issues at the core of their political processes. In this context, this project aims to investigate the trajectory by which Brazil-China have internalized the environmental issue, especially with regard to the climate issue, primarily analyzing two social spheres fundamentally present in this process: the sphere of government and the scientific community. The study of the pillar Science-Policy in Brazil-China is of fundamental importance, and consequently one of the innovations proposed in this research project. Regarding methodological aspects, different methods of investigation will be adopted, including, in particular, the systematic analysis of primary and secondary sources, such as the bibliographic and documentary research, and semi-structured interviews with government and scientific agents. We have a team of Doctors and Postgraduate students who will participate in the activities described in this research project, contributing to the realization of the proposed study in this project.

Key words: global environmental change, climate change, environmental policy, Brazil, China.

Alliances, Cooperation and Conflicts Between Ecostate-Men and Fishermen In The Pendjari River Area, Northwest Of Benin

Northern Benin (Dassari area) is crossed from either side by numerous little rivers and catchments that dry up very quickly because of the pronounced shore-line deforestation among other things. The area is severely threatened by environmental changes. The causes are multifaceted: lack of rain (only 70 to 110 rainy days on an average), technical and administrative inadequacies of the water, land degradation. Migrations of African fishermen from neighbouring countries (Niger, Burkina Faso, Nigeria, and Ghana) towards the protected Pendjari River in the Dassari area remain locally important drivers for environmental changes into new spaces configurations. This paper will open with the recounting of the whaling moratorium that the Japanese have been forced to accept. The utilization of new technologies and an ever increasing pool of fishermen will have to be taken into account. The consideration of the regulation of the international whaling as a form of global environmental regime shows that the decisions within the International Whaling Commission (IWC) has a long tradition dating back to the 16th century. Even today whaling is socially, culturally and economically important in the whaling towns as Taiji. However, the articulation of whaling as commercial culture was not successful. A comparison of the Japanese and the Greenlandic articulation strategies show: Despite of many similarities of the coastal whaling, the Greenlandic whaling is still seen as a cultural activity failed. In this way Japanese coastal whaling is considered as "scientific whaling," while internationally criticized as being an illegitimate practice with suspected background of commercial interests. The consideration of the regulation of the International Whaling Commission as a form of global environmental regime shows that the decisions within the International Whaling Commission will be determined by global models and categories of the world polity. Japan as an industrial country left the stage of indigeneity behind which is reserved for indigenous peoples as the Greenlandic Inuit and is perceived by the world community as being too modern, too enlightened and too developed.

Policing and Crime Control in Contemporary Nigeria: An Agenda for Reform

Crime and insecurity are major challenges of contemporary Nigerian society, with the barrage of various forms of criminal behaviours, including: terrorism, political violence, ethnic-religious and communal violence, unbridled corruption, politically-motivated assassinations, murder, violent crimes, kidnapping for money, and robbery. Efforts by security agents to solve the problems have not yielded the desired results. The inability of the Nigeria Police to effectively tackle the
problem has made people to question the capacity/competence of the police, and also casting aspersions on the quality of governance. Recently, the military was drafted to support the fight against terrorism. In response to the problem, some ethnic militia have sprung up, with some serving as “local police” in communities. Nigeria currently operates a unitary/centralized policing system, but there have been demands for the establishment of state police – separate from the federal police. Increasingly, communities and individuals do not wholly entrust their security to the police, and there have been local community actions against crime, including street barricades and the restriction of vehicular and pedestrian access at certain times. While the informal policing outfits have been playing positive roles with security control, the relationships between them and the police have not been entirely cordial.

Drawing from recent challenges, issues and experiences with the war against crime and insecurity (including terrorism), this paper discusses the policing and security system structure, as well as the relationship/interaction between the various security units. Suggestions are made for more effective policing in Nigeria, including greater collaboration/partnership between the formal policing system and the informal policing structures. The paper also advocates greater collaboration between the police and the public for a more successful campaign against crime in Nigeria.

Transnational Trajectories? Studying Nation and Citizenship in East Asia

Despite sociology's increasing engagement with global processes, the relationship between global/transnational studies and cross-national, comparative studies remains a question, both conceptually and methodologically. This paper inquires into this relationship through an empirical focus on the transnationalization of Nation and citizenship in East Asia. Unlike the common practice, by transnationalization, I do not simply refer to the advance of explicit transborder regimes (e.g. the World Trade Organization and the European Convention on Human Rights), or social formations ‘spanning borders’ (e.g., migrant networks). Rather I offer transnationalization as an analytical node to capture the diffusion of non-nation-specific, universalistic frameworks, models, and standards, and the engagement of nationally located actors’ (states, social movements, professional organizations, and individuals) with such frameworks to orient their actions and strategies. This view locates the nation-state and a variety of national actors within their broader transnational environment—in an analytical sense these two levels are inseparable. Densely organized at the national level and beyond, education policy is highly susceptible to transnational isomorphism. The analysis of the post–World War II school curricular reforms and content (particular focus on Japan and China, in comparison with European developments) shows that national educational systems in East Asia increasingly assume a globalized society, and the role of active and able citizens and nations in making this society. In so doing, they systematically insist upon the “distinct” contributions of the nation and its citizens to the good of the wider world. Yet, as the nation (and its uniqueness) is expressed more forcefully, the policy reforms that affirm transnationally difficult, common models of social order. Nations as “imagined communities” and individuals as citizen acquire commonalities across societies. The assertiveness of the nation (divergence), as well as its progressively common imaginary (convergence), is linked to its transnationalization.

Environmental Agency and Power in the Global Network Society

Over the past two decades, practice theories as developed by Anthony Giddens, Theodore Schatzki and Elizabeth Shove amongst others, moved center stage in the sociology of sustainable consumption and everyday life. Practice theories offer an attractive third way in between individualist (value driven) and determinist (technology driven) models of environmental social change. In this paper, we explore in more detail the two modalities for analyzing the reproduction of social practices as put forward by Giddens (1984) and Shove (2012) in particular. First, when discussing practices as performances or as strategic action, we explore how specific lifestyle groups with particular ‘green’ portfolios or competences participate in the practice in order to make the practice and their lifestyles more sustainable. We show that the environmental dimension of consumption practices can be crucial for attracting new practitioners to the practice since they expect gaining emotional energy (Randall Collins, 2004) from participating in the process of simultaneously greening the practice and their lifestyles. Second, when discussing practices as an entity and as part of an institutionalized set or nexus of practices, we focus on the process of strengthening or weakening the connections between different practices. We argue that the concepts of power as put forward by Manuel Castells (2009) can be used to illustrate the interrelationships between practices and thereby of the key dynamics of environmental changes in the global network society.

atic patriarchal oppression of women within the Catholic Church. This radical and pioneering international movement is struggling for recognition as a legitimate religious formation as it campaigns for a more inclusive and accountable Catholic Church. The female ordination movement thereby provides a fertile conduit for examining how religion can both oppress individual freedoms and also be used to mobilise political, social and spiritual liberation from institutional disempowerment.

This paper will utilise critical discourse analysis of various social media outlets and webpages to elaborate on the institutional oppression and spiritual liberation which lies at the heart of this religious group. Drawing on feminist theology and a feminist epistemology, this paper will explore the effectiveness of social media in connecting women across the world who are facing institutional religious repression and who are seeking support from like-minded faith believers. Through critical discourse analysis, this paper will find that social media is used by groups involved in the female ordination movement such as The Catholic Network for Women's Equality, Women's Ordination Worldwide and The Women's Alliance for Theology, Ethics and Ritual, to subvert the dominant attitudes towards women within the Catholic Church and to provide an alternative form of religious expression for disaffected Catholic women. These groups are thereby able to mobilise women into a solidary international religious formation which empowers women who have experienced suppression or subjugation from the Roman Catholic Church.

UK Maternity Services 'Risk Culture': Is the Professional Status of Midwives 'At Risk'?*

UK maternity services, accounting for a significant proportion of National Health Service litigation claims, are increasingly regulated by 'risk management' standards. Such standards, aimed at improving the safety of maternity care and reducing litigation, inevitably associate childbirth with risk, and the control of professional behaviour in managing such risk. The growth of this 'risk culture' within maternity services poses significant threat to professional status claims.

This paper presents findings of a Doctoral ethnographic study observing the real-time impact of the 'risk culture' within an English National Health Service maternity department. Litigation and subsequent increasing regulation has fuelled the social construction of a 'risk discourse' surrounding maternity care. Aligned with the assertion that modern society has become increasingly risk averse (Beck, 1992), professional anxiety regarding risk has provoked socialisation amongst doctors and midwives that control over the childbirth process promotes risk minimisation. The stereotypical medical interpretation of risk, based upon fear of uncertainty and pathophysiology, has consequently permeated all aspects of pregnancy and childbirth. This in turn has led to the subscription of the 'biomedical model' as the prominent paradigm in managing maternity care, fuelling control, intervention and the 'medicalisation' of childbirth. Such 'medicalisation' has cemented doctor-led, intervention-laden management firmly within modern childbirth, with midwife-led, naturalistic childbirth becoming an ever-decreasing occurrence. A professional identity crisis has ensued amongst midwives in that the role of the midwife in the 21st century is in a state of flux, raising concerns for the professional status of midwives within future childbirth provision.

The 'risk culture' in the UK has provoked significant inequalities between the professional status of doctors and midwives within modern maternity care. The role of midwives as autonomous practitioners in normal childbirth is eroding; therefore is the 'risk culture' in the UK placing the midwifery profession at risk of deprofessionalisation?

Doctors’ Narratives

Doctors' Narratives

Answer to the question outlined in the title of this session would be: "Doctors’ Narratives". As illness narration is a means to gain direct access to the subjective aspects of illness, so utilization of doctors’ narratives in which they portray themselves is important in order to understand who physicians really are. Making a distinction between the motivations behind their choice and the manner in which physicians perform their profession, the author tries to deciper the “black box” of medical identity. He does so using 40 qualitative, in depth interviews with doctors working in Italy in various branches of different ages and professional placements. The narratives so collected appear strikingly similar to those of doctors in flesh and blood from other parts of the world or to “imaginary” doctors created by the fantasy of great writer - doctors (Bulgakov, Chekov, Celine, Conan Doyle, Crolf, Dostoievsky, etc.). Perhaps even the sociological choice of trying to understand the profession through biographical tales reveals more than a point of intersection with the “narrative” approach in medicine: to make a proper anal-
The paper presents results from an experience of castor beans production to obtain biomasses for small farmers in the south of Brazil. This research provides some reflection about the family farm crisis, which has been accentuated in recent decades, because the rural aging population, as well as the lack of successors. The social responsibility to settlement people on lands is the government’s role, in this way; the agrarian policies would propose strategies to modify the productive logic inherited from monoculture production, in the southern of Rio Grande do Sul. It is essential to rethink the viability of family farming beyond funding programs of the federal government. As a result, experiences articulated with different areas of knowledge could bring innovations in the ways of generating household income to the sustainability of rural activity.

Ethnic Differences in Premature Mortality over Three Decades – the Intersection Between Indigeneity, Social Class and Preventability

This study uses national-level mortality data to investigate the changing social class and ethnic patterns in premature mortality in New Zealand men from 1975 to 2006. During this period there was a political struggle for recognition of indigenous rights, a social policy focus on inequality, and major macro-economic reform. We used information from national death registrations and national census data from the five yearly national population censuses from 1976 to 2006 to examine changing patterns in social class differences in all cause, preventable, and non-preventable mortality for Maori and non-Maori men under the age of 65. Our results show that social class differences in male mortality have increased since 1975. Maori male mortality was significantly higher than non-Maori mortality in each social class for preventable, non-preventable and all causes of mortality. The social class mortality differences within Maori were markedly greater than those within non-Maori. Despite focussed efforts to improve Maori health, the inequality between Maori and non-Maori in premature mortality appears to be increasing, even when social class differences are taken into account. The persistently higher Maori rate of potentially preventable deaths indicates that the health sector is still not meeting the serious health needs of many Maori. It also appears that there is increasing social stratification developing within the Maori population such that the social class differences in mortality within Maori are now larger than the inter-ethnic differences between Maori and non-Maori. The presentation suggests various reasons why decades of indigenous development have not overcome ethnic differences in a fundamental marker of population health such as premature mortality but have resulted in increased inequality within the indigenous population.

The Internet Is Not The Answer To The Problem Of Leisure Identities, But The Internet Is Interesting For Leisure Studies: Against Poststructuralist Theory and For Empirical Leisure Research

As people's leisure lives have become mediated through the global networks of the internet, leisure scholars such as Tony Blackshaw (2010) see a digital world of liquid leisure. Drawing on the work of Castells, Beck and Bauman, Blackshaw and others such as Rojek (2010) who have advocated the ‘post-structural’ turn in leisure studies welcome the dissolution of boundaries, the reduction of inequalities of power, and the individualization of leisure choices and leisure identities that the internet supposedly brings. In this paper, I provide a strong critique of the post-structural turn in leisure studies by showing that the theoretical foundations of such claims are weak, and the evidence base for such claims demonstrates only that some people in some countries have some freedoms to play at leisure identities. I will show that the internet in the work of post-structuralist leisure scholars has become a chimera that has little resemblance to the internet that actually exists. I will end by using some of my own research to demonstrate the limits of leisure on the internet and the structures that still shape human interactions, human leisure and human culture.

Sustainability of Family Farming in Biodiesel Production

We used information from national death registrations and national census data from the five yearly national population censuses from 1976 to 2006 to examine changing patterns in social class differences in all cause, preventable, and non-preventable mortality for Maori and non-Maori men under the age of 65. Our results show that social class differences in male mortality have increased since 1975. Maori male mortality was significantly higher than non-Maori mortality in each social class for preventable, non-preventable and all causes of mortality. The social class mortality differences within Maori were markedly greater than those within non-Maori. Despite focussed efforts to improve Maori health, the inequality between Maori and non-Maori in premature mortality appears to be increasing, even when social class differences are taken into account. The persistently higher Maori rate of potentially preventable deaths indicates that the health sector is still not meeting the serious health needs of many Maori. It also appears that there is increasing social stratification developing within the Maori population such that the social class differences in mortality within Maori are now larger than the inter-ethnic differences between Maori and non-Maori. We present several reasons why decades of indigenous development have not overcome ethnic differences in a fundamental marker of population health such as premature mortality but have resulted in increased inequality within the indigenous population.

Party on the Ground and Candidate Selection in France (1969-2013): The Story of a Difficult Inclusion

Political parties are still today the main actors in the political recruitment in France. Most of the French parties use a mixed system, which involves the local members and the national organization. In general, the final decision is taken at the national level by a national selection committee, an organization that is not known for its transparency. The selection procedures have thus always been considered the ‘black box’ of the political parties. But, today, the political parties are confronted with the challenge of democratization for these procedures. The expansion of democracy goes mainly through direct participation from the party members. So, an increase of the party member’s power within the party is a typical response for democratization. But, if the party members are more and more included in the decision-making of the selection, the problem is that the decision of the party leaders does not always match with their choice. This paper looks at how political parties have responded to the demands of more democracy, using France as a case study, with an empirical study of the evolution of intra-party democracy in the candidate selection. The aim is to identify the impact of the introduction of more intra-party democracy and the difficulties for the different party strata to deal with it. Therefore, we have systematically reviewed contemporary and historic party statutes and internal rules document from the left-wing party and the right-wing party, since their creation from 1969 to 2013. The analysis from political parties through their internal formal rules allows to understand how the party on the ground is, at least formally, included in the selection procedure. This will be illustrated by semi-structured interviews. Current party leaders, members of parliament, party secretaries were among those interviewed.

Motherhood Fatal Illness Narratives: Death Awareness and Biographical Reinforcement to Restore Continuity

Within a broader context of medicalisation, dying and death in Thailand remains a disturbing and taboo topic, let alone being studied sociologically outside the medical realm. However, there seems to have an increasing demand to comprehensively understand various dimensions of dying and death as the institution of medicine is moving towards excellence. Illness narratives, reflecting patients’ experiences, could plausibly open new approaches in medical education, practices, and management.

This study illicits illness narratives from mothers of dependent (very young age) children who have recently been diagnosed with cancer. The social identity of motherhood, widely perceived to be self-sacrifice and a sole responsibility of the women themselves, makes the situation of sick mothers even extraordinary. Illness narratives of these dying mothers should be capable of revealing processes and mechanisms in which motherhood as a personal and social identity interacts with the fatal illness in a personalised context and hence produces experiences and conceptualisation of illness in terms of causes, treatment, prognosis, and especially awareness of their death based on gender and moral discourses of being a mother in Thai society and (2) accounts of embodiment and suffering and its implications on daily management of this disruptive event.

An initial round of talks regarding life history with 5 participants (aiming at least 10) tend to suggest that motherhood is an ultimate source of inspiration which helps reconstructing meanings of fatal illness through an unconventional pattern of death awareness rather than vice versa. Death awareness of these mothers is unfolding through a complex relationship between information and knowledge of cancer as a fatal but common illness disclosed formally through their interactions with physicians and informally through lay perspectives and the emotions of being ill and feeling ill. This kind of awareness stimulates their determination to survive and thereafter an adherence to treatment.

Disentangling Disease Stigma: Conceptual Counters and Methodological Challenges

This paper briefly examines the core social science literature surrounding stigma in general and disease stigma in particular to explore the social matrix that stigmatizes and excludes the People Living with HIV/AIDS. The multiplicity of social science approaches for understanding the correlation between social stigma and exclusion, either resort to the trap of functionalism or in the individualization of
the problem or argue for a unidirectional cause and effect relation. The conceptual
inflation in the field of stigma research also confined the strategies to counter
the stigma within the vicious circle of exclusion limiting the scope for out of the box
social engineering. This paper argues for a multidimensional understanding of the
stigmatisation process that addresses the functionality without functionalism and
without resorting to excessive individualization. It is vital to distinguish between
what we can call HIV/AIDS stigma, and what we should call HIV/AIDS related social
exclusion. How the linkages operate; uni/multi-dimensional? It is also important
not to unravel the social process operating at different levels of reality and how
the old inequalities play a significant role in producing and reproducing the new
forms of social exclusion where the Right to Live is under threat. The paper calls
for an integrated paradigm for understanding the social process of stigma and
exclusion and try to explain the dynamics of stigma within and outside the matrix
of micro-macro versus subjective-objective axes of social reality. The empirical
exploration with this framework requires a re-examination of the existing meth-
odiological practices in stigma research.

Inequality and Inclusion in Primary Health Care System in India: An Interstate Analysis

The trajectory of primary health care system in India is at crossroads with the gradual withdrawal of state from health sector. However, there are efforts to re-
vamp the organisation and delivery of health care in rural areas with the intro-
duction of National Rural Health Mission (NRHM) in 2005. Within this context the
present study tries to analyse the internal differences in health outcome in
India and its relation to the social determinants of health. Secondary data analy-
sis showed that there are wide inequalities existing between different states in
terms of various indicators of health development. The state of Kerala stands
out in terms of its achievements on major indicators and often hailed as kera-
la model of health development, whereas the state of Assam performs lowest in
most of these indicators. However the state of Assam is the only state in India,
which included health as one of the basic right to its citizens. A secondary analysis
combined with an ethnographic field work in these two states revealed that the
inequalities between these states and within the states are complex and a unitary
model of inequity determinants fails to answer the complexity. Thus the social
health determinants models needs to be re-looked from the vantage points of
the local context. The study also highlights the pitfalls of government policy of in-
clusive health development which still lack in terms of health as a basic right.

A Multilevel Model of Organization and Network Change

According to one vision organizations are more likely to establish network ties
with partners having similar operational experiences (homophily). A second vi-
Sion suggests that interdependent organizations connected by network ties are
more likely to assimilate each other's knowledge and develop progressively more
similar portfolios of internal activities (assimilation). The internal structures of
organizations can be represented as networks of interdependent portfolio items.
These intra-organizational networks are nested in networks of organizations and
influence the homophily and assimilation described.

In this paper we try to establish which of these two visions best describes the
dynamics of collaboration (measured as patient transfers) and organizational change
(measured as change in specializations) in a community of hospitals. We estimate
developed stochastic actor-oriented models (SAOMs) for multilevel
networks which specify how inter-organizational relations affect organizational
decisions to change the portfolio network of internal organizational activities by
adding or abandoning activities. At the same time, the model allows joint exami-
nation of how the common affiliation to internal activities affects decisions to
change networks in terms of patient sharing relations between part-
ner hospitals. We innovate over existing studies of network dynamics in that we
represent processes of change in internal organizational structure, and change in
the structure of inter-organizational networks as coupled sub-components of
a more general process of co-evolutionary development. The objective of this
paper is to examine this multilevel process that occurs empirically using data observed between 2003 and 2007 among all the hospitals in a region-
al community. In the discussion of the results we emphasize the connection be-
 tween recent advances in the specification and estimation of SAOMs for multilevel
networks, the current theoretical debates about the emergence of organizations
and markets and the interpretation of our findings in the light of rational choice
assumptions of the statistical framework.

The Precariat: From New Dangerous Class to Class-for-Itsel

Neoliberalism, stemming from the musings of the Mont Pelerin Society after the Second World War, meant a model of liberalization, commodification, individualism, the privatization of social policy as well as production, and – least of all – the systematic dismantling of institutions and mechanisms of social solidarity. From the late 1970s onwards, it meant the painful construction of a global market system, in which the globalization era was the disembodied phase of the Global Transformation, analogous to a similar phase in Karl Polanyi’s Great Transformation. In both cases, the disembodied phase was dominated by financial capital, generating chronic insecurities and inequalities. But whereas Polanyi was analysing the construction of national markets, the Global Transformation is about the painful construction of a global market system.

One consequence has been the emergence of a global class structure superimposed on national structures. In order to move towards a re-embedded phase, it is essential to understand the character of the class fragmentation, and to conceptualize the emerging mass class-in-the-making, the precariat. This is a controversial concept, largely because traditional Marxists dispute its class character. However, it is analytically valuable to differentiate it, since it has distinctive relations of production, relations of distribution and relations to the state. It is still a class-in-the-making rather than a class-for-itself. But it is the new dangerous class because it is a force for transformation, rejecting both labourist social democracy and neoliberalism. It has a distinctive consciousness, although it is this that holds it back from being sufficiently a class-for-itself. It is still divided, being at war with itself. However, it has moved out of its primitive rebel phase, and in the city squares around the world is setting a new progressive agenda based on its insecurities and aspirations.

The paper discusses my new book, A Precariat Charter: From Denizens to Citizens (2014), which builds on key arguments from my 2011 book which introduced the Precariat as an emerging mass class, characterized by inequality and insecurity. A Precariat Charter discusses how rights - political, civil, social and economic - have been denied to the Precariat, and the importance of redefining our social contract around notions of associational freedom, agency and the commons. The ecological imperative is also discussed - something that was only hinted at in my 2011 book but has been widely discussed in relation to the Precariat by theorists and activists alike. By taking debates about the Precariat a step further, I further examine the kind of progressive politics that might form the vision of a Good Society in which such inequality, and the instability it produces is reduced.

Public Access to the Unorthodox Sacred Via Portuguese Urban Spaces

Drawing on numerous interviews carried out in 2010, this paper focuses on the popular cult surrounding a medical doctor famous for helping the poor, Dr. Sousa Martins, who died over a century ago in Lisbon. Because of contested rumors of Sousa Martins’ having been Freemason and having committed suicide, he is now regarded as a seer-turned-writer who has written numerous popular books on Dr. Sousa Martins, and the owner of a kiosk selling cult objects, who has invented rituals for communicating with the doctor which she tells to her customers. This paper will explore the importance of the public spaces through which devotees ‘communicate’ with Dr. Sousa Martins, how this complicated process takes place, and how these public spaces connect to charismatic Christianity and other, more private spaces such as sessions with spiritual mediums who claim to be able to communicate with Dr. Sousa Martins.

Abstracts are organized by first presenting author’s last name.

Public Access to the Unorthodox Sacred Via Portuguese Urban Spaces

Drawing on numerous interviews carried out in 2010, this paper focuses on the popular cult surrounding a medical doctor famous for helping the poor, Dr. Sousa Martins, who died over a century ago in Lisbon. Because of contested rumors of Sousa Martins’ having been Freemason and having committed suicide, he is unlikely to ever be canonized within the Catholic Church, and the cult of devotion surrounding him exists completely outside of the church’s authority. The popular devotion toward Sousa Martins involves thousands of Portuguese of all ages whose numbers appear to be growing. Devotees believe that Dr. Sousa Martins can cure their illnesses, find jobs and homes for them, and even conduct ‘spiritual surgery’ on them to remove cancer. Despite the fact that the Church does not condone this devotion, the cult is enabled – and its ritual activities organized – by three public spaces within and near Lisbon (his statue, his tomb, and his home-turned-museum) in which devotees can openly ‘communicate’ with Sousa Martins to ask for his help (especially medical cures), bring him offerings, and leave gifts of thanks for miracles performed. The fact that this devotion has no organizing institution also means there is room for active individuals to guide it in particular directions. Such individuals include a charismatic female medium, a seer-turned-writer who has written numerous popular books on Dr. Sousa Martins, and the owner of a kiosk selling cult objects, who has invented rituals for communicating with the doctor which she tells to her customers. This paper will explore the importance of the public spaces through which devotees ‘communicate’ with Dr. Sousa Martins, how this complicated process takes place, and how these public spaces connect to charismatic Christianity and other, more private spaces such as sessions with spiritual mediums who claim to be able to communicate with Dr. Sousa Martins.

Development and Inequalities in Post-Socialist Countries: Comparative Perspectives

The main purpose of the paper is to explain some differentiations in the levels of social capital and socio-economic status between the inhabitants of post-industrial cities in Central and Eastern Europe.

In accordance with the sociological literature, two components of social capital will be considered: trust and social networks. Socio-economic status will be analyzed by level of education, monthly income, and job situation.

The main thesis of the paper is the assumption that in the post-industrial cities of Central and Eastern Europe access to social capital is not highly associated with the socio-economic status of inhabitants.

The empirical basis for the paper is a database from surveys carried out in selected post-industrial cities of Poland, Russia, Hungary and Lithuania. In each of the above countries one city was selected in order to conduct a survey of representative samples of inhabitants between the ages of eighteen and seventy.

The empirical investigation was carried out in the year 2012 with the financial support of National Centre of Science in Poland.

STASZYNSKA, KATARZYNA* (Kozminski University, kstaszynska@kozminski.edu.pl)

New Cognitive Perspective in Survey Research Methodology. Comparative Results from Georgia, Russia and Poland

Applications of the cognitive psychology theories analyze the bias in survey research limiting the meaning of the term “cognitive” to cognitive functioning of peoples’ minds. Cognition should be understood in a broader sense because it is determined not only by intellectual capabilities of people but also by their socio-cultural background as well as by their values and attitudes. Although it is obvious that achieved education is an inferential indicator of intellectual capabilities of a person, thus his or her cognitive abilities, it is not that obvious that intellectual capabilities are determined by social background and social experience of the people and that heir perception of survey situation depends not only on the abilities but also on the attitudes. If respondent has never experienced democratic form of government and, in addition, does not have a theoretical knowledge about what democracy is, he/she cannot really express his/her attitudes to democracy. And, of course, his/her intellectual capabilities have something to do with the ability to express attitudes toward democracy but their effect on quality of response cannot be limited to strictly cognitive processes that are involved in answering the survey questions because this depends on the attitudes as well. Our approach assumes that social background, political knowledge and experience as well as political attitudes of people affect how they understand public opinion polling and, finally, affect the quality of answers. The comparative data were gathered in Poland (2010), Georgia (2013) and Russia (2012). The aim of analysis was to find to what extent political attitudes and experience determine the perception of public opinion polls and quality of answers. Significant differences have been found between attitudes and survey behaviors of Georgians, Poles and Russians.

Trust and Democracy in Different Post-Communist Societies: Poland, Russia and Georgia Comparison

The subject matter of the paper is a comparison of political trust (that consist the fundamental of political stability) and democratic attitudes in three very different post-Communist countries: Poland, Russia and Georgia. Poland is exceptionally different from the two others because of a very strong democratic tradition while neither Russia nor Georgia have such a tradition and experience but they differ in terms of their political culture and present political aspirations. Differences of political trust are analyzed in their relations to attitudes towards democracy.

We are particularly interested in analyzing social differentiation of trust in political system and in particular political institutions in the three countries. We would like to answer the question what are the segments of their societies that might be considered fundaments of social stability and development towards legitimized democratic system. We would like to find out what are the determinants of democratic attitudes, especially their relation to political trust in the system as a whole and theirs’ institutions in countries with different traditions and different pace as well as direction of transformation. The main question is, what are the differences between those three countries in terms of the level of political trust and democratic attitudes, what are the differences in relations between the two, and what are the differences in social composition of those who trust the political system and support the democracy and those who do not. That is especially important because of the differences in existing systems. The attempt to answer these questions is made by analyzing the results of survey research conducted on nationwide random representative samples in Poland in September 2010, in Russia in March 2012, in Georgia in August 2013.

Intergenerational Dependencies and the Financialisation of Retirement: Lessons from Australia

Across the developed world, population ageing has coincided with rising living standards and expectations in retirement. Since the 1980s this has led to growing concern about the sustainability of public pension systems. Australia has been held up as an example of prudent fiscal management, as it looked to fund retirement income through compulsory private savings. This supplemented Australia’s flat-rate and means-tested public pension system, also supported by widespread home ownership. The shift to private pensions has made individual workers more reliant on lifetime savings and on benefits accrued through the tax system rather than direct retirement benefits. We examine the intergenerational implications of this trend towards greater financialisation of retirement incomes by analysing cross-sectional data from the Australian Bureau of Statistics. Given the significance of the Australian model to international debates, we discuss the potential long run international implications for inequality in retirement of this experience.

Leisure in the Middle East: Tradition, Taste, and Equal Access

Much of leisure in the Arab/Iranian Middle East may be accounted for by the forces of tradition and taste in free-time activity as these two have evolved across the centuries since the birth of Islam (c. AD610). Tradition and taste have become the cultural foundation for scores of leisure activities which are preferred by one sex or the other, and coordinated with the Islamic calendar, appeal to particular age groups, and among other differentiating principles. This paper, using a variety of library resources, examines the traditional and contemporary leisure activities in the Middle East, pointing out where equal access to them is an issue. Most Arabs and Iranians with deep family roots in this culture seem satisfied with their traditional leisure tastes. Differentiation according to the aforementioned principles is not generally problematic, not considered “unequal” in the social scientific sense of the word. What are considered unequal by some participants in the region, however, are certain “new” leisure activities, this new leisure being adopted (and often adapted) from outside the region, usually the West. These new activities range from imported European fine arts (e.g., classical music, ballet) to imported popular culture (e.g., rock music, stand-up comedy). Here, inequality is evident, for example, in differential monetary and geographic access to the fine arts. Adherence to Islamic values and traditional gender roles number among the factors generating inequality in popular culture.

The (In)Stability of Disorder Across Time and Space? A Spatio-Temporal Analysis of Physical and Social Disorder and Fear of Crime in the Netherlands

Whereas the occurrence of physical and social disorder across the urban landscape and the explanation of the observed spatial patterns have long preoccupied criminologists and urban sociologists, relatively few studies have looked at the spatio-temporal patterning of disorder patterns. In this paper, we examine a data source from a spatio-temporal perspective. Elucidating the (in)stability of spatial patterns of disorder and fear of crime is especially important for the model of urban development known as the Broken Windows Thesis, which posits that physical and social disorder, if unabated, lead to heightened fear of crime, reduced informal social control, and eventually a rise in more serious crime.

The present contribution is a spatio-temporal cluster analysis of physical disorder, social disorder, and fear of crime in the Netherlands based on the Dutch ‘Police Population Monitor’ survey between 1993 and 2005, a large-scale bimodal household victimization survey covering every municipality in the Netherlands. By aggregating the individual survey respondents of each commune, we constructed a municipality-level longitudinal dataset spanning twelve years. We perform geovisualization and spatio-temporal clustering analyses of Dutch municipality accounts in order to determine whether there are significant local differences in physical disorder, social disorder, and fear of crime and whether these spatial patterns persist over time. In addition, self-organizing maps serve to classify individual municipalities into clusters of similar spatio-temporal type across the Netherlands. Finally, we test to what extent this “data-driven” typology of municipalities accounts for the observed shifts in the spatio-temporal patterns of disorder and fear of crime over the twelve-year study period. The study thus produces evidence whether the front end of the hypothesized “developmental sequence” linking disorder with heightened fear of crime and reduced informal social control can be observed across time and different types of municipalities or is a rather transient and exclusively urban phenomenon.

It’s Hard out There for a Girl: Online Surveillance of the Female Body on Social Media

In 2013, we interviewed 50 Canadian girls and young women between the ages of 15 and 22 about their experiences as girls on social media. They described a complicated, often playful but often difficult relationship with online surveillance that magnified the need for them to comply with mainstream expectations of beauty and the bodily performance of girhood. Although they relied on social media to keep in touch with friends and family, many of them experienced a high level of discipline from these groups when they stepped outside the narrow bounds of stereotypical performances of femininity, reducing their opportunities to experience a lived equality in online spaces. Most of them also internalized and then acted out a narrow, stereotypical performance of the female body online in order to protect themselves from criticism. Girls who were unsuccessful in doing so suffered from harassment and self-criticism; girls who were successful articulated ongoing concerns about the precariousness of this success. Rather than enjoying their social relationships with peers through increased online interaction and connection, many of them relied on a series of (mutual) agreements to mobilize online when the reputation of a member of the group was attacked. Perhaps most disturbingly, the online surveillant gaze encouraged many of them to rely on external validation of their physical appearance to manifest a performance of “confidence”, both deepening the effect on mainstream stereotypes and discouraging them from developing an internal sense of validation and worth. Our findings underline the need for policy and educational initiatives to support girls online and open up spaces for them to confront online stereotypes, push back against the gendered constraints they encounter online and participate equally in online society.

Shaping the Romanian Identity. The Nationalist Discourse of the Orthodox Romanian Church

In a Europe increasingly secularized, Romanians trust the church is high and growing. According to the World Values Survey 1999-2000, 47.9% of the Romanian has high trust in this institution while only 2.7% is the opposite. Also, except Malta, the highest percentage of Europeans who believe that religion is very important in their lives recorded in Romania (51.3%). We can say that we are witnessing, in the XXI century’s Romania, a true resurgence of God (La revanche de Dieu, Q. Kepel & Samuel Huntington).
Analyzing the academic literature (Bryan Wilson, 1998, Steve Bruce, 2002, Rob Warner, 2010, Pippa Norris and Ronald Inglehart 2011, etc.) one can note the following explanatory factors of this phenomenon: the degree of modernization and economic development, human security and the feeling of vulnerability to risks, political repression during the communist and nationalist discourse of the Orthodox Church.

The purpose of this paper is to identify –in a longitudinal and transversal discourse analysis – the proximity between Orthodox Church and national ideas. We will try to prove that in Romania, as well as in other Eastern European countries, religious nationalism was a constant, regardless of the political regime. We argue that the Romanian nation is biological-spiritual synthesis Dacian elements, Latin and Orthodox Christian (...) Orthodoxy is an essential trussed in posts, armored and motorcade and transformational body at difficult

Shopping For Community - Local Businesses As Features Of Social Inclusion?!

Increased ethnic diversity, a high degree of differentiation in income and education levels as well as lifestyles and related the socio-spatial changes have changed not only residential and commercial neighborhood structures, but also the range and level of local interactions and leisure time activities - with wide implications for neighboring communities, i.e. everyday social contacts and connections between and among various groups of residents, how these affect local social capital.

So far, the great majority of research on this topic has focused on narrow and well-integrated primary relationships among neighbors in residential settings and attainment of local social networks.

But these studies have mainly neglected the comparatively loose and unpre-
tentious everyday interactions, particularly during leisure time activities as well as interactions in (semi-) public spaces and how both contribute to community building and social cohesion, activities, for fostering local networks, mutual assistance, trust and local partici-

ation will be empirically assessed with the case of an exemplary shopping street in Berlin.

On the basis of on-spot observations and interviews with store owners, em-

ployees and customers, the paper presents empirical findings on the ways in

which local shopping represents an important social in- or excluding social prac-
tice that affect wider urban structures of inequality.

STEIN, ARLENE* (Rutgers University, arlene@rci.rutgers.edu)

Performing Transgender Authenticity Through Video Diaries

Growing numbers of young transmen (female-to-male transgender persons) in North America are choosing to publicly narrate their body modifications and life transitions in video diaries on YouTube. This paper considers two genres of such videos: (1) videos that document breast binding (minimization) and (2) videos that narrate the process of top surgery (breast removal). It examines recurring themes in such videos, as well as the public comments they elicit. The paper speculates as to why individuals would choose to narrate such seemingly private acts in such a public space. Toward that end, I draw upon feminist theories of embodiment, attention to the wide range of functions local small businesses and their employees play, including those which yield aspects of supply, sociability, local service and employment.

Claiming that shopping streets are significant places for forming proximity rela-
tions, the impact and meaning of shopping as both, leisure time and supply activities, for fostering local networks, mutual assistance, trust and local partici-
pation will be empirically assessed with the case of an exemplary shopping street in Berlin.

On the basis of on-spot observations and interviews with store owners, em-

ployees and customers, the paper presents empirical findings on the ways in

which local shopping represents an important social in- or excluding social prac-
tice that affect wider urban structures of inequality.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
teenage girls narrate their consumer practices. I argue that transgender videos play a double role as personal and collective identity work, affording individuals the possibility of enacting a transgender self, and also participating in the act of community-building via new media, in the context of post-feminism, the medicalization of gender, blurred public/private boundaries, and late capitalism. Turner (1996) suggests that economic transformations characteristic of postindustrial capitalism have changed the meanings of the body for individual social actors. Once the site of ascetic control and discipline, the body is now the locus of pleasure, leisure, and consumption. Not a fixed biological given, “the body can indeed be restructured and refashioned to bring about profound changes of identity, including changes of gender” (21). While these transgender video autobiographies do in fact exemplify the malleability of the body, I suggest that they also display the enduring importance of ascetic control and discipline.

STEINER, PHILIPPE* (Institut universitaire de France, philippe.steiner@paris-sorbonne.fr)

Auguste Comte, Altruism and the Critique to Political Economy

Altruism is now a current concept among economists and sociologists. When Comte coined that word in 1851 he wished to oppose a new spring of action to the selfish one that was, according to him and many other social observers, flourishing in the industrial society. While focusing his attention on the opposition between egoism and altruism, an opposition deemed to be the “great human issue”, Comte was not merely pursuing the elaboration of his own system of thought with the so-called “positive approach” and the development of the religion of humanity at the heart of his Catechisme positiviste (1852) and his Système de politique positive (1851-54). He was also pushing further the critique to political economy that he had exposed in the 4th lecture of his Cours de philosophie positive (1830-42).

Comte’s theory of altruism is a central point of his religious credo but it is also a critique to the political consequences of the spreading of political economy altruism that gave birth to a large debate. The topic is thus perfectly fitted to a history of the relations between sociology and economics.

The first considers how selfish behavior or egoism came to be considered as a major threat endangering the functioning of the industrial society, by Comte and those who were worried by the diffusion of egoism. Then, the second part summarizes the methodological critiques set forth in the Cours before connecting this critique to the economic content of the Système and the concept of altruism. The last part contrasts Spencer’s view of altruism to the one held by Comte and, how French political economists reacted, defending the moral value of their science.

STEINER, PHILIPPE* (Institut universitaire de France, philippe.steiner@paris-sorbonne.fr)

The Great Performance: Economic Design Versus Social Design

There are now a significant number of studies done on the performativity of economics — to use Michel Callon’s words — according to which economics as a science is actually not describing the state of economic affairs, but performing its own principles about the functioning of the economy.

The topic of this communication is to suggest a larger view of the performative theory to combining Callon’s and Polanyi’s approaches. In his Great Transformation (1944), Polanyi explains how much political economy contributed to the creation of the market system; however, he added that there existed as well counterforces protecting the society from such market system. Accordingly, the communication claims that there is a “Great Performance” at work. With the development of design economics, matching markets, economists are able to create market institutions that perform economics; but, on the other, alternative principles of exchange are as well designed in order to perform gift-giving behaviors. This side of the performance of social sciences through the creation of institutions of exchange could be taken into account.

The communication will first explain how Callon’s and Polanyi’s views can be combined to understand the role of played by social sciences, whether economics or sociology, in the functioning of this “Great performance”. Then, the communication will explain how the two different forces are actually at work, first in the domain of financial transactions, second in the domain of postindustrial capitalism of human body parts. This part of the communication will be based on the current studies done on financial markets (notably by Donald McKenzie) and on my own work on organ transplantation.

STEINHOFF, PATRICIA* (University of Hawaii, steinhoff@hawaii.edu)

Whatever Happened to Japan’s Radical Left?

In the early postwar period Japan developed two major parliamentary left political parties, the Japan Communist Party (JCP) and the Japan Socialist Party (JSP). Each was supported by labor union federations and other affiliated organizations, which mobilized for social movement activities on many issues. By the late 1950s, an extra-parliamentary New Left emerged among university students. The first group broke from the JCP-dominated national student federation to form an independent Communist League, and a second independent student group developed out of Trotsky study groups on various campuses. For over a decade, the student-based New Left played a major role in social protests alongside Old Left parties, labor unions, and other civil society organizations.

During the late 1960s and early 1970s, Japan experienced a New Left protest cycle that paralleled those in Europe and the United States. It concerned very similar issues and had a similar trajectory of escalation of violence followed by strong state repression, which ended the protest cycle and drove the most radical elements underground or into exile. However, unlike the radical left in many European countries and the United States, the radical left in Japan has been largely invisible since the 1970s and is only now beginning somewhat more visible.

Based on long-term fieldwork, this paper will trace the Japanese radical left’s evolution into an “invisible civil society” that continues to engage in social movement activity, but has had little impact on mainstream Japanese political agendas and action repertoires. The analysis will examine internal conditions within the movement and its interaction with the larger Japanese social and political context, including public fear engendered by the escalation of violence, the rigid employment structure that permanently marginalized radical activists, continuing state counter-measures against the radical left, and the gradual dismantling of the support base for left political parties.

STENBERG, HENRIK* (Halmstad University, henrik.stenberg@hh.se)

Relational Art and Managing Emotions

One of many intentions in art is to examine and portray emotional processes and experiences of the artist and other peoples’ emotions in different situations. The “traditional” artist carried a need to explore personal relationships or to portray emotions in social interaction at a distance. The relational aesthetics that has been of great significance since mid 1990 is oriented towards peoples’ social and emotional experiences in different contexts (Bourriaud). The relational artists’ ambition is to intervene in social situations and to find ways to visualize, communicate and reflect on the social exchanges that occur in these situations. The artist wants to problematize the existing emotional rules that occurs (Hochschild) and explore and process emotions such as hidden shame in Thomas Sheff’s sense and the contribute to the reshaping of social relations.

The purpose of this paper is to examine how the relational artist uses his/her artistic skills to intervene in and influence social communities and to understand what happens to the emotions expressed in these coherences. The aim is also to investigate what happens to the artists’ creativity and artistic capacity in an outward relational artistic work. How can the artist establish a constructive relation between his/her artistic identity and the social and emotional involvement in others doing emotional work? The paper also aims to explore how theories of emotion can contribute to an understanding of creativity as a dialectical relationship between individual and collective motivations for art based on symbolic interactionism and micro sociology. The empirical material for the study is interviews with artists involved in artistic projects in workplaces in Sweden but also the study of non-institutionalized forms of relational aesthetics.

STENGER, NATALIA* (MAYA/Marina Anahuc Querétaro, natalia_stengel@hotmail.com)

Dignity and Capabilities: An Approach to Human Development CANCELLED

To promote the full exercise of Human Rights it is necessary to have a comprehensive view of dignity with its different dimensions. The relevance of human development without losing sight of the notion of respect to personal identity, local context and cultural identity, all of these contemplating the importance of allowing social actors to become, by themselves, the ones who develop a capacity to construct quality of life, sustainable development and the overcoming of the most social problems. By explaining the situation in this way, it seems that the Theory of Capabilities gives the best solution, specifically the contribution made by philosopher Martha Nussbaum in which a capabilities list proposes that individuals with a full flourishing of capabilities would be able to become key factors in guaranteeing the fulfillment of Human Rights focusing on human development.

To recall what has not been described above, it is not surprising described above, it is not surprising that the UN (United Nations) has given such attention to the Theory of Capabilities as a promising strategy to achieve the Millennium Development Goals (eradicating extreme poverty, achieving universal primary education, promoting gender equality and empowering of women, reducing child and maternal mortality, ensuring environmental sustainability, etc.). However, and this is the main goal of this paper’s analysis, it seems like the implementation of Nussbaum’s Theory of Capabilities would make the UN’s action for social assistance, promoting Human Rights and
propulsive human development shortighted in time and duration; meaning that once the conditions are set for full development and enjoyment of capabilities, the intervention of the UN would be over, although, apparently, the way they are working with the Theory of Capabilities suggests the contrary.

STERRETT, SUSAN* (University of Denver, ssterrett@nsf.gov)
Care, Surveillance and Legal Mobilization
Legal institutions must be mobilized by people and institutions in response to disaster. It has brought people to two different positions: as victim and as people who have been rescuers. In studying assistance after disaster, we often treat programs as though they are distinct and experienced separately. Yet people encounter the law in disaster after having encountered other law in their lives, and interpret how to make legal claims through what they know about other programs. Similarly, state responses to disaster or efforts to mitigate or respond often work in ways that are characteristic across social programs. Although care might well be the goal of disaster assistance, for example, in the United States it is one program in a welfare state with goal of getting people off assistance and ensuring that poor people take responsibility for themselves. The people who need assistance the most can experience it as hard, confusing and frightening when it ends before anyone can find a job or get resettled, whatever the goal. This project draws on assistance for people who fled the Gulf Coast after Hurricane Katrina.

A Spitting Image of Reality? Analyzing Stories of Meaningful in-out Group Incidents As a Tool for Understanding Students’ in-out Group Relationships in a Divided Community
This article explores the usefulness of analyzing narratives of particular incidents that are meaningful to and involve members of different ethnic groups in a situation of conflict. Narrative analysis of the content and structure of stories told by 15 Greek and 15 Turkish Cypriot students about a particular ‘spitting incident’ and the micro- and macro context in which these students, selected from two secondary schools in the Republic of Cyprus develop their narratives, shows that the analysis of such stories can enhance our understanding of: a) the different ways in which actors represent this incident and the factors and processes that inform these representations and b) the more general representations actors make of their own in-group and perceived out-group. More specifically, TCs portrayal of the TC protagonist as a vulnerable but likable and brave hero who is the victim of deliberate and hostile actions of a powerful and untrustworthy villain (the GC protagonist) is particularly the GC community), who uses his power to punish the hero unfairly and excessively corresponds to their views of how GCs treat TCs in the Republic of Cyprus more generally and TCs passive, more defensive response to such treatment. Similarly, GCs portrayal of the GC protagonist as a pious hero (in its different forms) and organic intellectuals. We draw examples from the exchanges of digital piracy, identifying and analyzing the possible consequences regarding how we define and understand Internet technologies. In identifying the importance of a ‘digital materiality’ perspective in research on digital piracy, I explain how the form and structure of services and goods results in the development of expectations and desires leading to the consumption of copyrighted material. The resulting conceptual approach speaks to a number of possible consequences regarding how we define and understand Internet technologies. The inclusion of cultural materiality to digital content also provides a new perspective on how previous sociological definitions of materiality have been limited to a particular conceptualization of physicality.

STEWART, FRED* (University of Westminster, f.steward@psi.org.uk)
Transition Cities – A SocioTechnical Approach for Transformative Innovation
The paper draws on the sociotechnical transitions and system innovation framework of Geels and others to develop a new approach at city level to govern and manage the transition to a low carbon society. It reports on the European Institute of Innovation & Technology (EIT) Climate-KIC Transition Cities project. This involves a partnership of 6 cities – Birmingham, Frankfurt, Castellon/Valencia, Bologna/Modena, Wrocław & Budapest. The aim was to develop a transition policy capability to facilitate transformative low carbon innovation in three major end use sectors – buildings, transport, and energy networks. An inventory was made of all low carbon innovation projects underway in the partner cities. This used a broad socio technical definition of innovation and included a diversity in terms of scale, knowledge and types of innovation. 107 projects were identified with a value of €2 billion in the 3 areas identified. The distribution was similar to earlier studies on city climate innovation but was at a significantly higher scale, suggesting that the national focus of innovation policy is underestimating the extent of activity they tended to be treated as separate, disconnected projects and there was little evidence of strategies to link and enable wider system innovation.

An analytical and practical framework was developed in order to facilitate the clustering of projects around clearer arenas of system innovation. Social network analysis involving stakeholder participation was carried out to assess the prospects for system innovation and plausible transition pathways up to 2020 in each partner city. The results showed major differences in the prospects for transition in different arenas. It also showed the emergence of key integrating non-technological innovations in different cities with the capacity to play a key role in making transition happen.

STEWART, LANCE* (University of Toronto, lance.stewart@mail.utoronto.ca)
Beyond Piracy: The Materiality of Digital Objects and the Consumption of Copyright
With the growing use of digital technologies in media consumption, companies around the world have experienced a new frontier in providing goods and services to a wider range of consumers. Despite the elevated success of digital distribution of cultural objects like music, film, video games, and books, the issue of illegal access and distribution of copyrighted materials has become a widely acknowledged social problem. Economical, legal and criminological practices have largely dominated research on the digital piracy, identifying and analyzing it in legal terms. Issues with these approaches arise as assumptions are carried forward in exploring and explaining these practices, resulting in their failure to identify this activity as the development of online consumption practices. In identifying this limitation in the literature, this paper sets out to create a conceptual model in approaching the study of digital piracy. Bridging the perspectives of cultural sociology with science and technology studies, my approach identifies the root of consumption practices in the properties of digital objects. Integrating the theoretical approach of cultural materiality, I explore how the conceptualization of digital objects as “dematerialized” dismisses important sociocultural dynamics of both the attributes of digital objects and the architecture of online services. In identifying the importance for a ‘digital materiality’ perspective in research on digital piracy, I explain how the form and structure of services and goods results in the development of expectations and desires leading to the consumption of copyrighted material. The resulting conceptual approach speaks to a number of possible consequences regarding how we define and understand Internet technologies. The inclusion of cultural materiality to digital content also provides a new perspective on how previous sociological definitions of materiality have been limited to a particular conceptualization of physicality.

Sociologists and the Labour Movement: Between East and West
Sociologists and the labour movement: Between east and west While a tradition of creative engagement between worker intellectuals and academic researchers in Western Europe has been documented recently (cf Stewart and Martínez Lucio, 2011) a similar trajectory in Central and Eastern Europe remains largely unexplored. The contrasts and continuities between both regions forms the core of this paper. We examine and compare the different historical experiences of worker intellectuals and the academy in Poland the UK, indentifying the re-emergence of a pattern of engagement not only within traditional sectors of the working class but also among the new, precarious workforce, including migrant workers (UK) and agency workers (Poland). We argue that this engagement can be characterised on the basis of different and historically dependent patterns of institutionalisation of the sociology of labour in these countries. Moreover, this in turn can be derived from the fate of the historical relationship between labour (in its different forms) and organic intellectuals. We draw examples from the experience of union organising and workers in the UK and Poland amongst new and emerging workplaces where the tradition of labour movement activity has been historically weak (or nonexistent).

The authors are either directly or indirectly participating in FP7 Marie Curie Initial Training Network Programme “Changing Employment”. This is providing a novel opportunity to link international funding opportunities in such a way as to foster cooperation between labour and academia.
Cheating Among American University Students: A 30-Year Follow-up Study and a Comparative Study with Chinese University Students

Cheating is an increasing problem on college campuses, made even easier by the advancement in technology which has increased access to information. Furthermore, we are seeing a shift in attitudes toward cheating as well as a change in the definition. Faculty are reporting changes in cheating behavior. This current study reports the results of a 30-year follow-up study on cheating at an American university (Vandehey, Diekhoff, and LaBeff, 2007), as well as comparisons with a comparable sample of Chinese university students. Our findings indicate both cross-cultural differences but also similarities in cheating behavior and attitudes.

Chinese students reported a higher incidence rate of cheating on exams, and a greater tendency to neutralize (i.e. justify) cheating. A factor positively correlated with American students cheating is a characteristic related to a cohort effect currently labeled the Millennial Generation or Generation Y students. Our results also point to factors that may be effective in preventing cheating.

How Media Cultivates Body Perception and Sexual Attitudes: The Effect of Television, Magazines, Video Games, and Internet

In the late 1960s, George Gerbner developed cultivation theory to understand how exposure to television shapes individuals’ perceptions, particularly violence in the real world. Research using cultivation theory consistently showed that heavy television viewers were more likely to perceive the world as more violent, even after controlling for negative experiences involving violent situations. Gerbner later extended cultivation research to sex-role stereotypes and sexuality (Gerbner and Shanahan, 1972).

Using cultivation theory, the current study explores how different types of media influence individuals’ body perception and sexual attitudes. The media studied are television, magazines, video games, and internet. The sexual attitudes studies are acceptance to hooking-up (casual sexual encounter) and rape myths. For the current study, we collected data from undergraduate students at an American university, using an online survey. The data indicate that body perception and sexual attitudes differ by media type consumed. More specifically, we find that (1) controlling for gender and self-esteem, exposure to television, magazines, video games, and internet is negatively associated with individuals’ evaluation of self body image; and that (2) high exposure to television, magazines, video games, and internet correlates to more mythical sexual attitudes and sex-role stereotypes. We will discuss the implications of the results and provide suggestions for improving self body perception and eliminating sexual myths.

Debating Canadian Climate Change Policy: Policy Networks and Discourse Coalitions in National News Media

The news media serve as an important forum for public debate among key actors and organizations involved in climate change policy networks. We examine national news coverage of climate change policy debate in Canada during 2007-2008, which is a peak period in national climate change news coverage. We use a discourse analysis approach to answer four research questions: Who are the central organizational actors who appear in national news coverage? What are the central discourses about climate change in national news coverage? How do these central organizations cluster around shared agreement over key climate change discourses? How do these central organizations cluster around shared opposition to key climate change discourses? By answering these research questions, we see how the national media and key news sources attribute responsibility for addressing climate change, and define the political responses that should be implemented to mitigate or adapt to climate change. We also gain insight into the ways that organizations align around particular policies and ways of understanding climate change, resulting in discourse coalitions, as well as rifts in climate change policy debate.

Old Harry and New Media: Environmental Movements and the Oil-Tourism Interface in the Gulf of St. Lawrence

Over the past two decades, offshore oil development and tourism have gained importance within the political economy of Atlantic Canada. In the province of Newfoundland, these sectors represent alternative models for living with and making use of coastal environments. While environmental movements routine- ly mobilize against oil projects like the Alberta oil sands, Enbridge pipeline, or Keystone XL pipeline, there has been an absence of critical engagement by environ- mental movements in relation to offshore oil development in Newfoundland. However, recent proposals to open up oil exploration in the Gulf of St. Law- rence, which border the Canadian provinces, as well as Gros Morne National Park, has sparked resistance from environmental movements and has brought the tourism-oil interface into sharper focus. We draw on internet ethnography of key websites and web 2.0 content, as well as interviews with core members of environmental organizations, in order to better understand how environmen- tal movements are for intervening in environmental governance and shaping the oil-tourism interface in the region. Our analysis shows that environmental organizations use websites and web 2.0 applications to make productive use of the tensions between different political and ecological scales. These new media technologies and environmental movements important tools for inserting their voices into the oil-tourism interface and defining offshore oil development as both environmentally and socially problematic.

Nationalism and Antisemitism in Postnational Europe: A Comparative Analysis of Austrian and English Print Media Debates on the Economic Crisis

Karín Stoegner (Vienna/Lancaster)
Nationalism and antisemitism in postnational Europe: a comparative analysis of Austrian and English print media debates on the economic crisis

The post-offensive period’s “postnational constellation” (Habermas) characterised by pluralism and cultural mobility, globalised economy and the nation-state’s change of func- tion. Especially the recession period’s “global economic crisis a particular vulnerability to producing nationalist and antisemitic reaction, whereby moments of both tend to intertwine, becomes evident. This presentation sheds light on the intermediation of nationalism and an- isemitism in a cross-country comparative perspective, including Austria and En- gland. By applying Critical Discourse Analysis, print media debates on the current economic crisis are analysed as to how they operate with nationalist and antise- mitic discourse fragments.

In mainstream print media, nationalism as well as antisemitism do not gener- ally occur in a blatantly exclusivist manner, as openly articulated racist forms of expression, but rather in latent forms, encoded in everyday linguistic practices and routines. Therefore, a broad concept of nationalism and antisemitism is de- liberately chosen and the analysis gives priority to everyday modes of inclusion and exclusion. By focusing on discourses around the Self and the Other in the context of the global economic crisis, everyday social communicative practices are problematized in order to trace the role of nationalism and antisemitism with- in them. This approach draws on the working hypothesis that in contemporary Western societies, extreme and open nationalism and antisemitism are not the only force that stands in the way of a society of world citizens, but also unnoticed but well-practiced routines of exclusionary identification in everyday life. These routines subtly refer to a horizon of understanding, an archive of ideological hab- its, which by tradition includes nationalism and antisemitism.

How to Avoid “Normal” Accidents? Risk Management As a Dynamic and Inter-Occupational Negotiated Decision Process

This communication aims to describe how two high-risk organizations are oper- ated, i.e. nuclear power plants and railway operation system. These technol- ogies are so complex that ambiguous situations often arise. Organizations’ re- sponse to uncertainty usually relies on procedures. Despite a huge amount of technical documents, applying a procedure is not such an easy task to perform. The procedures must fit the current situation and so they have to be adapted. As they appear, “normally disturbed situations” (Journé, 1999) seem to be quite unique. Due to systems’ complexity, the process may be in different phases, workers teams may be available or not…Thus coping with technological complexity and uncertainty implies operators to make “difficult tradeoffs and decisions about how much risk is acceptable and even how to measure the risk” (Leveson et al., 2009, 240). Rather than focusing on major failures, the communication zooms on day-to-day activities, on how operators make technical decisions that try to en- compass all the demanding issues of high-risk systems (safety, system availability, workers’ safety, environmental protection, etc.).

Both organizations studied are characterized by a strong technical and social division of work: high-risk systems operators turn to be specialists in their field (production, safety, maintenance, etc.). Yet, these specialists are interdependent regarding the organizations’ functioning: organizational reliability thus relies on workers teams’ cooperation and interactions between human and techniques (Perrrow, 1984). Our empirical results describe in depth the nature of arrangements and negotiations made within and between occupational groups to articulate the work. To increase decision-making rationality, professionals communicate with each other. They develop argumentation and exploitation practices to make their point visible and to contribute to the collective bargain about technical decisions that have to be made. In sum, a major way to cope with complexity relies on com- munications performed in situation, especially during technical points-of-view confrontations.

Future Visions in Social Milieus Among the Middle-Class of Nairobi and Mombasa – Empirical Results and Theoretization of Future Concepts

In this paper I will focus on own research on future visions in the middle classes of Nairobi and Mombasa. These results will be the basis for a theoretical interpre- tation of these views on future. The various future visions among the different social groups (=milieus) in the middle classes of these two Kenyan cities point at certain social developments and can thus be interpreted as paradigmatic tenden- cies in the present society. While the social context of the milieus and their future visions might reflect global tendencies like forms of urbanisation they are at the same time highly local as they are adaptations to specific conditions - as the term ‘glocalization’ (Robertson) suggests.

Different social milieus in the middle classes of Nairobi and Mombasa have certain lifestyles and related future visions which reflect different tendencies of the contemporary social world. Kenya is a very interesting case study as the coun- try has undergone considerable change and an increased integration into glob- al structures in the last 20 years while it is still a developing country. Especially the differences in future orientations of East Africa’s dynamic economic centers Nairobi and the old multicultural town and port to make can reveal a variety of future references. Thus I will demonstrate by paradigmatic examples how future orientations of milieus in urban Kenya reflect specific social developments and how they can contribute to the theoretical interpretation of sociological future concepts. This way the paper even tries to (re)construct social theory from a spe- cific perspective of the Global South.

STOLL, FLORIAN* (University of Bayreuth, Germany, stollflorian@gmail.com)
Social Milieus in the Middle-Class of Nairobi – Lifestyles, Attitudes and Future Visions Beyond Homogenity

One of the key questions in the debate on (political) orientations of middle-class homes how these groups develop their attitudes. To answer this it helps to consider political positions in their heterogenous sociocultural contexts among the different groups of the middle classes. As an example I will take a look at some social milieus, their lifestyles and their future visions in the middle-class of Nairobi – with a look at milieus in Mombasa as a contrast.

The reconstruction of milieus in the specific context of Kenya’s capital aims to demonstrate how a variety of factors influences the lifestyles of Nairobians and that there are heterogenous groups with different lifestyles in the middle income strata.

Future visions are an excellent indicator for lifestyles and corresponding orientations of milieus to see how they integrate these visions into their daily practices. E.g in Nairobi developed over the last decade a milieu of Young Urban Professionals between 20 and 35 years who have a consume oriented lifestyle and who are bound to the city. They are usually not driven by religious or traditional values. Their orient insects and future visions differ a lot from groups who are strongly led by religious affiliations, (neo-)tribal values or by connections to the country side.

So this paper will provide a sketch of exemplary milieus, their life styles, their living conditions and their future visions. Another relevant question might be how different milieus look for solutions or demand different actions concerning the threat of the Islamist terror group Al Shabaab whose last attack shook Nairobi in September 2013. All aspects mentioned will contribute to draw a complex picture of the different social milieus in the Nairobi middle class and their divergent life styles.

Morality in Context: A Multilevel Analysis of the Relationship Between Religion, Governance and Values in Europe

The exact relationship between religiosity and moral values is understudied, and it is so far unclear what the process of secularisation means for the morality of Europeans. Attitudes to religiosity and the visibility of religion, must be seen in light of whether religion’s presence in the public sphere strengthens moral communities and identities, or merely highlight moral differences.

From Haidt’s (2012) moral foundations theory and Norris and Inglehart’s (2004) existential and cultural theories, we know that religion is associated with traditional and conservative values as well as levels of political and economic development. One question is whether religion can act as a substitute for well-functioning secular authorities where these are absent, or if it simply has an additional effect on morality that is independent of the quality of governance. Another question is whether the relationship between religiosity and morality changes as the average citizen becomes less religious, and as religious diversity increases.

Using data from four waves of the European Values Study (EVS) 1981-2008, we analyze attitudes to personal autonomy and self interest in a multilevel model of 48 European countries. Results show that religiosity is most associated with moral values that concern personal and sexual autonomy, that individual religiosity is more associated with morality in countries with high levels of religiosity and that religious context is only negatively associated with self-interest in countries with high levels of religiosity and that individual religiosity is more associated with morality in countries with high levels of religiosity and that religious diversity increases.

Included But Still Not Equal? Board Interaction and Gender Segregation

Abstract

Included but still not equal? Board interaction and gender segregation Norway was the first country in the world to pass legislation specifying gender representation on company boards of directors. The Norwegian Parliament passed a new regulation in December 2003 that required at least 40 percent of each gender on company boards. Before the reform, laws opponents claimed that the new women directors would not be able to, or allowed to, participate fully in board decision-making; instead their role would only be window dressing. Based on a questionnaire sent to all directors in public limited companies in 2009, the article studies this allegation.

Results show that women directors report less ability to influence board decision-making than men directors. Moreover, women to a lesser extent feel they are part of the inner circle on boards, where such phenomena are perceived to exist. These tendencies also hold when we control for a lot of other independent variables such as board role, ownership interest, number of directorships and occupation. Hence, the he quo regulated boards show tendencies of hierarchical gender re-segregation.

Wearing the Veil: Hijab, Islam and Job Qualifications As Determinants of Social Attitudes Toward Immigrant Women in Norway

Immigrant women are a particularly vulnerable part of immigrant population. In this paper we analyse negative attitudes toward immigrant women in Norway. We focus on immigrant women’s formal job qualifications, their religious background and wearing of Hijab—the headscarf that is sometimes used by Muslim women. Using survey-embedded experiments (N=1250) we are able to analyse the net-effects on attitudes of job qualifications, Islamic religious background and Hijab. The results show that natives have more negative views of Muslim women that wear a Hijab, but that the negative effects of Hijab are reduced when a woman wearing it has higher education. With a single exception, the results also show that Muslim background itself (i.e., without Hijab) does not have any strong effects on attitudes of natives toward immigrant women. The results are discussed with a point of departure in cultural threat theories and current socio-economic situation in Norway.

Provincializing Postsecularism: Critical Reflections On New Western Civil Religion

This paper aims to denounce the provincialism of the European postsecularism, considering that an insufficient pluralism was often invoked by European Union in order to justify the cultural failure of her integration’s process. The Postsecularist orientation risks, if applied without an adequate sociological and inter-cultural reflection, to become a new civil religion. In the first part I will bring up the consequences of this critical reflection on the actually relation between State and religion in the specific context of Italian society, lacerated between a public secularism and a private Christianity. In the second part, I will try to apply to the European postsecularism, as discursive regime of the European identity, two critical hypothesis emerged from the Post-colonial Studies: the suggestion to “Provincialize Europe” and the critic to her “Cultural Hegemony”. Provincializing Postsecularism does not mean, of course, repudiate or abandon secularism, but thinking about how to renew it. In Italy the transition to post-secularism can not be seen as a simple historical transition, but also as a case of translation: translation of plural memories, religious tradition, desires of believers. In the third part, I appeal to the hermeneutic tradition of Paul Ricouer, trying to connect a new translation of postsecularism to a new phenomenology of the Italian believer, hoping that the recognition of the religious pluralism can contribute to the constitution of a lay European political community.

STRECKER, DAVID* (University of Jena, david.strecker@uni-jena.de)
How Market Economy Did Away with Violence: A Liberal Story and The Ugly Truth of Contemporary Slavery

The history of power and violence in modernity has traditionally been conceptualized within a nation state-framework and along notions of centralization: While socially dispersed in pre-modern times, power and violence had later be-
come increasingly concentrated in the political realm. In the course of functional differentiation, the core feature of modern societies, a state apparatus developed which organized positions of power and ultimately monopolized the legitimate use of violence. Violence, thereby, more or less disappeared from all other social spheres which turned into arenas of predominantly peaceful cooperation. With regard to this process, this book was facilitated by the alleged irrecusable functions of market transactions: Contractual relations and trade are premised on trust and, thus, do not allow for manifest violence in the economic realm. Accordingly, it has been claimed that capitalism was the driving force behind the abolition of slavery. However, violent labour relations have not ceded to exist. In fact, contemporary slavery is a pervasive phenomenon subjecting millions of people to privatized violence. This papers aims at making sense of this situation by discussing the relative merits of the claim about capitalism’s civilizing effects on labour and relating it to contemporary slavery from the perspective of a world societ shaped by economic globalization and the transformation of state authority.

STRECKER, TANJA CONNI* (University of Lleida, tanja.strecker@gmx.de)

The Transition from School to University: Pressure and Coping in Catalonia (Spain)

In this paper I present results from a study about university transitions in Spain. Young people face uncertainty, precariousness and discourses that individualize structural problems currently in most Western societies. Spain suffers, moreover, from the severe effects of economic crisis and high unemployment, accompanied by severe cuts in the education system and an increase of university fees. Hence, the pressure on young people is growing further, and the contradiction between high skills and little or no power is especially pronounced. In the paper at hand I aim to identify main pressures, affecting young people in their transition from school to university, and their shown coping strategies.

In spring 2011 I conducted twelve focus groups with pupils in their last year of post-obligatory education in public, semi-public and private schools in an urban and a rural context in Catalonia and from September 2011 to May 2012 I accomplished 21 interviews with some of the participants, amplifying the sample with first-year students from underrepresented groups. I selected and analyzed several of the focus groups and interviews with the documentary method including elements of intersectional analysis.

The end of school is characterized by uncertainties and pressures, especially related to being admitted to the chosen studies, the study choice itself and fears not to be successful in university – both, academically and socially. Students experience these pressures differently and show varying strategies to handle them, whereas their personal characteristics, structural dimensions and representations interact. I identify types along the dimensions worried/non-worried and idealistic/pragmatic, relating those to gender and social class. The comparison with the follow-up interviews does not only reveal additional problems in the further transition to university and throughout the first year of studies, but enables considering the encountered difficulties from a different perspective, adding insights due to the methodological triangulation.

JÖNASSDOTTIR, ANNA G. (Örebro University)

Feminist Theorizing of Intersectionality

This paper arises from collective work within the 5-year Swedish Research Council project, “Feminist Theorizations of Intersectionality”, organised within the GEXcel Collaboration for Advanced Transdisciplinary Gender Studies (Örebro-Karlstad-Linköping Universities), with a specific focus on the equality architecture, and in part from the EU FP6 project QUING.

The whole larger project examines intersectionality as a central concept in contemporary gender studies, in relation and dialogue with the diverse, and sometimes conflictual, theoretical and political stances in feminist debates. The project is designed against the background of the rich and diverse feminist traditions for theorizing of intersectionality, but it is also informed by the tensions between these traditions.

This paper analyses and compares how equality architectures (Walby, Armstrong, Strid, 2012, Social Politics) in Europe are restructured and challenged by the developments related to intersectionality and diversity, and the implications of the restructuring for theories of intersectionality. It links concepts of equality and intersectionality to policy frames and frameworks. It examines how the challenges of intersectionality are reflected and dealt with “on the ground”, in practical equality architectures on national and institutional level, e.g., in governments and universities, and the implications for gender equality and for the quality of the gender equality architecture. It takes the merger of equality institutions in European countries as case studies and analyses the implications of the mergers for theory and practice.

Preliminary conclusions based on previous research (Walby, Armstrong, Strid, 2012, Social Politics, QUING) suggest that even though the quality of the architecture may have improved by the inclusion of multiple inequalities, there may be a reduction of quality in terms of resources. For theory, preliminary conclusions suggest that intersectionality as mutual shaping (Walby, Armstrong, Strid, 2012, Sociology) may be a more successful approach to theory and practice than the often-preferenced mutual constitution.

Uses Of Social Theory In Comparative Religious Studies: Assessing Chidester’s Social Redescription Of Religion In South Africa

In analysing “sociality” (the formation of inclusive or exclusionary collective identities), “materiality” (gendered bodily performance of rituals, gender experiences and the desire for material objects) and “exchange” (communist or capitalist economic exchanges in rituals of gift-giving and expenditure) as three aspects of religion within local and global contexts, David Chidester has used the social theories of Durkheim, Bataille, WEB Du Bois, Weber, Marx-Adorno-Horkheimer, Benjamin and others. The purpose of this paper will be to assess what we have gained from Chidester’s use of such social categories to redescribe religion in South Africa within a global context, by relating Wild Religion: Tracking the Sacred in South Africa (2012) to his preceding oeuvre of twenty years, particularly Authentic Fakes: Religion and American Popular Culture (2005), Savage Systems: Colonialism and Comparative Religion in Southern Africa (1996) and Religions of South Africa (1992). In line with the aim of this panel I will, in assessing Chidester’s social redescription of religion in South Africa within a global context, reflect on the legitimacy of using etic vs-emic emic categories.

Competing Narratives of Modernity and Muslim Middle Class in India

Competing Narratives of Modernity and Muslim Middle Class in India

The last decade has seen an increased interest in the “phenomenal rise of the Indian middle class”. With economic liberalization since the 1990s, the entering of multinationals into the Indian market and the simultaneous process of a rapidly growing transnational media and consumption culture “new economies of desire” have developed. Boundaries between ‘traditional India’ and the ‘modern West’ have been broken down and a new national self-image as a modern global player has emerged. Public Indian discourses typically make a correlation between the growing middle class and the national pride of modern India. While increasing consumer choices, and western connoted values are important symbolic markers of middle class membership, the latter is linked to an expressive and confident af-
Emergence of the Interns' Collective Actions

This paper looks at the protests at both collective and individual levels taken by student interns in Chongqing in the summer of 2013. Drawing on a 5-month participant observation of the protesters' school life and their internships in the electronics manufacturer YD, this article examines the favourable factors, features and outcomes of the interns' collective actions. The author first argues that the emergence of collective action by these student interns could be attributed to the injured self-esteem during their placement and the culture of solidarity emerged from their lives in school. Regarding the first reason, those student interns from the occupational school had higher self-respect and expectations for the future than their counterparts of previous generations. Meanwhile, the student interns have encountered "coercive discipline" which aimed at eliminating students' humiliation during their internship. Those students were attacked in the form of violent fighting rather than strike due to their previous school experiences. The students usually resorted to violence such as fighting to resolve individual or collective disputes in their school. Third, the author suggests that school violence not only determined their action repertoire, but also help to nurture a sense of solidarity and brotherhood, which in turn provided a supporting network to students, particularly to those who lacked support from their family and teachers, valuing their workplace resistance. Fourth, the students' collective actions tend to be generally scattered and transient. Last but not least, most students who participated in the collective actions were later expelled from factories and schools, negatively affecting their prospects after the internships. This paradoxically consolidated their sense of solidarity, sowing the seeds of future resistance against capitalist exploitation.

SUBRT, JIRI* (Charles University, jiri.subrt@fhs.cuni.cz)

Norbert Elias: Figuration As a Solution of Problem of Individual

One of the questions that Norbert Elias tries to resolve in his work - either explicitly or implicitly - is the issue of the relationship between the individual and society. Elias critically assesses two resolutions to this issue that sociology offered in his time, namely the Weberian conception of individualism that postulates the human individual as the starting point of sociological thought, and the Durkheimian concept of holism, which considered society as a whole as the starting point, giving regard to holistic, supra-individual social facts. Elias considers both of these solutions one-sided and unsatisfactory, and in his conception tries to supercede them. His strategy is close to that of Georg Simmel before him. It consists in heightening the “third” that lies between the individual and society, which connects them. Simmel calls this “third” “Wechselwirkung”. Elias speaks about “figuration”. In this paper, we consider how successful Elias’ strategy is, its positives and its shortcomings.

Social Time, Fact or Fiction? Several Considerations on the Topic

In 1937 P. A. Sorokin, together with R. K. Merton, published an essay entitled Social Time: A Methodological and Functional Analysis, in the American Journal of Sociology. They noted that most social scientists share in a silent assumption about the use of the astronomical concept of evenly flowing, quantitative time, and maintained that the astronomical concept of time has a number of shortcomings when applied in the social sphere, so they tried to promote the concept of “social time” as a methodological tool, to lead to a deeper understanding of social periodicity. Since then, the concept of social time has become settled in sociology and social sciences and been the subject of various reflections. This paper examines the problems associated with its use.

SUBUDDHI, KARUNAMAY* (Indian Institute of Technology, suubuddhi@iitb.ac.in)

Politics and Policy Making Approaches to Development Practices: Towards a Sustainable Citizenship

Thinking around the politics of development we are able to identify a growing body of research into the actual politics of development that threatens to turn mainstream governance thinking ‘upside down’. Politics stands at a crossroads caught between discrediting the ‘good governance’, and repolitizing tools and discourses that attempt to reposition politics, creating space for alternative thinking.

Social theorists situate ‘Rights Talks’ as politics (as social movements) and institutional arrangement that links specific rights to developmental practices, lends support to marginalized sections, making it possible for them, as well as policies planners to re-politicize the language of development.

Ever since participation entered mainstream development discourse, critics have attacked it as form of political control. If development is indeed an ‘anti-politics’,
The Complicated Relationship Between Generalized Trust and Mobility Survey in Japan and 2005 World Values Survey Data. An analysis of Putnam focused on only the positive and negative influences on democratic values because it intermediates with generalized trust and democracy, as it allows us to see that generalized trust has both positive and negative effects on different network effects of the two types of generalized trust. This model enables us to explain a non-linear relationship between generalized trust and democracy. This fact seems to imply that Putnam's thesis can be rejected, but needs to be complemented by new theoretical assumptions. On the one hand Muslims are expected to open up for the generation of the mosque associations, which also offer leisure activities and courses with an orientation towards the German society, like e.g. German language courses. Previous studies and my own research suggest that this development is a result from both internal changes (demographic change, unemployment among members) and changing expectations of their environment, which are closely linked to the widespread participation of the mosque communities in civic life. Furthermore, I have analysed newspapers and different documents (statutes, city council records, declarations) and I did participant observation in council meetings and neighbourhood assemblies. A case comparison shows, from the bottom-up-perspective, how different actor-constellations and local systems of relevance affect the development of the local Muslim organisations.

Mosque Associations and the Expansion of Socio-Religious Infrastructure

Mosque associations represent the social and organisational core of Muslim religious life in Germany. Their primary goal is both the practice of religion and the transfer of religious knowledge to its members, irrespective of their specific shape (e.g. organisation affiliation, ethnic composition, etc.). More recently, sociologists draw attention to the increasing multifunctionality of the mosque associations, which also offer leisure activities and courses with an orientation towards the German society, like for example German language courses. Previous studies and my own research suggest that this development is a result from both internal changes (demographic change, unemployment among members) and changing expectations of their environment, which are closely linked to the widespread integration debate.

However, a closer look on the expectations of the environment reveals a paradoxical situation. On the one hand, Muslims are expected to open up for the generation of the mosque associations, which also offer leisure activities and courses with an orientation towards the German society, like for example German language courses. Previous studies and my own research suggest that this development is a result from both internal changes (demographic change, unemployment among members) and changing expectations of their environment, which are closely linked to the widespread integration debate.

An analysis of the 2005 World Values Survey Data, however, does not show us such a relationship between generalized trust and democracy. This model enables us to explain a non-linear relationship between generalized trust and democracy. However, a closer look on the expectations of the environment reveals a paradoxical situation.

The Complicated Relationship Between Generalized Trust and Democracy

R. Putnam (2001) insists that social capital is made up of generalized trust, reciprocal norms, and social activities. Social capital, he points out, has a strong and positive impact on democracy. An analysis of the 2005 World Values Survey Data, however, does not show us such a relationship between generalized trust and democracy. This fact seems to imply that Putnam's thesis can be applied to only advanced democracies. In this presentation, I will discuss the reason such a phenomenon emerges against the prediction of Putnam's social capital theory, and show that the social capital theory does not need to be rejected, but needs to be complemented by new theoretical assumptions. In order to explain the weak correlation between generalized trust and democracy, I distinguish between trust based on democratic values and trust based on authoritarian values, and demonstrate a simple mathematical model assuming individual's rational choice and different network effects of the two types of generalized trust. This model enables us to explain a non-linear relationship between generalized trust and democracy, as it allows us to see that generalized trust has both positive and negative influences on democratic values because it intermediates with educational achievement. Thus, we can say that Putnam focused on only the positive influence of generalized trust on democracy in advanced democratic societies, and ignored the negative influence of generalized trust on developing democracies. In order to test this theoretical explanation of the relationship between generalized trust and democracy, I analyze the 2005 SSIM (Social Stratification and Mobility Survey in Japan) Data and 2005 World Values Survey Data. An analysis using multilevel SEM shows that predictions of non-linear correlation between generalized trust and democracy at both individual and national levels are accurate.

In Japan, the number of people who moving to rural areas (or the countryside) from urban areas (or metropolitan area) is currently increasing. In this presentation, I will examine this phenomenon by using the idea of "lifestyle migration", and then discuss the relationship between the decision to migrate and enhanced quality of life.

In foreign countries, "lifestyle migration" means moving to elsewhere in search for a better way of life (Benson & O'Reilly 2009). This idea is associated with a new form of international migration, unlike the case of internal migration in Japan. However, "lifestyle migration" occurs as result of self-reflection among these migrants, and consequently, this idea can be adapted to describe Japanese who move to rural areas from urban areas in Japan.

Searching for a better way of life by moving to the countryside relates to quality of life. For example, in my research at Chichibu area in Saitama Prefecture, I found that some migrants engaged in farming, but they often visited the nearby urban area where they engaged in consumption activities. Meanwhile, some people chose to keep working in Tokyo. That is, a sense of "the better way of life" differs according to each migrant. However, moving to rural areas had a positive impact on the health and mindset of migrants; in the countryside, they could achieve balance between work and leisure. Notably, they do not move for the sake of work or leisure alone, but aim to control both. In my presentation, I will attempt to consider the relationship between "lifestyle migration" and quality of life through a case study of migrants who moved to the countryside in Japan.

The Complicated Relationship Between Generalized Trust and Democracy

R. Putnam (2001) insists that social capital is made up of generalized trust, reciprocal norms, and social activities. Social capital, he points out, has a strong and positive impact on democracy. An analysis of the 2005 World Values Survey Data, however, does not show us such a relationship between generalized trust and democracy. This fact seems to imply that Putnam's thesis can be applied to only advanced democracies. In this presentation, I will discuss the reason such a phenomenon emerges against the prediction of Putnam's social capital theory, and show that the social capital theory does not need to be rejected, but needs to be complemented by new theoretical assumptions. In order to explain the weak correlation between generalized trust and democracy, I distinguish between trust based on democratic values and trust based on authoritarian values, and demonstrate a simple mathematical model assuming individual's rational choice and different network effects of the two types of generalized trust. This model enables us to explain a non-linear relationship between generalized trust and democracy. However, a closer look on the expectations of the environment reveals a paradoxical situation.

This model enables us to explain a non-linear relationship between generalized trust and democracy. However, a closer look on the expectations of the environment reveals a paradoxical situation. On the one hand, Muslims are expected to open up for the generation of the mosque associations, which also offer leisure activities and courses with an orientation towards the German society, like e.g. German language courses. Previous studies and my own research suggest that this development is a result from both internal changes (demographic change, unemployment among members) and changing expectations of their environment, which are closely linked to the widespread integration debate.

The Role of Family Caregivers and Their Working Lives: Convergences and Divergences Between France and Japan

This paper presents the method and results of a comparative research on family caregivers and their professional trajectories in France (Ile de France) and Japan (Osaka).

The aim of the research is to chart two kinds of trajectories in a person’s life: professional and of caregiving, and to examine their interdependence. In the current context of the prolongation of life expectancy, a person can provide care several times in different periods of life, or care for more than one person in parallel at the same time. The care provided may be for different causes of frailty. We should therefore look into the temporality and the global view of the caregiver’s life without limiting the study to a certain type of frailty.

We rely upon a sequential analysis of data on caregiver’s trajectories. We also collected on-care networks developed around the caregiver by individuals participating in the care, including care for the caregiver. The typologies of professional trajectories are analyzed in relation with variables such as socio-demographic characteristics of the caregiver and care-receiver, types of care networks, etc.

We try to study the different configurations that come out for Ile de France and for Osaka, while situating them in the context of the public welfare and labor markets of each country and region. We will be interested to know, for instance, what traits of caregivers come out, and on what type of conception of care and work related logic they are based.

The Islamization of Leisure in Indonesia (A Comparative Analysis of Aceh and West Java)

In this culturally unequal world, Islam is perceived as a minority civilization which is acted upon by the dominant “western” civilization. The influence is allegedly reflected in various spheres such as leisure in which a “division of labor” between leisure and work come forth. The recent revitalization of Islam portrays a more assertive Islam in society with the development of Islamic leisure in addition to Islamic economy. The case of Indonesia indicates that there is a process of Islamization of leisure with the application of Islamic values such as the prohibition of “haram” or non-“halal” food and liquor, “khalwat” (close proximity between men and women), gambling as well as the obligation to comply with Islamic dress code. The implementation of this process can be seen as a colonization of life-world along with economy and state in which society emerges as a new arena and theater.

A comparative analysis between Aceh (a Shariah province) and West Java (a non-Shariah province) will shed lights on various social movements that support or reject the Islamization of leisure. The roles of CSOs, political parties, state and intellectuals in their efforts to achieve compromise will broaden our understanding on the multiple meanings of leisure—and social life.

Between the War and Consolidation of Communist Power: The Forgotten Social Research in Poland in the Second Half of the 1940s

Opinion commonly held has it that empirical social research in Communist Europe resurfaced only as late as in the second half of the 1950s, during the post-Stalinism ‘thaw’. However, in some countries like Poland, Czechoslovakia and Hungary, social research was possible immediately following the WWII. It did not last long though. Consolidation of Communist power delivered blow to this research in the late 1940s.

In this paper I discuss how in the years 1946 – ca. 1950 sociologists in Poland took an advantage of opportunity to study the society in which they lived. Polish society has just come out from the war and was about to enter a process of political ‘reconstruction’ under the leadership of the Soviet-style Communist party. Following the war sociologists immediately started to investigate social and psychological effects of the war, post-war migrations, new communities in the former German territories, ethnic relations (especially Polish-Jewish), and social mobility as a result of the war and the political changes. Fieldwork and questionnaire were methods of these studies. However, politically sensitive issues, e.g. mechanisms of political power and public opinion were banned by the authorities as topics of sociological inquiry. Later in the 20th century the post-war social research was almost forgotten and only now is being rediscovered by social historians.

The Power of Women’s Representation in Local Government in Combating Women’s Underrepresentation at Local Politics

The importance of local politics is on the rise particularly concerning the discussions of gender inequality in and relations with power, democracy, economy, and the urban environment. This analysis allows us to identify appropriate rehabilitation initiatives that will lead to home and health improvements in informal, peri-urban communities.

the last two decades, the academic interests about the relation of local politics and gender have been on rise and policy-makers who are aware of this fact have been paying serious efforts to bring local actors to the front to increase women’s political involvement. Since the 2000s, Turkish government has charged various branches of politics, including the municipalities and mayors in the scope of this research, in enhancing women’s participation particularly in local politics. However, recent studies and statistics reveal that neither the number of women at local level politics have been increased either these responsibilities have been fully acknowledged by the local actors in Turkey. It is assumed that, as women representatives, female mayors would contribute to increase women’s political participation in local politics and be more assurance to fulfill the related responsibilities to support women’s involvement into local political relations. Thus, in the case of 2009 local elections in Turkey, this study aims to find out to what extent female mayors can contribute in enhancing women’s political involvement at local level. In the context of this study, this research will try to analyze the related discourse and activities of female mayors who were selected in 2009 local elections in Turkey by in-depth interviews.

The Controversy: Family Separation and the Immigration Law in the U.S.a

This study examines whether the Courts in the United States are recognizing the provisions of the UN Convention on the Rights of the Child as an international customary law even though it is not ratified by the U.S.A. Drawing on multiple primary sources, including the work of scholars and legal professionals the article explains the deportation of parents and discusses the family separation through immigration procedures and human rights approaches. The article then presents the results of recent court opinions, and compares court decisions. It concludes that some courts have made significant progress toward family integrity and for the best interest of the child, however some court decisions rejected to recognize the Convention and gave priority to the State interest and deported numerous parents even though their children are citizen of the U.S.A. On the other hand, this article also identifies a need for further improvement, which can be accomplished through the contributions of national and international organizations.

Care Migration in Asia: A Comparative Study

As some countries in Asia develop economically and experience major demographic challenges such as persistent below-replacement fertility, the issue of immigration and care provisions emerges. It is particularly important in the Asian context where people have to rely on the market in the absence of effective welfare state. This Asian situation is called “liberal familialism.” In this paper, we try to answer the following questions relating to care migration by drawing on data from China, Japan, South Korea, Taiwan, Singapore, Thailand, and Vietnam: Whether and how care provision is mediated by international migration or internal migration? What are the working conditions – are the migrant care workers documented or undocumented? Are they protected or covered under the local employment laws? To what extent are they allowed to immigrate to the host countries? What are their ethnicities and nationalities? What is the history of employing care workers in different countries – for childcare and/or for elderly care? What are the primary sites at which care is provided (for example, in the households via marriage migration or in institutional spaces via healthcare migration)? What are the challenges faced by sending countries and receiving countries? Finally, what are the ways in which care migration relates to various forms of social stratifications in Asia – in particular, gender, class, ethnicity, and urban-rural inequalities?

Lateral Networks of Homeowner Associations and Civil Society Building in Urban China

Civil society organizations are crucial for the development of civil society, because these organizations teach citizens democratic practices on the one hand, and constrain the power of the state on the other. Recently, lateral networks of homeowner associations are being formed in many Chinese cities. While not being recognized by the authoritarian state or even faced with potential political risks, these networks are playing an ever more important role in facilitating homeowners’ collective actions to defend their private property rights. Existing literature tends to understand homeowners’ collective action as a reactive response to counteract the powerful real estate developers and their management agencies in a yet mature housing market. But based on interviews, participant observations, and online discussions of the lateral networks of homeowner associations in Beijing, Shanghai, and Guangzhou, this study argues that these networks are proactively adopted as important infrastructures for the development of civil society in urban China. Driven by the ambitions of promoting the development of civic organizations in China, the activists use homeowner associations as the most practical way to make such attempts. They not only deal with immediate material interests concerning housing and neighborhood management, but also strive for the participation of member associations on a regular basis and for their transformation into full-fledged civil organizations. This study attempts to explore the political implications of increasing homeowner activism as well as their strategies and tactics to establish and run such lateral networks. It has profound implications for state-society interactions and civil society building in contemporary urban China.

Pro-Growth Coalitions and Homeowner Activism – a Comparative Study in Shanghai and Taipei

Middle-class homeowners, whom one would expect to be the gainers of China’s urbanization, have formed one of the highest-profile new social groups as other social groups such as relocated households or migrant workers. These groups are highly active in collective actions – petition, litigation, sit-in demonstration – to uphold their private property rights. Existing literature tends to understand homeowners’ discontent as a result of the immature housing market, the deceitful real estate developers and their management agencies, and the non-independent legal system. While focusing on immediate causes, existing studies neglect more important structural factors that contribute to homeowner activism. By adopting a comparative study – based on documents and interviews – in Shanghai and Taipei, the author argues that different levels of state intervention in housing-related disputes lead to different dynamics of homeowner-making processes. This study attempts to explore how land-owners and play a dominant role in planning, relocating, and leasing the land to the developers. They build close relationships with the developers. When housing disputes emerge, the local states are motivated to intervene and ally with the developers considering the fact that they have substantial interests involved. This explains why more often than not homeowner activism in Shanghai directly targets the government and proceeds in a non-institutional manner. But in Taipei, the local states are mere regulators in land development processes. Individual land-owners initiate the redevelopment projects and negotiate with the developers. Housing disputes in Taipei are usually dealt with through negotiation or courts. This study offers a new perspective to understand increasing homeowner activism in Chinese cities. It also has profound implications for state-society interactions and urban governance in contemporary China.

International Migration of Nurses from India: A Case Study of Delhi Nursing Colleges

This paper examines the extent of potential nurse migration from India and their causes, types and nature. Methods: Apart from empirical study, the research also relies on secondary sources. The study is based on the response of 48 potential migrant nurses from Delhi. Discussion: India has been and will continue to be an important source country of nurses for the developed countries in the light of emerging shortfall of nurses in the major destination countries in the future. Under the current scenario, it may be presumed an annual out-flow of 8-10 thousand nurses from India. However, in spite of the fact that the country has a stock of 1.6 million registered nurses, there is an additional requirement of 10 lakh nurses to fulfill nurse-population ratio of 1.500. The current nurse-population ratio stand at 1:1100 compared to the developed country averages of 1:150. Therefore, India is in a double effort to produce nurses for meeting both domestic and international demand by creating a vast and sustainable infrastructure for the production and training of nurses. Policy suggestions: First, improving the availability of data on migratory flows of nurses from the country. Second, a detailed analysis of alternatives available for procuring and filling up the vacant posts in the shortage areas on the one hand, and identifying and targeting the surplus areas for international recruitment of nurses on the other. Three, twinning programmes between organizations of both sending and destination countries and undertake programmes of research, staff exchange, staff training and support, and flow of resources to sources countries. Four, preferential treatment for migrant nurses for immigration in the destination
country and facilitate return as per the willingness of migrant nurses, and finally, signing of nurse-mobility partnership agreements with the important destination countries, such as, UK, USA, Middle Eastern countries, Ireland and Australia.

**Public-Private Partnerships and Micro Health Insurance Schemes in India: A Sociological Perspective**

This paper is an attempt to look at the socio-economic features, and health seeking behaviours of the lower income group and their involvement in the functioning of the micro health insurance schemes. The model micro health insurance as a mechanism of social capital is examined its strength to create a good “health for all”. In other words, it focuses on the importance of public (government) intervention to create a feasible health care systems with the partnership of private both for-profit and non-for-profit sector, so that, the micro health insurance schemes profitable for the vulnerable sections of society. More precisely, practicable schemes for better health can be created by the intensive involvement of public and private, by which willingness-to-pay for health can be possible by the lower income groups.

Despite increasing acknowledgement that social capital is an important determinant of health and overall well-being, empirical evidence regarding the direction and strength of public-private linkages in the developing world is limited and inconclusive. An increased contribution from the community has been identified as an important financing option. To date, however, there has been little systematic documentation or analysis of experiences with different health financing methods.

Currently, the health sector is unable to meet the growing needs of the population and is severely financially constrained. The study estimates the impact of the program on trust and cooperation in rural communities. Rashtriya Swasthya Bima Yojana (National Health Insurance Programme) is the government initiative to provide quality health facility to the lower income groups. It is important to emphasize that the study does not separate the direction of causality between trust and cooperation. The analysis treats both aspects of social capital equally in the impact study public and private inter-linkages for better health facilities of the Indian society.

**Ordinary Sociologists**

Until the 1990s the sociology department of a public university in Indonesia strengthened their college teaching staff by recruiting college seniors with good academic achievements as part-time teaching assistants. After obtaining their bachelor’s degrees in sociology some of these sociologists would continue to teach on a part-time basis while waiting for an opportunity to be recruited as a full-time faculty member. For most of them, however, the wait was in vain, among other things because there were very few vacancies available, and also because the eligibility standards for becoming a full-time faculty members were gradually raised. After teaching part-time for a number of years – while, in some cases, working towards a masters’ degree -- most of them finally sought and obtained full-time employment at other public or private higher education institutions, where they continue to teach sociology.

The practice of recruiting college students as teaching assistants was eventually discontinued, Factors such as centralization and bureaucratization within the university, the tightening of recruitment criteria for teaching staff at colleges in compliance with national standards, and the application of efficiency criteria forced the department to abandon its policy.

This paper, a case study of sociology teaching, describes the biographies of a selected sample of former teaching assistants in sociology – their social backgrounds, present social statuses, academic performances and careers. The life history data are based on depth interviews with informants who were part-time teaching assistants recruited in the 1990s, are still working as academics at institutions of higher education outside their alma mater, and are still teaching sociology. Data for the study are also based on interviews with on-campus resource persons, and on the examination of relevant documents.

In Times of Civil War: On Being a Schizophrenic (public) Sociologist

This contribution will address some of the dilemmas that sociologists in the Global South face – how does one choose between the demands of the public moment, the university as a space of work and struggle, and our duty to our “disciplines”? How do we engage in practically extending the democracy and equality that we routinely learn and teach about, and yet seize the time and space required for reflection and produce research that is valued to the extent that it is seen to be disinterested? And how do those of us who live and work in the global academic periphery validate our sociology in a world where the standards are often set by scholars abroad?

Undue Process and the Paradox of Increasing Juridification

Since the publication of Malcolm Feeley’s 1979 classic, The Process is the Punishment, the idea that improved adjudicative processes necessarily lead to an increase in substantive justice has been questioned. In more recent work, Nassar Hussain, The Jurisprudence of Emergency (2003) has argued that colonial legality in particular, relied on rules and laws as a form of rule. Post colonial legal systems, like that of India, are notorious for the costs they impose on those participating in the system, primarily but not only litigants, in terms of fees, delays, the alien nature of legal norms, or the unwillingness of the executive to implement court orders which go against them. This burden falls disproportionately on the poor.

Paradoxically, however, there is an increasing juridification of social and political issues, with a range of disadvantaged groups resorting to the courts, asking for some right or protesting against some violation. This paper explores this paradox of increasing juridification coupled with the ongoing and perhaps increasing procedural injustice in the name of due process. Scholars of Indian law have argued that litigation is often conducted to aggravate rather than resolve issues, a transfer of a dispute to another sphere. But in the case of indigenous groups and others attempting to access the courts, knowing they will be harassed themselves, what is at play? What does justice mean in this context, and is that even the objective?

Heterogeneity of Childlessness in South Korea

Childless families constitute an emerging family form in contemporary Korea. According to 2010 Census, approximately 15% of households consisted of child-
less couples, indicating that the meaning of parenthood and the norm of childbirth have changed in the post-Confucian agrarian era. The burden of child care and education has exacerbated couples’ motivations to become parents, particularly among dual-income families. However, childless Koreans may not be a homogenous group. Some couples remain involuntarily childless due to infertility, and others simply delay having children. In this study, we categorized childless married Koreans into three groups, voluntary, involuntary, and delayed, and examined the factors associated with each group.

Data came from 553 childless married Koreans who had been married at least for three years using quota sampling in metropolitan Seoul. We conducted multinomial logistic regression to identify the individual, attitudinal, and marital factors associated with participants’ membership in each of the three childless groups using involuntary childlessness as a reference group. Both the voluntary and delayed groups were more likely to perceive advantages of childlessness, to put less importance on religion, and to have less intention to adopt a child. However, other factors were differently related to the voluntary and the delayed groups. Specifically, attitudinal characteristics were significant among the voluntary group while marital characteristics were significant among the delayed group. The voluntary group was more likely to have negative attitudes toward parenthood and to report a lower ideal number of children compared to the involuntary group. The delayed group was more likely to be dual-incomers and to report a shorter length of marriage compared to the involuntary group. Our findings suggest that childless couples may not be a homogenous group in Korea. It is worth noting that there are differences in attitudes towards parenthood and marital characteristics depending upon the childless group.

US Retirement Migration to the Philippines: Reasons and Explanations for Later-Life Migration

Studies of retirement migration in the United States often focus at the national level, and there is comparatively little information about the retirees who cross international borders in their search for new homes. Retirement migration flows are unusual in that the late-life migrants select destinations in less-developed countries in reaction to the general pattern of migration from poor to rich countries in search of jobs, higher incomes and a better standard of life. This study has examined the reasons for retirement migration from the United States (US) to the Philippines using data collected from different locations in the Philippines. A non-random sample of 141 US retirees was surveyed. The findings identified four major reasons for migrating to Mexico: financial circumstances, the natural environment, a sense of community and friendship, and finding life-sexual partners. While these relocations contradict much taken-for-granted and popular knowledge about migration patterns around the world, they have important implications for the ways of life, social relationships and welfare of the migrants. More in-depth multidisciplinary studies are needed to increase understanding of this evolving phenomenon.

SURTEES, NICOLA* (University of Canterbury, nicola.surtees@canterbury.ac.nz)
Becoming Father, Doing Fathering: How Gay Men's Practising of Relatedness, Intimacy and Care Disrupts Normative Constructions of Families

Fatherhood is frequently conflated with parenthood for any man who begets children. Fathers are typically assumed to be involved parents as ‘natural’ outcomes of biogenetic relationships with children. Drawing from the findings of a qualitative study examining the ways in which the gay men considered and distinguished between biogenetic relationships and the doing of fathering and parenting through reflexive negotiation of expected or actual roles and involvement with the lesbian mothers of their planned or current donor-conceived children. The paper highlights three ways in which multiple parenting models based on cooperative nonsexual reproductive relationships between men and women, and intimate same-gender relationships, disrupt normative constructions of family. Firstly, such disruption occurred through the men’s deliberate separation of biogenetic fatherhood, motherhood and parenthood from the doing of parenting in ways that can be flexibly, negotiable and centred on practices of involvement rather than biogenetic relatedness. Secondly, disruption occurred through the men’s separation of the doing of father and mother from gendered assumptions about parenting roles; they performed both fathering and mothering. Thirdly, the men disrupted the assumption connecting fathering, mothering and parenting with joint residence through the de-centering of ‘home’; neither fixed nor static, ‘home’ was attached to relationships, not places. Troubling the taken-for-granted primacy of heterosexual two-parent family forms, legal relationships between parents, legal and biogenetic relationships between parents and children and co-residence as benchmarks operating to regulate families, the men’s stories open (discursive) spaces for recontextualising possibilities for queer fathering, mothering and parenting beyond heteronormative understandings of ‘proper’ families. Within a context of escalating family transformations in an increasingly complex society, thinking and talking about new forms of practising relatedness, intimacy and care in ways that are expansive and generative will open up rather than shut down possibilities for all families.

A Longitudinal Perspective on Quality of Life in Times of Crisis: Switzerland from the 1990s to Nowadays

During the past twenty years Switzerland experienced three major recessions and periods of economic slowdown: the prolonged and deep economic stagnation of 1992-95 – the country’s most pronounced recession of the post-war period – and the comparatively mild two recessions of 2002-03 and in the wake of the global financial economic crisis of 2008-09. During these periods of economic crisis, unemployment and poverty increased, particularly during the crisis of the 1990s, when unemployment soared from its previously extremely low level. The proposed paper aims to explore the consequences of recessions and economic downturns on various dimensions of quality of life by comparing the three historical periods of economic stagnation.

In order to analyse how quality of life has evolved since the early 1990s, we use various longitudinal databases, notably the Swiss Labour Force Survey (SLFS, available from 1991 onwards), the Swiss Household Panel (SHP, available from 1999 onwards), and the Swiss Statistics on Income and Living Conditions (CH-SILC, available from 2008 onwards). Various indicators of quality of life, poverty, deprivation and inequality, as well as of subjective well-being will be calculated in order to measure and compare quality of life during different recession periods. Our empirical analysis will explore the impact of economic crises for different populations as well as for various quality of life domains (objective and subjective indicators). First results suggest negative crisis impacts on quality of life and subjective well-being particularly for specific vulnerable population groups.

Being Dad or Mum? about Traditional Parental Roles from the Perspective of Polish and Swedish Fathers

Parenthood must be considered as one of areas within which reproduction of gendered practices occurs. In my paper I will try to show how Polish and Swedish fathers understand traditional parental roles, how they perceive biological and cultural differences between motherhood and fatherhood and how they think about gender equality within the household. My paper is based on 52 in-depth interviews conducted with Polish and Swedish fathers in 2012 and at the beginning of 2013. It is a part of broader research project on fatherhood in Poland and Sweden. Interviews concerned men’s experience of parenting and are analysed in the institutional and social contexts of both societies. In my opinion these contexts are extremely important here. Stereotypical roles of fathers and mothers are strongly connected to cultural patterns of masculinity and femininity. Beside that Polish and Swedish societies provide, through family policies, completely different conditions for having children and differently approach the problem of work-home balance. Unsurprisingly, these have an impact on how men define father’s and mother’s roles. Among Polish fathers there is a tendency to look at it with more conservative and traditional approach. They are convinced that it is impossible to cross biological differences between motherhood and fatherhood and that the father is rather regarded as mother’s helper or additional carer. Whereas Swedish fathers are more eager to question imposed by society patterns of behaviour. Sometimes they really struggle with stereotypical gender roles to be more involved in family sphere and try to redefine traditional fatherhood. Obviously these attitudes have an impact on everyday fathering and the way family is constructed. Fathers’ perspective is important here, since without their bigger involvement in family life, gender equality cannot be achieved in other areas of social life.

Prosper Or Deteriorate : Modern Millennium's Path To Happiness
The objective of this academic paper is to present students’ perspective on methods of attaining happiness. After realizing that this age group is leaders and possesses the potential to lead, it is helpful to bring their perspective and expand it into a philosophical study to analyze and adapt to the livelihood of the general society as a whole.

The results revealed 4 methods of attaining happiness in the perspective of students. They include 1) Living under moral and ethical conduct and live with the intent of eradicating delinquents 2) Setting a constructive intelligence and mindset; human beings have the ability to comprehend logic and causes of phenomena as well as resolve issues 3) Human beings should place importance on spiritual and interpersonal relation aspects over materialistic aspects 4) Body of knowledge passed on or accumulated by ancestors or knowledgeable people.

If ultimate happiness and collective social happiness are the goals of human beings, it is reasonable to follow the path that leads to a good management of life and society by understanding the principles or the valuable rules and apply them in all levels and forms of society.

The Rise of Community in Asian Care Provision

Theories of civil society sometimes assume or praise a civil society as being independent from the state, in which citizens, by communicating their opinions freely, cultivate their power to claim oppositions and/or propose alternatives to governments. However, in Asian countries, governments themselves have intervened in cultivating civil societies in the modernization processes.

For example, in Japan, the Meiji, Taisho and Showa governments tried to bring up a civil society in order to catch up with western modern nation-states (Garon 1998). The neighborhood association, chônaikai, originates in such a government’s effort to organize a cooperative civil society. Recently, even in many countries including advanced welfare states in the west, the governments have become more relied on the voluntary/community sector to deliver care to the elderly and/or children. Parity because of the financial constraints combined with changes of demographic structures, the role of volunteer/community is more important to sustain lives of vulnerable people. The introduction of the social model of care (as opposed to the medical model) seems to have legitimized this trend.

This paper tries to grasp the weight of voluntary/community sector in care diamonds in Asian societies. It outlines common features as well as differences among Asian societies in the structures of community care provision, and it also investigates how governments promote community care through regulations and incentives. Through these inquiries, it tries to explore whether and to what extent the community sector contribute to de-familiarization of care in Asian societies.

Why Did the “Blue-Green Coalition” Develop in the Case of Minamata? an Analysis of the Struggles of the Union and Social Movements Against Chisso

From the late 1960s to the mid-1970s, there was an upsurge of social movements against industrial pollution. Victims of pollution diseases as well as local residents organized anti-pollution movements and opposed the construction of pollution-prone plants in their neighborhoods. Reactions of labor unions to these social movements were indifferent or even hostile. Some enterprise unions supported activities of residents against pollution in principle but withdrew their support when the latter’s actions, such as filing lawsuits against polluters, came in direct conflict with the interests of unions and their firms. Other unions at firms that caused industrial pollution stood on the management side and took confrontational attitudes toward local resident social movements.

The earlier case of the period coincides with a case of this general tendency (the absence of “blue-green coalitions”), by focusing on the relationship between the enterprise union of Chisso (the SNU) and social movements of pollution victims and their supporters. When it became clear in 1968 that organic mercury discharges from Chisso’s Minamata plant caused Minamata disease, the SNU became actively involved in supporting Minamata disease patients and formed cooperative relations with social movement groups concerned with Minamata disease. The paper explores the factors contributing to the formation and development of this “blue-green coalition” and what concrete results the coalition achieved from the perspective of “strategic capacity” of union leaders. The paper argues that the SNU developed its strategic capacity as it coped with challenges posed by hard-line management policy toward the union and management plans to drastically downsize Minamata plant. Union leaders developed the strategic capacity to frame the mutual interests of union members and Minamata disease victims by identifying the management of Chisso as their common opponent in their respective struggles and to mobilize the union’s resources effectively in cooperation with social movement organizations in the struggles against the company.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
with professional Japanese female writers, the paper first identifies some important features in the contemporary Yosi/BL texts such as transgression of sexual norms, subversion of gender fixity, renewed definitions of masculinity and femininity, and highly context-dependent sexual orientation of protagonists. By doing so, I argue that Yosi/BL has made it possible for Japanese heterosexual women to transform normative gender dualism, sexual acts and sexuality at least at the level of discourse; 2) to use men's images not only for their empowerment but also for their own gratification as agent of desire. This is a significant step forward from early Yosi works that focused upon getting affirmation from others and fleeing from patriarchy.

To be or Not to be, That Is the Question: The Bifurcation Approach of the Japanese State and Identity Formation of Koreans in Japan

Koreans in Japan present an important case for understanding the nature of the interconnections between race, nationalism, and ethnic relations. All too often, studies of these phenomena center on Western cases or on cases where non-Western racial minorities move to Western states. In this paper, however, I examine these inter-relations within Northeast Asia. The Zainichi Koreans or old-timer migrants in Japan (who are already in the fourth generation) must face what I call a 'bifurcation approach,' which makes a strict distinction between the Japanese and the non-Japanese based on nationality in the management of ethnic/racial diversity instituted by the Japanese state and society. In Japanese, the concepts 'race,' 'ethnicity,' and 'nation' are virtually indistinguishable. The formulation race = ethnicity = nationality = culture is essential to the Japanese conceptuation of what makes one Japanese. Moreover, under the Japanese sense of nationhood defined along exclusively ethno-genealogical lines and nationalistic multiculturalism, minority cultures have become fossilized owing to state sponsorship of the dominant Japanese culture. As a result, Zainichi Koreans—who have significantly become acculturated to and share a similar phenotype to the mainstream Japanese—have been racialized and constrained in their formation of hyphenated identities such as 'Korean-Japanese.' Based on interviews with Zainichi Koreans, this paper demonstrates how they negotiate the shoals of race, nationalism, and ethnicity in order to survive in a deeply racialized state and examine their collective identity-formation under circumstances in which they have to live by hiding their ethnic origin with a constant pressure to 'impersonate' being Japanese.

SUZUKI, MAYA* (Tokyo University of Foreign Studies, mayasuzuki.edu@gmail.com)

Challenging Law and Justice from below: The Public Interest Litigation (PIL) Movement in the Dalit Community

In this paper, I examine protest movements of the marginalized Dalit community (formerly known as Untouchables) in contemporary India from a case study of Balmiki (a sweater keeper). In particular, I explore the political aspects of caste by focusing on the caste-based quota system, known as "reservation," which is a part of India's affirmative actions.

This paper is organized around two significant issues. The first is the formation of a "new" identity among the Dalits through saint worship, which poses the following question: Why has the community embraced saint worship? The answer to the question lies in their religious choice to worship a saint, which gives them a sense of dignity and empowerment, and helps in the construction of a collective identity among members.

The second issue is the implications of caste-based identity politics. Since the late 1980s, an important factor Indian politics is the shift to a multiparty system and the rise of identity politics. With an increase in equality and social justice, marginalized castes have risen to challenge existing policies and demand an equal share in state resources.

I found that the success rate for the implementation of the reservation policy for the benefit of the lowest castes was significantly low. The distribution has been uneven among the targeted groups. Moreover, the results of my fieldwork revealed that most people tried to hide their caste. However, a number of them also affirmed their creation in order to obtain the benefits of welfare schemes and protect their rights by challenging the judicial system through Public Interest Litigations (PIL). This paradoxical response explains why caste identity has become more positive and assertive, which has led to the politics of difference in contemporary India.

SUZUKI, MIKAKO* (Keio University, mikako0308@gmail.com)

The State of Neoliberalism Criticisms in Japan: Why the Discussion on Cosmopolitanism Does Not Gain Steam in Japan

As economic globalization progresses, a wave of neoliberalism is sweeping across the world, demanding states and societies to render a variety of modifications. Such a phenomenon has been analysed, described, and criticised extensively worldwide. Japan is no exception; criticisms toward neoliberalism are said to be forming a major trend in Japan.

However, such critiques are slightly different from those toward neoliberalism in other parts of the world. Worldwide criticisms toward neoliberalism often lead to discussions on global transformation and cosmopolitanism, whereas such a connection is almost never made in Japan. For example, David Harvey, the author who disputes neoliberalism in his worldwide bestseller A Brief History of Neoliberalism, expresses in Cosmopolitanism and the Geographies of Freedom published in 2005 his empathy with De Sousa Santos’ (2005) idea of ‘subaltern cosmopolitanism’—Harvey finds hope in the movement to form a cosmopolitan solidarity by amplifying the voices of the victims of neoliberalist globalisation that exists worldwide. Ulrich Beck (2008) also criticises the trend, stating that state politics are reduced when the state neoliberalistically prioritises adaptation to global market competitions; he argues that becoming cosmopolitan is the realistic future for states.

As seen from the above, a global trend is seen in the inclination to progress from criticising neoliberalism to promoting a cosmopolitan transformation. However, neoliberalism criticisms in Japan rarely lead to the discussion of cosmopolitan transformation. One of the reasons for such a difference is that neoliberalism criticisms in Japan are rarely discussed solely in a global context because they have significantly become acculturated to and share a similar phenotype to the mainstream Japanese—have been racialized and constrained in their formation of hyphenated identities such as ‘Korean-Japanese.’ Based on interviews with Zainichi Koreans, this paper demonstrates how they negotiate the shoals of race, nationalism, and ethnicity in order to survive in a deeply racialized state and examine their collective identity-formation under circumstances in which they have to live by hiding their ethnic origin with a constant pressure to ‘impersonate’ being Japanese.

The Effects on Self-Consciousness of Junior High School Students in Japan Depending on the Fact That They Have Boyfriend/Girlfriend or Not

The purpose of this study is to make clear the significance of a boyfriend or girlfriend for junior high school students in Japan. For this purpose, I firstly investigated the determining factors of having a boyfriend/girlfriend, and then clarified the level of discourse; secondly, when I analyze the effects of that fact on their self-consciousness, it is necessary to consider not only the very thing that one has a boyfriend/girlfriend or not, but also if she or he is likely to have a boyfriend/girlfriend. This analysis suggests that a success in love for girls in junior high has a more complex meaning compared with that for boys.
Divorce Studies in America and Japan

This paper aims to suggest ‘Good Divorce’ comparing divorce studies in America with divorce studies in Japan. The divorce rate in the United States has continued rising over the last 50 years, and one out of every two marriages ended in divorce among the couples who married. At the same time, as remarriages has also increased, ‘step family’ is not rare in America. A new sociological concept, ‘binclear family’ advocated in "The Good Divorce" (1994) by Constance Ahrons has become generalized. On the other hand, the divorce rate in Japan has continued rising as well as the United States. In 2010, it almost caught up with the divorce rate in the United States. In this paper, we will introduce divorce studies and works developed in America since 1980s and in Japan since 1990s. First, we will discuss the history of divorce studies in America and Japan. ‘Nuclear family’ advocated by Talcott Parsons is certainly universal, but not absolute at all. Second, introducing the discussions in "The Good Divorce" and "We’re Still Family" by Constance Ahrons, we will describe divorces in America. On behalf of ‘nuclear family’, it is found how the concept called ‘binclear family’ became to come up. Third, introducing Atsuko Okano’s various discussions on divorces, we will describe divorces in Japan. About divorce circumstances of America and Japan, some common points and differences will become clear. Finally, through both divorce studies, we will suggest what should be done to be ‘good divorce’. ‘Good divorce’ means to ‘keep your family together when your marriage comes apart.’ We will also introduce International Academy of Collaborative Professionals (IACP) for collaborative practice, including Collaborative law and interdisciplinarian Collaborative Divorce.

Sociological Theory after September 11, 2001 and March 11, 2011

This paper aims to rethink theoretical foundations in sociology comparing American sociology after September 11, 2001 with Japanese sociology after March 11, 2011. Although some ‘empirical’ sociologists in America described and analyzed attacks by terrorists on September 11, 2001 and American society after 911, almost ‘theoretical’ sociologists kept silence. However, Jeffrey Alexander, a leading American theoretical and cultural sociologist, has interpreted sociological theory and American society of and after ‘911’ from a post-Paronsonian point of view. On the other hand, although some ‘empirical’ sociologists in Japan have described Japan Now after the Japan earthquake and Tsunami on March 11, 2011, almost ‘theoretical’ sociologists within the Parsonian and Post-Parsonian tradition in Japan have kept silence.

In this paper, I will suggest that theoretical foundations for the sociology after 911 and 311 would be established on Jeffrey Alexander’s theoretical logic, cultural sociology, and political society. Firstly, I will discuss that new sociological theorizing including the sociology of 911 and 311 should be multidimensionally reconstructed on the metatheorizing by Talcott Parsons, Jeffrey Alexander, Jonathan Turner, and Richard Münch. Secondly, I will argue that new solidarities could be founded on the metatheorizing by Talcott Parsons, Jeffrey Alexander, Jonathan Turner, and Richard Münch. Finally, I will present what should be done to reconstruct Japanese sociology multidimensionally after March 11, 2011.

Constructing Identities Across Borders: Case of the Istritian-Italian Diaspora in Trieste

In the last two decades, the accelerating speed of globalization has challenged the modern notion of state borders. Rather than the fixed line of a sovereign state, state borders are viewed as a dynamic interplay between territorial organizations and local sociocultural entities. This is evident in the border regions of Europe wherein extensive cross-border cooperation and interaction transform a border from a geopolitical “territorial line” to a socio-cultural “contact area” of neighboring societies. On this basis, people living in borderlands have new resources and opportunities to construct or safeguard their identities.

This study examines the construction of a “We” consciousness by the Istritian-Italian diaspora, who suffered from national conflicts and mass exile after World War II, and emigrated from their native homeland Istria (formally Yugoslavia) to settle in Trieste, a border city in Italy close to the Slovene and Croatian borders. By utilizing a philosophical analysis, identity construction of this diaspora by specifically using the case of national celebrations when cross-border interaction collides with national manifestation. Our data is based on fieldwork conducted in Trieste on the procedure of how commemorative events are organized by local authorities and these exile groups, focusing on the practices and discourses on the ways to selectize and use certain historical pasts, “We” and “the Other” relations, and forms of recognition.

The results indicate that two opposed identities have emerged within Italian diaspora communities: pro-Italian national identities and multietnic regional identities. Whereas the former tried to produce a national image through patriotic ritual performance and victimization of exiles, the latter tried to reconstruct regional identity in relations with Italian minorities and local authorities in Croatia across nations and borders. In the following discussion, different forms of identities are associated with not only the capacities of the diaspora but also the local and transnational opportunities available to it.

SUZUKI, TOMIHISA* (Momoyama Gakuin University, tomi3@sakai.zaq.ne.jp)

“Intellectuals” in Gramsci’s Prison Notebooks: An Active Relationship As a Key Concept

In Prison Notebooks (written between 1929-35), Antonio Gramsci (1891-1937) analyzed the theorist – reconstructed the notion of intellectuals in the process of reconstituting the Marxist “class” concept. What are “intellectuals” in the theoretical world of Gramsci? And how did Gramsci theorize intellectuals and their roles in modern society? My presentation first introduces how Gramsci and his work have been studied and contributed to sociological theoretical research in Japan and then illustrates how his writings in his Prison Notebooks located intellectuals and active relationship constructions. Content analyses of Prison Notebooks reveal that the logical foundation for his understanding intellectuals was the reconstructed concept of “man” or “human being which was formed by active relationships. This study shows Gramsci’s belief that there was no ‘man’ who was not intellectual; therefore, all the human beings are indeed the intellectual. Yet, not everybody plays the socially organizing functional role of an intellectual. The active relationships of the ordinary people most of the time have individual characteristics; on the contrary, intellectuals create and engage in socially active relationships which are any of the economic, social, cultural, and political field. Therefore, I argue that Gramsci advanced Marx’s social class theory by focusing on intellectuals and their hegemonic social engagements in which the socially active relationship plays a crucial role in society. This paper contributes to our sociological understanding of Gramsci, his theoretical roots, and commonalities with the Marxist and other theoretical traditions.

Visualization of SNS Communications Concerning Radiation Risk from the Fukushima Daiichi Power Plant

In this presentation, I visualize people’s communications on a Social Networking Service (SNS) concerning the risks of radioactive pollution stemming from the Fukushima Daiichi power plant accident. The data consists of the communication log from a regional SNS that was launched by the residents of Iwaki City, Fukushima Prefecture, after the accident. It contains text from diaries and comments written by the SNS members and information about who made comments to whom. The co-occurrence network of words derived from the text data reveals the members’ concerns about radiation risks. Comment relations are expressed as a form of social network that shows the structure of the human relationships on SNS. The co-occurrence network of web text data for communication on SNS can be integrated and analyzed concurrently to show the development and interaction of the members’ shared concerns and the social networks in the SNS. The SNS members expressed various concerns, including radiation measurement, influence on health, food safety, and so on. Based on their concerns, they created networks in the comments written as “conscientious organisms” to “technical artifacts”, or even “organisms being merely alive” as their experiment progresses (Linde-
Japanese way of honoring the animals killed for scientific research has been known for "offering a ceremony" for dead animals (Kuyoo). This paper pays attention to not only to the ceremony but also everyday caring practice in the laboratory. Thus, I discuss how scientists and technicians affectively commit to experimen
tal animals. Inspired by Science Studies scholar Casper Bruun Jensen and the sociologist Anders Blok (Jensen and Blok 2013), who developed Actor Network Theory through Japanese techno-animism, I explore new dimensions of contempor
yary Japanese techno science.

Does Men’s Involvement in Family Planning Threaten Women's Reproductive Rights?: A Case of Kurdish Rural-Urban Migrant Women in Turkey

This study examines the production chain of Rapana Venosa (veined rapa whelk) and the socioeconomic statuses of women factory workers in this pro
cess. In rural areas of the Black Sea region in Turkey, women often participate in non-agricultural production. The production of veined rapa whelks is one of the sectors which rural women are especially employed. Veined rapa whelks are "marine invaders" which migrated from Far East Asian seas to the Black Sea by ballast water in the 1940s. Today, they are considered to be threatening the Black Sea's eco-system since they consume many native species. In the context of globalising marine ecosystem and multinationalising agricultural production, rapa whelks began to be exported from Turkey to Japan in the 1990s. While the prevalent method, algæna
dredging, is known to be harmful for the reproduction of many native species, the exportation of rapa whelks is hoped to reduce their ecological pressure in the Black Sea and create employment opportunities for rural women. This study explores the use of rural women’s labour in the global production chain of rapa whelks and their experiences in the context of globalising marine ecosystem. This paper is based on an ongoing research project that focuses on the relationship between people's class positions and their practices towards people that they construct as "the other", as "immigrant" or "ethnically different". The empirical findings consist of qualitative interviews with working class people with different positions in the Swedish class structure.

In research, and especially quantitative research, the working class is often singl
ed out as more xenophobic than other classes. However, it appears that the working class has actual relationships with "immigrants" to a larger extent. Rather than determining which class is the most xenophobic, the aim of this paper is to discuss the relevance of dominant theories about class and racism in relation to empirical findings, and more specifically to interrogate why and how class may be important for understanding people's use of racist discourses in different social contexts. This paper is based on an ongoing research project that focuses on the relationship between people's class positions and their practices towards people that they construct as "the other", as "immigrant" or "ethnically different". The empirical findings consist of qualitative interviews with people with working class positions (based on their work, employment relations and income) living in a working class area, and people with higher class positions living in an an
cially要比women who can't

Interconnected 21st Century and the Decline of Traditional National Security System

Traditional national security system has been definitely one of the crucial pillars for Western statecraft paradigm since Westphalia Peace agreement in 1648. Especially in last two centuries the main task of sovereign state was how to protect own citizens and territory from foreign (military) threats with strategic concepts like deterrence and retaliation are. It was very clear the national power was based on physical and natural resources, industrial production as well military capabilities. The national state was practically the only reputable actor in international society and for many scholars like Fukuyama this historic development was ended with the end of Cold War, I think the crucial revolution began with modern information and communication technology already mid of former century. Consequently till the end of millennium we got interconnected society with borderless, lightly regulated and largely anonymous online environment which has been rising to new strategic domain. At the same time security as a concept was changed by possible interconnection and new non-state actors like individuals, corporations, cyber terrorists, organized crime and autonomous actors appeared as international players. That makes traditional national-based security system incapable to prevent all security incidents occurring in cyberspace. In spite of the merits of measures to protect society against new kinds of security threats, national security policy makers therefore have to accept a certain level of vulnerability and redirect their focus to recovery and resilience, the ability to restore a state of normalcy after disruption. The current primary objective is effectively mitigating the impact and quickly restoring the original situation. For that purpose traditional very rigid national security should be redesigned into more flexible crisis management and knowledge integrating system with capability to collect all societal skills and potential convenient for ensuring security in interconnected semi-transparent world.

Locating the Media Discourse of Climate Change Policy Network in India 2007-2010

This paper explains the framing of climate change in Indian newspapers. With its economic growth, India has become a major contributor of greenhouse gas emissions and has a major role to play in any global cooperation to reduce emissions. Yet India's rhetoric and concerns about climate change differ from other developing and developed countries. India is the world's largest democracy, but it has a weak state that lacks levers of control over its society and economy. Consequently, the distinct framing that India's newspapers give to climate change concerns, not the need for new government policies, but the need to convince and mobilize civil society.

Trust Me If You Can: Trust As Strategic Tool for Decision Making to Deal with Ignorance and Uncertainty in Contaminated Sites of Germany and India

In this paper we will investigate the role of trust in decision making process under ignorance and uncertainty. Classical approaches to risk analysis are based on statistical calculations dependent on hitherto known variables. This research shows that knowledge for risk calculation is limited then the decision making process of experts as well as lay persons are dependent on their individual and intuition trust. Based on newly emerging sociological theories of ignorance, this paper involves two field studies: redevelopment of contaminated sites in Germany and mitigation of groundwater arsenic contamination in India. Interestingly, in both the cases knowledge on underground processes is limited. Processes of cleaning-up in Germany usually are confronted with contaminations that had not been identified in investigation activities. Unexpected surprises by the actors are taken as normalcy. In the Eastern Indian region, concentration of arsenic in groundwater increases due to geological processes in succession of a decreasing groundwater level, caused by human activities. So, today's clean water may be poisonous by arsenic tomorrow. This creates a situation of ambiguity and confusion. Stakeholders (from policy makers to local inhabitants) have to take various pertinent decisions based on trust in individual, group or system. From the existing sociological literature the paper explores various dimensions of trust involved in decision making for both experts and non-experts.

Physical Activity and Quality of Life Among Chinese Cancer Survivors

Cancer is the leading cause of death among Asian American populations in the United States (CDC, 2013). Asian Americans are actually reported to have lower cancer deaths compared to non-Hispanic Whites. Consequently, more Asian Americans will survive cancer diagnosis and live a longer life after treatment. It has been shown that physical activity at modest intensity can significantly im-

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
prove the side effects of cancer treatment, quality of life among cancer patients, and breast cancer mortality. Although research on exercise has grown in quantity and quality (i.e., moreRCTs) during last decade, most available studies recruited primarily Caucasian samples and were based on smaller sample sizes (Pekmez & Demark-Wahnefried, 2011). Thus, these findings are not able to be generalized to non-Caucasian subgroups, such as AAAs. Furthermore, exercise patterns vary with different cultural traditions. Intervention strategies such as aerobic exercises, resistance training, and Yoga which have demonstrated positive impacts might not be applicable to AA cancer survivors because most Asians will be more inclined to use Tai Chi over Yoga for their exercise routine. Thus, more research is needed to study the unique cancer experience of various racial/ethnic groups.

This paper examines the linkage between physical activity and quality of life among Chinese American cancer patients and survivors. It is hypothesized that more physically active cancer patients and survivors are reported to have higher quality of life (QoL) (2). Data was collected from self-report surveys of 55 Chinese cancer patients and survivors. In addition to basic demographic characteristics, weight status, medical history, two standardized scales are used to measure quality of life (SF-36) and physical activity (CHAMPS). Currently, we are conducting the data analysis and a manuscript based on the results of the data analysis that will be completed in the spring of 2014.

SWIDER, SARAH* (Wayne State University, ssvider@gmail.com)
Constructing Asia: An Emerging Model of Migrant Labor Exportation

This article explores how global forces are reshaping the form of labor migration in the region. China has become an important influence reshaping the Asian region through increased foreign direct investment (FDI) in public construction projects such as roads, railways, and ports. As Chinese companies expand operations overseas they often bring their own workforce, exporting hundreds of thousands of Chinese migrant workers. These workers migrate under the umbrella of Chinese multinational companies and represent a fast-growing form of labor export migration called “project contract migration.” This expansion of project contract migration represents an important form of temporary migrant worker programs which are generally governed by either labor brokers and/or bi-lateral agreements among states, and are characterized by receiving states only accepting immigrants under “strict functional and temporal limits” (Castles, 2004: 28). In contrast, China’s emerging labor export model is an example of multinational corporation-led migration with a new twist. Historically, multinational corporation-led migration has taken the form of high-skilled professionals being relocated from developed nations into developing countries (Findlay, 1990; Stahl, 1991) while China’s multinational companies are exporting both high and low skilled workers.

According to China’s Ministry of Commerce the number of Chinese workers sent abroad has risen from about 2,000 in 1979 to around 6.5 million in 2013. Roughly 812,000 of these overseas Chinese workers are now employed by Chinese companies in the form of project contract workers, and if we include illegal or undocumented migrants, these numbers double. This article focuses on understanding why Chinese multinational companies are importing their own laborers instead of using local labor. I argue that this emerging model of labor exportation creates a kind of extraterritoriality that allows Chinese multinational to evade national and international regulations designed to protect worker and migrant rights and increasing worker control.

RC44-739.14

SWIDER, SARAH* (Wayne State University, ssvider@gmail.com)
Engaging the State: Informal Worker Protests in China

In China, the rise of precarious and informal work is closely linked to the processes of migration and urbanization. There are roughly 150-200 million migrant workers, representing between 15-17 percent of the total Chinese population (Chen 2010). By 2009, sixty percent of all urban employment in China was informal (Huang 2009); most of this is precarious work and a majority of these jobs are filled by migrants. Informal work is performed outside the purview of the state, and it is labeled precarious because these jobs do not provide employment stability, are low-wage and lack social protection.

This paper explores informal worker protests in China. I look at two different groups of informal workers: construction workers and street vendors and find that the salient issues for each group are different. The most salient issue for informal construction workers is non-payment of wages and among street vendors it is the unfair treatment by local urban para-police calledchengguan. I explore these two issues and the resulting protests by analyzing the ways that their relationships with the state, the organization of their work, and different integration into urban spaces shape their organizing and protests efforts. I detail the major characteristics of these protests and argue that that these informal workers (and their protests) represent more of a threat to the government and the Communist Party of China due to the political instability inherent by formal workers.

SWINDE, JEFFREY* (University of Michigan, jswindle@umich.edu)
Gender Roles in an Ecumenical, Covenant, and Charismatic Christian Community

Marital gender roles and religion continue to capture the landscape of much sociological research in families. A significant amount of research has emerged in investigating how Promise Keepers movement which primary locus is in Evangelical-American Christianity. Much of the critique of the movement focuses on language such as: “the last gap of patriarchy,” the “first backlash of patriarchy,” “soft-boiled masculinity, “sphere of anti-feminist backlash,” “hegemonic masculinity,” “an essentialist retreat from progressive gender relationships,” and the Promise Keepers operating the centrality of the political within the faith movement. Against this backdrop, this paper presents empirical evidence from a 350 member Ecumenical(1), Covenant(2), Charismatic(3) community named “Alleluia” in Augusta, Georgia, USA. Husbands are expected to lead, protect and provide for their wives and children. They are called to be leaders in their marriages and could be seen to reflect the images portrayed above in regard to the Promise Keepers. However, with data based on interviews from randomly selected cases (36) and 300 members of 350 who provided quantitative information, a very different story of leadership is presented.

The husbands model their leadership on a kenotic style of headship. This consists of leaders which is humble, empty of self-interest, sacrificial love (agape), a detachment from status privilege, gentle, meek, kind and self-effacing. They are to love their wives as “Jesus loves the Church,” and wives are to respect their husbands.

From the interviews, both of men and women, this was the common story. Regression analysis of measures of gender roles shows significant correlations with a wide measure of measures of religion.

[2] This refers to the kind of community wherein members make a life-time vow to live the Christian life in close and intimate relationships with one another.
[3] A Community which uses the charismatic gifts
The Developmental Hierarchy Cultural Schema

In everyday conversation, popular media, and scholarly work, terms like the “Third World” or “developing countries” are often contrasted with the “First World” and “developed countries.” As such, these terms imply that there is a cultural schema of a developmental hierarchy of societies. How prevalent has this schema been throughout history? Drawing from cognitive anthropology, I argue that in general the terms people use are indicative of specific cultural schemas. This is the especially the case with terms that refer to societies’ position on a developmental hierarchy (e.g. “developed” versus “developing countries,” or “advanced” versus “primitive societies,” etc.). Using the Google Books N-gram Database, I analyze the usage of over 80 such terms by year, measuring their relative frequencies in all books written in English from 1700-2008. I then combine this quantification with archival data and other work, constructing a historical narrative of the developmental hierarchy cultural schema over the last three hundred years. The terminology of the developmental hierarchy has been prominent throughout the time period examined, though it has experienced significant changes. During the eighteenth century, developmental hierarchy terms gained popularity as the ideas of social evolutionism expanded. Notions of sovereignty and capability eventually challenged social evolutionary ideas in the beginning of the twentieth century, leading to their demise. In their wake, modernization theory quickly became prominent, bringing a new set of developmental hierarchy terms, institutionalized by the founding of various international organizations in the mid-twentieth century, modernization theory renovated the developmental hierarchy cultural schema by shifting the object of development from societies and peoples to that of the nation-state. The developmental hierarchy cultural schema has exercised considerable power in organizing the way people classify societies.

From Chicago to Los Angeles: Western Concepts and the Study of Post-Socialist Cities

Post-socialist cities have been omitted from disputes on global urbanism. However, the insights gained from the study of their dramatic transformations can provide important suggestions for the international urban studies. The paper first introduces the key features of post-socialist urban transformations placing them within the context of contemporary global urbanism. The paper specifically discusses the differences in development in cities, which developed during periods with different political regimes and socio-economic conditions. Their urban landscapes reflect multiplicity of socioeconomic logics and are characterized with a high level of socio-spatial hybridity. The western models that assume relatively stable relations between the principles of urban development and resulting socio-spatial patterns are not capable to capture the nature of cities in radical transformations. The paper then discusses the relevance of “western” concepts for the study of post-socialist cities. It is framed within the paradigmatic evolution from Chicago to Los Angeles schools of urban studies. The paper argues for the recognition of a multiplicity of urban logics and urban structures interrelated within urban landscapes of transforming cities. Relating long term development paths and contemporary path-shaping practices, paper documents that concepts from both schools are relevant for the understanding of post-socialist cities. Finally, despite the present urban landscapes of post-socialist cities can be seen as different from cities in other world regions, there are striking similarities. The paper argues that despite historic and cultural specificities in local contexts, contemporary urban development is conditioned by the universalistic driving forces of urbanization embedded in a globally spreading capitalism. The hybrid coexistence of different socio-spatial landscapes can thus be only temporary as the most dynamically developing urban areas related to global capitalism gradually dispose the original urban patterns. The theories and concepts developed in the social context of capitalism thus have high relevance for contemporary global urbanism.

Gambatte Ikô : Negotiating Identity and Belonging at a Japanese University Women's Kendo Club

This paper draws on an 18-month ethnography at a Japanese university women's kendo club and examines the concept of seishin (spirit), and how it is embodied through the process of doing one's best for the group. Gambatte Ikô (Let's do our best together) expresses the personal commitment to endure hardship in order to achieve a group goal. The strengthening of seishin can be attained through enduring physical, mental and emotional hardship alongside others, where the hardships are embedded in the club's demanding training, work obligations, and inter-personal relationships. As such, seishin training takes place on all levels, in a variety of situations, encouraging the holistic development of club members. Seishin development can be goal of membership and its embodiment can be advantageous as it promises to equip members with the resilience necessary to fulfill their gendered roles as capable, exemplar models of society. Arguably, for female club members developing significant relationships takes precedence over the development of seishin. In time significant relationships with other members became my reason for being and the primary source of motivation to engage in seishin training.

Safety in the ‘House of Certainty’: The Question of Violence in a Ukrainian Prison

Prisons are potentially volatile places. This paper draws on ethnographic research in a medium-security men's training prison to discuss the nature of a relatively low level of physical violence in a Ukrainian prison despite the low staff-to-prisoner ratio. It attributes this phenomenon primarily to the informal structure of prisoner society, and the central role of its illicit normative code of prison life. I explore how the legitimacy deficit of the Ukrainian State and its legal system, together with often anachronistic and unreal official prison rules and limited staff presence render the unofficial prisoners' behavioural code the guarantor of the peaceful co-habitation. I demonstrate that despite discriminating against certain prisoners and instigating mutual and self-surveillance, these informal arrangements were deemed by most prisoners more just and legitimate than the official ones. Whilst this informal structure was inescapable and entailed harsh punishments for violations, it, to some degree, controlled and limited arbitrary violence and established a 'house of certainty' (Foucault, 1975). Furthermore, I argue that despite the official antagonistic stance towards the 'inmate code,' prison authorities heavily depended on the prisoner-controlled informal structure to both keep the prison orderly and safe and maintain uninterrupted industrial production. I then discuss the implications of the recent and current changes in Ukrainian society and prisoner profile to the maintenance of safety and order in national prisons. I posit that the intricate power-balance present in the prison has relevance beyond Ukraine because it represents a microcosm of the interaction between powerful legitimate and illegitimate interests, where the vested interest of both is profit (industry) and order (status quo).

HIV Stigma in U.S. Faith Communities

Stigma remains a significant barrier to HIV prevention/treatment in African American communities. Religious congregations, especially black churches, have been called to address HIV stigma. Social forces such as religion may create reinforcing stigmatized conditions that predispose individuals to HIV infection and limit their ability to access HIV testing and treatment. However, scientific evidence examining the concept of HIV stigma and its effects in religious communities is limited. Our work is guided by the concept of stigma as “a social and cultural phenomenon linked to actions of whole groups of people.” This approach emphasizes the need to examine social structures and processes and enable communities to move from individual-level perceptions to collectively identify and act upon negative stereotypes and discrimination against the stigmatized. Our multi-method study examines HIV stigma in faith communities from the perspectives of congregations, community members, and people living with HIV. We collected and analyzed data from interviews with faith leaders representing a theologically diverse sample of congregations; interviews with HIV-infected individuals; and, town-hall meeting-generated ideas about faith-based strategies to address HIV. We used predictive modeling of factors linked to welcoming/alienating attitudes on the part of congregations, as well as content analysis and concept mapping to qualitatively assess the concept and extent of HIV stigma present in faith communities. In congregations, stigma was often attached to the perception of individual moral敗 of infection: homosexual orientations as most stigmatized, followed by injection drug use, heterosexual relations, and mother-to-child/healthcare-related situation. Some HIV-infected individuals reported feeling alienated in congregations because of stigma/discrimination. Finally, community stakeholders identified reducing stigma as the most important strategy to address HIV in their faith communities; however, the feasibility of this strategy was questioned. In the analysis, we triangulate/discuss the findings to explore the concept of stigma, its consequences, and potential stigma-reduction strategies in faith-based settings.

SZAFLARSKI, MAGDALENA*
Religiosity has been linked to better mental health including lower rates of depression and other psychiatric problems. However, little is known about the association between religiosity and mental health in immigrant populations. This study examined the role of religiosity in the association between foreign-born status and occurrence of dysthymia (long-term depressed mood) in the U.S. population using a nationally representative sample of U.S. citizens. Dysthymia prevalence and 3-year incidence of dysthymia were modeled using nested logistic regression (weighted analyses). Immigrants were more likely than US-natives to have dysthymia, controlling for sociodemographic factors. This difference was explained after accounting for religious activity, acculturation, stress, and other factors. Religious activity remained a significant predictor of dysthymia after all adjustments; higher levels of religiosity were associated with a lower likelihood of dysthymia among the respondents over and beyond other factors. There was no difference between foreign-born and US-natives in developing dysthymia over time, but religiosity remained a significant predictor (lower likelihood) of developing dysthymia over time in the total sample. Further analyses will examine the differences in the effect of religiosity between the foreign-born and the US-native populations and discuss the findings in the light of acculturative stress and religious coping perspectives. We hypothesized that dysthymia would be more prevalent among foreign-born than US-natives because of acculturative stress. We further expected that religiosity would help to explain this difference as a protective factor. We tested our hypotheses using a nationally representative sample of U.S. citizens. Dysthymia prevalence and 3-year incidence of dysthymia were modeled using nested logistic regression (weighted analyses). Immigrants were more likely than US-natives to have dysthymia, controlling for sociodemographic factors. This difference was explained after accounting for religious activity, acculturation, stress, and other factors. Religious activity remained a significant predictor of dysthymia after all adjustments; higher levels of religiosity were associated with a lower likelihood of dysthymia among the respondents over and beyond other factors. There was no difference between foreign-born and US-natives in developing dysthymia over time, but religiosity remained a significant predictor (lower likelihood) of developing dysthymia over time in the total sample. Further analyses will examine the differences in the effect of religiosity between the foreign-born and the US-native populations and discuss the findings in the light of acculturative stress and religious coping perspectives. Public health implications will also be addressed.

Young Chechen Refugees in Europe: The Role of Gender and Religion

The presentation focuses on two intertwined factors that shape immigrant incorporation in today's Europe: religion and gender. It draws on an empirical study of young refugee women from Chechnya (Russian Federation) residing in Germany, Austria, Poland and Belgium. It aims to explain the relationship between women's religious identities and gender practices while considering the significance of their pre-migration childhood experiences of life in a war-torn society and refugees' living conditions in the receiving societies. The study examines two topics, which have dominated debates about incorporation of Muslim immigrants and their children in European societies: 1) new forms of religiosity among Muslim young people and 2) transformations of women's roles in immigrant families and communities. It focuses on Muslim immigrants from Eastern Europe who have received little scholarly attention as opposed to communities originating from Maghreb or Turkey. That is despite having gained a considerable presence in Europe since the early 2000s. Russian citizens, most of them from Chechnya, have been among the most numerous groups of asylum seekers in Poland, Austria and Belgium for almost a decade now. The numbers of Chechens applying for asylum in Germany in 2012 and 2013 have also risen sharply. The data collected in Germany, Austria and Poland reveal remarkable intergenerational differences in adaptation strategies of Chechen women. A significant number of young women in these countries are adopting more conservative gender practices and embracing new religious identities that are perceived as alien by the women of the older generation. The study in Belgium examines the validity of these findings in a different institutional environment. Compared to the other three countries, Belgium offers recognized refugees an easier access to citizenship and provides more inclusive educational environment for young immigrants.

The Integration of Cultural Minorities in the Swiss Armed Forces

The issue of medical treatment of fertility has special social relevance today for most of the European societies which are characterized by very low levels of fertility, and an increasing number of people not having children at all. Biotechnology makes parenthood available for those who used to be excluded from that earlier (medical problems, single women and same sex couples).

The aim of this research is to examine the attitudes of European society on in-vitro fertilization: Do they think that it is a stigma to become a parent without sexual intercourse or do they consider it as a possibility to help people to experience parenthood. The previous studies have already indicated that respondents' gender, age, educational level and religious background determined whether they supported 'fertility treatments': women, younger people, those with higher educational level and non-religious background tended to be more supportive than others (Kailasam 2001, Scheneker 2005). This research would exceed that by focusing on how traditional gender roles, family beliefs and attitudes towards homosexuality can influence the acceptance of fertility treatments. The paper also seeks to answer the practical question whether the institutionalisation level of assisted reproductive technologies can affect the social acceptance of fertility treatments in Europe.

Our data come from the last wave (2008) of the European Value Study (EVS). The EVS provides insights into the ideas, beliefs, preferences, attitudes, values and opinions of citizens all over Europe by applying standardized questionnaires. In the fourth wave of EVS an artificial reproduction-related variable was introduced, which we chose as our dependent variable, measuring the acceptance level of the artificial insemination or in-vitro fertilization. As both individual and country level factors have also to account the most appropriate statistical technique to be used are multilevel techniques.

Far-Right Voter: The Efficiency of Social Bases As a Discriminating Factor in Voting for Far-Right Parties

The paper will address two problems: the social characteristics of voters who identify themselves as „far-right”, and secondly what are the additional factors which are conducive to identifying with, and voting for either radical (far-) right parties or mainstream right (or conservative) parties. Beginning with H. Kitchel’s (1997) and H. Norris (2002) seminal works we know that social bases, i.e. changes in social structure and economy are not sufficient conditions for the appearance and stability of radical right parties. Kitchel and Norris identified the party system and the electoral rules as two decisive factors for far right parties’ electoral success. The authors argue that the conductive factor is „convergence of moderately left and right parties toward a median voter” and Norris emphasizes the role of institutional context (e.g. electoral rules). It will be shown, using the left-right self-placement scale as a measure of far-right identities, how far-right voters distribute their votes among political parties and what are the social and ideological factors which discriminate against mainstream right parties, apart from the type of party system and broader institutional context. The analysis will be based on recent ES&S surveys and a more detailed analysis of the Polish case based on general election studies.

The Integration of Cultural Minorities in the Swiss Armed Forces

Due to a high migration rate, Swiss society became more multicultural. This can also be observed by the composition of the Swiss Armed Forces. Besides other governmental institutions the armed forces contribute to the integration for persons with migration background. In an ongoing research project we analyze the impact of the armed forces on the integration of soldiers with a migration background in the Swiss Armed Forces and also in the civil society. Furthermore, we assess if there are differences between soldiers with migration background and those without migration background concerning their motivation to serve in the armed forces. For this purpose we conducted at three different times a

*Art Against Racism. Works By Santiago Sierra As a Voice Against Racism*

In my paper I would like to present an artist who is socially engaged and whose works refers to very important social issue – exploitation of workers and cheap work force. Santiago Sierra, born in 1966 in Madrid, is the best known contemporary Spanish artist, who lives and works in Mexico City. Main topics of his works are: critic of capitalism, underpaid labourer completing menial tasks and immigration. It is said that he get involved in social engaged art when he realised how little money get Mexican workers for performing gruelling work. His social background also has a big influence on his work, because he comes from a working-class family.

In my presentation I will discuss some of Santiago Sierra works, which can be understood as statement about (or rather against) racism. As we consider racism as invention of modernism we can also see some direct link between racism and capitalism, cheap labour force and illegal immigrants. We can also easily match those factors: being subjected by racism is often connected with being illegal immigrant who delivers low paid menial work. Furthermore, as we can learn from Loic Wacquant that racism has always been a convenient excuse to justify exploitation of some groups of people. Almost every economic system needs some resources to exploit to exist. Especially capitalism. In capitalism racism has its economic function: it lowers cost of production and stabilizes hierarchy. Similar functions also have illegal immigrants, who are necessary in the system, because capitalism still needs people to complete menial tasks for small salaries. Employing illegal immigrant for lower wages may be justified by racism – they are no us, they are foreigners, they not equal to us.

**SZYMANSKA, AGNIESZKA*** (Adam Mickiewicz University, agnieszka_szymanska@vp.pl)

*Concept of Artistic Brand As a Tool for Analysing Art World*

Social construction of artistic reputation and artistic success have been an important issues in sociological research from many years now. In my paper I am going to present the idea of artistic brand as a tool for analysing art world and construction of artistic career – mainly the careers of contemporary visual artists.

Artistic brand can be a person (artist, gallery owner, collector, curator, critic) or an institution (gallery, museum, art fair). The most important criterion for distinguishing the artistic brand from *non-branded* artist or institution is its recognition by the representatives of the various spheres of social life. I separate three spheres of social life in which artistic brands can be present: art world, media and ordinary social life. In every of those three spheres could exists different artistic brands, which are also constructed and sustained in different ways.

Phenomena that have recently occurred in the art world (development of conceptual art, separating the artist from the art work, the lack of clear criteria for evaluation works of art, professionalization of the art market) made that artistic brand have gain an importance in the art world. Artistic brand simplify the complexity of the art world, improve the decision making process, add value to the art world product. Artistic brand is a guarantee of quality, a mean of communication with customers and agents. Brand is also a tool of negotiating rules in the artistic field, a tool for building hierarchy in the art world and a tool for building artistic field autonomy towards other fields.

As the exemplification of my conception of artistic brand I am going to present the outline of my research project concerning the in-depth analysis of the presence of artistic brand (contemporary visual artists and institutions dealing with contemporary art) in Poland.
We will show that the field of political controversy around these tenets has clear resting on the idea that any unemployment at all in this age group is a problem. To understand what the use of the NEET category is founded upon, we shall show of the NCCR Lives project (http://www.lives-nccr.ch/en), we shall first attempt to
cultural and social fields since the beginning of the last crisis.

This paper introduces the concept of the ‘Conditions for Sustainability’ and reviews some of the main conceptual approaches dealing with the relationships between complexity, social learning and global environmental change. The aim is to produce fresh theoretical insights and to outline an operational synthesis to better understand the types of interactions, ways of knowing, and required feedbacks that influence the production of social-ecological complexity and affect our structural conditions and learning capacities to cope with accelerating global change. Social learning is understood as the only possible means to overcome current cultural constraints for a rapid societal transformation, and to provide the kinds of fair and quality of life development pathways that may allow humanity a dignified way out of the present unsustainability predicament.

In particular, my approach uses an ecological sociology perspective based on a further operationalisation of the SEIC conceptual model (Tabara & Pahl-Wostl, 2008) and focuses on the case of the integrated governance of climate change. From a non-dualistic standpoint, I look at the agents’ interactions and social-ecological systems dynamics in complexity production and their implications for social learning and transformation. Such analysis is carried out in a relational mode within and between the following social-ecological components and systems: 1. Structures, rules and institutions (S); 2. Energy and resources (S); 3. Information and knowledge (L) and 4. Cumulated socio-ecological change (C). It is argued that such a framework can provide a more robust theoretical understanding of the required conditions for a global sustainability transformation and support Integrated Climate Governance (ICG) policies and options.

In this paper I present a new methodology that I call “ethnographic biography”. I have used this methodology to examine changes and developments in ethno-class identity among young adults from different social classes who are graduates of an integrated school and who are now finding their way in adult society in Israel. Ethnographic biography involves repeated in-depth interviews with all of the subjects over time, and from different perspectives, alongside the ongoing ethnographic study of events in their lives through various communications media, such as telephone conversations, email correspondence, and the subjects’ activities in social network sites (e.g. Facebook). It also entails attending life events in the subjects’ lives (going to a football match together, visiting a subject in mourning, joining a fast for meal, visiting subjects at their place of work, attending weddings, and so on).

The method of ethnographic biography has a number of important advantages. First, it offers a framework that is tightly linked to the subjects’ everyday lives while at the same time reinforcing both their interpretative and reflexive capabilities and the ethnographic dimension. Second, it enables us to follow various biographical events in the subjects’ lives in real time, and not retrospectively. Finally, ethnographic biography allows us to study the development and dynamics of ethno-class identity at varying, complex and nuanced resolutions, and thus to draw out its various pathways and instantiations.

In OECD countries, the problem of young people not being in education, employment or training (the so-called “NEET”) has been frequently raised in the political and social fields since the beginning of the last crisis. On the basis of empirical data collected in Switzerland within the framework of the NCCR Lives project (http://www.lives-nccr.ch/en), we shall first attempt to understand what the use of the NEET category is founded upon: we shall show that it is based on two tenets. One is of a social nature, founded upon the fact this age group is the most affected by unemployment; the other is of a moral nature, resting on the idea that any unemployment at all in this age group is a problem. We will show that the field of political controversy around these tenets has clear borders (Bourdieu, 2012) and that it mostly centres on whether various measures should be imposed or not, whilst there is complete agreement on the category itself.

We will then show that street-level bureaucrats dealing with youth unemployment endorse the official normativity about NEET. 44 of them have been asked to identify and precisely describe three situations that they consider as emblematic of their interventions toward unemployed youth people; hence, more than 150 such situations have been collected and allow investigating how the past, present and future stages of the beneficiaries’ life course interact within them. The data show that the normative figure is the employed adult and that they see NEET as people in need of socialization.

In conclusion, we will show that the NEET category is founded upon a linear and androcentric representation of the life course (education-training-employment-retirement) (Levy, Gauthier, & Widmer, 2006) which not only subsumes very different social universes into chronological categories (Bourdieu, 1984, Yates & Payne, 2006), but tends to deny the importance of power relationships founded upon age.

TADA, MITSUHIRO* (Kumamoto University, tada.mitsuhiro@gmail.com)

Language As a Zombie Category of Sociological Theory

The aim of this presentation is to discuss how sociological theories have dealt with language.

Many theories in sociology regard language as the most fundamental institution of social life. These theories suggest that the same language is shared intersubjectively by people, which in turn enables them to understand subjective meanings. This idea has become a marked trend since the 1960s in relation to Max Weber and his interpretation of sociology, and is found, for instance, in Peter Berger and Thomas Luckmann's phenomenological sociology, Harold Garfinkel's ethnomethodology, and Jürgen Habermas's theory of communicative action.

However, Weber himself, who lived during the formative period of the German nation-state, had consciously avoided the hypostatization of speech community linked to hegemonic nationalism. Hence, it is debatable whether a nationally constructed language is shared by a nation-state. A linguistic sociology that presupposes the sharing of language is possible only in the assumption of a "nation-society" by methodological nationalism. Hence, it is debatable whether a nationally constructed language can be given the status of a natural language of the life-world. Historically, the theoretical idea of sharing a language was in prevalence during the cold war period, when nation-states were relatively stable. In sociological theories, language is one of the zombie categories that carry the residue of such "nation-societies."

TAG, MIRIAM* (Bielefeld University, miriam.tag@gmail.com)

Complexity and Simplification: A Framework for the Analysis of the Visual Representation and Constitution of Suffering

Since the evolving global interest in them, children are constituted as a especially vulnerable group. Based on an analysis of visual representations of children in flagship reports of International Organisations, I propose a framework for theorising and analysing the visual constitution and representation of suffering in two forms:

The first form of images of suffering is based on visual media such as photography and paintings, which represent specific individual and collective cases in aesthetic and documentary logics. A second form of representing suffering is based on numerical data and indicators and takes the form of lists (e.g. statistical tables with country-specific data in alphabetical order), rank-ordered lists (e.g. the Under-5-Mortality-Ranking), and graphical forms (e.g. world maps). Especially this second form deserves closer attention and theorisation as it not only integrates numerical and graphical elements but moreover two distinct logics: simplification and complexity in transforming social phenomena into data and data into images representing social phenomena. I will discuss firstly the line of complexity running from simple listings to positioning to visually transforming data; and secondly, the line of simplification by which all three forms transform the complexity of social phenomena into visual clarity; a process in which diverging interpretations are hidden behind the visual representation, and ambiguity and interpretative openness is transformed into graphical decedidness.

I will conclude by linking the visual analysis back to semantic representations, as images of suffering are embedded in discursive frames through which their meaning is shaped, enacted, and specified. I will present the change of discursive frames with regard to the constitution of children from objects of humanitarian action to bearers of human rights, to human capital, and human potential; and the consequences of these shifts in meaning for the representation of suffering in visual forms.

TAGA, FUTOSHI* (Kansai University, f.taga@kansai-u.ac.jp)

Westernization or Hybridization?: Restructuring Japanese Hegemonic Masculinity in Globalization

During the economic growth period, a form of masculinity attained a hegemonic position in Japanese society, that is, salaryman. The Japanese can easily build up a mental image of a typical salaryman as, a man who works for the same company for life, being protected by career-long employment and a seniority system, and throws himself into the role of the breadwinner leaving domestic duties to his wife. Until the 1990s, majority of Japanese people approved the idea of gender division of household labor and Japan's economic conditions at the time could afford to provide a large part of people with such lifestyles. Hence, male-dominated regime in Japanese society in the second half of the 20th century has been legitimized thorough a masculine ideal characterized by preoccupation with work to provide for a family rather than violence or physical prowess.

In the age of globalization, however, any local gender orders cannot be isolated from the world and the hegemony of a locally-dominant form of masculinity is always threatened not only by local conditions but also by economic, political and cultural struggles in a global scale. Based on in-depth interviews with Japanese men in two different social contexts, the paper explores the conditions of restructuring salaryman masculinity in terms of the world gender order. First, the encounter between different local hegemonic masculinities in a transnational arena is examined, showing the cases of businessmen working at subsidiaries of Japanese-affiliated companies in Australia. Then, the impact of contemporary globalization on a local gender order is considered by looking at the gender practices among middle-class men to keep up their hegemonic positions, being confronted with globally-expanding feminist agendas and neoliberal economy which undermine the basis of male-dominated Japanese society. Finally, we will discuss how ongoing reconstruction of hegemonic masculinity is associated with multiple social (in)equities.

Recovery or Redevelopment: An Examination of the Long-Term Socio-Spatial Transformation of Earthquake-Affected Neighbourhoods in Bhuj

This paper examines long-term socio-spatial transformation of historical urban neighbourhoods in the earthquake-affected city of Bhuj. The research draws upon a critical review of the visual representations of data presented in the post-earthquake period. The study is based on the recovery programme and plans for reconstruction at different scales of city, neighbourhood and individual buildings, with a particular attention to housing reconstruction policies. It then examines two narratives of rebuilding in the old fabric of the city across time; from the pre-earthquake condition, to the disaster time and ten years after it. Changes in the social environment of these neighbourhoods are investigated through the examination of interviews with the pre-earthquake residents of the two neighbourhoods. The juxtaposition of the narratives of those who stayed in the neighbourhood and those who opted out to leave it demonstrates the contested meanings of recovery. The paper discusses how socio-economic trends, the disaster and its impacts, as well as post-disaster interventions of different actors played a role in such transformation. It is discussed how these influences are manifested in the still changing built environment and how these manifestations are in turn perceived by the residents of the two neighbourhoods. The paper concludes by drawing lessons from this case study to inform future urban planning efforts following major urban disasters.

Negotiating Identity Performance in the Canadian Forces; Soldiers and Stereotypes

A new security paradigm has driven an expansion in the roles of women in warfare; female soldiers are becoming an increasingly valuable asset in counter-insurgency tactics. Female soldiers are uniquely suited to penetrating the private spheres of traditional authoritarian societies, and remain the only means by which females-of-interest can be apprehended while still respecting the cultural mores of the host state. However, this line of reasoning begs the question: If the military is relying on a social construction, in what ways is military subculture influencing it? I explored this question using theories of gender politics advanced by Judith Butler to frame interviews I conducted in 2011 with Canadian combat arms soldiers recently deployed to Afghanistan. The excerpts from these interviews focus on the soldiers' recollections of female soldiers in active duty from the perspective of their male and female colleagues. The interview illustrates that the space permitted for female soldiers to express their identity remains artificially bound by stereotypes concerning their physiological and psychological aptitude. More broadly, this adaptation of Butler's classic framework suggests that an ideal female gender performance is discursively incompatible with the ideal soldier identity performance.

The Dubious Benefits of Technology in the Military: Applications and Abuses

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
Perhaps the most undetermined influence on the latest generation of Canadians is the impact of technology on Millennials’ intellect and interaction. While some scholars advocate for increased integration of technology into personnel training and communication, others warn against the potential for the dissemination of privileged CF information. This tension is not easily allayed by statistical evidence on Millennials’ use of technology either; studies reveal that Millennials are nearly as likely to abuse technology as they are to use it effectively. Like other epochal transformations, the advance of technology is ineluctable. The Canadian Forces must prepare for the integration of a generation who has fully integrated modern technology into their day-to-day operations. Not only has technology re-shaped the methods that Millennials use to execute tasks and communicate, but it has profoundly reshaped their cognitive abilities, their expectations of experience and their access to information. The trouble arises when the ambitions of licensed bookmakers from non-partners such as players in danger.

International sports organisations try to protect their business partners including football association in England struggled to protect their sport and players from money for the sport”. This presentation briefly discusses various measures that organisations’ attitude from vigilance to trust towards the sports betting industry - becoming involved in match-fixing. Interestingly, this dramatic shift in sports or bivalent attitude towards the issue . One the one hand, they deal sternly with means to understand and analyse the manner in which people comprehend envi’ unnatural’, which consequently affect their visual experiences and overall sense as a form of pollution . They expressed a deep concern regarding the physical mitigation schemes and transportation routes were viewed by the local people healthy river for the locals include also the physical environment surrounding it .

Local people have a broad conceptualization of river pollution. The values of a river or abundance of aquatic species in the river are some of the common visual experiences described by the locals as indicative of pollution. What emerges is that local people have a broad conceptualization of river pollution. The values of a healthy river or broad concept also the physical environment surrounding it. Specifically, the concrete grey walls and straightening of the Klang River for flood mitigation schemes and transportation routes were viewed by the local people as a form of pollution. They expressed a deep concern regarding the physical transformation and modifications of the surrounding riverscape from ‘natural’ to ‘unnatural’, which consequently affect their visual experiences and overall sense of place. In conclusion, the concept of place is central to this paper. It is a useful means to understand and analyse the manner in which people comprehend environmental degradation and more specifically river pollution.

On the Function of “Symbolic Media” in the Process of Functional Differentiation

It is one of the most important contributions which Niklas Luhmann has made toward the thesis of functionally differentiated society to indicate the roles of “symbolic media” in concrete temporal events of crumbling order. Medium/Form-distinction is the theoretical device introduced by Luhmann for the purpose of analysis of Form-functioning in autopoietic and information processing systems (including meaning-processing communicative ones). In short, it is necessary for meaning-processing systems in general, communication systems in particular to constitute any appropriate distinction between Medium and Form and symbolize objects in the environment as Forms through Medium to operate and observe them.

We focus on this distinction of Medium/Form. This presentation shows how Forms in Luhmann’s terms, which mean distinctions with asymmetry between things inside and outside, and as symbols in the self-production of the communication in which they are adopted. And we deal with “health as symbolic media” for an instance so as to elucidate the significance of this theoretical device for empirical researches. In concrete terms, we will take up a case study about care work for people with physical disabilities in Japan in order to scrutinize the validity and the applicability of the thesis of functional differentiation in Luhmann’s theory. It shall be confirmed that various kinds of Forms employed as symbols are so connected with “health as symbolic media” as to allow the emergence and the self-reproduction of the functionally specific communication of care work.
Various needs of elderly people in health and social care could not be solved by a single profession, such as medical doctors. Many symptoms in health care occurred in the elderly, such as senile dementia, metabolic syndrome, hemiplegia, dysphagia, fragility fracture and dysuria, could be better treated by a team of multiprofessionals. Health care outcome such as average and/or healthy life expectancy may not be always correlated with a number of doctors.

In order to improve QOL of service users, a paradigm shift is needed in strengthening competencies of health and social care professionals for interprofessional collaborative practice, to develop a comprehensive health care network in a community, consisting of three community-based powers on health care, welfare and education.

Method: We conducted a semi-structured qualitative study in 2013. The interviewees were 23 married men, who were volunteers, and 28-58 years old. Twelve men lived in Niigata, 5 in Hyogo and 6 in Kagoshima. The majority of them were members of the Japanese Trade Union Confederation and participated in our questionnaire survey in 2012. The rest interviewees were recruited through the personal relationship of the first author.

Results: We have identified a few of new factors to promote the household work participation of married men in Japan. A married man would have positive intention to participate in the household work, if he thinks as follows: he could take the power to decide the principles of his family life (modern patriarchal hypothesis); he could manage the household economy (family economy management hypothesis); and he has clear memories of the experiences in home economics education classes (home economics education hypothesis). In the near future, we will look into these hypotheses by analyzing the data of questionnaire survey in 2012.

* This study was partly supported by Health Labour Sciences Research Grant of Japan in 2012 and 2013. Dr. Ayako Kuramoto, Kagoshima Prefectural College, is a member of this study.

**Women’s Reversion-to-Japan Movement in Okinawa**

This paper considers women’s reversion-to-Japan Movement in Okinawa in the era of U.S. military occupation from 1945 to 1972. The fact that women supported that “all Okinawa movement” with the number of mobilization is seldom known. In Okinawa, the women engaged in the movement against the war and after the battlefield, how tackled the movement, and how lived after the reversion?

Are there experiences, the feature, and a meaning unique to women? I think the viewpoint of gender is indispensable to consider overall structures of the movement and the community in Okinawa, although it has not been paid enough attention.

For that purpose, I have conducted document analyses and interviews about female teachers. I paid attention to relations between the United States, Japan, and Okinawa, and also to those between men and women.

Despite that work family balance (WFB) has been addressed as an important policy issue in Japan for over a decade, Japanese employees, especially those with children, appear to have more difficulty in reconciling work and family life compared to their counterparts in advanced European welfare states. In fact, there seems to be in Japan a wide agency and capabilities gap between policies and practices, and between entitlements and a sense of entitlement to make claims for WFB. From our empirical study of working parents in Japan, we have witnessed that barriers in workplace organization and the socially endorsed working time regimes have made it difficult for the vast majority of workers, especially men with small children, to exercise their rights for WFB (Takahashi et al. Forthcoming).

Based on the above finding, we turn to Japanese employees working in EU countries where WFB is considered to have been better achieved. The main aim of this study is to explore whether these men’s perceptions and attitudes towards WFB have been transformed by living and working in a different country, viz. a context constituted by a different social system, work environment, organizational culture, and the like.

Face-to-face interviews with Japanese men with children under 13 years old, mainly working for Japanese enterprises in Netherlands (13 persons), Germany (13 persons) and Sweden (10 persons) were held in August-September 2013. The preliminary analysis shows that the different social institutional settings seem to have enhanced their WFB; the majority of the interviewees report that they have more time to spend with their family and with themselves than they did in Japan.
This research begins a discussion by examining distinctive features with Japa-
nese discourse on quality of life addressed by decision-makers of public policy. It will be questioned how the media and public debates have addressed the safety and quality of life in post-3.11 Japan. The main focus of this research is on various ways of manifesting citizens’ well-being, including freedom from violence in private life, as a point of start of social empowerment. In the post 3.11 world it seems more important to take into consideration the intersectionality of various factors concerning social quality, whenever we attempt to seek proper public policy response for nurturing social empowerment. It will be studied which social indicators have been referred to and/or ignored by Japanese media, and in which manners non-Japanese media has been approaching the issues on well-being. In domestic debates Japanese media and governments tend to be selective with data sources and indicators, excluding substantial among of information on those risks and issues such as radiation risks, well-being of vulnerable citizens as well as transparency in decision-making, i.e. governance risk. In brief, this research will ultimately attempt to enhance our understanding on scientific relevance of comparative studies of social quality and empowerment.

One of the most recent examples of this trend took place in Japan; in 2010 the government set up the “Committee for Disability Policy Reform”, forming it in such a manner that the committee became significantly more influential than any previous committee on disability policy. As a result, the committee was able to introduce the notion of “social transformation” (sociai tenso-bo) into the political discourse. This notion was originally introduced by former Prime Minister Koizumi as a way to address the country’s social issues. The committee proposed a series of measures aimed at promoting social transformation, including the creation of new public offices and the establishment of a new system of social benefits.

However, the committee’s efforts were not without criticism. Some observers argued that the committee’s proposals were too radical to be accepted by ordinary people. Moreover, the committee’s proposals were often criticized for their lack of specificity and detail. Despite these criticisms, the committee’s efforts were seen as an important step in promoting social transformation in Japan. The committee’s work has been praised for its innovative approach and its ability to bring together different stakeholders, including the government, businesses, and civil society organizations, to work towards a common goal.

Peter Singer and the “Why be Moral” Problem

The aim of this presentation is to point out the fatal flaw in Peter Singer’s thinking by analyzing his discussion about the “Why be moral” problem. Peter Singer is one of the most influential ethicists today. He studies theoretical ethics and also engages in social practices in order to address moral issues like animal rights, bioethics, environment problems, etc. The “Why be moral” problem has been one of the topics he is passionate about since his master’s thesis.

“Why be moral?” has two meanings: “Why should we be moral?” and “Why should I be moral?” The former means, “Why do societies need moralities?” The latter means, “If societies need moralities, why should I accept them?” This problem is connected with the discussions about civil societies because it also asks us whether civil societies are necessary.

Ethicists submit some valid answers to the former question but no ethicists have submitted answers to the latter. Peter Singer tries to answer the latter. In his opinion, the ethical life is better than the unethical life because ethical people can realize the consistent meaning of their life but unethical people can’t. In other words, ethical people are happier than unethical people. So we, individuals, should be moral. This answer is invalid. For example, there are people who are satisfied with being egotistic. Therefore he fails to solve the problem. This is the fatal flaw in his argument.

Some say trying to solve the “Why be moral” problem is nonsense, worthless or useless. In fact, even though we don’t solve the problem, we can do many social practices. Nevertheless, solving it is important for Singer because his opinion is too radical to accept for ordinary people. That Singer doesn’t solve the problem becomes an excuse for people not to act morally.

Increased Involvement of the Disabled in Welfare Policymaking

There is increasing emphasis on participation by disabled people themselves in the process of formulating policies for the disabled, both in Japan and abroad. One of the most recent examples of this trend took place in Japan; in 2010 the government set up the “Committee for Disability Policy Reform”, forming it in such a way that more than half of the members were directly concerned with the issue (people with disabilities and/or their family members), to discuss reformation of policies for the disabled, and to develop dialogue and cooperation with them.

The aim of this report is to identify the conditions for successful advocacy that promotes the participation of disabled people in the field of welfare policymaking. I will review and compare the advocacy of organizations consisting of disabled people in reference to Esping-Andersen’s welfare regime typology. The discussion covers the organizations’ history, fundraising strategies, ways of participating in the policymaking process, relationship to the government, as well as their role and influence.

My research results are as follows; disability organizations are actively participating in policymaking both in the Scandinavian countries, classified into the social-democratic regime, and in the United States, the liberal regime. However, there is a difference between the two cooperative relationships with the government: in Scandinavia, welfare policymaking is carried out with strong support from the government, and thus always runs smoothly. In the United States, on the other hand, it is often carried out amid a tense relationship with the federal or state government, and because of this, there are cases in which it is not smooth. I will add analyses of Japanese cases classified into the conservative regime, and examine the universal conditions and problems requiring distinctive solutions that can be found through the participation of the disabled in every country.

Japan’s Making of ‘Western Society’ without Democratic Social Foundations: A Historical Analysis of the Meiji Era and Beyond, 1850s-1900s

This paper provides a sociology-of-knowledge style inquiry into the process and consequence of prewar Japan’s major national project: the making of ‘western society’ in Japan. My claim is that intellectuals and policy-makers, in order to actualize the idealized ‘western society’ in Japan, heightened hostility toward people’s native, traditional forms and notions of society, and denied a possibility that Japan’s ‘westernization’ was accommodated by people’s traditionally democratic awareness. For this reason, prewar Japan’s promotion of western society necessarily lacked social foundations of democracy. This problem, I conclude, ironically supported the prewar reactionary movement, and even led to a negation of the promoted ‘west’ by the totalitarian regime.

For one thing, eminent intellectuals who existed who advocated the modernization of Japan in the Meiji era, and introduced the western conceptualization of ‘society’ by referring, most importantly, to J. S. Mill. It was an attempt to deny Japanese native forms of society and replace them with western types, on the ground that Japanese society had no internal capacity to nurture democracy and the ‘individual’, which were thought to be the key for modernization. Based on such understandings, harsh policies were imposed to ban people’s participation into indigenous forms of socialization.

Another, undoubtedly, some patterns of Japanese society were far more progressive than what modernists assumed. One type of such traditional social formations was what was called ‘kou’. Being originated in the Buddhist beliefs, ‘kou’ gathered small merchants and peasants in city and countryside, providing them with means of daily association and mutual-financing. In many ways, ‘kou’ had moralistic, non-partisanal, and democratic bases, on which people voluntarily socialized outside of narrower social-determination by birth, kinship, and territorial bonds, even free from the feudal status system. Had modernists stopped banning it, ‘kou’ might have democratized Japanese western society of Japan from below.

Vulnerability of Functional Systems in Societal Transformation: On the Case of Political System

Populist political movements indicate the weakening of formal political processes. Today’s advanced information society provides influential channels to get popularity and political momentum. The theory of functional differentiation predicates the autonomy and unity of each functional system. But, through mass media and the internet, populists can stimulate a societal emotion and mobilize it. We can observe, at least in Japan, a bifurcation of two political processes. On the one hand, there are formal and traditional political processes. Various interest groups support political parties as their representatives (or agents) in the political arena which adjust their interests. On the other hand, there is an arena of political communication in which various political groups are contesting to get societal resonance. Now, political system becomes increasingly vulnerable to opinions in this second arena. This arena of political communication could bring a risk (e.g. of political extremism). But, it could also bring a chance (e.g. to achieve an ambitious consensus on social reform for sustainable society). One way or another, we can describe this situation from the point of view of social systems theory. Niklas Luhmann defined a resonance of social system as a reaction of social system to its environment in accordance with its structure. I will slightly redefine the concept of resonance to describe a societal resonance. That is, a resonance of social system is a reactive reproduction of communication in accordance with its structure (e.g. g. democracy). So, we regard agendas in this second arena as societal structures which can induce societal resonances (communications). And, the problem is how societal communications affect trajectories of functional systems. The case of politics will be suggestive for this problem.
Policy makers such as European Commission, UK, and Japan are now interested in happiness as a policy tool. Happiness is normally measured by a likert scale. The comparison of happiness scale needs common understanding of happiness. However, happiness distribution can be classified into three types: normal, skewed and twin-peak. For example, the distributions in Japan and Hungary are twin-peak. This implies that individuals have different reference points culturally. The reference points were tested to apply question about ideal happiness. Some may refer to 100% happiness, but the other may refer to 50% happiness and 50% unhappiness. Quantitative survey was conducted in Japan, Thailand and Philippines. It included questions about their current happiness on a 0-10 scale and ideal happiness. Adjusted by ideal happiness, the distribution was skewed distribution similar to Nordic countries. The survey's result confirmed that distribution of happiness embodied the difference of ideal happiness.

 Others' Happiness: New Evidence from Four Asian Countries

If individual pursuit of happiness forced others' happiness to lower, happiness would not be a good concept to evaluate the progress of a society. We can call the society a "selfish happiness society". However, if happiness is more interpersonal, the balance between pursuit of individual happiness and other person's happiness may make society lead good direction. In particular, we now face many issues related to sustainability. Balance between economy, society, and environment and balance between current generation and future generations are keys for our survival. We can call the society a "social happiness society". Thus, the concept of "social happiness" is much more important in our society. However, effect of a person's perception about her own happiness and others' happiness on her happiness is a debatable topic. Therefore, it is worthwhile for us to explore if a person who takes care of or pays attention to others' happiness is happier. I analyzed the relationship by using a survey in Japan and confirmed that other person's happiness makes us happy (Takahashi, 2012).

Similar to the survey in Japan, surveys conducted in Thailand and Philippines in 2013 included questions about general happiness and interpersonal happiness. Using these dataset, the author can test this interrelationship between individual happiness and other person's happiness. Even after controlling other important factors such as age, income, job and marital status, the results reported that those around her were happy and she made those who were most important to her happy are happier than others. From the result, the author can conclude that other person's happiness makes us happy at least in Asian countries.

 Identifying and Reducing The Anti-Japanese Prejudice By Koreans In Job Hiring Decisions

We investigated the level of prejudice that contemporary Koreans hold toward contemporary Japanese because of the Japanese military's victimization of Koreans during the 1950s. The hypothesis was that those who report that those around her were happy and she made those who were most important to her happy are happier than others. From the result, the author can conclude that other person's happiness makes us happy at least in Asian countries.

 A Comparative Study of the Effects of English Language Proficiency on Wages in Japan and France

The purpose of this study is to compare the effects of English language proficiency on wages in Japan and France. Many Japanese women have been learning English in the hope of finding jobs which require communicating in English. Such women have abandoned the idea of careers with Japanese firms, where women are entrusted only with jobs that carry little esteem. These women also have strong affinity for Western culture. However, to date, there have been few jobs requiring the use of English in Japanese society and their dreams have remained unfulfilled. However, given the strong impact of globalization, the value of English proficiency in the market place is changing. English has now become an important common language for global communication. Does this mean that these women are now prized in the market place?

I examined data from Japan and contrasted it with data from France, a Western nation where women are employed in highly esteemed jobs, using a 2010 internet survey conducted by Yoshiai University, Japan, and a 2012 French survey. The results show that English proficiency of women was not related to wages in France but positively affected wages in Japan. The high value placed on English language proficiency has been helpful in raising women's wages in Japan; however, the results also suggest that women have been unable to take full advantage of the English language proficiency that they possess.

Association As a Tool or As a Principle?: The Reception and Usage of the Concept of the Association in Postwar Japanese Modernization Theory

How the association could be legitimized was a key question for French Sociology, because the French Revolution prohibited not only old corporations but also new voluntary associations in order to establish a Modern Society. For some sociologists, “Association” was theorized as an alternative to market society, for some legal scholars, the state was defined as a contract of association, in order to submit State Power to Civil Society’s control. In either case, the basic principle of association was the union of different peoples to accomplish their common purpose.

Comparing the French case, this paper focuses on the place of the association in Japanese Modernization Theory. This theory stressed the liberation of individuals from traditional ties, rather than Civil Society’s independence from the State. As a result, first, the association was understood as one type of secondary group, which is contrasted with the local bonding community, and not as a principle for the society as a whole.

Second, the association was not considered to contribute to the Modernization Process in Japan; Modernization took the form of individualization in the free Market Society.

Today, Japanese society has been thoroughly modernized in that sense; individuals are free from tradition and customs. Paradoxically, engagement with local community activities has been revalorized and is considered to be an individual choice. Tradition became one of the resources that create the voluntary association relationship.

These situations seem similar to Giddens “Reflexive Modernity” in appearance. However, today the Japanese regard the association as a tool for solving problems, not as a principle of society that unifies different peoples for the good of the commonwealth. Retracing this history, we would like to critically examine why we have understood the association as a tool, rather than a principle, and how this understanding affects today’s policy.

Transitional Pathway from a Temporary Migrant Worker to a Permanent Resident: Narratives of Filipina Live-in Caregivers in Canada

With the rapid growth of the Tagalog (Filipino) speaking population, recent demography in Canada has been directly affected by the pattern of global female migration and the subsequent arrival of these women’s family members. In particular, a specific foreign temporary worker program, known as the Live-in Caregiver Program or LCP, explains the current population growth of this visible minority. More than 80 percent of the migrant workers registered under the LCP are females from the Philippines. Furthermore, the LCP grants these female migrant workers the opportunity to apply for permanent residency and to bring their families to Canada after fulfilling a 24 months live-in working requirement. The LCP is the only temporary foreign worker program that has this legal pathway towards permanent residency in Canada.

This study aims to understand the social constraints on female migrant workers through examining everyday experience of Filipina live-in caregivers in Canada. The paper particularly focuses on the transitional legal pathway from temporary to permanent residency. The study of the transitional pathway of migrant workers uncovers the social process of inclusion and exclusion of migrant workers and their family members by states. Furthermore, this social process is highly gendered and racialized experience because vast majority of the applicants under the LCP are females from the Philippines.

The Nagano Olympics: Impacts on Local Community

This study aims at demonstrating the impacts of Sport Mega-Events (SMEs). In Japan, some studies on environmental or fiscal impacts caused by SMEs have been studied. However, few studies address the concrete impacts in a specific area and local community, nor try to investigate the long-lasting effects.

In recent years, the International Olympic Committee (IOC) has attached a high value to ‘Olympic legacies.’ However, there are two main concerns regarding the IOC ‘Olympic legacies’. First, these legacies are mostly based on positive effects for the host city/nation, the National Olympic Committee (NOC), other sport-related organizations, and for the IOC itself. Secondly, the ‘Olympic Games Global Impact’ project, launched by the IOC in order to improve the evaluation of the overall impacts is completed within 2 years of the event, and is much too soon to measure the legacy. This study argues that it is important to conduct research for a prolonged period of time in order to capture not only the positive aftermaths of actions but also to address negative aspects thereby ensuring a more complete understanding.

This study evaluates different aspects of SME impacts through a case study of Hakuba village (Japan) which hosted the Nagano Olympic Games in 1998, and retells three angles: the tangible/intangible; the positive/negative and planned/unplanned impacts. Especially, the impacts on the tourism industry of Hakuba are discussed in detail. The analysis in this study is based on the questionnaires and interviews conducted with people from the community itself and on a variety of statistical data.
Making Irregular Migrants Vulnerable: A Tangle of Biopolitics and Morals in Japan

This paper examines the changes in the irregular migrants’ situation in Japan and argues that the renegotiation of migrants has led to highlight the effects of sovereignty, which makes irregular migrants vulnerable.

Giorgio Agamben (1998) theorized that biopolitics, as a function of sovereignty, operates to define the included and the excluded, the latter of which is called “bare life.” Some studies regard irregular migrants who are legally excluded as living a contemporary “bare life.” However, other studies have criticized Agamben’s argument that emphasizes legal criteria in arguing biopolitics in the geopolitical and historical contexts. Following these studies, this study explores the case of irregular migrants in Japan.

Irregular migrants began to attract broad public attention in the late 1980s. Generally, Japanese citizens did not initially have negative attitudes toward them. Despite their lack of legal status, they were included in society according to various criteria such as the moral economy of society or international norms before the labor shortage and Japan’s self-recognition as a major power at the time.

However, since around the turn of the century, reactions to irregular migrants have dramatically changed. Their presence has been linked to security issues, and they have come to be regarded as “criminals.” Immigration authorities collaborated with the police in launching a large-scale crackdown, which endangered the daily lives of irregular migrants. At the same time, however, the legalization of irregular migrants was promoted based on moral values. At present, sovereignty, connected with moral values, mainly defines the included and the excluded among irregular migrants.

Thus, changes in the situation of irregular migrants in the last two decades in Japan show that the substantial effects of sovereignty can vary over time and according to the circumstances in which it operates.
This research area called ‘Tukishima’ is located in the water-front area adjacent to the urban center. The Water-front mega-projects in the 1990’s opened new large business/commercial district on the reclaimed island which attracts international and domestic tourists. The new subway lines were constructed through Tukishima, the number of tourists come to Tukishima increased.

The traditional local shop owners in Tukishima changed their business, they opened special local food restaurants. This special local food called ‘Monja’ used to be a common afternoon snack for working-class children here. About 60 Monja restaurants made the distinctive street of local food. Many tourists come to eat it at lunch time. After lunch they go sightseeing and shopping at the water-front. Tukishima became a popular tourist spot. This is the first impact of urban regeneration on Tukishima.

The second impact of regeneration is the boom of building super high-rise condominium towers. Tukishima is very close to the business district both of urban center and the water-front, it became the area filled densely with high-rise condominium towers where professional service class live. Tukishima is gentrified, and new residents enjoy to eat Monja as a traditional local taste.

The third stage of regeneration is about to begin. Tokyo has been chosen to the host the 2020 Summer Olympic Games. The venue is very close to Tukishima, high-rise tower residence can see flames from their windows. The price of condominiums goes up. Local food will be popular to visitors. The new era of Monja is about to start.

Challenges for Healthy Eating: A Cross-Cultural Study of Conceptions of Eating Among Young Adults in Urban Australia and Japan

In the early 21st century when bio-medical view on health and medicine dominates global discussion on “healthy eating”, most guidelines and recommendations are primarily concerned with fulfilling nutritional requirements and avoiding or limiting the intake of undesirable substances. They are motivated by the prevalence of chronic diseases such as cancer, cardiovascular diseases and obesity in modern society. Consequently, cultural ideologies around “healthy eating” are being constructed around these rationales. Beyond food intake, some studies and public health policies assert further that communal eating (eating with others) encourages healthy eating behaviours such as eating slowly and consuming a variety of foods.

I argue that the bio-medical approach mentioned above is often individualistic and overlooks the socio-cultural contexts of eating and living in a local community such as communal eating, culinary culture, history, lifestyle, and food supply chain. I explore the construction of “healthy eating” among young adults in urban cities of Australia and Japan through 71 in-depth interviews conducted during 2012-2013. I examine holistic aspects of eating by including contextual aspects of communal eating. I was part of a previous literature, I find that the majority of participants see communal eating as a good cultural practice and may associate it with mental health benefits, but that this practice is not necessarily associated with the healthy intake of food (portion size, pace and food content). This is due to the fact that communal eating is rather complex and sensitive to socio-cultural circumstances.

In conclusion, this study identifies dynamics of eating contexts in different cultures as challenges for healthy eating promotion in the modern society.

How Japanese Male Narratives Are Made up?

We have recently researched Japanese university students’ sexual lives for a few years and published as a book in Nov. 2011: “talking about sex with college students: sexuality through the narratives of gay students’ sexual reality at the research and described how much they suffer from their lives. After the book published, I used that as a textbook in some universities. Then I happened to meet some gay students. After lunch they go sightseeing and shopping at the water-front. They noticed a paradox of the narratives as a gay or that of ‘gender identity disorder’; the more they talk, the more they are suffered. I wish I could suggest some case studies of their narratives what is to against ‘male narratives’ from their words and why they suffered from such unimportant miss much from their identities.

Do the Small Firms Give Advantages to Female Employees?: Firm Size Effects on Taiwanese Women’s Career Choice

This study examines whether the difference of firm size influences job career of females in Taiwan using the Panel Study of Family Dynamics (PSFD) data. Previous studies show that majority of Taiwanese women continue their job without a long career break by marriage or childbirth. Well-known explanation for this is that the industrial structure composed of large number of small-and-medium sized enterprises (SMEs) and family business provide women with flexible working conditions. However, existing studies testing firm size effects on a woman’s career, have failed to reach a consistent result. To eliminate possible problems providing the inconsistencies, this study limit the objects of analysis to female employees with regular salary, excluding self-employed workers and workers of family business without payment. Also, previous studies usually treat job change and job turn over separately, but in this study those two actions are simultane-
ously analyzed in a discrete-time multinomial logit model.

This study tests mainly two hypotheses: female workers in small sized firm are able to (1) enjoy flexible working conditions by negotiating with their employees and (2) accumulate better skills which are useful for a labor market than their counterparts in large firms are. Dependent variable is employment choice, which have 4 categories; “continue the same job”, “change job in SMEs firm”, “change job in large firm” and “leave from working”. Main independent variable is a dummy variable indicating working experience in SMEs and interaction terms SMEs dummy and event dummies standing for marriage and childbirth. The result indicates that women who have working experiences in SMEs are more likely to have interrupted working careers than those who have experiences in large sized firms.

Jeunes, inégalités, Sens Du Changement Social

De quoi parle-t-on à propos de “changement social” lorsqu’on prend en compte le problématique des jeunes confrontés aux longs effets des inégalités sociales, dans la société brésilienne, mais qui sont dans un processus collectif actuel de changements surtout au plan subjectif (de leur collectif et/ou collectivitée) ? Changement d’attitudes quotidiennes en face de leurs propres situations précaires de vie et vis-à-vis des rapports sociaux qui rétrécissent toujours leurs possibilités de participation (économique, sociale, culturelle ou politique). Les multiples transformations à l’intérieur d’une société ont des effets différenciés sur les sujets sociaux selon la place qu’ils y occupent, raison pour laquelle le sens du changement social ne peut être défini qu’à partir des perspectives sociales. Peut-on envisager une discussion sur le changement social et le processus de subjectivi-
tisation (sens foucauldien) tout en considérant certains des effets inattendus liés au développement des réseaux sociaux appuyés sur les nouvelles technologies d’informations et de communications sociales? Peut-on réfléchir sur le change-
ment social tout en s’affranchissant des concepts « classiques » de reproduction, déviance, antagonismes de classes... afin de permettre l’émergence dans le dis-
cours sociologique, et la conceptualisation d’autres modes d’existence sociale, d’autres espaces d’expérimentations, d’autres intensités de vie, d’autres modes de penser le monde ou d’autres modes de plier les lignes de force telle qu’une multitude en son essai d’une nouvelle économie affective où la subjectivité devient une puissance de vie (sens Deleuze et Tarde) ? Des collectifs jeunes, au Brésil, en leur essai d’expérimentations culturelles, artistiques et micropolitiques qui se déploient dans les « périphéries » brésiliennes, mais aussi certains « mouvements sociaux » où les principaux protagonistes sont des jeunes, depuis 2011 (‘indig-

A Mathematical Model of Status Hierarchy

The emergence of status hierarchy, defined as a social order that ranks in-
dividuals in society from top to bottom, is one of the main topics in sociology. Although many empirical studies on this topic have been conducted, the com-
plete theoretical understanding of it remains lacking. In recent years, Gould pos-
posed a groundbreaking theory of status hierarchy. Using game theory and social network theory, he showed that status hierarchy can be considered as a type of equilibrium when players assign attachments to all other players on the basis of their qualities. The major difficulty in Gould’s model, however, is the unwarranted assumption of limitless resources such as time and emotional costs that players
must pay in executing their attachment strategies. Here we extend Gould’s model to be theoretically more coherent and empirically more valid by incorporating multidimensional choices for resource constraints. Unlike Gould’s model, in our model, a player choose only one allocation strategy as a multidimensional choice; that is, a player must determine the attachment levels for all the other players at the same time. Our main result is to show what is called “the relationality of social status”. Specifically, we show that an individual’s status is entirely determined by the individual’s relative quality in the social system. This observation contrasts with that of Gould’s model in which an individual’s status is dyadically determined. Our model can be considered as a type of network formation model having broad applicability.

Remembering and Resilience after Traumatic Social Loss: A Multicultural Perspective

A challenging realm for Global Sociology is the cross-cultural thinking and pro-
cessing of the experiences of collective remembering after mass social trauma and post-traumatic resilience across cultures and generations. In this presenta-
tion we will develop a theoretical and applied multi-cultural framework for work-
ing on the intersubjectivity of memory, with a focus on the unprocessed dimension of social experiences of traumatic loss, building on the latent, private, intimate individual and cultural aspects of experiences of collective memory and trans-
mision. We will also work on the concept –building on Hallwachsian work of “undercurrents of memory,” incorporating the more recent concept of “moral injury,” a contemporary development out of the post-traumatic stress literature.

This line of grounded theoretical research, developed by collaborative efforts by the authors over the last decade, explores the underlying conflicts of the unre-
solved past as they are woven into the fabric of contemporary cultures, the effects of unprocessed experience lying in the undercurrents of collective memory, often excluded or absent from the public narratives of memory, but which paradoxically retain a profound intersubjective and cultural presence, until they finally push their way into the public realm. Social studies of collective memory need to include this realm of the unprocessed (latent but present) experiences and translate them to the public realm.

The authors will develop a joint conceptual approach to look at individual/
community and cultural traumatic remembering, and the resilience of certain memories, over time. Applied research cases will include Southern Cone political authoritarianism, the Japanese American incarceration experience in the US as well as the Japanese memories of the 3.11. Great Tohoku Earthquake.

TALBOT, JOHN* (University of the West Indies, john.talbot@uwimona.edu.jm)
Food Regimes and Food Import Dependency: An Analysis of Jamaica’s Food Imports, 1950-2000

This paper uses food regime theory to analyze the changes in Jamaica’s food imports in order to explain how it became so heavily dependent on imported food. It argues that food regime theory has a bias toward production and food exports; it tends to focus on the drivers of the food regimes: First World states and transnational corporations, along with the New Agricultural Countries, the food developing countries that have become major players in the global food system (e.g., Brazil, South Africa, Thailand). To correct for this bias, we need to examine how small Third World countries are connected to the global food system through consumption and food imports. As food regimes evolve, their characteristic commod-
ity complexes change. In turn, the types of foods imported by Third World countries also change. However, once a country becomes import dependent for a particular type of food commodity, it is very difficult to go back to self-sufficiency. Thus the evolution of food regimes creates a cumulative food import dependency of new and more kinds of food. One element of food regime theory which does focus on consumption and food imports into the Third World is the analysis of how the US PL480 “food aid” program changed Third World diets, undercut Third World agriculture, and created food import dependency. This paper expands on that analysis and uncovers additional mechanisms through which food regimes tend to create food import dependency in small Third World nations.

Chilean Universities, Crisis Ordinariness, and Respatializing Knowledge

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
University competition for international excellence centers faculty research productivity (measured by indexed publications, research citations, etc.), global rankings, and international recognition. This presentation analyzes internationalization and research development in Chilean universities as a spatial reorientation of faculty work, knowledge, and subjectivity. Since Pinochet's dictatorship, Chile's neoliberalization intensified everyday competition in a free market and declining welfare state. Following the regime's political repression, universities' knowledge alignment with popular subjects changed to creating practical, neutral knowledge through technocrats. More recently, Chilean university policy older to World Bank and OECD logics to increase research productivity and rankings.

I theorize globalization as a “spatial rationality” that attributes causal powers to space to create efficiency, utility, and normative ideas of “the good” that catalyze particular actions and subjectivities. Rhetorics of globalization's economic demands—“globalization equals modernity”—nurture a national developmental rationality for national, institutional, and individual well-being. Technologies of visualization (e.g., rankings) and cosmopolitanism incite faculty to compete as entrepreneurs, a spatial reorientation that secures theory, methods, and research networks of the Global North as norms for knowledge production for faculty from “peripheral nations.”

I present themes from interviews with twenty faculty across fields at two top Chilean universities: (1) Faculty describe becoming self-managers, securing grants, publishing in ISI journals, and participating in international networks, creating new privileges and barriers live abroad. (2) Chile's economic opening has increased the de-scribe losses: research regulation through funding agency and journal standards, abandoning local projects of social change, and diminishing space to participate in national debates; (3) These constraints produce alternative knowledge projects, such as using grant funds to create digital platforms for public exchange or indexing long-extant Chilean journals to legitimize “expressions that expand our social imaginary.”

This is not a simple narrative of research homogenization, domination, or resistance, but of how crisis ordinariness creates new spaces, subjectivities, and knowledges.

Pregnancy: Supporting Networks and Families in Disaster

The aim of this research is to analyze pregnancy in its social contexts: privatization and familism. In post-WWII Japan, pregnancy has become privatized as a family issue. The disaster in 1995 and 2011 revealed us that there was much limitation of supporting system in these social contexts. My research is based on data as follows: (1) statistics on pregnancy, (2) relevant laws, (3) articles in professional journals, and (4) 10 interviews of women who were pregnant in disaster. My presentation is as follows: (1) To review development of laws; (2) How pregnant women in disaster as well as in peacetime for these twenty years in Japan, (2) To show what happened to pregnant women and their families in disaster, (3) To figure out a chain of caring support and women's power to change disaster into opportunities, (4) To point out further issues left to us, especially in Fukushima. In more concrete terms, I show invisibility of pregnant women in 1995, and then development of networks to support pregnant women and their families by the third sector since 2011. We can find a great deal of change in Eastern Japan Disaster in 2011, in comparison with Hanshin-Awaji Earthquake in 1995. The voices of women and babies in the disaster show us that the disaster became a turning point to support pregnancy beyond privatization and familism. On the other hand, Fukushima remains as a harsh reality for families and mothers especially with babies. The facts tell us the way we construct families and supportive networking as well as their limitations after disaster.

When Are Interviews Good Enough? a Reflection on Threats to Retrospective Methods Posed By Automation and Performativity

Research on respondent performance in the research setting and on automa-
ticity in human cognition directly challenge the validity of interviews. Interviews, however, efficiently produce what looks like rich, relevant data and they are par-
ticularly appealing when studying complex work in difficult to research environ-
ments. This paper looks for evidence of the practical relevance of performativity and automaticity in transcripts of interviews with civilian and military staff just returned from their rotations in a reconstruction mission in a postconflict envi-
ronment. Re-analysis of these interviews suggests that the validity of retro-
spective methods may degrade rapidly as complexity increases.

Symbols, Communicative Citizenship Actions and the Claiming of Human Rights from a Transnational Perspective: The Case of the Social Movement of Victims of Eastern Antioquia, Colombia

In this paper I would like to present the experience of two social movements of victims of Eastern Antioquia (Colombia – South America) that have been devel-
oping different types of communicative citizenship actions and symbols in order to do political activism in regional public spheres and claim human rights from a transnational perspective in the midst of the Colombian armed conflict. Specific-
ally, I will focus on the experience of the Association of Victims of Granada Town (ASO-
VIDA) and The Provincial Association of Victims to Citizens (AProVICAC), and how these two association of victims have implemented transnational acts of communicative citizenship actions different symbols and forms of political action having as a reference other victims’ groups of the world such as Women in
Black (Serbia), Mothers of the Plaza de Mayo (Argentina) and May our Daughters Return Home, Civil Association (Mexico). My two principal arguments in this paper are: first, these two Colombian experiences (ASOVIDA and APROVACI) are successful examples of how it is possible to transfer, adapt and implement different types of political actions and symbols from other parts of the world in order to improve social and political activism in particular contexts. My second principal argument is that the concept of communicative citizenship represents the instrumentalization of a new dimension of citizenship where communicative action is at the centre of the social dynamic, and one of its primary purposes is to understand the different socio-communitive manifestations, actions, strategies, practices and tactics associated with the contemporary struggle for recognition, meaning and significance for different actors in public spheres. The analysis in this paper is based on results of a narrative analysis of 48 interviews that I conducted with different members of ASOVIDA and APROVACI in October and November of 2012 as part of my doctoral research fieldwork.

One Health Concept and the Uninsured in Japan

Objectives. The purposes of this research are to: provide a general overview of Japan’s universal health insurance coverage system, to examine the social factors that explain the rise in the number of uninsured individuals using Geographic Information System (GIS) mapping, and to discuss the future universal health insurance agenda.

Background. Due to its universal health insurance coverage system, Japan’s health and medical services are among the world’s highest quality. Japan’s system requires that all residents belong to either the national insurance system or an employer-based insurance system. However, total population coverage is not the reality. In Japan, 18.8% of households with national insurance fail to pay their premiums, and those who fail to pay their premiums for 12 months become uninsured, including the children in these households. In fact, a Japanese government survey (2008) revealed that more than 30,000 children under the age of 16 are uninsured.

Analysis and Discussion. One key social factor that explains the rise in the number of uninsured individuals is the increase in labor mobility, which was expanded from the given theoretical frameworks. Research on non-metropolitan cities shows that there is urgent need to go beyond binary understanding of collective action in terms of material and symbolic, old and new, urban and rural to capture the complex interplay of socio-economic and cultural factors and to encompass the scalar complexity that we have under mined so far. Race, gender, caste and religion are not just general categories underlying these collective actions, but these are historically and spatially intertwined to express new combinations, alliances and contradictions. Collective action arguing for citizenship rights is also articulated in very different ways. The novelty and the creativity of the actors from the South has to be seen not as ‘aberrations’ from the given theoretical frameworks.

There is an urgent need to reformulate the theoretical tenets of urban studies to incorporate the dynamics of collective action in the urban arena and the framework in Sociology of Social movements warrant reformulation so as to address the novel and new, urban and rural to capture the complex interplay of socio-economic and cultural factors and to encompass new combinations, alliances and contradictions.

Coping With The Modern World and Re-Composing Ethnic Identity: Conversion To Christianity Among The Badeng Kenyah Of Long Geng, Sarawak, Malaysia

There has been considerable works on the anthropology of Christianity relating conversion and its impacts to colonialism and consciousness (such as the important work of J. Comaroff) or simply to the success of missionary activities. Works on conversion of indigenous minorities generally relate to the religious politics of identity in relation to the majority people, as pointed out by most contributors in the volume edited by Charles Keyes on Christianity among the indig enous peoples of Southeast Asia. We are interested in the tendency for conversion as a passive process on the part of the indigenous people. This paper will use the data from ethnographic research among the Badeng (a sub-group of Kenyah indig enous people) of Long Geng in Sarawak, Malaysia, to show how the “thinkers” and ordinary people have played major roles in actively engaged in conversion to Christianity in their negotiation with their encounter with modern changes that had reached their part of the world. In this respect religion and religious change are used as a kind of capital to negotiate with both traditions and modernity and to open up a way of adjusting to the changing world. Conversion provided the legitimacy to redefine traditions and even to remove some old practices, leading to the re-composing of ethnic identity.

TAN, JOOEAN* (Nanyang Technological University, jeton@ntu.edu.sg)

How Has Reformasi Affected Family Life? The Views Of Women In Jakarta, Indonesia

When Suharto’s New Order government fell in 1998, it ended more than 30 years of the highly intrusive Pancasila ideology that shaped the policies of the New Order. This conservative doctrine, in which conformity was a key element, had profound impact on everyday life including marriage and the family especially the participation of women in society. The end of the New Order was preceded and precipitated by the Asian economic crises. Indonesian GDP for 1998 shrank by 14.3% and the value of the currency plummeted from 2,909 rupiah per USD in 1997 to 10,014 in 1998. Since then there have been a number of political developments such as a decentralization of government, democratic elections, an anti-corruption drive. Reformasi also saw a rapid expansion of the media and reports on the visible Islamization of Indonesian society.

Based on qualitative interviews of 100 women in Jakarta that will be conducted in the latter half of 2013, we will examine how the changes brought about by the Reformasi movement have affected family life. We are interested in if and how radical social changes affect family life, or does family life remain stable in times of turmoil? We are focusing on Jakarta because it is a microcosm of Indonesia with people from the different ethnic and regional groups represented in the city. Also, the impact of the policies of the New Order and its subsequent demise would be strongest in the capital city. Also, we are interested in the views of women because their social roles were previously constrained under the New Order. Women who are at least 30 years old will be selected to ensure that they have some memory of life before and during Reformasi.

Sociological Analysis of the Formation of Network Popular Words

In recent years, network popular words have become an useful tool of the expression of the public opinion. This artical analyses the formation of network popular words in the perspective of social participation and interaction through connecting the buzzwords to the related social events. The writer attempts to illustrate that the new media such as micro-blog in China provide a more attractive and equal platform to the public and with the absence of physical proximity it creates a new form of equality to the political expression and social empowerment.
anine under the nation-state building period. In order to illustrate the kaleidoscop-
ic intellectual landscape, my paper divides into three parts:

Firstly, I will depict the general history of Chinese anthropology and the logic to facilitate the sociological and anthropological knowledge as a discipline “seeing like a state” before 1949. The Chinese anthropologists and state had to face up with two complicated problems: the exclusion of under the first response of nation-state building in China (1911-1949): the one is to construct a stable Chinese Nation (Zhonghua Minzu) community by which the modern state can identify itself and stand up to the external Others; the other is to mentally and physically develop and re-build the country. Second, I will interpret how the academic circles and intellectuals of sociology and anthropology co-relate with the nation-state building projects from 1911 to 1949. Huang Xianfan (1899-1982), Wu Wenzao (1901-1985) and Lin Chunsheng (1902-1981)’s academic lives can vividly signify how and why different intellectual trajectories jointly push forward the Chinese sociolog-ical and anthropological knowledge. And I will close read their academic writings to show how the geopolitical impacts their choice to produce the sociological and anthropological knowledge about understanding Chinese nation-state, and ask the questions how Huang’s learning from Tokyo Imperial University combined with the understanding of Chinese social realities made him a scholar of sociology and anthropology different from the nationalists, how Wu and Lin went to differ-ent discipline-form and settled their knowledge in China and Taiwan. At last, I will give opening conclusion on dealing with the relationship between the geopolitical gain/production of the knowledge and the practice of the knowledge in modern China.

An Intertemporal Comparative Analysis of Japanese Xenophobia Between 2009 and 2013

Japan is one of the most ethnic homogeneous countries in the world; however, Japan is also in the midst of rapid globalization with increasing numbers of foreign nationals living in Japan. Therefore the grassroots right-wing movements have spread and radicalized in recent years. But the causes and mechanisms of rapid growth of xenophobia in Japan remain unclarified.

The aim of this presentation is to reveal factors of xenophobic attitudes in Ja-pan, especially the effect of social events. I analyze two survey datasets which were collected in 2009 and 2013 all over Japan. Between 2009 and 2013, Japan has experienced terrible diplomatic problems like Senkaku/Diaoyutai Islands dispute against China and also economic recovery seems to be caused by “Abenomics”. The hypotheses on relationship between social events and xenophobia are as below. The first one is the influence of “East Asian geopolitics” (Higuchi 2012) on Japanese xenophobia especially toward Chinese and Koreans. Japan has ter-ritorial disputes against China and Korea. There are also political debates on the understanding of history in the period of Second World War. This hypothesis as-sumes that those conflicts have negative effect on Japanese attitudes toward Chi-na and Korea. The second hypothesis is the realistic conflict theory (Sherif 1966 etc.). From this perspective, in the time of economic depression, competition between immigrants and native citizens over limited resources are intensified, therefore negative feelings toward foreign residents are also escalated. If this the-overy is correct, the relations between respondents’ socio-economic status and xeno-phobia can be weaken from 2009 to 2013. Because in 2009 Japanese economy suffered in economic downturn precipitated by the Lehman Brothers bankruptcy, but “Abenomics” seems to show signs of economic recovery in 2013. I will confirm these hypotheses by using Multi-group Structural Equation Modeling.

Post-Colonial Immigration Memory: Social and Academic Resistance to Epistemic Violence

Since the end of the 1980s, French Immigration Memory (mémoire de l’immigra-tion) has gradually become visible in France. As a result of this process, the first immigration museum in France, Cité Nationale de l’Histoire de l’Immigration (CNHI), was inaugurated in late 2007. Immigration Memory, once an almost exclusive topic to the anthropological knowledge, has gradually become visible in France. As a result of this process, the first Immigration Memory (mémoire de l’immigration) has gradually become visible in France. As a result of this process, the first immigration museum in France, Cité Nationale de l’Histoire de l’Immigration (CNHI), was inaugurated in late 2007. Immigration Memory, once an almost exclusive topic to the anthropology, has become invisible within the same process. The following will be the explanation of the exclusion of Post-Colonial Immigration Mem-ory in social and academic spheres as epistemic violence and aims to explore individual and collective resistance against it. The resistance against epistemic viol-ence is practiced by activists and artists with post-colonial backgrounds through Memory Work. Memory Work is a cultural and artistic practices of reconstructing certain past stories that they directly experienced or not and they find themselves inherited from. Their positionality and proximity to the past story, depending on their gender, life-course and/or ethno-racial identity, gives a different signification to each Memory Work. Through the analysis of several exemplary Memory Works about “memory of struggles” based on my fieldwork in Lyon, Toulouse and Paris since 2009, I aim to empirically study epistemic violence in order to resist it as a researcher. Post-colonial Immigration Memory, in this sense, is not only an object of study but also a social academic project to bring normative construction of knowledge and its violence into question.

A Biographical Analysis of Women’s Political Participation: The Importance of Politicization in Female Legislators’ Biographies

Politics as a social institution remains highly gendered in many societies both quantitatively (few politically active women such as legislators) and qualitatively (androcentric political culture). It has been a major area of concern in both the-oretical and empirical cultural studies to ask how and why women are still minority among those who are in the decision-making positions. This paper applies a biographical approach to a study of women’s political participation and explores what promotes their participation in decision-making. Data used were collected in 2010 through qualitative interviews with female legislators in the local Tokyo assemblies. An analysis of the data revealed that women who used to be politically inactive, even uninterested, could be ‘ politicized’ in middle adulthood or at a later phase of life. It is argued that this process of politicization can play an important role in women’s decision to run for office. In Japanese society such politization rarely occurs in women’s lives. Women are traditionally ascribed to the private sphere of domestic work, being excluded from – or discouraging women from being engaged in – public life. Scholars of women’s political partici-pation have stressed the androcentricity of institutional politics and identified in-stitutional politics have stressed the androcentricity of institutional politics and identified in-pathways. We will first present multiple narratives used by beginning farmers that illustrate their understanding of the dynamics of finance capital in agriculture. Using the “economic map” as both a methodological and theoretical tool, we will then discuss the key patterns of how these beginning farmers position diverse financial/economic actors as critical resources for, or hindrances in, shaping their farming practices. We will also explore in these narratives how the concepts of “sustainable farming” and “economic viability” are articulated to guide their practic-es.

An International Comparative Study on the Sport Development for People with Mental Health Problems in 5 Nations

Aims: The aim of this study is to explore how sports for people with mental health problems have been promoted in 5 nations, which are Italy, England, Den-mark, Germany and Japan. Those countries have developed sport for people with mental health problems, according to Tanaka et al. (2013). This study attempts to identify each support system in order to contribute to international sport move-ment for people with mental health problems.

Backgrounds: People with physical and intellectual disabilities in many nations have come to enjoy sport not only for rehabilitation but also as a normal part of everyday life. On the other hand, sport offers people with mental health prob-
The Role of Tourism Companies in Forming Ethical Tourists: Case Studies of Tourists from China to Japan

The increase in Chinese tourists overseas and its socio-cultural and economical influence are of interest worldwide as well as in Japan. While many agents in the tourism industry link Chinese tourists, the conditions of tourism between China and Japan are unstable, especially under the influence of political events.

Two case studies are examined. First is the case in which tourism companies teach their clients tourist ethics. This study finds that tourism companies have been successful in creating a negative image of Chinese tourists.

Second, it links to the types of national governing bodies. Third, nations whose ideas are based on the sport tend to organise sport games/championships, while nations whose ideas are based on the medical treatment organise sport promotional events.

Recovery and Social Inequalities: The Use of Capabilities Approach and Intersectionality Analysis in Exploring the Social Conditions for Recovery

‘Recovery’ has become a dominant discursive feature in the UK mental health policies. Under the neo-liberal context, the mainstream recovery services tend to promote individualistic recovery strategies. Such policies and services fail to address the structural inequalities that give rise to distress and mental ill-health or place sufficient emphasis on the diversity of intersectional inequalities among service users that shape recovery journeys.

This paper critically engages with the concepts of ‘recovery’, based on a case study of Chinese mental health service users in the UK which explores how structural factors, such as class, gender and ethnicity, contribute to their diverse recovery journeys.

To shed light on the complex interplay of structure and agency in shaping recovery journeys, a synthesis of the Capabilities Approach (Sen, 1999, Nussbaum, 2001 and Hopper, 2007) and Intersectionality Analysis (Walby, 2007 and Anthias, 2006) was developed as an alternative framework. Repeat ed-in-depth history interviews were carried out with twenty two Chinese people who have received a psychiatric diagnosis, recruited from three cities in the England. Findings showed that participants strove, sometimes cautiously, to retain and exercise agency to move from patienthood to personhood. Their journeys were shaped by social inequalities demonstrating that targeting social inequalities is essential for facilitating and nurturing meaningful recovery.

Drawn on the findings in the case study, this paper will illustrate in what ways the medicalisation process enhances or hinders the development of capabilities. It will also discuss about the use of the Capabilities Approach and Intersectionality Analysis in exploring the social conditions for meaningful recovery.
Intercultural Training Program as a Mechanism of Raising the Individual Level of Competition

Seventy people representing five regions, and 32 countries were involved in the research. 25 expert interviews and 6 focus-groups were conducted by the researchers. Most contrast patterns of cultural clashes were observed in the interaction between students of St. Petersburg and the representatives of western and eastern cultures. The strategies of acculturation of people with diverse origin are very different. The representatives of Western Europe and the USA tend to believe that their difficulties in adaptation result from low standards of local people and Russian social environment. Newcomers from far eastern countries make enormous efforts to understand the motives guiding the local people’s behavior, and try to adjust to the context of local culture. Africans tend to conceal their problems. The main problem of their adaptation is the lack of local people’s tolerance resulting from physical and cultural differences. Weighing pros and cons of living in St. Petersburg they often try to focus on positive aspects and push up negative sides. As for the citizens of the CIS and former Baltic republics (Estonia, Lithuania, Latvia), the process of their adaptation is the easiest one, because they speak fluent Russian, have been visiting St. Petersburg since childhood and do not feel enormous cultural differences. However, the lack of notable differences led to certain difficulties in constructing the cultural assimilators with their participation. At the same time, the migrants from the CIS, who came to raise their earnings and living standards, are often excluded from the social environment of St. Petersburg because of their limited access to economic and cultural resources.

Sociological Study of the Cultural Differences in Korean-Russian Mixed Marriages

According to Korean statistics in South Korea 90489 marriages between Koreans and foreigners were registered. The share of marriages with Russians was 835, among them 523 marriages between Russian women and Korean men. For the present study of the cultural differences in Korean-Russian mixed marriages the method of semi-structural interview was selected. This method gives a good opportunity to gather the necessary information and to interpret the object of research. The empirical research was conducted in Seoul, South Korea in 2010. Ten Russian women in the age from 19 to 31 years old, married the citizens of the Republic of Korea, participated in the study. Following the opinions of the respondents, the most difficult thing in family life in mixed Korean-Russian marriage is the difference in their understanding of the importance of their marriage, communication with husband’s relatives, the obligation to visit them during the collective family holidays (Lunar new year, the harvest festival “Chusok”) when crowds of relatives gather in parent’s home. Russian women definitely emphasized the differences in celebrating holidays, family rituals and ceremonies of life cycle. Cultural differences in such marriages are quite big due to specific scenarios of children’s socialization in two societies. In the same time various actual differences in presented research were not found out because of the length of marriage of the respondents. Young Russian women and their Korean husbands who participated in the research were in their so called “honeymoon” period. It is also worth mentioning that the cultural context of ethnic relations and global trends change nowadays so rapidly that in several years Korean-Russian marriages will turn from somewhat exotic and unusual into ordinary and routine practice.

Social Cleavages Caused By Radioactive Contamination of Food and the Environment: The Case of Fukushima

The nuclear disaster in Fukushima has inflicted devastating damage to agriculture and food of Japan in many respects. I will give an overview of the social cleavages caused by the first, the social estimation of organic agriculture was tremendously damaged because the regional circulation of organic matters, one of the most important characteristics of organic farming, was broadly contaminated by radioactive substances. Many consumers particularly concerned about food safety have stopped buying organic foods not only grown in Fukushima but in surrounding areas. Despite the fact that radioactive substances remaining in soil were not transferred to agricultural products, most of the consumers have not yet come back to the farmers. The fall of the reputation of organic agriculture is the more serious because it is deeply connected with the growing distrust of Japanese food in general. Radioactive contamination of food has become a serious threat to the national food security. Second, a deep cleavage occurred between the farmers who are willing to live and farm in Fukushima at the risk of exposure of radiation and many anti nuclear activists who criticize these farmers insisting that they quickly leave the contaminated hometowns. The recognition gap concerning the risk of being exposed is so wide between them that it is difficult to establish the solidarity movement between farmers and anti nuclear movement.

Third, there appeared a great gap between Fukushima and the rest of Japan, or between Tohoku District, northeast part of Japan consisting 6 prefectures including Fukushima, and the rest of Japan. The nuclear disaster has reproduced the unequal development patterns that were often observed during the modernization history of Japan: taking the goods to the center and bringing the bads to the periphery.

“Strength through joy” in Japan

During the second half of the 1930s and into the 1940s, the National Socialist leisure organization “Strength through Joy” (Kraft durch Freude, shortly Kdf) had a great influence on the development of Japanese leisure movement (Kōsei movement), and played a crucial role in the establishment of relations between the two countries. Since the World Recreation Congress in Hamburg 1936, the activities of the Kdf, which should regenerate the “strength” of workers through “joy” in leisure, attracted public attention in Japan, where the general interest in the subject of leisure had been slight. The Kdf gave the Japanese movement many suggestions and became its model. After the foundation of the Japanese Recreation Association (JRA, Nihon kōsei kyōkai) in 1938, the Japanese leisure movement made a rapid growth into the holding of the Recreation Congress for Asian Development (Kōa kōsei taikai) in Osaka 1940. At this congress, which also representatives from Germany were invited, the slogan “Strength through joy” was adopted and the Japan-German cooperation in the field of social policy was proclaimed. However, the actual discussions between the two countries on issues relating to leisure were not deepened by the congress, and also the mutual perceptions of Germany and Japan contained contradictions in many respects. This report therefore examines the image of the Kdf in Japan and that of the Kōsei movement in Germany, and also investigates the relationship between the two countries, in order to clarify the features of the mutual perception and its significance.

Mapping out the Educational and Future Trajectories of the Children of Internationally Mobile Families

Children’s education and future career trajectories are of paramount concern for many transnational families. Educational concerns impact upon whether and when families decide to move internationally to either stay or stay apart. This paper focuses on teenage and young adult children of Asian and African backgrounds who participated in transnational family lives in Germany and Japan, as well as their family-related experiences of education and economic futures intersect with the ambivalence that young people feel about their transnational upbringing and identity, as well as the way they imagine ‘home’. Given that international mobility is the norm for the young cohort I studied, their experiences offer significant insight into the complexity of transnational family lives and its impact on children.

Data is drawn from a yearlong ethnographic research conducted in Jakarta, Indonesia in 2009 at an international school catering to foreign expatriate and local elite families. I conducted participant-observation of high school students (grades 9 to 12), as well as in-depth interviews with over 130 students, school staff, parents and alumni of international schools.

HIV/ AIDS Among Adolescents in Brazil and France: Similarities and Differences

In order to analyze the Aids epidemic in France and Brazil, particularly among adolescents, a critical review of literature, official documents and on-site verification of services for sexual and reproductive health for adolescents was held. The concept of vulnerability and its categories were used as theoretical basis of comparison. A comparison to France and Brazil between the HIV prevalence and social inequalities is highlighted. This paper highlights the way pragmatic considerations about education and economic futures intersect with the ambivalence that young people feel about their transnational upbringing and identity, as well as the way they imagine ‘home’. Given that international mobility is the norm for the young cohort I studied, their experiences offer significant insight into the complexity of transnational family lives and its impact on children.
Anti-Nuclear Movement Discourse in the Countries of so Called “Nuclear Renaissance”

Since the first half of 2000s the world society has been observing the expansion of national nuclear energy programs in a number of countries, also called by nuclear power industry as ‘Nuclear Renaissance’. This development has been accompanied by the contemporary trend in public opinion showing positive attitude towards nuclear energy. The striking is, however, that this situation occurs in the countries with the history of significant anti-nuclear movements, e.g. Sweden. The revival of nuclear energy programs, public opinion favouring the expansion of nuclear energy and the experience of anti-nuclear movements in the past are the points of departure for this study. The constellation of these circumstances in several countries encourages the following research questions to be considered in this paper. First of all, the national nuclear energy policies have affected the discourse of anti-nuclear movements, the primary task of this paper is to find out in what way. Then, the second question is to analyze how these policy changes account for a shift in contemporary understanding of nuclear energy by anti-nuclear movements. Thirdly, the connection between discursive opportunities embedded in these discourses and movement mobilization is studied. Finally, the paper aims to discuss whether there is a change in public perception of nuclear energy.

Several explanations and events are responsible for the mentioned changes, among others are the issue of climate change and the accident at Fukushima-Daiichi. This paper explores in what extent and how these turning points become part of the anti-nuclear movement discourse.

In terms of methodology this study is based on discourse analysis.

Multiple Discrimination: Personal and Institutional Perceptions, Impacts, and Actions

This paper investigates the phenomenon of Multiple Discrimination in Hungary, with special attention paid to cases of intersectionality based on ethnic origin. The research uncovers those mechanisms that lead to multiple discrimination in the field of job seeking, hiring, and employment. The phenomenon of multiple discrimination is studied, on the one hand, from the perspective of decision-makers representing public and private employment agencies; on the other hand, from those who are the victims of discrimination on multiple grounds. The research project identifies the personal and institutional perceptions, impacts of and actions taken with regard to discrimination by the various stakeholders. Through a series of semi-structured interviews and a survey of private and public employment agency clients we demonstrate how a low awareness level of discrimination, in particular of multiple discrimination, among victims, and a high inertia and inaction on behalf of decision-makers lead to the reproduction of social mechanisms responsible for discrimination.

Education for Lifestyle (Leisure) Counselling in an Unequal World (Szeged, Hungary)

Max Weber’s lifestyle model emphasizes the role of life opportunities, life chances and choices. Life opportunities provide the conditions for choosing one’s lifestyle. Life chances are the chances of actually realizing the given values. For realization it is the social environment that ensures the structural prerequisites. Opportunities, chances and choices in everyday life mean that people have a free choice within the wider or tighter boundaries provided by their social environment and related social pressure. At the same time, lifestyle is not only a dependent of one’s social position, but it also plays a considerable role in designating one’s position in the social structure.
Recogiendo Looking: Political Spectatorship Distinct from Action

Desde museos que comemorador genocidio a human rights organizations organizando grandes manifestaciones, fotografías de violencia son un fenómeno insidioso que se convierte en una forma de política. Las representaciones de sufrimiento como resultado de política de violencia se convierten en una trayectoria teórica que se conecta con la interpretación visual en el contexto de un cambio político. Esta trayectoria se ha desarrollado en modelos de espectador que evolucionan con la teoría visual contemporánea, con la perspectiva de Azoulay. Al observar las intensificaciones recientes y las dicotomías discursivas sobre los lugares de reconocimiento y adopción de las prácticas de interpretación, este libro examina las transformaciones en el campo de la fotografía y la creación de imágenes en el contexto de una dinámica política.

Tools of Violence, Traces of Memory: Photographic Identity Cards and the Visual Narration of the Rwandan Genocide

Photo identity cards played a crucial role in the politics leading to and the perpetration of the 1994 Rwandan genocide. The identity cards and their portraits now figure prominently in Rwanda’s national memorial sites as both evidence of the racist politics that culminated in genocide and as commemorative images. Attending to the interpretive shift prompted by the material transformation of bureaucratic portraits into memorial images, this paper will examine the complexities of using portraiture to memorialize mass violence. To critically examine the politics of transforming bureaucratic portraits into commemorative images, this paper draws on Ariella Azoulay’s ontology of photography, which presents photography as an ongoing event capable of continually deriving alternative interpretations of the photographer. By approaching the identity cards and their portraits through this relationally-focused ontology, this paper provides an account of the ambiguity present in the different uses of the photographs, focusing on the portraits’ repressive and heroic capacities and attempts to stabilize their political meaning in the development of Rwanda’s post-genocidal narratives. While the Kigali Genocide Memorial Centre exhibits works to re-approach identification cards and their portraits for memorial ends, I contend that the changes to the photograph’s material conditions cannot produce a fixed or stable interpretation.

Ciclo De Imágenes y Alteridad Migrante: Antropología De La Imagen ‘brazuca’ En La Cinematografía Contemporánea

CICLO DE IMÁGENES Y ALTERIDAD TRANSFORMATICA: ANTROPOLOGÍA DE LA IMAGEN ‘BRAZUCA’ EN LA CINEMATOGRAFÍA CONTEMPORÁNEA

El presente trabajo intenta producir una interpretación sobre las estructuras de las focalizaciones discursivas en las imágenes utilizadas en el cine mundial contemporáneo, retratando el universo de las realidades brasileñas singularizadas en los juegos de escena entre Brasil y los brasileños mas medios expuestos en las películas ibero-americanas. A partir de una serie de imágenes relacionadas con la producción cinematográfica sobre Brasil y los brasileños en el cine iberoamericano, se pretende observar los procesos de transmisión de imagen y la confección de la exofobia “brazuca”, articulados en los contextos operativos de los sistemas de reconocimiento y adopción de las prácticas de interpretación contrapuestas de los exóditos migratorios a los países europeos. Las imágenes relacionadas con Brasil y los brasileños, son vistas a la luz del debate sobre las construcciones del imaginario de los brasileños en el exterior, con el objetivo de observar las transformaciones recientes y las dicotomías discursivas sobre los lugares de reconocimiento de colectivos migratorios y los extranjeros míticos de los países mediáticos. En este sentido, el trabajo explora el impacto de la exclusividad de imágenes de referencia que adornan el cine, así como también la identidad de singulares de Brasil y los brasileños conducidos e intensificados de forma urgente dentro de la cinematografía iberoamericana reciente.

Gender and STEM: No Shift Required

In the past thirty years, several waves of opportunity have come successively closer to realizing Papert’s vision of a world in which children can self-actualize and creators of technology. Each wave, starting with Logo, has had strengths and limitations and while some have had considerable reach (FIRST Lego League, for example), none have as of yet become fixtures of childhood. Now, part of the opportunity that comes with a switch from a STEM to a STEAM or SoTL perspective is the chance to build foundations for female—and more widespread male—participation in computing on a wide, humane platform in which the outside world is involving, inviting and discovering rather than persuading, cajoling and selling. In particular, recent tools associated with the Maker or DIY (“Do It Yourself”) movement have the potential to increase embodied, craft-oriented performance-focused behavior. Girls (and a range of boys) can now create inexpensive, personalized, crafted objects that cause them to rub elbows with technology and technological thinking without having to first (or ever) label themselves as one of “them,” the kind of person that actually likes technology. They can tinker, both with creations and identity. They can develop skills which will help them no matter what they go on to do, and their relationship to those skills can change over time. The crucial opportunity, ironically, lies in the relative unimportance of the technology in defining the students’ projects. Supported by the National Science Foundation under Grant No.1142510.

Scientific Criticism in the Dispute over the Risk of Radiation Exposure

This study examines the role of scientific criticism in the dispute over health effects of exposure to low-level radiation, focusing on the situation in Japan after the Fukushima Daichi nuclear disaster. In radiation-related fields, it has usually been difficult for environmental movements to establish and utilize a network of scientists who provide a scientific basis for the movement, because of the strong connection between government officials promoting nuclear energy and scientists in these fields. Considering these difficulties, I will examine what enables...
The Relationship Between "Global Meanings" and "Local Meanings": A Case Study of Protests Against the Construction of the "Kaminoseki Nuclear Plant" in Iwashiwama, Yamaguchi Prefecture

TATSUNO, YOUSUKE* (Sophia University, tatsucon0703@gmail.com)

How do global social movements relate to local social movements, and in what way does the former influence the latter? This presentation examines the relationship between "Global meanings" and "Local meanings" considering two analytical frameworks on social movements: cultural theories of social movements and the new social movement theories.

Cultural theories of social movements pursue the "construction process and the source of meanings" (Nomiya 2002). On the other hand, the new social movement theory pursues the construction process of "collective identities" (Melucci 1988). In other words, this perspective highlights the fact that movement groups and participants construct ideas through the various interactions between them.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
In the present work, we provide a case study of a protest against construction of a “Kaminoseki nuclear plant” at Iwaihashi located in Yamaguchi Prefecture. Attention is given to two groups. The first one is the “Iwaihashi no shizen wo mamoru” group that specializes in the environmental aspects of biological diversity. The second one is “Kaminoseki genpaku wato tatesasenai Iwaihashi toumin shinsyrado” group that specializes in the environmental aspects against construction of Kaminoseki nuclear plant. Using the investigation data of the voice of the participant in that two groups, we analyze the motive of participation, the resource of motive, and cultural factors (e.g. collective memories, local histories, and identity) in order to find out the construction process of “global/local meanings” and “collective identities”.

Lastly, we attempt to clarify that the “global meanings” was related to the significance of the “local meanings”, and highlight the resource of the “global/local meanings” and construction process.

Sociological Study of E-Dating and E-Prostitution in Iran

Sociological Study of E-Dating and E-prostitution in Iran

Abstract

Iran has provided the possibilities for virtual networks by facilitating internet access to the public. But the open nature and lack of “enough” control over the virtual community contradicted with the laws and regulations put into practice by the Islamic Republic. One of these contradictions is the dynamics of online dating and prostitution.

As a result of strict rules imposed by the government, dating, “illegal” relationships, as well as prostitution, has been looking for new opportunities in virtual environment. In particular, online social networks such as Facebook have provided a new market for sex trade. There has been a surge in Facebook subscriptions in Iran with the purpose of advertising and seeking sexual services. This study attempts to examine this phenomenon from a sociological perspectives focusing on prostitution:

Data collected from Facebook pages of Iranian users concerned have indicated that the following key points have led to the growth and popularization of this phenomenon.

- evasion of law
- freedom from the restrictions of family,
- passing the limits of time and space,
- achieving social identity in digital social stratum of prostitution,
- anonymous identities,
- ease of socializing,
- desirably setting the conditions/price for services,
- avoiding loss of earnings to pimps,
- screening and vetting the persons of interest
- sociological (e.g. economic, cultural, religious) reasons, implications, and lowering the risk of embarrassment,
- possibility of freely expressing hidden sexual fantasies and leisure,
- combating social exclusion and finding the strength to oppose popular culture.

The trend of e-prostitution in Iran is on growth and our study attempts to discuss the consequences of this phenomenon.

Keywords: Iran, cyber-space, Facebook, prostitution, leisure

Women Go Shopping: Discussing the Behaviour of Generation Y and “Green Consumption” in Rio De Janeiro

This paper aims to discuss the buying behavior of the female segment with respect to the consumption of products with ecological appeals (“green products”), in the post-modernity, through the subject area of green consumption. The sample includes 100 surveyed women of Generation Y. For this study, we conducted a qualitative, exploratory research, with field survey using structured questionnaires. The interviews were held in January 2013, at the exit door of malls in Rio de Janeiro. The theoretical basis of this study are the concepts proposed by Bauman, Canclini and Lipovetsky. The data discussion reveals a women of Generation Y with a consumer behavior paradoxical, showing that the influence of fashion, media and academic information makes young people oscillate between follow ing fashion trends and practices resulting of a deeper understanding of environmental issues, according glances of environmental responsibilities and conscious citizen seized through education and through the Internet. The results also reveal the idea of consumption as a process of a hybrid culture (through the influence of global culture produced and widespread by the socio-technical networks) and local culture, with traces of belonging, social recognition, especially from the perspective of the consumer-citizen relationship. This ambivalent condition of this generation relies both from the perspective discussed by Bauman (dialogic relationship between the spectacle and the vacuum of consumption as a moral/social duty and the critical reflection of the consumption, through spaces as schools and universities), and by the vision of Canclini which emphasizes the logic of cultural hybridity and the idea that to be a citizen is required to carry a consumer identity. Complemented by Lipovetsky, both thoughts emphasize the consumption behavior of the social actor of female sex in the Generation Y as a reflection of a society that expresses the concept of a individualistic and consumerist ethic.

Cultural Artifacts in the Mexican Social Movement Sector: The Artifactualization of Performances and the Performativity of Artifacts in a Digital Age

Where residues of a less democratic past persist, as is the case in Mexico and several other Latin American states, challenges to the state often take more subtle and intuitive forms, which means that cultural inscriptions in mobilization processes can be especially instructive. Drawing on several mobilization sites and moments from contemporary Mexican social movement sector the paper aims at exploring whether the tools of cultural analysis—performances, ideations and especially cultural artifacts—are used in the production of oppositional meanings and whether the unfolding events and actions around them can become central to the identity and to the genesis of social movements. The social construction of these cultural artifacts, their social embeddedness, and the diverse ways that audiences respond to them, mean that artifacts themselves can play key roles in mobilization trajectories, as social actors encounter them, appropriate them, discover them, modify them, deploy them and mobilize around them. Focusing on the artifactualization of performances through digital technologies and vice versa on how artifacts can take on qualities of performances by being digitized and posted on a Facebook page or blog, the paper also enquires whether online social media have transformed the cultural analysis of performances and artifacts

Collective Action Between the Street and the Court: Public Hearings in India

Public hearings, in the contemporary Indian context, are public meetings organized around the implementation of a given public policy (for instance the right to education). These meetings take the form of a confrontation between the administration and the people, moderated by a panel of “experts”. This peculiar form of collective action, characterized by a deeply ambiguous relationship to the judicar y, has become increasingly visible in India in the past decade.

This paper will attempt, firstly, to trace the genealogy of public hearings, before reaching out to the people’s tribunals of the 1960s; it will show how the public hearing has since been reinvented and reinterpreted, and how it has met with a new population, as used by very different types of actors and struggles. Secondly, the paper will describe and analyze the dynamics of public hearings in order to highlight their hybrid nature, in between the community meeting and the lawsuit. Finally it will try to understand the sources and the limitations of the efficiency of public hearings as a mode of mobilization.

TAYLOR, EMMELINE* (Australian National University, emmeline.taylor@anu.edu.au)

Punitive Pedagogy and the Political Economy of the Surveillance School

Surveillance Schools are emerging around the globe characterised by new technologies and practices that identify, verify, categorise and track pupils in ways never before thought possible. The school gates have been opened to a variety of surveillance technologies including CCTV, metal detectors, fingerprinting, online monitoring, facial recognition and palm vein scanners, to name just a few. Of course, Surveillance Schools are not just comprised of technological apparatus, many have full time uniformed police officers, armed in some countries, patrolling the corridors and classrooms, they subscribe to random drug testing and use sniffer dogs to search students and their possessions stored in transparent lockers and bags. Taking schools as microcosms of society, they can provide us with a prophetic glimpse into an emerging penal vista characterised by surveillance, containment and control. Set against this backdrop, the paper examines the new penal pedagogies and corporate priorities that have increasingly flowed into schools as successive waves of neoliberalism have come to shape the political landscape. Corporate schemas increasingly pervade schools, reclassifying citizens as consumers and aligning education with the needs of the post-industrial market. As the Surveillance School assesses pupils according to their value
as ‘human capital’ (Apple, 1998) they are sorted into two ideal types; compliant ‘worker-consumers’ and ‘market rejects’; those that are disposed to poverty, or in the most extreme cases face a direct and expedited channel from the school to prison. The paper debunk the meritocratic myth to argue that the school-to-workplace pipeline has bottle-necked as neoliberalism desiccatates jobs. The school production line is no longer only routed to the industrial workplace, but rather prisons have become the relief valve, filtering off the already marginalised poor into carceral warehouses.

Mental Health and Illness and Workplace Harassment

Even though every person is protected against harassment and discrimination in areas defined by Alberta’s Human Rights Citizenship and Multiculturalism Act, The Canadian Charter of Rights and Freedoms and the Canadian Human Rights Act, general types of harassment or bullying are not prohibited in Alberta, so this qualitative analysis examines the avenues to resolve harassment issues within the context of Alberta Public Service in Canada. The goal is to achieve a healthy workplace for every person. The ‘harrassed worker’ has been explored within a psychiatric framework, so the paper searches for an appropriate framework namely labour code, union grievance, legal remedy or medicalization of deviant behaviours in the workplace.

Imagining Futures in Paper Homes. Ambivalence, the ‘Politics of Becoming’ and the Everyday Life of Temporary Immigrants

This paper asks whether changes in the patterns of migrant mobility have been accompanied by, or indeed have generated, the affective register of ambivalence as a way of coping with life as temporary, nomadic and often unwanted peoples. Migration is increasingly temporary in nature, with an attendant loss of access to the channels of full incorporation to formal citizenship and belonging. As a result, immigration as a process has become more fluid and fragmented, so that it is not clear where one may find a safe haven or one may build a permanent life.

Ambivalence can be conceived as a rational response to the uncertainties faced by immigrants: temporary and precarious work; second-class citizenship; marginality and invisibility. At the same time, ambivalence can also be understood as a more widespread emotional response, observable under the conditions of late modernity and uncertainty. Ambivalence and precariousness have become more pervasive in the everyday life of temporary immigrants, to the point that it has become a way of coping with life as temporary, nomadic and often unwanted peoples.

The content of the problem statement is as follows: how do (partners from) families behave in time and space with regard to holiday making, and are there inequalities related to their origin? (urban – rural; low versus high status; caring role; and gender?) We used data from diaries and from extensive interviews with husbands and wives.

In this paper the main findings of that analysis will be presented.

Conundrums for Policy and Practice Regarding Vulnerable Youth

Many youth related policies and institutions are aimed at supporting vulnerable young people to prevent problems from arising, to catch problems early, and to assist young people who are experiencing problems. Identifying some young people as vulnerable (or ‘troubled’, or ‘at risk’ – the terminology varies) rather than providing such services for everyone enables limited resources to be targeted at those who need them most.

This poses several conundrums. First, selecting some young people for special attention creates the dual risk of stigmatising some and excluding others. However, not singling them out may lead to further disadvantage. This creates a dilemma for the provision of services for young people. Secondly, determining which young people warrant what kinds of support and when is a fraught issue.

The presentation will engage with these conundrums by not only exploring how and why certain young people are identified as vulnerable in relevant policy, but also the policy-practice nexus and the potential impacts of such challenges.

‘Rooted Cosmopolitanism’ or ‘Politics of Becoming’; A Thick Convergence?

This paper proceeds from a grounded understanding of cosmopolitan values as ‘rooted’ in particular experiences and ways of life, yet assumes those same values to be generalisable – as human rights. ‘Rooted cosmopolitanism’ speaks to an aspect of human rights, namely its relationship to the nation-state form. Though historically rooted frameworks frame entitlements and claims occur predominantly at the level of the nation-state. The possibility of human rights – and of our commitment to their primacy (as ‘natural law’) hinges on cultural understanding of rights and questions of what is it to be human. Rather than proceeding from the well understood logic of universal human rights as internationally held norms that ought to be realized and applied through the domestication of those norms in particular states, the paper proceeds with a view to the realm of affect; sympathy and love as disgust, shame and humiliation. Why do we intervene and feel sympathy and compassion for some individuals and groups, and not others? How does a politics of affect emerge in relation to vulnerable migrant groups such as asylum seekers, temporally and unauthorized migrants? Through examining the perspectives of ‘rooted cosmopolitanism’ (or cosmopolitanism from below) and the ‘politics of becoming’, the paper aims to map a theoretical convergence between hospitality and attention to proximity (nationalism).

Professional Ethics for Social Justice: Codes, Principles and Resources

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
It is likely to be widely accepted that ethical reflection by professional workers, such as teachers, is of benefit for improving equity and social justice in society. More controversial, however, is whether formalized codes and principles are helpful. In this presentation I begin by analysing critiques of formal frameworks for procedural ethics: both professional codes of ethics and guidelines for research ethics, especially in the field of economic and social science research. Specific concerns relate to the restrictiveness of codes, the impact of codes on undermining professional deliberation, and a lack of cultural relevance. I draw on Nancy Fraser’s framework of social justice to relate these issues to considerations of inequality, justice and ethics. The second part of the presentation reflects on my experience teaching a module on ‘professional ethics’ in a pre-service teacher education course in Australia. Rather than pre-determining codes or principles for students to adopt, I started with a Smörgåsbord approach, offering various ethical theories and materials. These were resources for students in order to construct their own ‘professional ethical toolkit’. I provide examples of these resources and how they were used by students. Finally, I return to the session question of how professional ethics may contribute to diminishing inequality. I examine principles commonly used in research ethics frameworks internationally (respect for persons / autonomy, beneficence / non-maleficence and justice) as well as ethical resources through Fraser’s lenses. I conclude that in order to use ethics for equity, we need to carefully weigh up the potential impacts of formal, procedural approaches and more informal pedagogical approaches.

When Food Aid Supports Local Farming : Towards a Sustainable Solution ? Case Study in France

In Europe an increasing number of people require the assistance of food aid organization. It is not any longer an aid funding. Access to fresh quality foods gets difficult, impacting people health. This contribution is an original on-going case study assessing the impact of an innovative food aid supplying mode supporting small local farmers. Besides developing links between urban consumers and local producers, it reveals the current conditions shaping the creation of fair and sustainable markets.

This case study is based on the pluridisciplinary intervention research ECOALES in partnership with the ANDES (national association for food aid) which has set up in 2012 an innovative short supply channel for fruit and vegetable for solidarity grocery stores in western regions of France. Objectives are to increase fresh fruit and vegetable consumption among food aid recipients and support local farmers by buying their products at sustainable price via a pre-order system. The intervention also includes cooking workshops and visits to farms. The network of local farmers is organised by a coordinator in charge of deliveries to food aid outlets.

We will focus on the diverse constraints: creating links between shops and farmers who are spread over a large territory; the articulation between support to farmers in a difficult situation and regular supply in quality fruit and vegetable; meeting consumers’ expectations... We’ll also assess necessary adaptations and the sustainability of the system.

Fieldwork (including participant observation) follows the lines of global approach, including the diverse protagonists involved: farmers, solidarity food outlet staff, recipients as well as financial and political partners, representing institutions involved. The original methodology, combining interdisciplinary perspectives (anthropology, epidemiology and economy), offers finer understanding of what is at stake. The analysis should highlight the favourable conditions for the viability of such a project.

Intergenerational Coresidence, Support Transfers, and Psychological Wellbeing Among Older Persons in Myanmar, Thailand, and Vietnam

We analyze data from 2011-2012 nationally representative aging surveys from Myanmar, Thailand, and Vietnam to examine the associations between coresidence with adult child, intergenerational transfers, and psychological health among older persons in developing and rapidly aging Southeast Asia. Specifically, we ask: 1) How does coresidence with adult child and proximity of children influence the psychological wellbeing of older persons? 2) To what extent are support transfers from children associated with elderly mental health? 3) Do support transfers from children fully account for the relationships between parent-child coresidence and older persons’ psychological health? 4) How do the associations between intergenerational coresidence, support transfers, and elderly mental wellbeing vary across the three societies? The mixture of commonalities and differences in political systems, cultural underpinnings, kinship systems, levels of development and degrees of population aging that characterize Myanmar, Thailand, and Vietnam render the comparative analysis particularly interesting. While the research body of literature suggests that living arrangements of older adults are related to their psychological outcomes, most research focuses on the effect of living alone versus living with others, which may or may not include an adult child. Less is known about the effects of coresidence with an adult child and how other factors such as access to health care contribute to these outcomes. We have not seen any studies that examine the extent to which parent-child coresidence affects older persons’ psychological wellbeing in the developing Southeast Asian contexts.

This paper discusses the relationships between social representations (Moszynski 1961) of fatherhood, social policies and social practices in the period 1989-2013 in Poland. It investigates how shifts and continuities of social policies affect configurations of fatherhood. The analysis considers cultural, institutional (laws, regulations, organizations) and societal dimensions of fatherhood. The main hypothesis states that the institutional order shapes the social representations of fatherhood and simultaneously the cultural images of fatherhood define the patterns of social policy reforms and block radical changes as well as create the realities of fatherhood.

The institutional context of the welfare regime in Poland is often characterized through the strong familiarism and paternalism. The poor access to institutional healthcare utilization, higher spending on care, and higher mortality rates. Basing on evidence from other countries with similar constructions of leave entitlements it can be assumed that in Poland parental leaves will be used almost entirely by women. This assumption is further confirmed by a limited take-up level of 30% of maternity leave. However, the recent reform confirmed a strong link between the cultural images of fatherhood, the political agenda and the results of reforms. The rejection of father’s quota also revealed durability of the regulations that reproduce gender inequalities in care-giving and domestic work. Basing on evidence from other countries with similar constructions of leave entitlements it can be assumed that in Poland parental leaves will be used almost entirely by women. This assumption is further confirmed by a limited take-up level of 2-week parental leave.

When Food Aid Supports Local Farming : Towards a Sustainable Solution ? Case Study in France

In Europe an increasing number of people require the assistance of food aid organization. It is not any longer an aid funding. Access to fresh quality foods gets difficult, impacting people health. This contribution is an original on-going case study assessing the impact of an innovative food aid supplying mode supporting small local farmers. Besides developing links between urban consumers and local producers, it reveals the current conditions shaping the creation of fair and sustainable markets.

This case study is based on the pluridisciplinary intervention research ECOALES in partnership with the ANDES (national association for food aid) which has set up in 2012 an innovative short supply channel for fruit and vegetable for solidarity grocery stores in western regions of France. Objectives are to increase fresh fruit and vegetable consumption among food aid recipients and support local farmers by buying their products at sustainable price via a pre-order system. The intervention also includes cooking workshops and visits to farms. The network of local farmers is organised by a coordinator in charge of deliveries to food aid outlets.

The analysis should highlight the favourable conditions for the viability of such a project.

The Place of Art in Social Theory: A Possible Approach to Max Weber and Michel Foucault

Max Weber dedicates his work to the delimitation of the historical specificity of the West taken in terms of culture. His study on the rational and social foundations of Western music is his only formulation of that cultural specificity within the aesthetic sphere. This unique trial presents a precious articulation between the formal analysis of an aesthetic language and the definition of the specificity of Western culture through a method of historical sociology that settles the singularity of its objects by comparing them with similar expressions located in different historical contexts. In turn, Michel Foucault defines the literature as a specific happening that emerges in the eighteenth century, as a privileged locus for defining the knowledges and practices, double dimension of his conception of experience that takes place outside of a discourse systematically ordered. Therefore, it is up to investigate it in order to define the present as historical unique case. The purpose of this comparison is to examine the possible similarities between methodological arrangements proposed by both authors to undertake the analysis of aesthetic expressions in order to formulate the historical specificity of the modern world.
This study investigates whether faith-based organizations are making an impact in preventing human trafficking for the victims of human trafficking and prostituted women. This study assumes that human trafficking is closely linked with migration which often causes prostituted women to be trapped into sexual slavery. This study critically suspects that because human trafficking is closely linked with organized syndicate and criminal organizations, faith based organizations remain on the sideline of social problems and are driven into the public sphere. This study executed an in-depth interview with particular faith-based organizations working among prostituted women to probe whether these organizations are actively engaged in combating human trafficking in their own respective area of ministry. This study utilizes critical questions to test whether there are indications of participatory engagement of these organizations in partnering with government agencies or the civil society. This study finds out that faith based organizations are driven by their passion to see victims and prostituted women transformed by the power of the gospel.

This observation is based from the following evidences that faith-based organizations, despite the danger and risk involved, are actively engaged in providing various interventions and aftercare services for the victims fueled by their religious convictions and values. It was evident from the study however that migration, whether it is legal or not, is a mechanism of organized syndicates to deceive and betray victims of human trafficking. Also, it resonates to the study that combating human trafficking in local and international level requires corroborative network and engagement of faith-based organizations to non-government organizations and government agencies such as legal and justice experts.

This study suggests a theological framework in which faith-based organizations adopt and suggests ways on how to mobilize Christian churches to combat human trafficking in the local and international context.

Democratic Upset and the 15-M Movement: the Social Basis of the Political Crisis in Spain

Recent years have witnessed a great diversity of mobilizations in authoritarian political regimes (Arab Spring, Colours Revolution) and consolidated democratic societies (Europe, North and South America). Driven by the consequences of the economic crisis, the implementation of liberal economic programs in different social-corporate contexts of significant democratic deficit, mobilizations occurred in several countries with a low level of previous political mobilization occupied the public space to show their discontent. The reasons are complex and, therefore, it is difficult to find a unique explanatory array that can be applied in all cases.

The Spanish case has served as an example to other subsequent mobilizations and although it displays obvious peculiarities, due to the depth of the economic crisis, it also presents similarities with other cases mentioned. The aim of the paper is twofold. Firstly, deepen in the reasons that activists and sympathizers of the movement 15-M consider as mobilization triggers: the immediate consequences of the economic crisis and people responsible for it, the politicians’ behaviour and its role in the crisis, the functioning of democratic institutions, the elements that limit, condition and pollute democracy, and the crisis of the political link between representatives and citizens. Secondly, to analyse the contributions and proposals of 15-M claiming for a more democratic process, as well as the results and impact of the mobilization. The following data will be used: 1) the survey of the CJS (Center for Sociological Research) to the Spanish population on the 15-M movement; 2) eight focus group sessions and ten individual interviews with activists; and 3) the results of a survey carried out by the INJUVE (Spanish Youth Institute) on social and political attitudes on the 15-M based on the answers of 1,100 young people aged between 15 and 29 years old.

Persistent Invisible Inequality in Education: Sociology of Education and Gender Studies in Japan

Japanese sociology of education has a long history. Women and education and gender issues in education have borne some of the main topics in the sociology of education since the 1980s. This presentation traces the transformation of feminist discourses in education in Japan, focusing especially on the hidden curriculum: its internalisation through socially normalized socialization, and gender order penetrated in Japanese society deeply, while following the main issues of sociology of education since the 1980s to the present.

Gender is an important lens through which we can interpret the role of education in society and the ways in which it contributed to social change in late modernity. In this presentation, I will focus on the following three points: first, to understand gendered schooling and education in Japan, empirical data of Japanese education such as gender tracking, faculty components, the ratio of female teachers and principals, and female researchers in academic fields examined from a comparative perspective. Secondly, based on the analysis of the trends of articles related to gender issues in the Journal of JSES, the reality of persistent inequality in education will be discussed. Thirdly, I consider the issues of inequality of gender and other disparities in Japan, knowledge transmission, power relations and reproduction within the era of Neo-liberalism.

European and Latin American Higher Education Between Mirrors

Higher Education systems all over the world have gone through deep transformation and extraordinary expansion. In Europe, major transformations in higher education and the rise of the so-called Bologna process resulted mainly from the implementation of the Bologna process. The main goal was to establish a European Higher Education Area which allowed an increase in international competitiveness, attractiveness and comparability between European higher education systems. Evaluation of results and consequences of the Bologna process has largely depended upon the evaluators’ perspective. At the political level, it is easy to conclude that the Bologna process has been successful since it allowed greater integration and harmonization between the various education systems of the 46 participating countries. However, at the institutional and local level, the response is more cautious due to the great variety of contexts involved.

In Latin America, timing was different since this was the first region where neoliberal policies were put in place, after Pinche’s military coup in 1973. Several authors described the end of the 20th century in LA as the “lost decades”. The beginning of the 21st century brought with it important changes to the scene. The election of progressive governments in some LA countries gave way to policies which favored redistribution of wealth. At the same time, in some countries, with robust indigenous communities, their cultures were granted political and social recognition and intercultural policies were developed. It is not meaningless that it is precisely in LA, where the first neoliberal experiment was carried out, that the search for alternative policies and the construction of other rationalities were undertaken. This paper presents the results of a research project developed by the Network RIAPE, comprehending 31 universities from 21 countries of EU and LA, funded by the ALFA Programme through 2010-2013.

Institutional and Peoples’ Response to cope with Growing Urban Challenges: A Case of Women’s Participation and Leadership in Poverty Alleviation in Chandigarh

Chandigarh has distinctly implemented urban poverty alleviation (UPA) scheme called JNNURM unlike other towns in the region. The women as ‘change agents’ are leading various UPA activities in the city. The self help groups have been formed by the women and for the women who not only catalyse other women members but other women in the poor clusters to join the skill formation training programs for setting up self employment ventures to earn the livelihood and also to strengthen urban community development networks etc. Three major women based activities i.e., ‘Learning on Wheels’, ‘Eco-friendly Handbags manufacturing business’ and women SHGs ‘Change Leadership’ and bringing change in their ‘Community’ have recently won the prestigious ‘HUDCO Best Practice Award to Improve The Living Environment’. The new pattern of community leadership is emerging among the poor women. There is a positive informal response to the UPA activities in the city which seems to empower the poor women. The Municipal Corporation has formed a dedicated Cell with adequate staff to implement JNNURM and other UPA schemes. There seems to be democratic strengthening through enhanced participation and leadership of poor women in local decision making in implementing UPA program. They are able to articulate the voice and choice of disadvantaged women in a better way. The local participatory initiatives have multiplier impact on socio-economic conditions of the poor women. There is negligible poverty and better service provisions. The emerging pattern of women participation and leadership in Chandigarh is a positive step towards UPA, inclusive urban society, women empowerment and also coping with growing urban challenges. There are many success stories of emerging trend of women participation and leadership in UPA in Chandigarh which have been documented by the author for the paper.
as the most important factor of economic success is about 10% more than that in 2002. This difference can be contemplated that economic success for the youth are transformed from the individual matter to the social matter. This may mean the penetration both of the sense of inequality and the awareness that this matter should be treated publicly, not personally. In the presentation, we will discuss the impact of this transformation on the Japanese society and youth.

TERADA, MASAYA* (Tohoku University, teradamasaya@gmail.com)
The Pragmatic Social Theory of Sign in Shunsuke Tsurumi

While most critics may agree in applauding Shunsuke Tsurumi (1922- ) as one of the most influential intellectuals of post-war Japan, no one has recognized him as an eminent sociologist. The aim of this presentation is to show some sociological implications of his thought and methodology. His works should be categorized as sociology of culture and cultural studies. Shunecke Tsurumi's interest is in the life of ordinary people and in "pragmatism in Japan". He focused on a lot of cultural things, especially writing practices of elementary school children (TSUZURIKATA), comics and KARUTA (a Japanese alphabet card game). His notions on the so-called "research of mass" aim not only to find the roots of the resistance to share and acknowledge the methodology and importance of Tsurumi's work.

Research on Environmental risk perception has been accumulated focusing, for example, on "irrationality" or "emotionally" biased perception of lay citizens. These researchers have started to find that the assumptions that environmental and other risks can be calculated by the formula: Risk = Hazard x Probability (or Degree of Exposure).

Recently, however, risks from environmental hormone disruptors, genetically engineered organisms, and radioactive contaminants are those that the formula is not directly applicable to estimate the gravity of impact. The level of hazard or exact probability cannot be decided by the present level of scientific analyses. In addition, we experienced the catastrophic and irreversible impact from the Fukushima nuclear disaster. Thus, the new criteria to evaluate risks, other than risk/cost/benefit analysis, such as environmental justice, risk information disclosure, and participatory decision-making have become more significant.

After the Fukushima disaster, the public have become more skeptical about the scientists/experts-centered risk assessment and more citizens have demanded for "risk democracy" in which wider range of stake holders can participate in environmental decision-making based on the equal "risk literacy".

However, the degree to which respondents claim "risk democracy" or pay the cost for "risk literacy" varies according to their socio-economic status. Those in the upper-middle strata, in general, have more resources to access newer information on risks with scientific uncertainty and risks with catastrophic results such as GMOs and radioactive residues. Those in the lower strata, on the other hand, tend to be concerned about well-known risks such as air pollution and waste incineration. However, they are even more seriously concerned about "environmental justice" issues because they are more vulnerable to disproportionate risk burdens in general.

Thus, the effect of socio-economic variables is ambivalent. However, there is consistent interrelationship among "zero" nuclear option, serious risk perception, environmentalist consciousness, "environmental democracy", participatory and transparent decision-making orientation.

TERRIER, JEAN* (University of Münster, jteer_01@uni-muenster.de)
The Nation As Greek Gift? Marcel Mauss on the Ambiguities of the Nation Form

In 2013, Marcel Fournier and Jean Terrier published posthumously a book by Marcel Mauss, entitled The Nation. An article bearing the same name, collected in Mauss's Œuvres at Éditions de Minuit, had long been known to scholars. That article, in fact, is only the first part of a much longer book covering three topics: 1) a historical sociology of the national phenomenon, 2) a presentation of what a so-called "marginal art", •, is, and 3) an analysis of the relationship between socialism and nationhood. Mauss started working on this book project during the war. To it, he devoted most of his research time in the subsequent years, until approximately 1924. The book was never brought to completion, but its huge manuscript can still be consulted in Mauss's archive.

It is this manuscript that Fournier and Terrier, after many years of archival work, have entirely transcribed and made public. This book sheds a new light on Marcel Mauss. It gives us a much better sense of his political thinking. It provides a new background against which to re-read and re-interpret his celebrated Essay on the TERRIER, JEAN* (University of Münster, jteer_01@uni-muenster.de)
Reactions to the shooting death of unarmed seventeen-year-old Trayvon Martin in February 2012 and the not guilty verdict in the trial of George Zimmerman in July 2013 could be heard throughout the United States and around the world. In Al Jazeera, Susan Abdulhawa, a Palestinian writer, wrote, “The contempt, the disregard, and the disrespect for the black body runs through this whole case. It runs through this country and transforms itself to adapt to the times.”

On August 12, 2013, U.S. Attorney General Eric Holder announced that the Justice Department would work with the Department of Education, “to confront the ‘school-to-prison pipeline’ and those zero-tolerance school discipline policies that do not promote safety,” but instead lead to the criminal justice system. Reactions to the death of Martin and the announcement of a new approach to the disciplining of youth are acknowledgments of the systemic use of violence to control people of color in the United States.

While many accounts of the Martin/Zimmerman case have focused on race as a central theme, some have pointed to race as it intersects with gender and/or class. A narrative that resonates with an audience, thereby providing a kind of truth. Intersectional analysis complicates a narrative, but it also provides a nuanced view of societal violence/power as well as a vantage point from which to exercise agency and bridge the research/practice gap.

Using content analysis of media from around the world, we identify multiple ways in which the Martin/Zimmerman case has been narrated, focusing on intersectionally-framed accounts that along with race point to gender—masculinities deployed—and/or age—youth/adult to make sense of the violence. Statistical data on incarceration in the United States will be used to show the relevance of the narrations to the school-to-prison pipeline.

*Just Like Everyone Else?* South Asians In U.S. Media and Society

In the 21st century, representations of South Asians in U.S. popular media have grown exponentially. This is a particularly interesting phenomenon when considering the status that South Asians occupy in the American racial hierarchy. In my research, I examine audience perceptions of South Asian/Indian characters and actors in American popular media. Using data from 50 in-depth interviews, I argue that South Asian media representations today no longer embody the overt stereotypes associated with this group: savage foreigner, heavily accented new immigrant, and cheap small business owner. Rather, respondents describe and discuss contemporary representations to indicate that they are portrayed as assimilated and even “Americanized.” However, from a critical race perspective, I argue that while media representations of South Asians can be characterized as conforming to mainstream, white, American norms, these characters actually do little to challenge the racial status quo in American society. Additionally, these characterizations through intentional writing and casting decisions present a particular representation of American society in which racial hierarchies are maintained and not challenged.

Intersections of Race and Gender in U.S. STEM Careers

In the United States there are still discrepancies in the number of women and non-whites who achieve top positions in STEM fields. Despite vast infusions of money by the federal government to address this issue, little has changed in the past fifty years. Additionally, while it is assumed that Asians are the one non-white group to dominate these positions, they are in fact still outnumbered by whites in comparison. In this paper, I examine a sample of 22 Asian students who are pursuing careers in STEM to better understand intersections of race and gender for this sample, and larger implications regarding the assumptions around racial and gender “equality” in these fields.

**THAKUR, MANISH** (Indian Institute of Management Calcutta, mt@iimc.ac.in)

The Politics of Indigenous Social Science: A View from Indian Sociology

A deep sense of ambivalence towards the Western social scientific categories has been a characteristic feature of the growth and development of social sciences in post-colonial societies. Indian sociologists, in particular, have frequently turned their critical gaze on the ethnocentrism of the Western social sciences. They have demonstrated as how the conceptual categories used by Indian social scientists are the precipitates of the Western social, intellectual and particularly academic history that Indian cultural realities in Western framework and the attendant imposition of an alien epistemology on Indian reality have at times provoked extreme responses – from the impossibility of an Indian sociology to the call for an Indian ethnosociology. At the core of such responses is the contestation over one’s approach and orientation to Western modernity. Against this backdrop, the present paper seeks to investigate if Radhakamal Mukerjee’s conceptual and theoretical innovations should be treated as rejection of Western modernity lock, stock and barrel or only as refutations of the Western ethnosociology. The paper does not purport to look at Mukerjee’s contributions in their entirety, which, even otherwise, is a daunting task to undertake within the space of a single project. Nor is it intended to assess his role as a ‘pioneer’ in the context of the history of the growth and development of sociology in India. Its aim is to selectively present Mukerjee’s axial concerns and analytical themsatics from his enormous body of writings with a view to examine his critique of western modernity. Of necessity, the proposal intends to appraise Mukerjee’s critique of Western social science approaches to the study of Indian society and culture. It attempts to discern the elements of an alternative indigenous (Indian?) vision through a critical reading of his oeuvre.

Picture That! A Media Social Approach for Communicating Pro-Environmental Behaviour

With a social media- and peer education-approach the European project “useITsmartly” aims at building a community of young people to not only share knowledge about energy saving, but moreover change behaviour and adopt a sustainable lifestyle. For achieving this aim, the transdisciplinary project unites educators, researchers and young people developing together innovative and target group specific communication strategies on pro-environmental behaviour exemplified by green use of ICT.

Facebook and Twitter are social media which can be used classically to enhance a public understanding of science. But besides communicating ideas about energy saving behaviour and promoting a “green lifestyle” the unique possibility of social media is the connection to others. Other projects, initiatives, interest groups can be used as multipliers, like young people, who spread posts and pictures which are relevant to them. These two media channels can use videos and pictures, and have also the possibility of adding text and explain further details or include a link to another source of information.

However, knowledge is not everything. To know what is right, does not mean to act right. That is why beside Facebook and Twitter also an Instagram account has been set up for the project. This is a social media platform, where people only share, like and comment on pictures. With a hashtag (#) system like on Twitter metadata can be created on each and every photo very easily (like key words). By using hashtags the respective photo belongs to a sub-community of pictures from all over the world, which have one thing in common: the same topic (for instance #recycling).

In our presentation we will present findings from our on-going project evaluation, comprising statistics from the social media channels as well discussing possibilities and limits of social media in the scope of a project like useITsmartly.
rupt our humanity and sociality. While, simultaneously, we are being presented with a modality of equipotentiality (Heidegger, 1962; Dreyfus, 1991, 1992; Verbeek, 2005) from within the frenzy of technological activity, which paradoxically inures us in our sociality and sociability. This contention is carried through to its articulation in Castell’s (2000, 2001) theoretical substantiation of the Network Society in the Information and Internet Age with a view to opening up and tracking into specific transformational dynamics of the new modalities of the social, economic, technological and the global. The aim behind which is to consider in which ways the Internet-based transformations offer themselves up as nodal points that gather operationality and sociability in the ‘virtual’ world. And by contrast consider the ways in which the latter dimensions of social being as predicated upon individualism are scattered throughout the labyrinthine ‘cyber world’. Taken together the paper seeks to think through how both moments of gathering and scattering are recast in the new global informational-intellectual division of labour as mirrored in the ‘Digital Divide’. We close this line of thinking by reflecting on South Africa as engaged in this Internet-based New Global Network, with its ambivalences and consider the incorporation of Developing Countries into the new global order as a function of new social inequalities and subject positions that are emergent and made manifest in one of its forms as ‘Scatterings’ of the ‘Digital Divide’.

RC23-419.8

THELEN, LIONEL* (European Research Council, lionel.thelen@ec.europa.eu)

The European Research Council... An Open Door For The Sociology Of 21st Century?

The European Research Council is the most recent and most successful Funding Body created by the European Union. Why successful? Because it allows the funding of single research teams in all fields of Science (up to 2.5 million EUR for a 5 years project) and it is the sole EU funding body directed by a Council of top-notch Scientists.

The author is for now more than 5 years the Scientific Coordinator of the so-called SH2 Panel, bringing together 15 panelists – from Sociology but also from Anthropology, STS, Political Science, Religious Studies, Law and Communication Studies – in charge of evaluating between 120 to 200 proposals.

The way the ERC assesses proposals - singularly in Sociology – is quite peculiar and tends to blur boundaries between disciplines.

The evaluation procedure is done in 2 steps and, at step 1, each proposal is given to 4 reviewers. The latter are, frequently, not specialists from the main proposal's discipline. It follows, that from, debates among them not only about the excellence of the proposal but also about its relevance in confront with its subject, hypotheses or methods.

This fruitful interdisciplinary debate 1) helps panelists understanding each other point of view while bringing them, in most cases, to a consensual decision about any given proposal; 2) gives interesting hints about the various paradigms in use in disciplines apparently close from each other; 3) raises a lot of questions about the fact that some disciplines seem more “successful” than others and 4) allows to grasp at best that having reviewers from different disciplines can have paradoxical effects for interdisciplinary proposals.

Such a debate is undoubtedly helping outlining the main features of Sociology as a discipline increasingly aware of the need of rethinking ‘its’ own boundaries and, by extension, of the other social sciences’ ones.

THEOBALD, HILDEGARD* (University of Vechta, hildegard.theobald@uni-vechta.de)

Marketization in Long-Term Care and Growing Inequality within Care Workforce: A Comparison of Sweden and Germany

Since the 1990s, two distinct processes of marketization in long-term care provision can be found in Sweden and Germany. First, professional long-term care services were restructured inspired by ideas oriented towards New Public Management. Second, tax deduction policies were established to create a new mix of (ir)regular domestic and professional care services. Despite the international character of the development, the existing structure of professional and (ir)regular domestic services at the beginning and the approaches selected, their effects on the infrastructure and on the situation of care (and domestic) workers differ significantly from urban to rural areas. In both countries, research findings indicate – however country-specific – patterns of a worsening of working- and employment conditions of care workers embedded in distinct processes of hierarchisation among care workers. The paper aims to compare pre-existing service structures, policy approaches, their effects on service restructurings and the situation of care workers. As a consequence, it will reveal and explain the effects of country-specific policies and restructurings on processes of hierarchisation among care workers.

Conceptually, the paper combines international comparative research on care policies and marketization and intersectional approaches developed within sociology to relate the effects of marketization to the emerging patterns of inequalities within the care work force based on gender, social class (training levels and positions) and ethnicity. Empirically, it will include documents and laws, literature review and representative statistics to analyze policy changes and existing- and changing infrastructure. Findings of a German-Swedish research project on the situation of professional carers with approx. 600 care workers in each country, will be used to reveal the country-specific restructurings and processes of hierarchisation within formal care provision, which is complemented by research on the developments within domestic service provision.

AUTH-981.1

THERBORN, GÖRAN* (University of Cambridge, gt274@cam.ac.uk)

Göran Therborn: The Killing Fields of Inequality

This is a theoretical as well as an empirical book. Theoretically, it sorts out the differences between difference and inequality, it sets out a moral argumentation for why inequality matters, it presents a multidimensional analysis of inequality, and it lays bare the mechanisms of equalization as well as of inequalization. Empirically, the book is global in scope, historical in depth and multidimensional in range, analyzing life expectancy, health and body measures, and existential recognition, rights, and respect, as well as income.

It also tries to answer three puzzles: Why have the Northern welfare states failed on vital inequality? Why has existential egalitarianism been so (relatively) successful in the past fifty years? What is the connection between the concurrent inter-national convergence of income and rising intra-national inequality?

The paper ends with a discussion of the world politics of (inequality and the possibilities reducing inequalities.

Stunting and Deadly – Effects of Inequality

Inequality has to be understood and analyzed as a multidimensional phenomenon, and so have its effects. Drawing upon my new book The Killing Fields of Inequality this presentation will focus on the stunting effects on human bodies and personalities, and on consequences of early and premature death, set in a global perspective of class, gender, and territory.

THEVIOT, ANAÏS* (Université de Bordeaux, p.theviot@gmail.com)

Helen Margetts parle de « cyber parti », au sens où un parti tendrait à se détacher des structures traditionnelles et des modes de communication en face à face et privilégierait la machine sans intermédiaire humain (Margetts, 2006). Le PS serait-il en train de se transformer en « cyber parti » ; tance déjà amorcée en septembre 1998 avec la création d’une section virtuelle, Temps réel ? Ou reste-t-il fortement ancré dans des modes d’organisation traditionnels, réduisant les pratiques numériques à des effets d’affichage ?

Notre analyse se base sur un questionnaire diffusé auprès des militants PS (n=504) afin de dégager le profil sociodémographique du « cyber-militant » et du « militant-résistant » ; ainsi que sur 45 entretiens, réalisés auprès des militants PS au sein des Fédérations de Paris, de Gironde et des Alpes-Matinimes.

Nous verrons qu’au-delà de personnes âgées ou incompétentes sur la Toile, il existe de jeunes militants revendiquant les vertus de la militance sans l’intermédiaire d’un parti. Nous remarquons que le cybermilitant s’identifie davantage à un sujet politique que de manière plus formelle, se refusant à utiliser certains types d’outils numériques.

**The Potlatch of the Young: the Paradox of Excessive Intergenerational Solidarity in Aging Welfare States**

In this paper a new theoretical model is applied to a research field that is somewhat fragmented, namely that of intergenerational solidarity in aging societies. Inspired by utilitarian considerations many scholars tend to problematize the lack of commonality and reciprocity characterizing intergenerational exchanges. As some generations are longer old and more numerous they may receive excessive support of the younger generations, especially in a democratic setting. However, in reality there is limited empirical evidence of intergenerational conflict and theoretical explanations of this paradox are dim. An integrated and dynamic approach that incorporates Durkheim's solidarity theory, Honneth's intersubjective recognition and the current work on reciprocal exchange is necessary in order to understand the survival of intergenerational solidarity in aging welfare states. Our integrated approach is inspired by a cyclical model of solidarity (Thijsse & Thierbach, 2013). According to this integrated model in a prefigurative culture where the status of the young has risen dramatically, the empathic emotional exchanges is the driving force of intergenerational solidarity. Hence, we come to the paradoxical conclusion that attempts to preserve intergenerational solidarity by denouncing excessive transfers may be counterproductive because they may erode the empathic underpinnings.

**Understanding The UK Graduate Labour Market: An Occupational Approach**

The UK graduate labour market has in recent times received a lot of interest within policy, media and academic circles. With relative high levels of under- and unemployment and growing differences in labour market outcomes for graduates, there seem to be a changing relationship between degrees, skills, jobs, careers and rewards.

Our current understanding of the graduate labour market is currently lacking. We need to understand the graduate labour market in a wider framework rather than solely as supply and demand forces. There is a need to investigate as well as integrate how and where skills possessed by graduates are formed, what skills graduates offer employers, what skills employers want from graduates, how graduate skills are used and what impact graduates have on the workplace. Also, the majority of existing studies on the graduate labour market link labour market outcomes with aggregate educational categories and do not explore the role of skills and credentials within occupations or professions.

This paper explores the meaning of graduate skills within three graduate occupations and draws on qualitative in-depth case studies with software engineers, financial analysts and laboratory scientist in biotechnology and pharmaceutical companies. For each occupation it will show how and where graduates obtain their skills; how the competition to enter the occupation is organised; What the role is of degrees and other credentials within the competition; the employability strategies of those who enter the occupation; the skills demanded by employers; access to the occupation and abilities required by the work process; and how careers are developed and maintained within the occupation.

By focusing on the variation in development, demand, supply and deployment of skills the paper will highlight the heterogeneous nature of the modern graduate labour market as well as outline a renewed sociological understanding of graduate labour.

**Expectant Parents, Expecting Perfection: Constructing Down's Syndrome in UK Antenatal Care**

In the UK, expectant parents are offered screening for Down's syndrome, an incurable chromosomal condition, as part of routine antenatal care. Drawing on an ethnography of two antenatal clinics, I explore how the prospect of Down's syndrome is interpreted and negotiated by healthcare professionals and expectant parents during screening consultations. The potential diagnosis of Down's syndrome, despite the condition being recognised by professionals as "compatible with life", is confined within universalising discourses such as "risk", "problem", or "abnormality" which not only construct Down's syndrome as a detriment to the biological and social well-being of the foetus, it also imposes a collective category which masks the considerable variation of the condition. By drawing attention to the mundane interactions and materiality (e.g. booklets, posters, architecture) of the clinic and by considering diagnosis as both a category and process, I capture how Down's syndrome is interpreted and negotiated by healthcare professionals and expectant parents during screening consultations, and is further embroiled in, and reinforced by, cultural ideologies around perfection/impairment and normality/abnormality. This creates a range of affects including producing self-blame among expectant parents, particularly expectant mothers, who are enacted - within a neoliberal era of constant change and performance - as "good mothers" who are always striving to be better, to be perfect, to be "normal".

**Intra-EU Mobility: Posting As Permanent Organization Of Poor Labour**

An employee is legally considered as "posted" when working temporarily in a member state of the European Union other than its usual workplace. However, the temporary, neutral and legal status of posting tends to conceal the very nature of the process: organizing permanent mobility from south and east-European countries to the richer states, exerting of pressure on local bargaining standards (social dumping), giving legal appearances to illegal practices, understimating the massive character of the phenomena. These are at least the first results of a transnational French-Portuguese research programme in the construction sector. Further, sociological perspective raise more questions about how the legal rule of "posting is challenged. We distinguish here three different ways.

1) The first challenge is the existence of differences between legal and social rules. In fact the legal component is not opposed to the social component of the rule. It would rather be two sides of the same rule. There is not a peaceful legal side of posting and another conflicting social side.

2) The second extension of the legal rule we want to deploy in our research concerns the social regulations of conflict, agreement and collective action. They combine legal initiative, jurisprudence, the actions of the Labour inspectorate, the tribunal but also the initiatives of the workers themselves, the unions and employer organizations.

3) The third shifting from the legal rule is related to networks. The first element concerns the Portuguese community in France. Posting that is based in large part on channels mounted on the initiative or with the help of employers who are former Portuguese employees. The second element of networks relate here to interpersonal relationships. Indeed, recruitment in Portugal is often effective because a friend or a colleague did already work for the same company.
el turismo como un puente de intercambio material, cultural y simbólico entre los seres humanos; revaluar los recursos locales como herramientas para el disfrute de un tiempo libre de calidad; reestructurar la actividad turística a partir de una nueva escala de valores basada en la equidad, la ecoheliciencia y la simplicidad; relocular la actividad turística abriendo la posibilidad de redescubrir los espacios de proximidad y así ayudar a una redistribución de los recursos mediante una actitud de cooperación; reducir los impactos negativos a través de la conciencia de la relación entre sociedad, tiempo libre y naturaleza. Este trabajo explora las coordinadas para pensar un modelo de turismo rural basado en los intercambios sociales como vía para vincular recursos, territorios y personas, que se beneficien inmutuos sin incentivar el crecimiento y la acumulación.

THOMAS, TANJA* (University of Bremen, thomas@uni-bremen.de)
On Cosmopolitan Solidarity for Women’s Rights

1,127 is the number of dead people mentioned in the last reports on the disas-ter in the garment factory in Sabah, Bangladesh, 2013. The mostly female work-ers, who sew clothes for Western consumers were among the lowest paid in the industry worldwide. They died as a result of an accident that, according to critical voices, could have been avoided. Our research about ‘Western’ media coverage of this catastrophe is based on a concept of critical cosmopolitanism that strongly reflects the idea of recognition and solidarity. This means that on the one hand, we will discuss the media coverage of this disaster and how the portrayal of the victims as vulnerable could have evoked empathy. On the other hand, we will discuss different ways of making use of media to emphasize interdependencies among included populations and to demand social justice. This way we want to contribute to a renewal of cosmopolitanism as a concept of competence and practice and that may help us to elaborate the media’s potentials to promote solidarity.

Laboratorios Sociales De Turismo Experienzial. Exploración Colectiva De Un Paradigma Decrecentista Para El Turismo En áreas Rurales

La presente ponencia estudia el caso de los laboratorios sociales de turismo experiencial, un espacio de exploración colectiva para el desarrollo de un par-adigma de turismo decrecentista en la comunidad indígena mazatitana de San Francisco Oxtotitlan, en el Estado de México. Esta propuesta vincula a las comu-nidades, la academia y la sociedad civil a través de una experiencia de viaje, orien-tada por los principios de respeto a la naturaleza, la dignidad humana, los valores locales, la cooperación social y la simplicidad voluntaria. En este sentido, cobra un especial valor el aprendizaje colectivo en el que los anfitriones descubren oportunidades alternativas para complementar sus necesidades materiales; y los turistas construyen una experiencia de viaje creativa, auténtica y enriquecedora. Estos laboratorios funcionan desde la articulación que la academia realiza entre las comunidades y los viajantes, y orienta sus acciones desde la búsqueda de alternativas para incrementar la calidad de vida y el derecho a disfrutar el tiempo libre. En estos términos tiene un especial interés la capacidad de reconstructualizar

THOMPSON, MICHAEL J.*, (William Paterson University, thompsonmi@wpunj.edu)
Reification: Reconstruction and Extension Of A Concept

This paper will seek to reconstruct the concept of reification and extend it along three different social-theoretic lines. I argue that reification needs to be seen not simply as a reduction of human relations to relations between things, but that it also constitutes a deep pathology in the capacity of individuals to conceive of the pathological nature of the social relations themselves. Reification consti-tutes, on my reading, a cognitive defect within the thinking subject and therefore as a pathology of epistemic, cognitive, and evaluative capacities of subjects. This renders them unable to perceive and understand the true nature of their social being and, as a result, they come to distort the social and material world of na-ture around them. The depth of reification therefore leads us to an expla-natory model of why individuals are susceptible to accepting forms of social power and domination that do not serve common public ends. There is, I suggest, a social on-toalogy that is barred from their world-view due to the defective nature of reified thought. I take this theory to move against contemporary forms of Critical Theory such as Habermas and Honneth to bring us back to the more radical impulse of the Critical Theory tradition through a reworking of reification.

THORPE, RACHEL* (La Trobe University, r.thorpe@latrobe.edu.au)
Women and Aging: Appearance and Age Appropriateness

Evidence suggests that Baby Boomer women may ‘do’ ageing differently to previous generations (Calasanti and Slevin, 2001). To date, there has been only minimal research considering Australian Baby Boomer women’s embodied expe-riences of ageing. Drawing on data from semi-structured interviews and personal journals from 28 Australian women aged between 55 and 81, this paper explores the ways in which women’s presentation of self was strongly informed by no-tions of appropriate dress, grooming and even behaviour for older women. Often these ‘rules’ were taken for granted, and connected to broader ideas of ‘doing’ normative femininity and presentation of self.

This paper will consider the women’s motivations for doing this ‘appearance work’, and the impacts this had on their sense of self. While their endeavours were largely informed by established norms of female beauty and ‘appropriate’ clothing, there was also considerable resistance to these norms and acceptance of the ageing process. Competing discourses, such as ‘resisting age’ and ‘being yourself’, were also apparent, and these processes of contesting and disrupting appearance norms will also be considered.

THORSNEN, LINE MARIE* (University of Copenhagen, lm.thorsen@gmail.com)
Art As Acute Action: Art and Articulations of Public Concerns in the Wake of 3.11

In the wake of the immense earthquake disaster that struck Japan on the 11th of March 2011, a myriad of art-based projects were conceived and shaped instantly as a response to the issues and concerns faced by people in the affected areas. Responding to the acuteness of the situation, artists and art professionals alongside various other social actors – turned their practices towards aiding the disaster-zones. In doing so, artists started shaping their artistic practices accord-ing to the realities faced by North-Eastern Japan, in close cooperation with those affected and other actors involved in disaster support. I suggest that such disas-ter-driven art projects can be fruitfully viewed through Bruno Latour’s concept of matters of concern, and the wider theoretical context of Actor-Network Theory (ANT). With the notion of matters of concern, Latour allows for the analysis of new hybrid formations, prompted by public concerns and criss-crossing the spheres of art, activism and disaster relief. Analyzing specific artistic projects, I argue that this approach enables one to follow the practices and movements at stake as hybrid undertakings, which serve to publicly articulate, and thus give cultural shape to, the multiple concerns triggered by the disaster.
Figurative Methods: Towards ‘Brooding the Gap’ Between ‘Transition’ and ‘Cultures’ Research

The study of ‘youth transitions’ has consistently highlighted the persistence of class influence on life chances and opportunity. The study of youth cultures’ has had a more troublesome and fluctuating relationship with class. The foundational subcultural studies and more recent work continuing that tradition has been criti- cized for (among other things) over-romanticising working class practice; finding ‘resistance’ everywhere; and having an unhealthy focus on the ‘spectacular’ while disregarding ‘power’. Work done under the loose banner of ‘post-sub-cultural’ studies (including ‘scenes’ and ‘neo-tribes’) has been critiqued for giving too much heed to fluid notions of identity; ignoring structural constraints; and over-romanticising ‘choice’ in consumer culture. In general, youth researchers have tended to focus on ‘people like us’ or young people for whom we have em- pathy. There has not been a lot of work on what I would call the more ‘mundane’ end of youth cultural practice. By utilising Tyler’s ‘figurative method’, this paper proposes that tracing the use of terms such as ‘bogan’ or ‘hipster’ can en- able an understanding of the ways symbolic violence is disseminated at the same time ‘classes’ equate with middle class expectations and ‘haves’ and at least see class as something that is static and to be measured, a figurative method can shed light on the ways classes are relational categories produced through constant sym- bolic and moral struggles. This can help bridge the gap between ‘transitions’ and ‘cultures’ research and work towards ensuring that youth researchers do not un- knowingly produce ‘powerful stereotypes’. Further, figurative methods can en- hance knowledge of the ways young people are represented and the impact this has on their experiences of social (in)justice, symbolic and material inequalities and moral economies.

Global Reflexive Hipsters Vs. Local Abject Bogans: Towards Understanding Affective Inequalities in Youth Cultures

This paper looks at terms like ‘hipster’ and ‘bogan’. Using ‘figurative methods’, analysing the ways these terms are operationalised towards understanding the interplay between dia and popular culture can enliven global comparative youth sociology. These floating signifiers enable distinction to be performed while eschewing the very notion of class. Both terms are mostly used as a pejorative towards various youth taste cultures. The hipster is a global figure used in many English speaking coun- tries. It tends to equate with middle class culture and leisure practice. On the other hand, the bogan is a specifically Australian term but has relations in other countries that denote a similar class position such as ‘chav’, ‘white trash’, ‘red neck’ etc. Through processes of symbolic violence, the ‘bogan’ has rapidly become a prominent cul- tural folk figure from public discourse. For Skeggs, ‘Some people use the classifications and characteristics of race, class or femininity as a resource [hipsters] whilst oth- ers cannot because they are positioned as them [bogans]’ (my additions). These figures are indicative of the ways class is made and of the ways the boundar- ies between them, both local and global, are fuzzy sites of cultural conflict. As precariousness becomes normalised for even the well-educated middle classes, these figures also serve to highlight processes of global social change as they illustrate new forms of class based anxieties. The ‘bogan’ and terms like it tap into middle class insecurities producing forms of ‘downward envy’ (Everingham and ‘disgusted subject’ (Lawler). The ‘hipster’ plays a dual role: it represents a kind of clown that allows the middle class to both ‘reflexively laugh at itself alongside an ‘ambivalent’ and somewhat sheepish recognition of the ‘crue optimism’ (Berlant) of consumer culture.

Segmented Social Capital and Ethnic Diversity in the Work Place

Work places employing many highly skilled and low skilled migrant workers and members of ethnic minorities are interesting focal points for investigations of the potential build-up of social capital along and across ethnic and national lines. Factories, retailer shops, offices etc. represent social spaces with varying degrees of social closure, interaction and formation of social relations between different employees depending on the composition of the work force, the work tasks, working conditions etc. Therefore these social spaces represent sites in which workers may build up social capital encompassing members of other social and ethnic groups in their networks. However, so far research has paid insufficient attention to the way in which social capital formation among immigrants, ethnic minorities and locals in the work place is influenced by issues such as race and class. Nevertheless, we may expect differences in relation to social capital forma- tion depending on the composition of the work force (highly skilled vs. low skilled workers), working conditions (permanent vs. temporary jobs), ethnic origin (west- ern vs. non-western background) etc. This paper addresses research questions such as: Which is the impact of increasing ethnic diversity among the employees on social capital in the work space? In which ways does social capital formation differ depending on whether the employees at the work place are highly skilled or low skilled as well as on racial and ethnic origin? The analysis will be based on interviews with 49 employees from three highly ethically and nationally diverse Danish work places. One of these sites employees many highly skilled migrant workers while the two others primarily employees low skilled workers, including low skilled immigrants and ethnic minorities.
What is the recent development of environmental movements (EM) in the North in response to the institutionalization and globalization of environmental issues and the speeding up of climate change? How and to what extent do activists link EM issues with those of global social justice? This article will present preliminary results from a four-year research project titled Environmental movements in a globalizing world: transformation and institutionalization? In a pioneering study of the EM in Sweden, Denmark and the Netherlands from 1990, Jamison et. al. showed how the development of the EM linked to national political traditions and to different strategies adopted by each state in dealing with social movements. 20 years later, we analyse and compare the current development of the EM in Sweden, Denmark and Japan. In all three countries, the EM face the challenge of global politics as parts of relatively strong national political consensus cultures. In Scandinavia, the EM is increasing focusing on climate change, while parts of the traditional movement seem to be in decline. Local mobilization has given way to intensive networking and interaction on the global level via internet forums, websites and social media, a development that actualizes and articulates the idea of climate justice. The Japanese EM is comparatively weaker, but since Fukushima, the issue of nuclear power is giving rise to new movements and to heated debates regarding its pros and cons in fighting climate change. While the nuclear accident has pushed the climate issue to the background, it has also stimulated interest in energy and public debate regarding democracy and the fair distribution of risks in relation to energy.

Changes in Social Interactions in Reform-Era Urban China

The pattern of social interactions represents social divides and inequality. The homophily principle suggests that people are likely to interact with others of the similar social demographic, behavioral and intrapersonal characteristics (McPherson, Smith-Lovin and Cook 2001). As resources are differentially embedded within networks, social interactions represent the hierarchical structures of the society (Lin 2001).

Tonnies (1887) argues that the industrialization changes the pattern of social interaction from Gemeinschaft (community), interactions based on kinships, to Gesellschaft (society), interactions based on education and work. It was confirmed by much empirical work documenting a decline of intergenerational interactions (Cherlin 2012) and an increase of marriage patterns based on education and work (Kalmijn 1998).

We examine the changes in the general pattern of social interactions in the reform-era urban China – a nation with strong cultural traditions regarding kinship ties and one that has experienced rapid economic and industrial development over the past several decades. Using the position generator from two social networks surveys collected in 1998 and 2005, we aim to answer two questions: First, is economic reform associated with interactions less based on kinships and more on occupations? Second, does the pattern differ by gender?

TIAN, FELICIA FENG* (Fudan University, felicia.tian@outlook.com)
Changing Pathways To Adulthood In China: Urban-Rural Divides, 1982-2005

Pathways to adulthood have been increasingly diversified in the United States and Western Europe in the economic globalization (Buchmann and Kriesi 2011; Shengnan 2000). The standard, tight, sequential pathway to adulthood (Sewell 1990) has been challenged or abandoned (Buckner and Mayer 2003). These patterns are divided across the socioeconomic line: while most middle-class youths postpone the transitions, an increasingly proportion of working-class youths no longer follow the sequence of education, full-time employment, marriage and parenthood (Kalmijn 2010).

Little is known, however, about how economic change affects the life experiences of the youths in the developing world. This analysis aims to fill the gap, using reform-era China as a case study to examine how the pathways to adulthood have changed from 1982 to 2005.

It will focus on urban-rural difference. In these twenty-three years, China has experienced a noticeable increase in the urban-rural income gap (Sicular et al. 2007). The urban-rural divide arguably contributes substantially to the increasing income inequality in China (Zie and Zhou 2013). Therefore, it is both theoretical and substantially interesting to compare the pathways to adulthood between urban and rural youths, and explore the relative contributions of each institution (i.e., school, labor market, and family) to the difference.

To answer these questions, this analysis uses three censuses (1982, 1990 and 2000) and 2005 inter-censal survey. Instead of examining one transition at a time (Gugum and Sevasti 2001), this analysis incorporates education, work and family transitions simultaneously. Methodologically, it will treat each census as a synthetic cohort, and will use the entropy index to measure the level of heterogeneity in these pathways (Russell 2005) and the bootstrap to test the statistical significance. It will also use de-composition method to examine the institutional contribution to these changes. (References available upon request).

The Power of Media Communication: How Propaganda Techniques Used in Advertising Influence Japanese Women

Media, as a communication tool, has a great impact on society. From the traditional simplex communication tools such as T.V., radio, newspapers, and magazines, to the most current bidirectional communication tool, the internet, media has a great amount of influence on society. Media is a powerful tool that can influence a country's policies, shape public opinion, and even set the standard for societal norms. Consequently, research has shown that media outlets use propaganda within advertising. Advertising agencies skillfully manipulate female emotions, in order to create and bolster a perpetual culture of consumption. As a result, this directly contributes to gender inequality.

The primary purpose of this paper is to analyze how media propaganda influences females in Japanese society and the impact it has on their lives. Additionally, this paper will detail how media outlets use propaganda techniques, which have profound implications to female identity. This greatly affects how females view themselves and their roles within society.

Social problems including, excessive consumption, identity, and gender inequality, are viewed as generalized social problems. These social problems are often ignored or downplayed by the mainstream media. This paper will engage in a historical analysis, to include the studies that have been conducted, concerning media propaganda on women in Japan.

Although, the news media is supposed to report objectively, studies have shown that notion to be false. The news is often skewed to serve the interest of the power elite. As a result, the news media often reinforces the dominant social ideology. In Japan, the dominant ideology is largely male-oriented. Similarly, this paper argues that the propaganda techniques used by advertising agencies, even as a byproduct, serve that same purpose: to maintain a male-dominated power structure in society.

Gender Segregation in the German Vocational Training System

Transitions from education to work are known to be particularly smooth in Germany. This is mostly attributed to the “dual system”, which combines firm-based training and vocational schooling (Müller/Gangl, 2003). In the dual system trainees spend 2-3 years in a company as apprentices and acquire firm specific skills. Both firm and apprentice thus invest in the training which leads to a mutual commitment and a high probability that the apprentice is taken over by the company after training.

However, the German vocational training system does not only consist of the dual system but also of school-based vocational training. In these schools, the contact to potential employers is limited and the curriculum is not firm-specific. We therefore expect that the transition from education to work is less smooth for trainees from school-based vocational training. They should face a longer transition period and/or more job mobility.

As gender specific occupations coincide with the type of vocational training, training types are highly gendered in Germany. Women are more likely to enter school based vocational training. We therefore expect that their pathways into employment are less straightforward. The lower firm-specificity of their skills and the lower commitment of employer and employee also should lead to higher job mobility.

We use the German National Educational Panel Study (NEPS). This dataset consists of detailed retrospective lifestyle information about educational and occupational biographies of approximately 11,000 individuals. We examine transition patterns of German women and men after completion of their vocational training and assess how much of the gender differences in the duration of the job placement process and early career mobility can be attributed to the type of training.

Political Participation and Procedural Utility from a Gender Perspective: Activities in Neighborhood Associations in Japan

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
Political participation and participation in the community is often associated with higher levels of reported subjective happiness, but in the case of Japan a negative correlation between activities in neighborhood associations among female members was found by Tiefenbach and Kohlbacher (2013). The current study uses data gained from an online monitor survey (n=1600) conducted in September 2013 in Japan to get a better understanding of the relationship between happiness and participation in the community. A special emphasis is put on the sources of procedural utility (competence, autonomy and relatedness) as well as on voluntariness and loneliness as moderators and mediators of the effects of participation on happiness. Preliminary results suggest that participation in the community leads to higher or lower levels of happiness depending whether it is conducted voluntarily or not. In either case, participation leads to lower levels of loneliness, which in return has a positive effect on happiness. Finally, the sources of procedural utility can be linked to higher levels of happiness, but significant gender differences can be observed.

Historic Preservation of Significant Cultural Sites in Taipei-Comparing 2 Case Studies in the Aspect of Cultural Heritage Management

Cultural heritage management has traditionally been concerned with the identification, interpretation, maintenance, and preservation of significant cultural sites. The public face of CHM, and a significant source of income to support continued management of heritage, is the interpretation and presentation to the public, particularly in the aspect of communicating with government and the public is therefore a key competence.

The thesis focuses on 2 sites in the city of Taipei, Taiwan. Both targeted case studies are defined as art spaces of cultural property organized by Taipei City Government. Spot-Taipei Film House, built in 1926 with a southern colonial architectural style of the colonial period, was originally the residency of the U.S. Ambassador. Once closed due to Pacific war and reopened for the residency of the U.S. Ambassador under the rule of Republic of China. It had faced another closed due to U.S. changed its diplomatic recognition to PRC. Tsai Jui-Yueh Dance Research Institute, built in 1920, was a Japanese style house for the residency of the Japanese Governor. The later owner, Ms. Tsai Jui-Yueh, a dancer who was educated in Japan during the Japanese colonial period, had settled her dance studio in the dwelling, held a 24-hour-long creative activist to save it from demolition by the later ruling government of KMT. This paper will look at Taipei city government’s action toward the two historical buildings. How did the two dwellings process their way to become cultural heritage? The difference movements represent the interpretation and preservation of the space. Additionally, the thesis will review how the two culture heritages present themselves to the public as well as the spatial reinterpretation of Taipei citizen.

‘standpoints’: Attitudes to Global Justice Among Young People and Youth Workers in Ireland

This paper draws on an empirical study of attitudes among young people and youth workers in Ireland towards development and global justice issues, and of initiatives taken in youth work contexts to raise awareness and promote action in relation to such issues.

Young people’s views ranged from the very knowledgeable, critically aware and insightful to the uninformed and apathetic, with the majority in between these two positions, showing some limited knowledge of global issues or relationships but an appreciation of their relevance and a willingness to explore them further.

Youth workers (particularly but not only those with direct development experience) for the most part showed a high level of knowledge and awareness of global issues and relationships, and of the links between the global and the local. There were however considerable divergences of opinion among them as to the interpretation of certain key concepts, including ‘global justice’ itself.

Some young people gave examples of actions they had taken themselves in response to global issues and concerns (for example decisions about where or what to buy), but respondents on balance felt relatively ineffectual with regard to global issues and relationships, and of the links between the global and the local. There were however considerable divergences of opinion among them as to the interpretation of certain key concepts, including ‘global justice’ itself.

When the Political Participation and Participation in the Community is often associated with higher levels of reported subjective happiness, but in the case of Japan a negative correlation between activities in neighborhood associations among female members was found by Tiefenbach and Kohlbacher (2013). The current study uses data gained from an online monitor survey (n=1600) conducted in September 2013 in Japan to get a better understanding of the relationship between happiness and participation in the community. A special emphasis is put on the sources of procedural utility (competence, autonomy and relatedness) as well as on voluntariness and loneliness as moderators and mediators of the effects of participation on happiness. Preliminary results suggest that participation in the community leads to higher or lower levels of happiness depending whether it is conducted voluntarily or not. In either case, participation leads to lower levels of loneliness, which in return has a positive effect on happiness. Finally, the sources of procedural utility can be linked to higher levels of happiness, but significant gender differences can be observed.

Historic Preservation of Significant Cultural Sites in Taipei-Comparing 2 Case Studies in the Aspect of Cultural Heritage Management

Cultural heritage management has traditionally been concerned with the identification, interpretation, maintenance, and preservation of significant cultural sites. The public face of CHM, and a significant source of income to support continued management of heritage, is the interpretation and presentation to the public, particularly in the aspect of communicating with government and the public is therefore a key competence.

The thesis focuses on 2 sites in the city of Taipei, Taiwan. Both targeted case studies are defined as art spaces of cultural property organized by Taipei City Government. Spot-Taipei Film House, built in 1926 with a southern colonial architectural style of the colonial period, was originally the residency of the U.S. Ambassador. Once closed due to Pacific war and reopened for the residency of the U.S. Ambassador under the rule of Republic of China. It had faced another closed due to U.S. changed its diplomatic recognition to PRC. Tsai Jui-Yueh Dance Research Institute, built in 1920, was a Japanese style house for the residency of the Japanese Governor. The later owner, Ms. Tsai Jui-Yueh, a dancer who was educated in Japan during the Japanese colonial period, had settled her dance studio in the dwelling, held a 24-hour-long creative activist to save it from demolition by the later ruling government of KMT. This paper will look at Taipei city government’s action toward the two historical buildings. How did the two dwellings process their way to become cultural heritage? The difference movements represent the interpretation and preservation of the space. Additionally, the thesis will review how the two culture heritages present themselves to the public as well as the spatial reinterpretation of Taipei citizen.

‘standpoints’: Attitudes to Global Justice Among Young People and Youth Workers in Ireland

This paper draws on an empirical study of attitudes among young people and youth workers in Ireland towards development and global justice issues, and of initiatives taken in youth work contexts to raise awareness and promote action in relation to such issues.

Young people’s views ranged from the very knowledgeable, critically aware and insightful to the uninformed and apathetic, with the majority in between these two positions, showing some limited knowledge of global issues or relationships but an appreciation of their relevance and a willingness to explore them further.

Youth workers (particularly but not only those with direct development experience) for the most part showed a high level of knowledge and awareness of global issues and relationships, and of the links between the global and the local. There were however considerable divergences of opinion among them as to the interpretation of certain key concepts, including ‘global justice’ itself.

Some young people gave examples of actions they had taken themselves in response to global issues and concerns (for example decisions about where or what to buy), but respondents on balance felt relatively ineffectual with regard to global issues and relationships, and of the links between the global and the local. There were however considerable divergences of opinion among them as to the interpretation of certain key concepts, including ‘global justice’ itself.

When the Political Participation and Participation in the Community is often associated with higher levels of reported subjective happiness, but in the case of Japan a negative correlation between activities in neighborhood associations among female members was found by Tiefenbach and Kohlbacher (2013). The current study uses data gained from an online monitor survey (n=1600) conducted in September 2013 in Japan to get a better understanding of the relationship between happiness and participation in the community. A special emphasis is put on the sources of procedural utility (competence, autonomy and relatedness) as well as on voluntariness and loneliness as moderators and mediators of the effects of participation on happiness. Preliminary results suggest that participation in the community leads to higher or lower levels of happiness depending whether it is conducted voluntarily or not. In either case, participation leads to lower levels of loneliness, which in return has a positive effect on happiness. Finally, the sources of procedural utility can be linked to higher levels of happiness, but significant gender differences can be observed.

‘standpoints’: Attitudes to Global Justice Among Young People and Youth Workers in Ireland

This paper draws on an empirical study of attitudes among young people and youth workers in Ireland towards development and global justice issues, and of initiatives taken in youth work contexts to raise awareness and promote action in relation to such issues.

Young people’s views ranged from the very knowledgeable, critically aware and insightful to the uninformed and apathetic, with the majority in between these two positions, showing some limited knowledge of global issues or relationships but an appreciation of their relevance and a willingness to explore them further.

Youth workers (particularly but not only those with direct development experience) for the most part showed a high level of knowledge and awareness of global issues and relationships, and of the links between the global and the local. There were however considerable divergences of opinion among them as to the interpretation of certain key concepts, including ‘global justice’ itself.

Some young people gave examples of actions they had taken themselves in response to global issues and concerns (for example decisions about where or what to buy), but respondents on balance felt relatively ineffectual with regard to such issues. While the youth workers were much more likely than the young people to say that they thought they could make a personal difference to how the world works, there were very different views of how this could be done; and the researchers noted that workers commonly spoke in terms of what they could or should do in response to development and global justice issues rather than describing what they had done or were currently doing. Overall the research suggests that there is a high degree of ambivalence regarding the nature of global justice, the operation of key, related concepts such as power and agency and the relevance of these to youth work practice.
multicultural, pluralist, inclusive and respetuoso of the misiones de servicio público (los pueblos originarios, ocupan un lugar privilegiado en este nuevo sistema audiovisual).

Our central questions are:

- What is the role of worker identity in these organizing processes?

Our analysis undertakes two case studies grounded in interviews and participant observation: day laborers in the US, and street vendors in Mexico. It is a bit unconventional to carry out such a non-parallel comparison of different sectors in the two countries, but we have chosen to examine these two informal groups because the literature suggests that they are the most advanced instances of informal worker organizing in each country. We will need to take the sectoral differences into account in explaining differences in strategic direction and degree of success, but choosing the two most advanced cases should give us leverage on our central questions.

In our case studies, we will examine national-level organizations, but our main focus will be on day labor organizations in Los Angeles California and street vendors in Mexico City, Mexico. These respective cities not only house the greatest concentration of these groups of workers, but are also the home base of the leading national organizations representing these trades.

Re-Imagining The UK National Health Service Patient In a Neo-Liberal Policy Context

Historically, the UK National Health Service (NHS) has been taxpayer funded, and largely free to patients. Though some private sector service has always been part of the NHS, this has increased substantially in the last 15 years. Hospitals are important sites for biomedical research, with many patients participating in studies.

In this paper, I will analyse an initiative that represents a new configuration between public and private, and a re-imagining of the patient’s role in the UK NHS. This is the NHS Biobank. A biobank is a repository of biological specimens combined with data about the donors of those specimens, stored for the purposes of medical research. In this instance, the aim is that samples will be collected routinely from NHS hospital patients (with consent), but, rather than patients consenting for a specific study, they will give an enduring and general consent for the samples to be used. At the same time, their samples will be linked to the data that is collected about them for clinical (rather than research) purposes. Biomedical researchers are excited about the possibilities that such a biobank may offer, and there is a significant private sector involvement in the funding of this initiative, though it remains part of the NHS.

I will argue that this initiative represents a re-ordering of the moral contract between the UK NHS and its patients. Rather than receiving NHS services as a right of citizens and taxpayers, there is now an increased expectation that NHS patients will donate samples and data to be used in (commercial) biomedical research.

Beyond Mannheim: Conceptualising How People ‘See’ and ‘Do’ Generations in Contemporary Society

It is sometimes argued that generation has been hollowed out as a sociological concept outside the family context, yet it continues to feature prominently in policy debates, media discussion and everyday talk. The solidarity, conflict and ambivalence frameworks continue to be widely and usefully applied, but are unable to capture the complex ways in which we perceive and enact generation within and across the family and societal spheres. This paper seeks to develop a more grounded conceptual framework for both characterising and explaining the evolving notion of generation. We view generations as dynamic and varied reflections of how people relate to family members, their own cohort, and groups in wider society. The paper draws on qualitative primary data collected in the course of several recent projects pertaining to intergenerational relationships and the life course; it also draws on learning from the application of this data with final-year undergraduate sociology students who were engaged as an interpretive community to examine ways of ‘seeing’ and ‘doing’ generation. Far from outdated, generation emerges as a still-relevant concept that encapsulates the meaning of familial relations but also perceptions of how material resources, period effects and the welfare state context shape lives in contemporary societies.

Social Networks and Environmentalism: Structural Embeddedness and Ongoing Participation in the Canadian Environmental Movement

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
“Common sense” arguments for participation in movements like the environmental movement often refer to grievances, or beliefs, as key factors that give rise to participation. However, structural analysts have demonstrated that neither discontent nor ideology are sufficient conditions to explain social movement participation. Rather, while discontent and beliefs might help to define those who might potentially be mobilized, individuals need to be connected to other movement participants in order to become active. We explore the relationship between social network ties and participation in the Canadian environmental movement. Data are from a self administered questionnaire, collected from nationwide probability samples of environmental organization members. We find that ongoing participation is positively associated with ties to individuals in a range of environmental organizations. This effect is net of positive effects for identification with the movement, and the respondent’s NEP score, on participation. Past participation is the strongest statistical predictor of network embeddedness. Thus we argue that both “social selection” and “social influence” effects are in play. People develop ties through their participation, and are more likely to participate in new activities because of their ties. We further examine the mechanisms underlying these patterns, and discuss practical implications of these insights.

Social Media Use for Contentious Politics: Facebook-Activism Against Imposed National Education Curriculum in Hong Kong
This paper examines the use of social media for the protest against the “Moral and National Education” curriculum in Hong Kong. Employing media content analysis and archival research, it explores how social media use facilitated grassroots movement organizations and stimulated cyber-activism among atomized users in practice. On 30 August 2012, a local student organization – Scholarism – went on a hunger strike. Occupying the public area in front of the Headquarters of the Hong Kong Government, members of Scholarism protested against the controversial curriculum imposed by the Education Bureau. In the subsequent days, tens of thousands of people joined the protest. Nine days later, the government succumbed to the pressure and retracted its plans. While new information and communication technologies provide the technical infrastructures for organizing movement campaigns and protests, various uses of new media configurations offer flexible mechanisms for people to take part in contentious activities. During the occupation protest, Scholarism eagerly employed Facebook technologies to coordinate collective actions and mobilize participants. At the same time, numerous users made active use of Facebook to communicate about the movement, forge social networks, produce alternative knowledge, and create innovative protest activities. As diverse actors simultaneously undertook online activism, the patterns of their computer-mediated communication facilitated the emergence of counter-publics and the development of movement practices and culture. Borrowing insights from the growing theory on computer-mediated social movements that challenges the assumption about requirements for formal leadership and organizational hierarchies, this paper argues that new media use modified the relationship between social movement organizations and individual users, and permitted alternative forms of civic engagement for democratic participation.

TIRADO, RICARDO* (UNAM, tirado@unam.mx)
Blood Sacrifice, Instant Celebrity, Organization and Mobilization
The paper deals with cases in which almost unknown persons, because of a tragedy, suddenly jump from anonymity to the civil sphere converted in celebrities with great capacity for civil intervention. These celebrities owe their instant fame to the fact that they are closely related to the victim of a bloody tragedy: the kidnap and murder of a child, a wife or a husband.

The paper will concentrate in these aspects:
1) The casual birth of a new (involuntary) celebrity, because of a bloody tragedy.
2) Scandal, annoyance, desperation, and new tragic stars in the media.
3) The re-edition and impact of the old myth of sacrifice, blood spill and redemption.
4) The effectiveness of the myth that tragic death of an innocent victim is a sacrifice and sacrifice should be useful and deserve compensation.
5) The great impact of bloody sacrifice symbol. Bloody sacrifice and “conscience crisis” (Habermas).
6) The great possibilities of social action and intervention of some of these people.
7) The different strategies, goals and routes of social action.
8) The discovery of the possession of an unknown new great “magic” like power.
9) Amazement and improvisation of the action of the new celebrity
10) Why some of the co-victims can develop social leadership and others don’t?
11) Resources for the mobilization of this mythical power.

12) The process of diminution or transformation of these leaderships.

The empirical base of the study relay in the cases of some co-victims who lose in Mexico their relatives by criminal actions, and which after the event, they lived a quick process of transformation into sociopolitical leaders who, after a short time since their loose, create organizations, to call huge mass mobilizations and to question severely the incapacity of the government to display public security to the people.

Secondary Education in South America: Analyzing Expansion Dynamics in Argentina, Brazil, Chile, and Uruguay
This investigation examines the secondary school expansion process in four South American countries (Argentina, Brazil, Chile, and Uruguay) from its origins at the end of the nineteenth century to present day. The objective is to compare the processes of growth that these countries share while contrasting their specific characteristics in order to identify patterns in secondary schooling in national contexts of late modernization. This study begins by conducting a statistical analysis that allows for a subsequent description of how varying factors specifically influence each national context.

Secondary education expansion systems emerged in these countries due to a combination of modern educational models and distinct cultural “figuration” within each national context. These consolidated “national education matrices” derived from the particular blending of four elements: society, state, market, and education. Chile, Argentina, and Uruguay have had highly centralized educational systems, typified by mass primary education, whose aim was to culturally homogenize the population, and an elitist and selective secondary education. On the other hand, educational expansion in Brazil has been much slower, characterized by development of productive forces and industrial advancement. Secondary education expansion began to intensify in the 60s and has undergone strong transformations in recent decades. Chile and Argentina decentralized their educational systems. The former converted into an unequal market directly correlated with students’ socioeconomic levels, while the latter is clearly a fragmented system in terms of the population’s economic and cultural characteristics. Uruguay maintains a centralized, public, and secular model, which, at the secondary level, has expanded at a slower rate over the last several years. In Brazil, secondary education has experienced a strong democratization process due to a political order pushing them to reach standards consistent with the leadership role that it has acquired at both the regional and international level.

TODEVA, EMANUELA* (University of Surrey, e.todeva@surrey.ac.uk)
Business Network Theory and the Role of Country of Origin
Business networks are recognised as the new organisational form of doing business, where cooperation and competition take place simultaneously, where the interdependencies between firms co-evolve through complementarity of skills, assets and capabilities, and inter-firm relationships thrive in the form of long-term repetitive exchanges and alliance membership. The theoretical and empirical literature is very rich in assertions about the benefits from networking and the positive impact of alliances and cooperation on firm performance, on supply chain integration, on dissemination of innovation and on learning and development of individual firms. Business Network Theory represents an eclectic body of theorising that focuses on the processes of growth that these countries share while contrasting their specific characteristics in order to identify patterns in secondary schooling in national contexts of late modernization. This study begins by conducting a statistical analysis that allows for a subsequent description of how varying factors specifically influence each national context.

Traditional concepts of international business theory, such as ‘country of origin’ could hardly explain the complexity of resource flows that take place on a global scale. While research on Asian multinational firms demonstrates clear evidence of distinctive patterns of governance and investment strategies, ‘country-of-operations’ has become a more dominant concept that can explain global collaborative strategies.

The paper presents a new argument that global supply chains and commodity chains, or multinational business networks in a number of industries exhibit a common characteristic, where the regulatory environment in countries-of-operation induces similar strategic behaviour.
Mothers’ Use of Terms Referring to Their Child in Japanese Conversations: A Conversation Analytic Perspective

This study examines ways mothers refer to their child in conversations in Japanese from a conversation analytic perspective. Conversation analysis is a methodology to examine real-time interactions from the perspective of the participants themselves (Sacks, Schegloff, and Jefferson, 1974). Person reference has been among the major topics of conversation analysis since the seminal work by Sacks and Schegloff (1979). Studies have shown that forms of reference can do a special interactional work other than referring to (a) person(s) (Schegloff, 1997; Stivers, 2007). For instance, Oh (2010) shows that Korean speakers use a quasi-pronominal based on the distal demonstrative ce (‘that over there’) in referring to a co-present third person in order to distance themselves from the referent. In this study, I focus on the kind of interactional work mothers are doing when they use different expressions to refer to their child in conversations. My data were collected at two Kosodate Hiroba in Osaka, Japan. Kosodate Hiroba is a place where mothers of a very young child spend time watching their child and enjoy conversations with other mothers and staff members, often sharing their problems in child-raising and getting advice from them. I found that the unmarked form of a mother’s reference to her child is either the child’s name or kono ko (‘this child’), neither of which does anything more than refer to the child. By contrast, the mother’s use of kono hito (‘this person’) to refer to her child can do a special interactional work. For instance, mothers recurrently make reference to their child with kono hito when they explain the child’s actions. The expression kono hito makes a complaint more easily recognizable because the word hito (‘person’) conveys that the referent has independent thought and is difficult to control even for her/his mother.

Improving the Quality of Volunteer Web Panels: Evaluating Propensity Score Adjustments Methods for the Leisure Panel

With the rise of the Internet more and more data are collected via volunteer panels. These panels are not based on probability mechanisms and hence inferences are difficult to make. Post-survey adjustments techniques such as propensity score weighting are often used to improve data quality. However, which methods work best and which variables need to be taken into account differ per survey. In an attempt to structure methods of post-survey weighting techniques for the volunteer Leisure Panel, different weighting methods are evaluated as well as different weighting variables, such as behavioral, attitudinal, lifestyle, and socio-demographic variables. Results are compared to outcomes of a probability-based panel (LISS Panel) and figures from Statistics Netherlands.

Investigating Response Quality in Mobile and Desktop Surveys: A Comparison of Radio Buttons, Visual Analogue Scales and Slider Scales

Mobile devices have smaller displays, touch screens and different methods of navigation compared to desktop computers. This may limit the amount of information that can be placed on a mobile phone screen and it can also affect how a survey is comprehended and completed. The most traditional rating scales in Web surveys are made from radio buttons. Radio buttons require quite a lot of space, which is scarce on mobile devices like smartphones and tablets. Thus, only a limited number of response options can be presented simultaneously. Otherwise, respondents have to scroll to see all response options which may bias ratings. Visual Analogue Scales (VAS) are operated by point and click: respondents move the mouse arrow to any position on the line and after clicking the mouse button a marker (e.g., a cross) appears at the very position. In contrast, slider scales have a handle visible directly on load of the Web page. Ratings are done by drag and drop. Both scales can either be implemented as continuous rating scales, or as discrete rating scales where only a limited number of different responses can be given. A continuous implementation is especially valuable if respondents use mobile devices like smart phone where an efficient use of space is required. A comparison is needed of radio buttons, VAS, and slider bars to see how they affect data quality on mobile phones compared to regular desktop completion. Finger navigation on mobile phones is less precise than mouse navigation on desktops. This could result in selecting the wrong (not intended) answer option in radio buttons. Slider bars or VAS might be more efficient in selecting the intended response option. The usability of question formats is conjectured to be related to the number of scale points.

Energy Regime Change and Institutionalism: Understanding Developments in Carbon Capture and Storage

Many analyses of energy technology development disregard the importance of institutions and the interdependence of economic, technological, political and societal concerns and events. I propose a dynamic institutional systems framework to integrate the various concerns into a simultaneous analysis and demonstrate the framework with case analyses on the budding developments of Carbon Capture and Storage (CCS) technologies in Europe.

The framework integrates cognitive institutionalism, Socio-Ecological Systems (SES) and socio-technical transitions theory. Institutions are the rules of the game andconfigure human interactions; both formal rules, such as laws and regulations, but also informal institutions through traditions, practices and beliefs. Individual but shared beliefs about energy regimes shape how the systems develop, leading to issues of technology lock-ins, incremental change, institutional inertia and path dependency.

"Table of Contents"
This paper focuses on self-referentiality in the mental models of stakeholders as a factor that shapes these issues. The institutions held by the actors are seen to organize in a nested mental model: the three levels of socio-technical landscape, socio-technical regimes and the innovative niche (Geels 2002) are seen nested holons or SESs.

This paper is based on case studies in Finland. The case studies are focused along two projects: one cancelled retrofit of a coal power plant and one case of technology in development, mineral carbonation. These two projects are deeply embedded in a national and international context, and the aim of this paper is to establish how stakeholder’s institutional self-referentiality affects the developments in the projects and what these project issues tell us about CCS and energy regime change in general.

TOIKKA, ARHO* (University of Helsinki, arho.toikka@helsinki.fi)

Measuring Path Dependency in Politics through Text Mining

This paper demonstrates novel methodology to measure path dependency in policy-making. The method takes large text corpora of policy documents, plans, scenarios, roadmaps, preparatory text and the like, and analyzes the flow of concepts, phrases and blocks of text as later documents inherit bits of earlier documents. The analyses proceed by looking at relative frequencies of words and phrases in documents through a measure called term frequency-inverse document frequency, and translates this into two networks: the document-document network, in which similarities and dissimilarities describe how conceptual usage is inherited between documents and the concept-concept network describes courses or network areas of concepts that are used together and start to institutionalize in the political language.

The paper demonstrates the method through an analysis of energy policies in Finland, and how various technologies, policy tools, and conceptualizations rose and fell over a fifteen year period from 1997-2012, from right after joining the European Union, through the rise of climate change negotiation and the Kyoto treaty, and into a period when energy policy came to be incorporated with climate policy.

TOIVANEN, MARI* (University of Turku (Finland), mario@utu.fi)

"Belonging" in the Study of Younger Generations of Migrant Background

This study discusses the analytic purchase of the concept of "belonging" to study identity formation among younger generations of migrant background. It is argued that "identity" has more usage as an empirical concept, whereas "belonging" provides more analytic purchase to grasp the underlying mechanisms of inclusion and exclusion that inform young people's identity formation.

The theoretical discussion will be informed by an empirical study on young Kurds' negotiations of belonging in Finland. The qualitative study looks at how young Kurds narrate their belonging in terms of various mechanisms of inclusion and exclusion, including institutional arrangements and (racialized) discursive categorizations. The broader theoretical premises of the empirical study lie on trans-nationality, intersectionality and narrativity, and the theoretical discussion leads to questions the analytical edge of “belonging” and how it addresses the questions of who gets to belong and who does not. The case study shows that young Kurds construct a sense of belonging in terms of the discursive construction of national belonging and “othersness” in the Finnish context. The racialized boundaries of “Finnishness” echo in their narrations and position them as the “other”, namely the “immigrant”, “refugee” or “foreigner” on the basis of their darker embodied signifiers.

Floya Anthias argues that belonging, in contrast to identity, assumes access and participation, and becomes activated in situations of denied membership and experiences of difference. In this sense, it is suggested that “belonging” better captures the political dimension of feeling at home among the younger generations of migrant background. Such theoretical choices also bear consequences on the methodological questions. This study employs the intersectional frame to analyse the intersecting attributes of gender, age and ethnicity impacting researcher positionality and the interaction situations with the interviewees. Hence, the theoretical and methodological challenges of employing “belonging” in junction with the intersectional frame will be explored.

The Impact of Community Size and Characteristics on the Articulation of a Doubled Security and Social Dimension: The Case of Urban Mediators in France

In France, an increasing number of local authorities have developed programs focusing on “urban mediators”, which aim to reduce insecurity within districts referred to as deprived areas. These individuals make the rounds in such districts to ensure a calming presence for inhabitants as well as to speak with them. This street intervention allows mediators to meet with various persons distant from public services, such as drug addicts, juvenile delinquents, actors of domestic violence, or immigrants facing integration problems. This demonstrates that such interventions include security and social dimensions at the same time: The mediators intervene not only with persons who “cause” insecurity but also with those who suffer as a result of it. Therefore, they differ, on one hand, from the police, whose actions consist mainly of repression (Roché, 2004) and, on the other hand, from social workers, who intervene mainly in the long term as a result of requests.

These features led us to question the way the characteristics of different districts can influence the respective importance given to both dimensions (security and social dimension). This fieldwork and the analysis of archival data since the year 2010 show that this action can be classified not only according to the degree of the municipal coordination but also to the community size (larger or smaller), the networks which the municipality has with other actors, and the social status and cultural background of mediators. This communication will reveal the impact of the municipal coordination on the articulation of these two dimensions, the process of construction of partner networks around the question of the insecurity, and the interaction between urban mediators and inhabitants.

By Whom Do You Want Your Wallet to be Found in Ethnically Diverse Neighbourhoods?

The claim that ethnically diverse living environments drive down social cohesion between and within ethnic groups, remains disputed, despite abundant empirical tests performed all over the globe. The Netherlands appeared to be an intriguing test site for this so-called ‘constriction proposition’, as numerous studies – using different operationalizations of ethnic diversity and social cohesion, different data, performed in different time era and defining macro-level geographical units differently – reached rather similar conclusions: in general, ethnic diversity does not erode social cohesion. That said, diverse neighbourhoods, trust in neighbours is indeed hampered. Yet, various questions remain. First, does ethnic diversity only drive down trust in neighbours of ethnic outgroups or also trust in coethnic neighbours? Second, is the neighbourhood the crucial geographical unit of which one would expect (negative) diversity effects? And related to the second question how should we define the neighbourhood and consequently operationalize neighbourhood diversity? In this contribution we answer these questions through analyses of the Religion in Dutch Society 2011-2012 dataset, supplemented with unique GIS-data. Our dependent variables are so-called wallet-items in which we systematically varied the ethnicity of the target of trust (co-ethnics versus outgroup members) and the location of the target of trust (neighbours versus non-neighbours). We introduced spatial thinking into the diversity-cohesion discussion and investigated to what extent the impact of ethnic diversity depends on the definition of the neighbourhood (administrative units vs. egohoods) and on the geographical scale of the analysis. We applied spatial regression techniques and multi-level models to test our hypotheses.

Isolation of Children Who Leave Social Care Facilities

On the basis of the results of a qualitative study in a children’s self-reliance support facility, this presentation will discuss the reason why children, who leave social care facilities, become isolated. In Japan, the social exclusion of children who are, or were, placed in these facilities has been a pressing topic. However, the relationship between the purpose of social care and the lives of the children who leave these facilities has not been sufficiently discussed.

The study was conducted in a children’s self-reliance support facility (called “2” in this presentation) from May 2012 to June 2013. Beginning in September 2012, I conducted semi-structured formal interviews with twelve staff members. Each staff member was interviewed once or twice, and each interview lasted for 45-110min.

The results reveal the following: First, even children who overcome a particular issue while living in the facility may regress to their previous behaviors depending on the process of construction of partner networks around the question of the insecurity, and the interaction between urban mediators and inhabitants.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
On the basis of the above results, I will discuss the dysfunction of self-reliance as a social norm.

The Process of Children's Socialization in a Group

This presentation will discuss the process of children's socialization in a group. Although the socialization of children has been one of the most important research topics in sociology, the concrete aspect of it is still uncertain.

The study was conducted in a children's self-reliance support facility (called "Z") in this presentation) from May 2012 to June 2013. Beginning in September 2012, I conducted semi-structured formal interviews with twelve staff members. Each staff member was interviewed once or twice, and each interview lasted for 45-110min.

The results reveal the following: (1) In Z, living with a group is optimally used to treat, care for, and socialize the children. In particular, their rank in their relationship, which is based on age or phase of treatment, plays a very significant role. (2) It is important to note that such a rank is not permanent. As the upper-class children leave the facility, or when a new child enters the facility, the rank shifts. (3) Moreover, the children do not uniformly experience the reconstruction of these ranks. Rather, it is an individual experience.

As indicated above, living in a group and experiencing the construction and reconstruction of ranks in their relationship take very important role in children's socialization. This process can be interpreted as the process of "role-taking" in group dynamics. Moreover, such "role-taking" can be regarded as a type of anticipatory socialization that occurs after children leave the facility. I will conclude by discussing the implications of these findings for the field of sociology.

TOMALIN, EMMA* (University of Leeds, e.tomalin@leeds.ac.uk)
Gender, Development and the 'De-Privatization' of Religion

'Poverty has a female face' in many contexts, which has been exacerbated by the recent global economic crisis. Amongst the range of actors that have responded to declining levels of welfare support by the state are 'faith-based organizations', and international donors and agencies increasingly recognize these as significant 'development' partners. This 'turn to religion' within mainstream development policy and practice has taken place against the backdrop of a perceived 'religious resurgence' or 'de-privatization' of religion, which casts doubts upon earlier predictions that secularization and modernization are two sides of the same coin.

From a 'gender and development' (GAD) perspective, the 'rise of religion' coupled with declining levels of state welfare provision presents a threat to gender equality and women's rights. The preference for 'secularism' amongst numerous women's rights activists and GAD practitioners is no secret, and has been promoted as the best route for securing equality, freedom and security for women globally. Therefore, it is crucial to view the recent 'turn to religion' by mainstream development actors through a gender lens. This is not only because women are more vulnerable to poverty, but also because 'religions have a male face' (see also Tadros 2010; Tomalin 2011).

This paper examines the future of the 'secular' in the light of theories about the 'de-privatization' of religion and the implications this has for gender equality and women's rights, which are central to GAD. Currently, understandings of religion that influence mainstream development policy and practice rely upon frameworks for analysis that are outdated and unhelpful for addressing the above concerns. Focusing upon examples from South Asia, I will demonstrate that distinctions between the religious and secular, the private and public, and the idea of a clearly defined 'public' vs 'private' space are unhelpful in addressing contemporary questions around 'gender development' and the de-privatization of religion.'

Albularyo Ritual Healing: A Construction of Ethnicity of Filipino Immigrants in South Korea

The transnational movement of people around the globe has challenged migrants' belief systems and their quest for well-being. The movement of people in itself is a form of ritual performance, a journey towards a dream and the aspiration to acquire a new sense of self and identity. The goal of this research is to illustrate how migrants reconstruct their ethnicity through access to the albularyo ritual healing of their homeland. In this paper, migrants are viewed as secular pilgrims who experience the manifold stages of liminality as they continue to seek well-being. Along the journey they suffer from pneumropsychosomatic illness, which helps them maintain connection with "home." They romanticize the memories of their homeland. They access shamanic ritual healing, which brings into the real "here and now" the interplay of memory and the self's narrative that defines their identity. The research is based on the ethnographic data collected April to June 2013 in South Korea. It focuses on the story of Filipino immigrants who experienced shamanic healing in their homeland and continue wearing the amulets given to them by shamans to prevent illness and protect them from evil while in a foreign land. The migrants' definition of their "new selves" is shaped by the core institution of modernity.

Findings indicate that the root cause of disease from pre-industrial society to the age of globalization is emotion. Negative emotion breaks one's social ties with the self, significant others, and the divine. Physical illness often stems from one's spiritual sensibilities in his/her religious worldview. Also, migrants' state of identity consciousness is "in between" - that is, "neither here nor there" - and they must undergo different stages of liminality in restoring selfhood. Thus, healing is an outcome of rebuiding relationships - practicing one's spirituality and reconstructing one's ethnic identity.

Development, Inequality, and Discrimination in Europe: A Comparison of Post-Socialist and West European Democracies

This paper uses the European Social Survey 2002-2012 to examine trends in discrimination, taking into account two different groups: those who feel discriminated against because of their ethnicity, and those who espouse xenophobic attitudes. The country-level relationship between feelings of discrimination and xenophobic attitudes calls for explanations that consider economic development and social inequality. A complimentary research question is: To what extent does social inequality influence feelings of discrimination and intolerant attitudes, beyond economic development factors, individual socio-demographics and various personal outlooks? Our analysis covers post-socialist and West European countries (N>16) in the period 2002-2012. Multilevel regression analysis on the ESS data provides the statistical means to examine the effects of country-level and individual-level determinants and their interactions on feeling discriminated and on xenophobic attitudes. Economic variables at the country level include national income per capita and Gini index of income inequality. At the individual level, we focus on social stratification - education, occupational status, and income - subjective evaluations of standard of living, as well as a range of attitude measures. Results demonstrate how these variables are related to ethnic discrimination and xenophobic attitudes, controlling for political views and national orientations. We show that in post-socialist countries ethnic discrimination became more salient as society embraced party pluralism and freedom of speech. At the same time, in both post-socialist countries and Western democracies right-wing and nationalistic attitudes are strongly fuelling discrimination. At the end of the paper, we discuss theoretical implications of our findings for analyses of development, inequality, and democracy.

Peruvian Immigration to Chile: Racism and the Deskilling of Female Transnational Workers

Historically Chile has been a country of emigrants rather than a country of immigration. There are around one million Chileans living abroad. However, in the last decades immigration to Chile has accelerated. Immigrants from Peru, Ecuador, Bolivia, Colombia, China and Korea confront a hostile and racist society. The largest of these groups is formed by Peruvian migrants. About 130000 Peruvians live today in Chile. Of these, 60% are women, many of whom end up working as domestic servants. Peruvians have become a large group among domestic laborers, in particular as live-in domestics. Although the levels of education of Peruvians are higher than those of Chileans, they are consistently pressed into low paid work with little protection. By using a netnographic methodology I investigate how racism, that has historically casted mestizo Chilean women in the role of 'namas', today transmutes Peruvian women into the homes of wealthier families as women domestics, regardless of the levels of education and skills they bring with them at the time of immigration.

A Study of Policing the Protest in Japan: Effects for Social Movement Organizations and Arrested Activists

* denotes a presenting author. Abstracts are organized by first presenting author's last name. 987
This study investigates the policing for social movements in Japan. Compared with other countries, a few studies empirically examined the policing in Japan. In 60s/70s movements, over 5,000 activists were captured by police. Though arrested activists had dramatically decreased since 1970s, policing still have an impact on social movement organizations (SMOs) and participants in Japanese political activism. In this study, researchers conducted the research by finding the effect of policing for political activities from two sides: SMOs and individual participants. Three kinds of data are employed in this analysis: Interview data, event data and network data. We could find some features of policing in Japan from event data. In Japan, policing is relatively not violent, but the period of detention is extremely longer than other countries. On average, protesters have arrested from 10 to 20 days and SMOs have to do activity for helping the arrested person. On the other hand, seized participants face to the crisis collapsing their careers as a student, businessman, housewife, and other roles in their usual life. Police could put a wound in not only their bodies, but their minds. From the interview and network data, the author cleared that policing becomes a barrier for participating and continuing the social movements. Once the participants are arrested, some activists avoid taking part in and continuing the social movements. SMOs have to spend their money and time to release the arrested one from police, thus their resource are decreased and it is difficult to continue the movements as they used to be. Moreover, arrested participants sometimes break off with external relationship from the social movements: his/her offices, friends, and families.

Heart Transplant Recipient Identities: Between ‘a Patient’ and an Individual

This study explores how heart transplant recipients (HTRs) post-surgery chronic conditions affect their identities, consisting of the roles of ‘a patient’ and ‘an individual’ in everyday lives.

HTRs need lifelong medical treatment to control their immune systems. After overcoming heart disease through transplantation operation, HTRs tend to think of themselves as individuals, while doctors see them as patients. Therefore, the experience associated with lifelong chronic conditions presents a difficult challenge for HTRs regarding their identity.

Three key theoretical concepts can inform the subjective experience of the lifelong chronic conditions: biographical disruption, narrative-based medicine and identity reconstruction. These concepts address issues of stigmatization of chronic conditions, loss of self, and reconstruction of identity following a heart transplant.

The participants for this study were recruited through ‘snowball’ sampling. Inclusion criteria required individuals age 20 and over who had undergone a heart transplant operation more than one year before the time of the study. Nineteen Japanese HTRs were interviewed by using semi-structured face-to-face interview techniques. All interviews were recorded and transcribed into a simple text. Interview data was thematically analysed.

The results of this study show that HTRs do not simply face an issue of ‘loss of self,’ but reconstruct identities between ‘a patient’ and ‘an individual’ through experiences of stigma. HTRs’ identity reconstruction process is primarily influenced by the location of the surgery, its duration, and the presence or lack of fund-raising support from the public. Depending on these conditions, recipients tend to experience stigma, which can be categorized as ‘enacted stigma’ or ‘felt stigma.’ Their stigma experiences are attributed to their relationships with doctors, family, friends, and the public. HTRs tend to experience ‘felt stigma’ than ‘enacted stigma.’ This indicates that HTRs’ distress may be internalised; apart from the medical support of immune control, they may not receive enough support.

Repussées Par Le Travail Ou Attirées Par La Vie Privée ? L’inactivité De Jeunes Diplômées En Italie

La monte des taux d’activité à intéressé les femmes de tous pays occidentaux depuis l’après guerre. Malgré un total de plus de 10 millions de femmes dans l’Europe unifiée, la compéti- tion sociale est une comparaison plus saine que dans les autres pays d’Europe même parmi les jeunes et le plus diplômées. Le recours à des explications culturelles est toujours à porté de main, mais ce n’est que rester à la maison représente pour autant d’italiennes une véritable choix ou l’accomplissement d’un désir? A` partir des résultats d’une recherche de terrain qui porte sur les expériences d’un échantillon de jeunes mères titulaire d’un niveau d’études élevé de manière générale, nous souhaitons souligner que l’autonomie des femmes qui, après avoir investi dans son éducation professionnelle, est aussi un choix. À première vue, on pourrait croire que le fait de rester à la maison représente un recul temporaire ou définitif. Cependant, lorsqu’on approfondit les analyses, on constate que la décision de rester à la maison est souvent prise dans un contexte de précarisation professionnelle et des contraintes de temps.

The contribution presents the outcomes of a research promoted by the Department of Political Science and Sociology, University of Florence. The aim of the research was to design an updated picture of nowadays housewives, as well as to investigate why so many Italian women still remain out of the labor market. In particular, we firstly focus on a so “invisible” group: the housewives. By means of a multiple methodology, reaching more than 500 women through online questionnaires, in deep interviews, meeting outside the malls and the schools, newspapers, blogs, etc. Outcomes show that the traditional label “housewife” is no more appropriate to describe a population more and more differentiated, with variable identities, personal histories, motivations, and trajectories.

The research investigate a high number of dimensions, nevertheless some of them (motivations, domestic life’s organization, role identification) allow to identify at least four different types: grateful housewives, aged women, who choose domestic life according to their traditional image of the family and firmly claim the value of their choice as well as a major social appreciation of the role of housewives; tailored housewives, aged women, who share a less traditional picture of the genders’ roles, has been employed and “adapted” to domestic life without represent themselves as only “housewives”; forced housewives, mainly elderly by labor market rejection because of stage of life who experience domestic life as a sort of punishment and do not represent themselves as “housewives; temporary housewives, generally younger and highly educated women who, considering the uncertainty of their professional life, invest in their family and consider their role of wives and mothers as moratorium, waiting for more favorable times in the labor market.

The Coordination Mechanisms of Organizational Routines: A Case Study on a Free/Open Source Software Project

How might distributed, peer-production organizations that rely on the Open Innovation paradigm sustain task specialization and achieve effective coordination in the absence of formal hierarchical control? This question is increasingly relevant because a number of production processes are being shifted from the physical to the virtual domain. Traditionally, scholars identified in organizational routines the building blocks of coordinated action in organizations. In this paper, we draw on the evolutionary perspective of organizational change (Nelson and Winter, 1982) to investigate the emergence and change of organizational routines in the context of distributed, peer-production communities. We argue that change emerges endogenously from the organization’s routines the building blocks of coordinated action in organizations. More specifically, we investigate how routines emerge dynamically from the dual association connecting individuals (or “problem-solvers”) and tasks (or “problems”) in organizations. In particular, we ask: How do organizational routines (structured sequences of actions) emerge, evolve and persist despite the demographic turnover of participants and the ever changing character of organizational problems? To answer this question we run newly developed class of Relational Event Models on the entire sequence of actions undertaken by software contributors on SourceForge (the main hosting site for the Apache HTR server, a very large Free/Open Source Software (FOSS) project). By examining directly the micro-level, socio-temporal interdependencies generated by individual actions performed by problem-solvers, we find that self-reinforcing processes underpin the endogenous coordination of a decentralized production community, by fostering task specialization and learning mechanisms. Different types of activities can exist and be coordinated over time in a decentralized decision environment. Our analytical goal is to show how sequences of interdependent problem-solving actions become embedded in temporal sequences of relational events, which then trigger...
specific self-reinforcing mechanisms that provide the social infrastructure sustaining the production of F/OSS.

**Case Studies on Working and Organizing of Domestic Workers in China**

The number of labors involved in informal employment is 163 million, which contributes to 58.85% of non-farm employment in urban areas. In order to analyze the social solidarity of informal workers, the article takes the domestic workers as case study and discusses the working condition of informal employment, as well as its possibilities of organizing. We found that there are at least four workers' solidarity types, labor NGO, trade Union, self-organization or grassroots organization and the internet. These social solidarities have different organizational culture, strategy, function and activities and play different role.

**Age of Transition to Parenthood Among Married Adults: Social Determinants and Gender Difference**

Using retrospective life history data from the 2008 Chinese General Social Survey (CGSS) and event history analysis, this study investigated the timing of transition to parenthood for both adult males and females for marriage cohorts spanning from 1965 to 2008. Within the neoclassical economic and second demographic transition frameworks, we expect that there will be a trend toward delayed childbearing and a lengthening of the duration between marriage and first child bearing across the cohorts. However, we found that a shortening trend of marriage-first child interval across cohorts, and the more recent cohorts are more likely to transit into parenthood net of other effects. We also found that higher educated people are more likely to transit into parenthood earlier than those who have primary or no education. We speculate that the trend in China contradicts the tendency for delayed parenthood in Western countries due to the resistance to change the traditional childbearing norm of “earlier parenthood after marriage.” This is because child rearing is an issue involving extended families, rather than couples’ own independent decision. Under the one-child policy, extended family care is more human and financial resources that they utilize for childbearing. We also speculate that increasing intimacy by newly married couples in the more recent cohorts contributed to this trend.

**An Institutional Approach to Autonomous and Connected Cities: Ostrom’s Distributed Metropolitan Governance**

Global cities are the economic and cultural centres in the world. They compete with each other for a number one status on various lists. International accessibility is essential for a city’s ranking and for its ‘supply’ of people, goods and resources, putting a city’s position in the international network of airports and harbours and in the international economy high on the political agendas of national and local governments.

Cities are constantly searching to improve their performance. Specialized planning models support city governments to deliver the various public goods and public services that are expected from them. More integrated models, such as the airport region and urban metabolism models, emphasize the tensions between internal connectivity and local liveability. The extent to which current institutions are capable of managing these tensions is questioned by stakeholders. They search for institutional structures supporting the delivery of the public goods promised, with a prominent position for questions of scale. Technological developments have made these questions more urgent. The fast developments in the field of renewable energy technology, smart grids and electric vehicles call for redefinitions of rules and roles of consumers, producers, citizens, local, provincial and national authorities and of the public goods delivered to them.

In this paper, we address the search for institutions that match today’s challenges by using the theoretical framework of distributed metropolitan governance as developed by Vincent and Elinor Ostrom. With this institutional approach, we explore current urban governance challenges in the Netherlands. To sustain their competitive position in the global network, Dutch cities strive to become resilient, self-organising and self-governing. We will explore how institutional mechanisms as consociationalism and pillarization, as identified by Lijphart, which have proven to be able to bridge conflicting values, are still relevant for a renewed conception of distributed metropolitan governance.

**Possibilities for New Forms of Resistance in the Neoliberal Era: Unification of All Rights Movements During Tekel Workers’ Resistance in Turkey**

The working class has become overwhelmingly disorganized in the neoliberal era partly due to the attacks on legal and institutional grounds of trade unions and partly due to the transformation of working class itself. Dialetically enough, the current phase of capitalism is pregnant with new crises and forms of resistance. After the result of increasing precarious jobs, jobless growth, insecurity and extra-compensation. Under these conditions, unions are faced with altering their strategies. A possible formula is to organize unemployed and precarious workers as well as workers around counter-hegemonic united front a non-nee- gative defence of collective rights (right to water, rights to transportation, right to shelter, right to decent work etc.). This study provides an historical account of a working class protest which took place in 2009-2010 in Turkey. It argues that this protest foretells the possibility of unifying all rights movements under an expansive struggle for collective social rights. June 2013 mass protests in Turkey also show that the sense of injustice is becoming stronger and felt increasingly by those who are subordinate to all sorts of unequal power relations.

**A Scientific Controversy Across the Channel: Unemployment Theories, Sociology and the Rise of Mathematical Statistics in the Early 20th Century**

In the early years of the 20th century, on both sides of the Channel, social reformers were struggling to define what « unemployment » could be. Political economy, sociology and statistical social sciences were mobilized in the process of shaping the novel category. Defining unemployment scientifically seemed to imply that the unemployed should be enumerated otherwise transformed in solid figures. Various statistical devices were imagined in both countries for trying to solve that same puzzle, but quite different scientific languages were mobilized: William Beveridge used the language of political economy (1909), Max Lazard that of Durkheimian sociology (1909), and Arthur Bowley the new tools provided by mathematical statistics (1912).

An argument developed in professional journals between Lazard and Bowley, who doubted of the statistical techniques the other one was using: Lazard had calculated an occupational unemployment rate, Bowley an index-number of the variations in the volume of unemployment. In order to describe this controversy, one can use the notion of « national scientific styles » and observe how tools circulated between British statisticians and French ones, through the International Statistical Association and an intense exchange of literature. The limited reception of the correlation coefficient among French statisticians raises an interesting general issue of the conditions of the circulation of knowledge. Accounting for the difference between Lazard’s and Bowley’s formalisations implies analyzing sociologically what they were designed for and the relations that were being established between scientists and the users of their knowledge in the respective labour administrations. In both countries, a close relationship between scientists and administrators conditioned the development of abstract statistical forms that could be applied to formalizing a new social issue and contemplated public policies: in France unemployment insurance by industries, in Britain public works providing jobs when an unemployment crisis would be looming.

**Network Analysis and Spatial Analysis Combined: The Case of Reform and Philanthropy in 1900 Paris**

Historical monographs on specific spheres of social reform are many when it comes to the late 19th and early 20th c. in the largest industrialised countries of the time – it was a « progressive era » for all of them. Every monograph points out that a good deal of the characters involved were simultaneously present in many other fields of reformist action – e.g. public health, housing reform, work relief, « protection » of women and children, prison reform, social science, etc. This invites scholars to cross the boundaries of specialisation and study reform and philanthropy as a possible unified field of action, interaction and sociability. This can be done through network analysis: voluntary associations used to pub-

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
lish reports and lists of leaders, members and supporters – by making the names of their followers public they increased the legitimacy of the cause. This circumstance made it possible to collect complete lists of members of 106 reform associations, totaling 17663 people in 1900 Paris. Two directories of Paris charities have been added to the data base, i.e. 1346 charities and 2060 people. Sources prove that his initial works and most of the individuals. A GIS was set up that allows it to locate every adress on the street plan of Paris (as of 1888). This material is exceptional by its quantity and systematic character. Using the data base, we can separately and simultaneously consider both social and spatial links: the affiliation of people to the same institution, the residence of people in the same building or neighbourhood, the co-presence of two institutions at the same adress.

The paper presents the most interesting results and discuss the methodological solutions that had been developed for combining social and spatial analysis, and facing the problems related to the bulky character of the data.

Negotiating Normalcy – Self-Narratives of Troubled Young People

Young people's risk-taking is in most contemporary societies a matter of concern. Research on troubled young people who have been placed in out-of-home care shows that these young people more often than other young people are involved in risk-taking behavior such as excessive drug use. What is rarely investigated, however, is troubled young people's own ways of understanding their risk-taking behavior in the context of their everyday lives. This paper analyses the role of excessive drug use and its influence on young people's self-narratives about their everyday lives. The young people's drug use experiences continuously inform their perceptions of what they consider a 'normal' youth life and thus how they negotiate their self-narratives accordingly. This paper is based on 15 in-depth interviews with young people at age 18 who in their childhood have been placed in out-of-home care and have experiences with extensive drug use. Drawing on theories of stigmatization and normalization the paper demonstrates that what the young people conceive as a normal youth life is influenced by their drug use experiences and troubled childhoods. Their risk-taking behavior thus challenges their wish to create meaningful and coherent self-narratives and the result is often the creation of fragile self-narratives based on subtle negotiations of what they perceive as normal.

Historic Environment as an Opposing Element to Inequalities

Taketomi Island in Okinawa Prefecture is one of the outer islands near the southwest border of Japan. Its islanders have suffered two-fold inequalities for years. The area of Okinawa Prefecture was a small independent nation until 1879. This nation was defeated by Japan and subsequently annexed by the national government. Afterward, mainland Japanese, especially uneducated ones, began to regard these islanders with contempt as defeated people. Another source of inequality was the location of the island, which was peripheral, even during its era as a small nation; the people of this small nation considered Taketomi islanders as non-cultural people. This tendency continued even after Taketomi’s incorporation into Japan.

However, the “historic environment” that Taketomi islanders have preserved and created through an active movement in the last 30 years has changed their dismal situation dramatically. Preserving historic sites did not affect the situational changes per se, but it elicited widespread discussion of common shared values and examination of the daily lives of islanders. As such, Taketomi residents have created peculiar historic environments, which attract many visitors and tourists.

Critics of Time in Modernity By Yusuke Maki

This presentation thematizes the series of works of Yusuke Maki, which is the pen name of Munesuke Mita. He is one of the most prominent sociologists in Japan. In this presentation, I would like to focus on the works of Yusuke Maki, and to define their significance and limitations.

For the abovementioned purpose, first of all, I will try to consider Yusuke Maki’s series of works as a unified process and which his project of criticism about “time in modernity (characterized as irreversibility and linearity; Newton’s abso-
lute time)” has been gradually deepening. Maki’s critique of his initial works were based on Marxism, or strictly speaking, on theory of refication. For example, in Gendai no shakaikou to Sonzetsu no shakai (Existential Structures of Contemporary Society) (1977), Maki carefully examined Marx, and in Ningen-Kaihou to Riron-no-Tameni (Toward The Theory of Human Liberation) (1971), he criticized the difficulties of an-
Social Capital in Late Life: The Case of Chilean Older People

Chile is experiencing an accelerated process of population aging. People aged 60 and older currently constitute 13% of the population. This proportion is projected to reach 28% in 2050. In this context, questions have raised about the quantity and quality of older people's social capital due to the decrease in family size and changes at the value level related to more individualized societies. The theory of individualization proposed by Beck and Beck-Gernsheim states that in today's society people are less bounded by traditional forms of representation and control. At the level of personal ties, this means that family members would relate to and help another because they 'want' and not because they 'must' do so. However, the latter does not necessarily imply negative consequences on older people's social capital, but rather it may produce a change of scenario. That personal ties can be developed based on voluntariness also means that older people can invest in relationships outside their nuclear family. From this stance, the practical and emotional help required by older people could be also sought in friendship relations and weak ties. Drawing on in-depth interviews with people between 60 and 75 years old living in the city of Santiago and secondary analysis of focus groups I aim to investigate whether the nuclear family is still the predominant source of social capital or, instead, older people are replacing or complementing family resources with other types of ties (e.g., friend, neighbors and/or state).

Gender and Education: Differences and Similarities in the Trajectories of Young Men and Women

The preliminary results of a longitudinal study, which has surveyed the same individuals at 13, 17 and 21 years old, indicate that there are convergences and divergences in the practices and attitudes of young women and men. Young women do better in school but, at the age of 13, they also report more depressive symptoms. On the other hand, at the age of 17 and 21, the trajectories of young men of both sexes are reshaped showing differentiations in some respects and similarities in others. Accordingly, young women's initial educational advantages may not have promising effects, culminating, sometimes, in early interruptions or corresponding, afterwards, to precarious experiences in the labour market. Drawing on a theoretical framework which combines an intersectional gender approach with sociology of education, this presentation seeks to explain young men's trajectories and the differences and similarities found. In order to do so, we will analyze the ways in which the trajectories of young people are influenced by factors, such as social background and class, parenting styles, networks of socializability, leisure-time, subjective well-being and physical and mental health, body image and risk behaviours. These relationships will be analyzed with descriptive and multivariate analysis.

EPIteen, the study on which this presentation is based, was launched in 2003-2004 by the Institute of Public Health of the University of Oporto (ISPUP) and collects data from individuals who were born in 1990, in a total of 2 943 research participants. When the study began, respondents were 13 years old and attended the public and private schools in Oporto, which is the second largest city in Portugal. With the collaboration of the Institute for Social and Political Science of the University of Lisbon (ISCP), a new wave will be carried out in 2014 when the youngsters will be at the age of 24.

Cash for Care Schemes and Older Migrants: Perspectives from Needs Assessment Practice

The ethnic and cultural diversity of older care recipients around Europe has increased over the past decade posing new challenges to the elderly care sector. In some parts of Europe, requests for cash for care schemes have increased as a result of the fact that the elderly care services that are offered by different welfare states are believed to be ill-equipped to meet the needs that this diversity creates. In this presentation we will explore how care managers who perform needs assessments for elderly care handle increased requests for cash for care schemes from migrant families. This presentation will address how they experience these requests and the challenges that they face when handling them within the course of needs assessment regulations in Sweden. The data is comprised of 12 focus group interviews with 60 needs assessors from seven municipalities in Sweden and 202 case documents (101 concerning cases with older migrants and 101 with older Swedish-born). The material has been analyzed through thematic analysis (focus groups) and content analysis (case documents). The findings show that the needs of older migrants is challenging especially when one is dealing with late-in-life migrants' requests for cash for care arrangements. The fact that these migrants' care preferences are very different from the individualist care understandings that lay at the core of needs assessment regulation in Sweden poses numerous challenges to needs assessment practice. The challenges are augmented by the fact that these migrants' younger relatives lack a foothold in the labor market and regard the formalization of their informal caregiving duties through these schemes as a potential source of income. The presentation will problematize the taken for granted assumptions about care that lay at the core of Swedish need assessment practice and the understandings of filial obligation from which care managers depart.
data bank, we will also provide empirical evidence from a study about Spanish citizenship which have used both qualitative methods (with in-depth interviews and focus groups) and quantitative methods (using a representative survey). Finally, we will consider the consequences of this new explanatory approach to the use of ICT and the digital divide has for the processes of social exclusion in contemporary information and knowledge societies.

TOSCHENKO, ZHAN* (Russian State University, zhantosch@mail.ru)
Trust As Indicator of Social Consciousness in Russia
Social consciousness has always included many indicators: results of activity, needs, motives, values, interests and other indicatives. Among them the significant place takes up the trust, which always reflects one of the main forms of comprehending existing social relations, and at the same time, level of knowledge, awareness and evaluation of the ongoing changes in the socioeconomics.

Role and place of trust in this sphere were studied in process of All-Russian comparative research of 1989 and 2012. The main goal was the comparison between the situation in the last period of Soviet time, when the market relations were being formed, and situation in Russia after 25-year realization of these reforms. Data of this study showed, that there are the different tendencies in the development of trust. In connection with the division of levels of social organizations - All-Russian, regional, enterprises and personal - the researchers tried to analyze the specific features of trust on these levels.

This study showed that on the level of Russian society the trust to political, social, economic institutes to a great extent decreased. On the regional level the trust has the contradictory character in depending in situation in region: the reach of trust is higher in rural regions, enterprises and personal trusts. The trust to political, social, economic organizations and political parties directly inspired by populist discourses and practices.

Trust in enterprises depends from the forms of property - state or private, municipal or public company. On the personal level the trust has increased and played the leading role among the kinds of trust existed all over the places.

Party Membership in Turkey and Members’ Participation during Local Elections in 2014

Party membership in Turkey and members’ participation during local elections in 2014

Scholars argue that since the 1980's there is a widespread disengagement from parties and party politics especially in many long-established European democracies, both at the electorate and voluntary party members' level. They also agree that decline both in terms of numbers and members' activities depends on different socio-economic and political factors explained by supply-side and demand led explanations. This study is intended to present an overview of party membership levels and of participation in party activities during the local elections which will take part in March 2014 in Turkey. In this presentation we will evaluate “Party and membership decline” thesis and observe the current situation in Turkish case since 1980's. We will compare the number of party membership by using the official data which are registered in the Supreme Court of the Republican Attorney Generalship and observe the fluctuations or decline in each 5 years period between 1983-2013.

According to the scholars, there is a decline not only in numbers of the members, but also in members' levels of activism in long established democracies. In order to see and understand the current levels of activism of the members, we will conduct a survey with different party members during local elections period in Izmir, which is the third biggest city with its population. We also plan to discuss the results of the survey and see whether there is a decrease in member's level of activism. Some issues guide our survey: Firstly socio-economic and demographic characteristics members have. Secondly why citizens enroll in parties and the third how they participate in party activities and to what extent they use new information technologies as participation methods during local elections in 2014.
expression of respect, humility and tolerance for decision makers, particularly expressed in the male population. Family relationships are characterized by respectful and caring relationships between family members: husband and wife, children, close relatives, respect for elders, tolerance and civility.

One of the leading trends in the experimental work in social psychology: it is the organization and conduct of scientific research projects, scientific field trips, “Categorical perception of facial expressions of racial characteristics”, “The specifics of communicative and cognitive processes of the Tuva Todzha people”, Congress “Steppe Civilization - 2004, 2009, and in 2012,” Human consciousness: traditional patterns of life-style evolution in today’s world: holding of international and regional scientific conferences , research projects, seminars, meetings with prominent researchers and practitioners exchange experiences, and workshops, have now become a tradition in the region and identify the problems of society, groups and personalit. Search, comparison, mediation, scholars, practitioners in the modern period of development of society and groups, with the position of the cultural and historical context, research approaches enrich the process of social cognition personality image of the world in a globalized world, the design and interpretation of environmental social reality of Tuva ethos.

Medical tourism as national economic development in Asia: comparative case study of Singapore and Thailand, versus Japan and Taiwan

Medical tourism development has been put on the national economic development agenda by a number of Asian countries in the last fifteen years. Beginning with the forerunners of Singapore, Thailand and Malaysia, subsequently other countries, notably India, the Philippines and South Korea, joined the fray. Most recently, Japan and Taiwan also declared that they would promote medical tourism. The governments of these countries seem to share a common policy goal in developing medical tourism, i.e. to increase foreign exchange earnings, expand medical and other ancillary services, and generate employment opportunities. However, each country has developed different strategies in targeting specific niches in the international healthcare markets. In this paper we compare state strategies, e.g. the market formation of two “early wave” countries, namely Thailand and Singapore, with the two most recent “later wave” countries, Japan and Taiwan. In their marketing strategies, Thailand and Singapore target diverse countries across the globe. In contrast, Japan and Taiwan have focused their strategies to solely the emerging market in China. We explore the roots of these differences in the character of the states and the nature of domestic health policy. While Thailand and Singapore can be characterised as developmental states or have come from such a historical background) with strong mandates to pursue aggressive economic development and growth strategies, Japan and Taiwan, being East Asian welfare states, have to be more cautious in balancing citizens’ rights and private interest. By teasing out the differences in the medical tourism development policies of these countries and tracing their linkages to the characteristics of the states, we aim to contribute to deepening our understanding of changing public health policies in the context of globalization.

Intergenerational Dependencies: Retirement and Old Age in the Prism of Family Geography

If the family is a determining element at every age in life, it is even more at old age. At the same time retirement and old age are more and more dissociated. What form does the family take for retired and aging persons? How does the social constraint in family apply on its members? The research undertaken until today has focused mainly on the one hand on the structural modifications affecting the households rather than the family and on the other hand on the residential mobility of the persons themselves rather than in the evolution of their environment. The aim of this research is to try to observe the spatial configurations and thus the places, not the individual or his household, but of his non co-resident family. When retiring, do individuals change their place of residence? Do they take advantage to move closer to their family? What about the following years when the individuals are ageing? Based on a transversal approach we will choose three life periods (the active individuals aged over 55, the retired aged under 65 and the retired aged over 75) to observe which spatial family forms are dominating and if it is possible to establish a link between the life steps after 55 years of age. This work obliges us to take into account social and demographic characteristics of individuals and their families as their mobility and family geography depends on it. This work builds on the survey “Famille et Logement 2011”, which collected data from the residents of both sexes aged 18 years of age and over. The survey gives information on the different places of residence of the children and parents of the individual questioned and thus allows for a mapping of the families of individuals at different age.

Revisiting the Boy Who Cried Wolf: Tornadoes and the False Alarm Effect

While the origin of the story is not clear, the 1867 publication of Aesops Fables brought "The Boy Who Cried Wolf" into the homes and hearts of many families. The story is simple and the message clear. It tells of a shepherd boy who lies to his community about a dangerous wolf to make people run to his assistance for his entertainment. The moral of the story is “if you don’t tell the truth people won’t believe you when you need them to.” Its appeal is massive and cultures around the globe use it to extol the moral virtues of truth, honesty, and honor. It is somewhat unsurprising then that building on the very same logic, academicians and practitioners have long debated the “cry wolf” or more often the false alarm effects of warnings. The question is simple: Are we somehow acting like that little boy and “crying (insert some weather phenomenon)” too often. Using a playful reference to the original fable, this analysis breaks down the key moral elements of the classic story and reinterprets their connection to current tornado prediction and patterns of risk perception as a way to help illustrate the range of complexities in need of targeted scientific research. We go on to provide several examples that illustrate analysis of the driver of false alarm, and behavioral response to a series of tornadoes that occurred between 2007 and 2010. Contrary to most existing research, we do find a statistically significant false alarm effect among other important predictors. Conclusions discuss the importance and limits of these results and suggest further research needs.

The Impact of Social Segregation on Educational Achievement in France

Social and spatial segregation is increasingly present in debates on urban policy and in the analysis of the phenomena of violence among young people. In recent years the extent of social segregation among French secondary schools is mainly due to a greater social polarization in some urban areas. There have been little studies about social segregation mainly because of the difficulties to build a set of relevant methods and measures. The aim of this paper is to provide various measures of social and spatial segregation in order to assess the links between segregation, competitiveness and educational achievement.

Internet-Mediated Cooperative Norm Setting: In Search of Institutional and Organizational Success Factors

Norms are an essential mean of any social group, organization or society to solve the problems of social life and to accomplish common goals. In a lot of social contexts norms are the results of formal processes, in which representatives, authorities or experts develop and impose norms on their recipients (e.g. parliamentary legislation or acts of authoritative imposing of norms in organizations). Current developments show an increasing demand for direct involvement in the process of collective decision making. The demand for direct participation is mostly justified with reference to democratic ideals, but there are also empirical evidences that the “quality” of norms increase if affected individuals take part in their development (Ostrom 1990, 2009). With the term “internet-mediated cooperative norm setting” we (a research group located at the University of Düsseldorf /Germany) define a process of drafting, discussing and deciding on norms that is mostly justified with reference to democratic ideals, but there are also empirical evidences that the “quality” of norms increase if affected individuals take part in their development (Ostrom 1990, 2009). With the term “internet-mediated cooperative norm setting” we (a research group located at the University of Düsseldorf /Germany) define a process of drafting, discussing and deciding on norms that are mainly due to a greater social polarization in some urban areas. There have been little studies about social segregation mainly because of the difficulties to build a set of relevant methods and measures. The aim of this paper is to provide various measures of social and spatial segregation in order to assess the links between segregation, competitiveness and educational achievement.

For a successful implementation of an internet-mediated cooperative norm setting two challenges are to be met: First, the individual contributions must be aggregated to an outcome. Second, people need to be motivated to take part in a process that will not only be longitudinal and cost-intensive. If these challenges can be solved, is dependent on context factors like the institutional embedding and on design factors like the forms of participation and the modes of decision making offered.

For this contribution, I will first outline the concept of an internet-mediated cooperative norm setting. Second, I will present a framework for the analysis of the institutional design. Third, I will present results of an empirical evaluation of a project of internet-mediated cooperative norm setting which was realized in the summer of 2013.
Concern Over Climate Change Among Young Australians

A large survey of young people in Queensland, Australia, indicates the majority believe that climate change is occurring, that the planet is warming because of greenhouse gas emissions and that anthropogenic global warming poses a serious risk to Australia. Parental education has an important influence upon the development of environmental attitudes among young people, with the children of tertiary educated parents much more likely than others to be concerned about planetary warming. A strong gender divide is also apparent, with young women consistently more concerned about 'the environment than young men are. Political party identification has an important influence upon environmental concerns even among these 15-17 year olds, with young conservative party identifiers far less likely than Greens or Labor identifiers to believe that global warming will pose a serious risk in their lifetime, after controlling for beliefs in human-induced climate change. The party identification findings point to an emerging support base of young Australians for parties that adopt a progressive stance on climate change among.

TREHIN-LALANNE, REMI* (CNRS, remi.trehin-lalanne@ens.fr)
The Modernization of Man By Numbers: Measures and Excess of the “Knowledge Society” (1945-2012). A Sociological Critique of Quantification

The starting point of this study is the adoption by the European Union in 2000 of numerical indicators and benchmarks to compare and stimulate the performance of the education systems of Member States. It looks closely at the processing of this statistical information during both fabrication and diffusion. These tools for government have been developed within the international institutions created around the Second World War (UNESCO, OECD) in an attempt to combat the material well being and social harmony by shaping education to meet the challenges of the industrial world. This policy of reliance on numbers has created an increasingly voluminous structure, in permanent expansion as it generates new data. Its growth has been fuelled by new technologies that facilitate the direct collection of data in schools and classrooms. Because they increase the traceability of school careers and allow for more regular evaluation of schools and students, these tools are used by both management and social science researchers to improve education and administration. Presented as teaching aids, they are designed to improve teachers’ performance by allowing them to evaluate, classify and grade both their students and their difficulties. The phenomenon of quantification, by which we mean the activity of giving numerical expression to realities not previously expressed in this way, is considered here from three points of view - administrative, scientific and industrial - in order to provide an understanding of the origins and the effects of the avalanche of numbers on the vitality of our democracies and their inhabitants.

TREIMAN, DONALD J* (University of California at Los Angeles, treimandj@gmail.com)
The Relationship Between Social Status and Health: A Conceptual Review

Although “health disparities” have been a long standing interest of public health researchers, the complex relationship between social status and health has only recently captured the attention of sociological students of social inequality. Indeed, the first appearance of a session on health at an RC 28 meeting was in 2003 in Tokyo. However, interest in this topic is expanding rapidly and it clearly is an important direction for future research by our community. The current paper reviews what is known about the relationships between indicators of inequality (primarily social origins, education, occupational status, and income) and health outcomes and also about the effect of health on subsequent socioeconomic status. The evidence regarding many of these relationships is equivocal. But, more importantly, when empirical relationships are well established, the social processes that generate them are often under-theorized. In this paper I attempt to lay out the theoretical basis for expecting particular relationships with the intent of encouraging new research.

Research topics I will focus on include the following:

- The effect of trauma experienced in pregnancy on education, adult socioeconomic outcomes, and adult health.
- The effect of childhood illness and injury on education, adult socioeconomic outcomes, and adult health.
- The role of education in affecting health behaviors and health outcomes.
- The effect of social rank on health behaviors and health outcomes.
The effect of income on health behaviors and health outcomes.

The role of poverty as an added detriment to health.

The effect of health on socioeconomic achievement.

Methodological issues:
- Getting adequate retrospective data to measure childhood illness and injury in surveys of adults.
- Improving subjective health assessments through anchoring and other techniques.
- How useful are biometric measurements, including blood and saliva samples, in general population surveys?

Historic Heritage and Petitioning in the Context of the Run-up to International Summits in Russia

Neoliberalism entangles all states, including liberal democratic ones, in capital-

IS A World Congress of Sociology
held in the West provoked fierce street protests, the summits held in Russia are widely and critically discussed online. Some intellectuals actively resist being complicit in the entrepreneurial discourse in their work and alternative discourses emerge. These discourses emerge by way of petitioning authorities. The lack of regulations regarding the predicament of evicted citizens; the absence of a program for the preservation of the cultural heritage of the city; an urgent remapping of the so-called “guarded zones” to accommodate the summits-related pressure to have enough vacant lots; and “a mess” (the metaphor of one of the interviewees) instead of systematic and logical administrative law-making—all these factors contribute to an increased “client-patron mentality” among active citizens. By “client-patron mentality” I mean the active citizens’ and political activists’ reliance on petitioning as the way for themselves to be heard and to get things done. Whether it is the only effective means to prompt the patrons to share a piece of the state budget pie or a quite efficient way to engage more public into discussions, petitioning prompts us to more closely look at the ambiguities behind genuine citizen participation.

TRUBINA, ELENA* (Ural Federal University, elena.trubina@gmail.com)
The Dialectic of Rationality and Irrationality of Urban Growth in Post-Socialist Urban Development and the “Classic” Capitalist One

It was during the 1970s that urban studies scholars began to analytically investigate the dialectic of rationality and irrationality related to urban growth. These pioneering analyses were a response to the early stage of the post-Fordist transition of Western economies and the emergence of supply-side-oriented economic development. Having admitted “the general irrationality of the present urban system” (1978: 329), Molotch described the American urban system of the second half of the twentieth century, in which cities retained relative autonomy from the central government. For his part, David Harvey called cities “the irrational rationalizers” within the capitalist mode of production (1976: 112) and demonstrated why “the capitalist laws of accumulation” remain, for the time being, the only known laws of history. While both scholars emphasize a recurrent reconfiguration of urban alliances in order to cope with difficulties in financing the development of cities, Harvey, in his later work, described how neoliberal urban policies found a strong friend in the central state via neoliberalization of the state itself. Drawing on these path-breaking scholars, I argue that it is an irrational rationality which unites postsocialist urban development and the “classic” capitalist one. Today it is neoliberalism that figures as the global political rationality. It promotes market logic across all spheres of life. Part of this rationality is the expansion of state institutions. These act to broaden their administration into the practices of all societal spheres. Urban growth machines in Russia and elsewhere have embraced neoliberal policies and promoted global, market-led urban development. Since these processes have recently unfolded in the context of the global financial crisis, the growth machines often go awry. Yet this does not impede authorities at any level from investing, symbolically and economically, in the new iconic projects—by continually putting forward the rhetoric of efficiency and growth.

Education and Future Well Being of Latin American Adolescents

Latin America has shown great progress in average education attainmentst during the past few decades. An increased participation of women in the education system occurred together with this education expansion. On average and in most countries, there are more girls attending school at all educational levels than boys. Women’s participation in post secondary education is also higher than men’s. In spite of this regional panorama favorable for women, there still are educational challenges to be confronted. This higher education level achieved by women is not being reflected later in their labor market insertion. Young women have a lower labor participation rate than men, higher unemployment levels, and a labor insertion in less protected sectors (with higher levels of informality, less productive, and with worse income trajectories).

Although this paradox is probably associated with labor markets’ historic discrimination factors, this paper seeks to identify elements from the education system that help to explain this fact. It concludes that although access barriers to the education system have been overcome by women, there is still a lot to be done in relation to the mechanisms that perpetuate the traditional socialization forms. That is, the process by which unequal and discriminatory gender stereotypes are still formed within the teaching-learning process, interfering with the prospects of equal labor opportunities. The paper also takes into account the gender differences within the reasons for aborting school early and how that impacts the design of appropriate social policies.

RC04-94.1

TRUCCO, DANIELA* (United Nations ECLAC, daniela.trucco@cepal.org)

Education and Inequality in Latin America

Latin America has shown great progress in average education attainments during the past few decades. Most countries are close to achieving universal access to primary education and some of them have the majority of the younger generations entering the secondary level. However, these same developments in education coverage and access have driven to an important stratification of learning achievements and attainments within the education systems. In spite of the numerous expectations associated with education as the principal mean for social mobility, this region of the world has not been able to transform the education system in a strong mechanism to equalize opportunities. This is partly related to the importance that household social and economic conditions have in determining educational achievements. Most of the time, this inequality is also reflected in a growing segmentation of the inequality and efficacy of the education offer.

This paper examines the development of the main education indicators in the past decade among Latin American countries. Data from the countries’ household surveys is used to describe the main attainment indicators (coverage and conclusion by education levels and social groups); and data from some international standardized tests (such as PISA and ICCS) is used to discuss learning achievement inequalities. The document identifies the main challenges Latin American countries have in terms of education development and the reduction of inequality.

Disaster Capitalism and the Chilean Earthquake and Tsunami of 27 February 2010

This paper addresses the earthquake and tsunami that hit Chile in the early morning of 27 February 2010. It highlights the resilience of the national state, the private and public press, and the large economic conglomerates to discursively, politically and economically profit from the catastrophe despite the weakness that appeared in the neoliberal state’s ability to prepare for the earthquake and for mitigating its consequences. It shows that a discourse of anomic and chaos fuelled by the press allowed for criminalizing the population, in particular the poor, and for occupying militarily vast regions of the country. It also discusses the deployment of charity as a means for the large monopolistic companies that dominate the Chilean economy to advertise their products and clean their images tainted by their practices during decades of neoliberalism. It finally addresses the resilience, solidarity and resistance of the population.

**Inside the French Hood. Revisiting Juvenile Delinquency in Urban Relegated Districts**

This paper aims to explore the constructed reality of the 'rising of juvenile delinquency in housing projects' social problem in France through the narratives told by the story of 3 chosen insiders, part of a larger population of teenagers studied in a longitudinal ethnographic fieldwork for 6 years. This topic is located at the centre of the national political debates since the 2005 banlieue riots and has generated effective and consensual typifications categorizing the banlieue youth and its commitment with delinquent activities. Those typification associated to these teenagers - mainly separating the 'good ones' who are going to school and the 'bad ones' who are hanging around on street corners - does not only suffer from a very biased empirical material but also fails to explain the social, symbolic and economical significance of juvenile delinquent practices. The key separating outsiders from insiders on this particular topic is the way time is - or is not - taken into account. Outsiders do not consider delinquent activities within an historical and biographical process but as an illegal and immoral activity to be eradicated. On the opposite, listening to insiders allows us to understand that illegal activities have to be understood in relation to social trajectories and, hence, have to be considered as significant and inclusive moments rather than only taking the place of the higher education. Uncovering behind this issue is a wider reflection about the way the French society has structured the relationships between its ethnic and social minorities and the 'majority'. Focusing on 3 cases allow to contemplate 'dense' ethnographical material which appears to be a potent sociological strategy to deconstruct engraved typifications. This paper is issued from my latest book: *Des capuches et des hommes. Trajectoires de ‘jeunes de banlieue’*, Paris, Buchet-Chastel, 2013.

**THE DISCIPLINE OF CHOICE. How students 'choose' further education in French priority education zones**

Through an intensive, participant and longitudinal ethnographic fieldwork conducted during 6 years, this paper raises the issue of further education's choices of French highschool pupils in priority education zones (*Zone d'Education Prioritaire*), in the northern outskirts of Paris. Studied pupils statistically concentrates with characteristics that disconnect them from other properties that had them to be objectively and subjectively placed at the bottom of the social structure as well as being less likely to have academ-ic 'success'. The study will focus on pupils following the academic track who are about to pass the *bacalauréat*, hence having to start to select the expected and oriented curriculum in the higher education system they are about to enter into. Contrary to the official discourse of “free choice” held by the institution, it shows the constitution amongst pupils of a *discipline of choice* (Truong, 2013) - a set of social rules for considering options and deciding between alternatives (Reay and Ball, 1997), as well as finding relative information to do so. This *discipline of choice* acts as a common rationale for subaltern students who remain undecided about their future, showing the importance of territorial stigma (Wacquant, 2007) and the rejection of university (Beaud, 2002) - vs. the praise of a more highly supervised and visu- alized type of further studies - in choices. This rationale leads to ambivalent and contradictory attempts to escape or dis-identify (Skeggs, 1997) - from a set of intertwined illegitimate categories (working class group, immigrant background and race, residency in housing projects and stigmatised banlieue, ‘muslim community’ etc.) within a society promoting access to higher education for all by offering a sociological strategy to deconstruct engraved typifications. This paper is issued from my latest book: *Des capuches et des hommes. Trajectoires de ‘jeunes de banlieue’*, Paris, Buchet-Chastel, 2013.

**Globalization and Higher Education in India**

The globalization is a process which is now transforming every sphere of our social, cultural and political life both in the developing and developed countries. Transnational flow of the capital, commodities and people is an essential feature of the globalization. This creates homogenization of higher education although

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
in a very limited sense to enable the mobility of the potential population of the countries who opened their economy for global trade in last few decades. This requires the standardization of the education system in terms of content and quality of education throughout the world. In India, the system of higher education is highly fragmented and stratified and produces students of different qualities. A large number of students having different social background and different type of schooling up to secondary level also vary in their educational attainments as well as in their career graph. They usually fall short to the national and international standards. Only few institutions of higher learning have the capacity to produce the students who have potential to compete in the global job market. Thus, globalization poses a new challenge to make necessary structural and qualitative changes in the institutions of higher learning in order to cope with the changes taking place in the globalized economy of the country. The present paper analyses various dimensions of the intricate relationship between globalization and higher education in a developing society like India.

Exchange and Life Satisfaction: Intergenerational Reciprocations in East Asia

Exchange plays a key role in affecting level of well-being. This study aims to develop a fundamental typology of exchanges across generations. By focusing on exchange of finance and household services between adult children and their parents (and parents-in-law), four types of exchanges can be identified: balanced, credited, debtled, and self-reliance. We then investigate if different types of exchange affect life satisfaction and marital satisfaction. Empirical data are drawn from the East Asian Social Survey, which allows a comparative study of Japan, South Korea, Taiwan and China.

Land Grabbing in Taiwan: The Crisis of Food Security and Land Justice

Since the 1980s Taiwan had adopted liberalism economic policy and given up the principle of food self-sufficiency. The importance of agriculture had decreased and the land had been seen as valuable asset rather than the means of production. These changes together contribute an over-dependence on imported food in the local market and the loss of food sovereignty of the consumers and farmers. As a result, the food self-sufficiency rate has been extremely low in Taiwan (33%), far lower than China (95%), France (122%), the U.S. (128%), and even Japan (40%). In recent years, the implementation of neo-liberalism in agricultural policy has further worsened the practices of farming and the ways of land use in the rural areas. Since several local governments aim to promote rapid development in the high-tech industry, many farmers and rural residents have been forced to leave their farmland and assets. Over the past decade, Taiwan has consequently lost 4,000 hectares of farmland per year and totally lost 109,652 hectares in the last 30 years equated around 12% of farmland. In reality, the legalized land exploitation which in the name of scientific and industrial park and various developmental projects could be seen as a new form of land grabbing. In this paper, we present two case studies and explore how the recent land exploitation has changed the agricultural practices and social context in the rural areas and the long-term effect on the food security of the whole society. The two cases cover the events and outcomes which have happened in Dapu District of Miaoli County and Sangtigxhiao of Changhua County, the former representing the form of anti-land-grabbing and the latter of an anti-water-grabbing one. Finally, we will attempt to discuss the impact of land grabbing on the food security and the possible citizenship aspires to food sovereignty.

Genetic Science in Identity Making: The Rediscovery of Taiwanese Origin and Ancestry

The global development of genetic science and technology has its various manifestations in different local political and cultural contexts. The government of Taiwan began to support the development of biotechnology by funding projects during the 1980s, when this country underwent dramatic transition from authoritarian rule to democracy, emergence of ethnic politics, and conflict of national identity. After the rule by martial law ended, scientific research on the origin and the genetic background of Taiwanese people began to emerge in the 1990s. Taking for example the research findings and scientific discourse of the team led by Professor Marie Lin, M.D., widely known as “the mother of the research of Taiwanese blood,” my article aims to explore the particular process of co-production between genetic research and identity politics in Taiwan. Since the 1990s, she has devoted herself to unveiling the mystery of the origins of the ethnic groups in Taiwan by finding scientific evidences of blood attributes and genes. Based on the research findings of her team over the recent two decades, Lin argues that 1) 85 percent of Taiwanese have aboriginal genes; 2) the Han Taiwanese people (Hoklo and Hakka ethnic groups) are mainly the descendants of the Yue people from southern China; 3) a major part of blood attributes of the Han Taiwanese people is derived from plain aboriginal people and 4) aboriginal peoples in Taiwan have multiple origins. These arguments pose a radical challenge to the dominant Chinese nationalist ideology of the period of the authoritarian rule, which is still lingering on nowadays. My article analyzes how the genetic research on Taiwanese origin and ancestry represented by Lin and her team’s has been shaped by social, political, and cultural factors in the context of democratization and ethnic identity. My analysis also shows clearly how science and politics are mutually constitutive.

Efficiency of Information Influence: Features of Measurement

Moscow is overloaded with outdoor advertisement that’s why analysis of advertisement efficiency becomes an extremely actual matter. We use tracking to solve a lot of research tasks, such as determination of the population percentage attracted by any advertisement, correlation between advertising images kept in mind and number of brands or company names recognized, poster attractiveness for target groups of any products or services, etc. In spite of considerable measurements, regular sociological surveys in this sphere were only conducted in England and Australia. Espar Analyst Research Agency has conducted the first monthly tracking surveys in the outdoor advising market in Russia. The objects of its research are advertising posters within the territory of Moscow and the matters are brands and companies.

The goal of the research is to determine an efficiency rate of an outdoor advertising campaign. Efficiency means here the rate of poster penetration and brand recognition. This goal may be achieved in case if the main task of measuring general parameter for evaluation of each outdoor advertising campaign’s efficiency is resolved.

The following factors shall be considered in the analysis of the data obtained:
- number, type and location of advertising media;
- duration;
- other media used for advertising the brand;
- creative solution;
- advertised product category.

One of the most important results of tracking campaigns is an opportunity to form a limited indicator basis for each group of products and services, which would allow to compare the campaigns and bring their characteristics into correlation with average indicators for different product categories or formats used. Such surveys are aimed at renewal the empirical basis of social sciences, which study the influence of different format advertising images of human consciousness that is extremely important when the so called visual culture is developed.

Quality of Life As Local-Global Reflection

The changing world exacerbates so many contradictions of economic, social and environmental issues what affects the quality of life of the inhabitants of modern cities and villages. This kind of problem is especially perceptible for the most vulnerable socio-economically disadvantaged groups such as young people and the elderly.

Finding this approach, according to which to a QoL refers to a comprehensive well-being, that takes into account the various aspects of human life, the Department of Sociology of Russian State University for the Humanities conducted research using questionnaires in October 2012 and September 2013. It represented the adult population and distinguished four main studying groups: youth, senior citizens, urban and rural population of different ages.

In the result, we obtained not only an idea of the self-perception of different socio-demographic groups representatives in relation to the assessment of individual aspects of life (personal economic status, social status, personal security, availability of education, social welfare and medical services, maternal and child welfare, employment, leisure etc.), but also identified mechanisms to increase self-perception of QoL.

The first one (objective) defines QoL as a result of combinations of different statistics. The second model is based on affirmation that the real sense of QoL is reflected in subjective feelings of individuals, which are formed on the basis

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
of system developments level of individual, his life experience, emotional status, etc. The objective indicators (measures) include following main groups: natural, economic and social. Subjective ones are represented by life satisfaction, the feeling of happiness and depression, social support, personal competence, anxiety, stress, etc. This non-linear relation between the objective and subjective indicators allows to find a paradoxicalness of public consciousness and offers an original mechanisms to overcome the negative trend in QoL.

All these aspects will be considered as Local-Global reflection.

Regional Development and Social Inequality in the Age of Globalization: The Case of Taiwan

Modern societies all face a fast-developing and fast-changing global world. Recent development of tighter connection among Asian countries, especially with Chinese economy has brought significant impacts on the regional development and local life of these countries. It is expected that the emergence of the Pan Asian economy might have changed the class structure and social distributions in Taiwan. The paper proposes to study the changes of Taiwan's social class as well as occupational structures during the last twenty years. Further analysis might show the extent of the restructurin of Taiwan's occupational structure. In addition to occupational structure changes, this paper will also focus on the trend of economic development. To compete with other economies, Taiwan government has pursued a series of large-scale urban development and regional reorganization, during the years of fast globalization, which might have caused an unbalanced development among regions and skyrockets the housing price in urban areas and thus further exacerbates the income inequality. I will analyze both macro and micro data to test the hypotheses whether the regional development either in a national scale or within the national territory has affected the degree of social stratification in terms of social classes and the inequality of distribution.

Inclusion Or Illusion: The Romance and Reality Of Integrating Students With Special Education Needs In Hong Kong

Integrating students with special education needs (SEN) into ordinary schools is a widespread movement towards "Education for All" in many developed countries. In principle, a shift from allowing students with disabilities to be educated in segregated special schools to providing them with opportunities to be educated in ordinary schools is justified on educational and normative grounds. Following the proclamation of the Salamanca Statement as advocated by the United Nations, the Hong Kong Government initiated a pilot project in 1997, and promoted a whole school integrated education in full scale starting from 2004. Despite its goodwill on the part of the Government, many difficulties and problems have arisen along the moves towards greater inclusion in the Hong Kong education system. For example, the practices of integration education are under criticism as many students with SEN are not properly cared or taught, and some are even bullied by fellow students. Provision of sufficient resources and support to ordinary schools or teachers is another matter of grave concern. Teachers also face with problems in maintaining classroom discipline and ambivalence in meeting the competing demands of academic excellence on the one hand and equality and inclusion on the other. Inclusive education is one of the most controversial education policies in Hong Kong. The progress of inclusion will be examined in the dimensions of access (the extent to which students with SEN attending mainstream classes); acceptance (the extent to which all students are treated as full school members); participation (the extent to which all students contribute actively in school, and achievement in terms of academic, social and emotional development. Values dilemmas and paradoxes resulted from the integrated education measures will be examined with a focus on accommodating diversity, quality, equity and fairness, as well as reducing or enhancing social inequality.

Silenced Controversies: The Professionalization of Psychiatry and the Biomedicalization of ADHD in Taiwan

ADHD (Attention Deficit/Hyperactivity Disorder), the most common mental disorder among children and adolescents in Taiwan, does not seem to be as controversial in terms of its entity, diagnosis and medical safety among local professionals as it is in some Western countries such as the United States. This is not to say that Taiwanese psychiatrists uniformly embrace the biomedical model of ADHD. However, alternative paradigms and practices of psychiatry are excluded from the public sphere and discouraged by the National Health Insurance. Besides, the strategic alliance among psychiatrists, teachers and parents for dealing with various learning difficulties effectively justifies the medical framework of children's deviant behaviors. By analyzing the archives of the professionalization of Taiwanese psychiatry, and by conducting interviews with psychiatrists, relevant medical professionals, teachers, and the main parents organization, I unravel the interrelated processes of the development of the medical sub specialty, the publicization of health services and the medicalization of education, in order to elaborate that the biomedicalization of ADHD in Taiwan is not a necessary achievement of advancement in psychiatry, but a co-production with various social and political conditions. In particular, the "biomedical evidences" and "gearing to the international norms" constitute the driving rationality and emotion of the professionalization of Taiwanese psychiatry in a latecomer context; moreover, as a late-developing medical specialty, Taiwanese psychiatry lacks a sufficiently powerful legacy of the psycho-dynamic approach, which dominated Euro-American psychiatry before the 1980s and has thus far provided competition for the biomedical approach. Furthermore, Taiwanese child and adolescent psychiatrists are few in number to encourage multi-paradigms. Therefore, although controversies and alternative practices concerning ADHD exist, they do not originate from the psychiatric in-group and thus find it difficult to shake the mainstream practices. Consequently, the biomedical discourses and treatment of ADHD have been stabilized and reproduced in Taiwanese psychiatry.

Digital Inclusion or Digital Exclusion? The Second Order Divide in Taiwan

The study of digital divide has shifted its focuses from unequal access to ICTs to the second digital divide that addresses the inequality resulting from the different ways people use ICT technologies. The shift to ICT usage because of its implication for social inclusion that ICTs play a critical role in all aspects of the new economy and information society. By including online activities in their measurement of digital exclusion, the studies of Oxford Internet Institute distinguished three levels of digital activities and found that individuals with specific disadvantages appear to be excluded from the digital activities that could help them most. This study, by employing secondary and longitudinal data of national Individual and Household Digital Divide Survey in Taiwan, aims at examining the barriers of second order digital divide and understanding the social implication of digital inequality in the information society. The results suggest that despite of the closing gaps of ICTs access across groups and declining usage gaps in basic internet activities (e.g. information searching, communication, entertainment), persistent or widening gaps are found across groups in intermediate and advanced internet activities, such as usages of online finance, e-government and civic engagement. These results imply that social inequality might accelerate in the information society for those well privileged groups take uneven advantages and benefits from effectively use of online activities in the social, economic, and political spheres, while lack of usage in needed digital resources will make groups that are already socially disadvantaged fall further behind. Without proper inter-connection, the wider array of ICT usages in information society becomes the potent tools to deepen social divides.

Vavilios Scandal: The Politics of Sexual Harassment in Post-Apartheid South African Trade Unions

Vavilios Scandal: The politics of sexual harassment in post-apartheid South African trade unions

In July 2013 the General Secretary of the Congress of South African Trade Unions (COSATU) (the largest political federation in the South Africa), Zwelinzima Vavi was accused of rape and sexual harassment of a junior female colleague. While the rape allegations were later withdrawn by the accused, Vavi was subsequently suspended and investigations into the allegations of sexual harassment are being conducted by the federation. Much focus from the South African media is also directed on Vavi's struggles within COSATU and attempts by Vavi to capitalize on the scandal to remove him from his position. However, the significance of the incident for this paper is that it highlighted the patriarchal, unequal and hierarchical gender relations dominant in the South African trade union movement (Scott, 1986). Unions are organizations of power, which is often defined in masculine terms. The incident also reminded us of the need to publicly acknowledge the importance of sexuality in organizations (Ackor 1990:139), where women and men are perceived differently and assigned roles according to how they are perceived. This study has brought to the forefront the manifestation of sexual harassment within the masculine organizational culture of the federation and its affiliated unions. The paper aims to discuss the politics of sexual harassment in the

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
post-apartheid South African unions, where women continue to be marginalized from leadership positions in spite of constituting almost half (48 per cent) of the union membership (COSATU 2011). The paper seeks to understand the significance of women’s composition in COSATU unions in terms of raising their voices and challenging dominant patriarchal practices. What is the significance of the increase in women’s membership in terms of their struggles to reconfigure the dominant masculine culture of trade unions?

Women Academics Under Crisis: A New Field for Reflexivity

Research data show that the present economic crisis has worsened women’s position in society. New categories of women become vulnerable to the impact of this crisis. To the traditional categories of vulnerable women (migrants, single-parent families, women victims of domestic violence, unemployed young women etc.) are now added women coming from middle and upper-middle class ladders of society (women entrepreneurs, women of high educational and employment credentials, women owners of big properties etc.). Women belonging to these new categories seem to be threatened by the risk of status degradation and the risk of impoverishment.

This paper focuses on the impact of crisis on women of high credentials. Such is the case of women academics that work in universities and research centers in Greece, a category of women of hitherto recognized social status and established high position in social hierarchy.

Our presentation is based on qualitative data coming out of the living experiences of women academics facing the impact of crisis in their professional and personal life. Initial results indicate the gravity of the present economic crisis as it expands also to include women holding highly privileged academic positions in the social hierarchy. Austerity measures have not only diminished the income of academic women but also have enormously affected their living standards and worsened their working conditions. Moreover it is to be noted that the economic crisis seems to have brought into surface latent aspects of social crisis resulting from pre-existing social transformations which in turn also affect academic women’s lives.

Thus our attempt is to develop a reflexive account on the living experiences of women academics as well as to discuss the impact of the present economic crisis on processes of women’s downward social mobility.

Young People in Social Disadvantage: Opportunities and Threats in Local Environments

The arguments advanced in the proposed paper are based on the analysis of data concerning the means and ways of combating social exclusion of young people in social disadvantage at local communities by means of suitable educational and training programs.

In fact, in an era of globalization of economic and social relations, the employment structures may not be understandable on the basis neither of the model of “technocratic advancement” nor of the model of “specialization”. If such is the case, there is an urgent need for the employment of other forms of “capital” in order to combat marginalization of those young people that suffer multiple social disadvantages. The question is how detached are modern societies from traditional forms of education, training and employment especially under conditions of austerity. Another issue for serious consideration is whether local environments possess new capacities for training and job opportunities for young people in social disadvantage. It is to be discussed also whether the local versus the global (i.e. in the sector of enterprises) may possess more opportunities than threats in combating unemployment and exclusion.

The Systemic Crisis of Greek Labor

Abstract

The current crisis in Greece has brought to the surface the employment security aspect of the Greek “labour system”. The employment relationship seems to be embedded upon a bifurcated system whereby labour is separated institutionally in a) a secured salaried public sector and b) a private sector defined by precarious labour conditions that characterised by the technical separation of work from its social security (mainly pensions) relationship. The two systems have been coupled with separate health care systems developing separately (recent attempts to unify are in process). The paper explores this hidden reality by defining the organisation of the labour system in Greece, its politico-administrative controls that formulate a binary legal system (public/private) that does not allow for the emergence of the not-for-profit-law institutions.

The “social” reproduction of private labour is based upon the formally established private and “commercialised” interests that practice “trade” in basic needs (health, education). As a result, communities rely on the family, the Church, self-help and, ... out-migration. By focusing on this anarchistic and discriminatory system of political order for the work labour we may be able to unlock the reasons for the weakness of labour social economy organisations in Greece and the acute unemployment rates (the highest in the Eurozone). This approach will aid our understanding of the Greek crisis as a failure of Euro-Zone’s public policy.

Key words

Greek institutional crisis; labour fragmentation; Euro-Zone, social development

TSOLIDIS, GEORGINA* (University of Ballarat, g.tsolidis@federation.edu.au)

Octopus Man and Tiger Woman - Why the Chinese Are Bad for Australian Nationhood

Historically Australia has considered itself a white, Christian and British bastion in the South Pacific region. The main threat to this status was conceived of as coming from the east, particularly from the ‘hordes’ of Chinese who would sweep down and over run the nation. These discourses were prominent during the Gold Rushes when Chinese men were constructed as a threat and represented as an octopus of evil. Immigration policies were instigated to stop the ‘yellow peril’. While the so-called White Australia Policy was formally rescinded in the 1970s those from Asia are still constructed as a threat.

Most recently it is Chinese students who are ‘taking over’ the most desirable government schools. Because they are new to the education systems they are excelling at entry exams and providing little incentive for mainstream Australian students to compete or be schooled in environments dominated by Asian students. Tiger mothers are represented as standing over their children, ensuring they work hard enough to achieve well. The work ethic associated with the Chinese is a form of racism. In contemporary discourses this is associated withrote learning for exams rather than independent thought.

In this paper historical depictions of Chinese men represented as an octopus ready to seduce Australian women, including through the provision of heroin, will be contrasted to depictions of Chinese women as Tiger mothers who stand behind their children ready to wield ‘tough love’ towards success. What does the promulgation of such representations in the media tell us about Australian nationhood and its reliance on gendered forms of racism for meaning?

Sakyadhita and the International Movement for Gender Equity in Buddhism

During the 1980s, the glaring discrepancies between opportunities for women and men in Buddhist institutions and societies caught the attention of a small group of women living in different countries and practicing in different Buddhist traditions. Communicating by post, they decided to gather to discuss what could be done to address these inequalities. In 1987, at the conclusion of this first gathering in Bodhgaya, India, an international association of Buddhist women called Sakyadhita was founded. Since then, Sakyadhita has received scant attention from the academic community, but the consequences for women in Buddhist traditions may not be understandable on the basis neither of the model of “technocratic advancement” nor of the model of “specialization”. If such is the case, there is an urgent need for the employment of other forms of “capital” in order to combat marginalization of those young people that suffer multiple social disadvantages. The question is how detached are modern societies from traditional forms of education, training and employment especially under conditions of austerity. Another issue for serious consideration is whether local environments possess new capacities for training and job opportunities for young people in social disadvantage. A Study on the Costs and Demand for Foreign Nurses/Care Workers in Japan – from the Angle of Hospitals and Care Facilities –

Many consider that the international migration of nurses and care workers is driven by economic factors. Wage and cost differentials should work as a ‘push factor’ in sending countries and a ‘pull’ factor in receiving countries, though rules and regulations may partly hinder it. Japan opened the gate for foreign nurses and care givers under the Economic Partnership Agreements for the first time in 2009. It was anticipated that application and entry would rise sharply because wage gaps with other Asian countries remained high and the rapid aging of Japan’s society badly needed more nurses and care workers. However, the actual entry of such personnel has been on a declining trend in recent years, despite government efforts for reducing entry barriers. This study has attempted to analyze the pull factor, i.e. the economic costs that accrued in the hospitals and care facilities based on a survey conducted. The analysis revealed no statistically significant correlation between the economic considerations and the willingness to hire nurse candidates, implying the existence of non-economic reasons for the reduced entry of such workers. For the care givers, economic considerations seem to have had some impact on the willingness of care facilities to receive additional foreign workers. It would be imperative for the government to address institutional impediments for the nurses and pay more attention to the economic incentives for the care facilities in order to increase the number of foreign nurses and care givers in Japan.

Organizing Immigrants in Rural Areas in Japan: Case Studies of the Tsunami-Devastated Areas

This study examines the process of organizing immigrant groups in rural areas in Tohoku, Japan, especially the 3.11 tsunami-devastated areas. In recent decades, Japan has witnessed the entrance of many more immigrants. Along with this influx of newcomers, their relationships with Japanese society and their social mobility have drawn attentions. Although previous studies tend to focus on the cases of labor immigrants in urban areas or highly urbanized rural areas, few studies have been conducted with a focus on the immigrants in rural areas that lack a concentration of immigrant populations, such as the Tohoku region.

Many of immigrants in the Tohoku region are female immigrants as spouses of Japanese nationals, who are mostly dispersed throughout small towns and villages. They tended to be marginalized from their local society and given the limited understandings and supports from the local government.

The Great East Japan earthquake that devastated many areas of the Tohoku region seriously affected these immigrants as well as Japanese nationals. The disaster and its aftermath consequently led them to form groups to help support each other and to change their social surroundings. How did they attempt to grapple with the difficulties after the disaster? To what extent did their organizational efforts contribute to changing their relationships with their local society? With a focus on these questions, this study analyzes the process of organizing immigrants in the Tohoku region. The findings from my interviews with the actors and participatory observations suggest how they obtain resources inside and outside their community on the recovering process after the disaster, and the social issues they face to continue living in rural society. This study contributes to considering the possibilities and issues of ‘bottom-up’ approach for immigrants to change their social surroundings in rural society in Japan.

Changes in Friendship Relations of Japanese Youth

This study aims at revealing the changes in friendship relations of Japanese youth. In their everyday life, friendship relations are becoming more and more important.

According to a recent report, “In response to questioning about when they feel their adult life is fulfilling, the largest percentage of Japanese youth answered “When I am with friends or companions” (74.6%)”. This is also the largest percentage among the other five countries (South Korea: 58.1%, U.S.A.: 64.7%, U.K.: 45.1%, France: 68.2%), and that have basically increased from past years (1977~78: 50.1%, 1983: 59.2%, 1988: 62.0%, 1993: 70.8%, 1998: 74.0%, 2003: 72.5%, 2007: 74.6%). But in recent years, there are some interesting changes. The percentages giving “When I am by myself without being annoyed by anyone” (13.8% in 2003 to 19.8% in 2007) increased over the previous survey. (Naikaku-fu, 2009, “The JAPANESE YOUTH: In Comparison with the Youth of the World, A Summary Report of the Eighth World Youth Survey, http://www8.cao.go.jp/youth/english/worldyouth-e/html/mokui-e.html). This is so complex situation that is difficult to be understood, and our recent research also shows the same situation.

In this study, there are two ways of approach. Firstly, I would like to review the hypotheses about the changes in friendship relations (e.g. the dilution hypothesis, the selective hypothesis and the homogenization hypothesis). Secondly, I would like to analyze the quantitative data, and reveal the present situation and the changes. The data was collected in Tokyo and Kobe in 2002 and 2012. Respondents were randomly sampled. Their age ranges from 16 to 25.

In conclusion, it is revealed that the number of friends are increased but the diversity of that is reduced. It suggests that the friendship relations of Japanese youth have been homogenized.
Examining the Chain Relationship from Initial Contact to Classical Music to Socio-Economic Status Via Music Preference

This paper examines the effect of the initial contact to classical music on the music preference, and the effect of the music preference on the socio-economic status, in Japan. Especially, as in Bourdieu’s reproduction theory, whether people’s “orthodox” music preference from family affects their income is examined.

A questionnaire was handed to 2,000 audiences of Saito Kinen Festival in 2012. 594 audiences answered. The questionnaire included the questions of initial contact to classical music, preferences to 20 composers, and household income.

By latent class analysis of the initial contact, four types were found: (1) vague, or no particular initiation, the effect of (2) family, (3) eye-opening experiences, and (4) various sources and experiences. By latent class analysis of the composer preferences, five types were found: (a) shallow listeners, who do not know many composers, (b) orthodox maestro devotees, (c) hard-headed devotees, who love orthodox maestros but dislike contemporary composers, (d) overarching lovers, and (e) contemporary music lovers.

Crossing the types of initial contact and the types of music preference, the following was found.

1. Those with vague initial music experience tend to be shallow listeners.
2. Those who are affected by family do not have a particular preference.
3. Those who had eye-opening experience are not shallow listeners.
4. Those who received various effects are not shallow listeners, nor hardheaded, but overarching lovers.

OLS of the equivalent household income reveals the following. Those whose preferences were affected by family tend to have higher income than those with eye-opening experience. The orthodox maestro devotees have higher income than those with vague preference or hardheaded. However, as seen above, there is not an effect of family on orthodox preference. Therefore, we should conclude that there is no clear evidence for the chain relationship in Japan.

Food Aesthetics and the Unintended Construction of Civility in Peru

Peruvian food had always had important elements that connected it to national identity. However, in the last 10 years, food has acquired new—meanings that pertained to a strong sense of national pride, and new understandings of what it means to be Peruvian, which are reflected particularly in media and politics. In Peru’s biggest city, Lima (where 35% of its population live), culture and cuisine reflect the diversity of its population through years of internal and external immigration processes since the times of the Spanish colony. In this paper I argue that, in great part, the “aesthetization” of food in Peru—a focus on aesthetics rather than just flavor—was pivotal to the transformation of its social meanings during the mid 2000s. In the early 2000s, chefs and tourism operators considered this process of “aesthetization” essential for the promotion of Peruvian food and, consequently, for the promotion of tourism and the increase of economic revenue to Peru. An unintended consequence of the success of this process was that the newly named “novo Andean” cuisine became a central element of an invigorated Peruvian pride. Additionally, this pride in Peruvian cuisine, in great part, allowed for local identity. This result offers some rationale for the indirect reciprocity model of intergenerational support.
Rebuild a Trust Relationship Between Doctors and Patients--Informal Exchange in Chinese Health Sector

Trust lies at the heart of effective patient-doctor relationship. Chinese health sector is facing a trust crisis between patients and doctors as shown in the rising numbers of conflicts and denials. In seeking an accountable health care, patients widely employ informal exchange by giving gifts and red-packets to doctors, seeking connections and acquaintance relationship (guanxi) to get health care. The gift exchange and guanxi network involve the cultivation of emotion (renqing, ganging, the emotional feelings of indebtedness and obligation), through which a trustworthy relationship is emergent and negotiated. However, in the changing moral context of China today, trust is very fragile amidst the inherent uncertainties of medical care. The individual efforts of gift-exchange and guanxi networking sometimes could not secure a trustworthy relationship, and patients frequently become the targets of defrauding, extortion and abuse of power. The paper, setting the context in the post-socialist China, shows how people in an increasing uncertainty in daily life and to secure a trustworthy doctor-patient relationship, it is about how trust is practiced, dismantled, and rebuilt in daily medical encounter. The paper recognizes the limits of individual informal exchange in building trust, and suggests more work to be done in building a trustworthy health system and improving the trust in society as a whole amid the wide mistrust.

Gendered ‘living Like The Other’ In Turkey

Some tourists, those who decide to stay a longer while than other tourists in a place they like, might ‘fetishise the idea of ‘living like the locals’’ (Davidson 2005: 46). One of the ways Davidson suggests they might do this is through ‘integrating themselves within and among local, indigenous communities, learning from them forms of experience and knowledge rejected and repressed by the West’ (2005:51). Some might even enunciate their sense of belonging by becoming tourism entrepreneurs and playing the role of host to tourist guests.

Related to this, Soares (1998) talks about globalization as increasing the opportunities for copying which may be related to a desire to perform one’s own fantasies about the ‘other’. Soares adds that, therefore, ‘mimicry can be a weapon against the political reification of identities’ because ‘the experience of being the other is different for each.

This paper considers the gendered dimensions of such tourist attempts at ‘living like the other’, at belonging and at becoming ‘other’. Drawing on my long-term ethnographic study of tourism relationships in Göreme, Turkey, the paper discusses the different ways in which foreign (yabanci) women and men experience and negotiate their attempts at ‘living like the locals’. The discussion will focus on the variable paradoxes and contradictions which foreign women and men face when attempting to live in Göreme for an extended period, as well as on how the paradox of it never being possible to fully become the other is different for each.

Taking Medicines: Expanding Routines, Disruption and Management in Daily Life

The Triple Role of Social Media: A Case Study

The Arab Spring’s ‘Facebook dimension’ has already received unprecedented attention. New technology was presented as an instrument used by protesters to build extensive networks, create social capital, organize political action locally and nationally, and put in place transnational links. A debate ensued between the views of ‘cyber-enthusiasts’ and those of ‘cyber-skeptics’ (or ‘digital evangelists’ and ‘techno-realists’). A common element, however, is that very little of this research integrates and explores the varieties into its analysis. Moreover, try to counter the video a rather fragmented picture of this complex phenomenon, with many scholars focusing on relatively narrow social media-related sub-fields. The present paper tries to overcome this division. Its goal is twofold. First, it argues that the full understanding of the impact of social media on Arab Spring regime change processes is possible only through the analysis of the key role played by this media at three interrelated levels that, until now, seldom have been studied together: as a tactical tool of mobilization, communication, and coordination; as an instrument of domestic and international revolutionary contagion; and, critically, as a mechanism of enhancing pan-Arab consciousness which, in turn, was fertile soil for that contagion. The paper’s second goal is to strongly anchor the analysis of social media in the political - and, more specifically, revolutionary - dimension of the Arab Spring. Social media may have been highly influential from many points of view. Still, one should not forget that the Middle Eastern process it influenced was fundamentally a revolutionary wave. As such, the role of social media needs to be addressed within the analytical framework of revolutionary contagion, which until now rarely has been done explicitly.

TUMA, RENÉ* (Technical University Berlin, rene.tuma@tu-berlin.de)

Comparing Different Styles of (Vernacular) Video Analysis

The paper presents the outcomes of a project that focuses on activities of interpretation of video recordings. The interpretation/analysis of visual data is not only performed within sociology but in a growing number of professional fields and everyday situations (‘Vernacular video analysis’ [1]). My presentation draws on a focused ethnographic study of interpretation practices. I have done ethnographic fieldwork in three fields and recorded practitioners at their interpretation work.

The three fields each highlight different aspects of interpretation work. In 1) Police Work the identification of actors and their (‘criminal’) actions is the police officials’ main concern, in 2) Football Training the aspect of instruction is most important and in 3) Market Research the interpretation of eye tracking video is distributed and organized via means of information technology.

By itself reflexively applying Videography [2] onto the practices of video analysis I am able not only to study those three fields and the spread of visual analysis as a communicative form of generation of knowledge, but am also presenting a reflexive form of videography that allows for the reflection of our situated practices and knowledge that has been criticized as missing in the use of video in interaction research.

Gender and Socialization of Knowledge

The purpose of this paper is geared towards analyzing how gender is an indicator that impacts scientific production in the administrative sciences perpetuating the differences between genders which affect the science. Particularly, significant differences that exist in the scientific visibility of men and women in Latin America are observed, as mentioned in the Latin American Quotes in Social Sciences and Humanities website (close based on its Spanish initials) and the Network of Scientific Magazines of Latin America, the Caribbean, Spain and Portugal (redalys based on its Spanish initials) for year 2012. The analysis is made as evidence that in scientific research, as in any other human activity, there is a gender related division in work, which should be considered in the science and technology agenda at all levels of government.

Sociological Approach on the ART of Using Drugs By Patients Suffering of Oncological and Psychiatric Diseases

This study aims to analyze the strategies and tactics used by patients suffering of oncological and psychiatric diseases on the scale of social classes. This study would help to analyze and discuss the most comprehensive questions about the subject at hand.

* Which are the factors that determine the choice of the patient when he takes a medicine?
Which are the motivations that characterize the behavior of the patients when they take a medicine? How do the norms established by the public health instances influence the perception of the patients when they take a medicine? Basing my assumptions on how the patients take the medicine, I will investigate how the way of taking medicine is influenced by their belonging to a specific social class and which are the cultural factors that determine the way they take their medicine?

Pretti-Wettel and Moatti[1] uphold that the patient is not only the subject of his illness but an active social role with his illness associated. He is not simply suffering from it and submitting to treatment, but he is an active participant in the process of taking medicine, influencing it and by taking part in his healing process. In that context I will investigate the factors which determine the way the patients take the medication, the way the patients take the drugs taking into consideration the influence of the media on them, their belonging to a social group, their environment, their age, their profession, their educational background, and their relationship between them and their physician. With this study I hope to be able to assert that there is a similarity in the tactics of taking medicine by patients belonging to different socio-economic and cultural classes and that the practices of public health in Turkey play a unifying role between the various social classes in question.

TURNER, BRYAN* (Australian Catholic University, bryan.turner@yahoo.com.sg)

Post-Westphalian America? Religious Conservatism and American Exceptionalism

In the sociology of globalization there has been much talk of porous borders, the effects of the international flow of labour, legal pluralism, the fragmentation of civil society by multiculturalism, and the decline of state sovereignty. America however appears as ever to be an exception. After 9/11 and the Patriot Act, there has been considerable emphasis on the securitization of society as a whole. The focus of national security is echoed in the agenda of the Republican Party which has opposed the naturalization of illegal migrants, supported a hawkish foreign policy, warned against the dangers of creeping Sharia, and rejected cuts to the Pentagon budget. Despite its ideological opposition to big government, the Tea Party has driven the GOP further to the right over national security and defence expenditure. While the rightward drift of Republican Christians is consistent with traditional millenarianism and Christian Zionism in America, it is reinforced by fears of American decline. Confronted by economic weakness foreign policy now faces a dilemma: isolationism versus confrontation. The foreign policy of Chris-
industry and the civil society have intermingled giving rise to many theoretical interpretations that underline the profound radical change of universities and sciences. Of these theories, the current article focuses on the triple-helix of university-industry-government relations. The model claims that intensified interaction between university, industry and government has given rise to a new kind of research, which not only seeks to advance knowledge but also tries to attain commercially viable products. As a normative policy model, triple helix might be transporting into analysis certain understanding of the developmental role of scientific research. The present paper summarizes the major viewpoints of this theory and reflects on the commentary given to it. To better understand the varying virtues of the model, it also analyses the model’s distinct theoretical status and claims that it is ambiguous, as it combines three types of sociological theory, i.e., diagnosis of an era, general sociological theory and research theory. After assessing the status of triple helix, the paper contributes to the discussion about the model by probing different theoretical avenues that research associated with the concept might proceed. Of central importance here is systems theory by Niklas Luhmann, as major protagonists of triple helix have frequently used his ideas in discussing the model. The current paper draws concepts from Luhmann’s theory to specify ways in which empirical research associated with triple helix could be made more responsive to the multi-functional and internally contradictory character of the contemporary research university.

Dress and the Embodiment of Age in Everyday Life

Clothes lie on the interface between the body and its social presentation. Getting dressed is an everyday body practice, one of the ways in which bodies are made social, given identity and meaning. When we get dressed, however, we do so within the bounds of a culture and its norms; and these include ones in relation to age – as they do gender also. The presentation which draws on an ESRC project published as Fashion and Age: Dress, the Body and Later Life, Bloomsbury, explores the role of dress in the day to day performance of aged - and gendered - identities.

New Approaches to Inequality Patterns in Education Science and Childhood Sociology

New approaches to inequality patterns in education science and childhood sociology

From a perspective that considers children as social agents we analyze how socialization- and learning environments are designed, processed and have an influence on children's self-orientation and autonomous learning. By using an interdisciplinary approach that combines sociological and pedagogical theories, different dimensions of the self are put into the center of attention. Thereby we aspire to gain new insights into causes of inequalities.

This article uses data provided by the (longitudinal) study “SEBI – Self-orientation and Self-directed Learning: An Analysis of Socialization and Learning Environments of Primary School Children”. First quantitative results of the ongoing study assessed the importance of parenting for children’s self-confidence in primary school. A perceived parental interest in the own personality – associated with parental interest in the child's specific hobbies, activities and interests – can be seen as central for the academic self-concept. However, a perceived parental emphasis on efforts for the child’s academic success does not have such a significant effect. Further, these findings could not be related to social class or ethnicity, which makes a difference to common findings of the majority of socialization studies. Thus, this study contributes to an extended view on inequalities in education by focusing on different socialization practices in families and institutions and how these interrelate to the child's academic self-concept and performance. The perspective gained by these findings can be supplemented by qualitative interviews concerning aspirations, parental practices and children's perspectives on school and family life with parents and children across various social backgrounds.

Based on this multi-method way of proceeding we aim to identify different patterns of inequality in socialization related to the self as a central variable. In how far this is a track worth following will be shown by presenting relevant data.

ZHANG, JING-WEN (National Tsing-Hua University)

Internet-Facilitated Social Activism in Taiwan: Modes and Constraints

On 3rd Aug 2013, a group of 39 anonymous ‘netizens’ mobilised, largely via the internet, a crowd of estimated 250,000 people in front of Taiwan’s President Office to mourn for the man-made death of a military corporal, Mr Hung Chung-Chiu, and to protest against how the government responded to the case. The pressure forced the government to concede, agreeing to abolish the discredited military judicial system during peace time.

The 803 protest marked a new mode of the internet-facilitated social activism in Taiwan. Its sudden surge and the much-acclaimed ‘success’ drove many veter...
an social activists and oppositional politicians into self-questioning why they had failed to stage a rally at a comparable scale in recent years—even with the help of internet. The question calls for a comparative analysis of this incident and other internet-facilitated social movements.

Drawing from literature review, interviews and some participant observations, this paper surveyed the existing practices of internet-facilitated social movement in Taiwan—a young democracy known for its strength in computing and communication technologies. Four ideal-typical categories are identified and discussed: (1) online activism of conventional advocacy/concern groups, (2) communication platform for a public debate on social issues, (3) issue-specific protest initiated in a decentralized, less consolidated fashion among concerned ‘netizens’ and (4) various ‘open access’ projects initiated within an IT-savvy community (e.g. the ‘goV; zero time government project).

A model will be theorized from the comparative analysis to account for the varying situationality of social movements: emotional, epistemic factor, cognitive entry barrier and technological entry barrier. At last, a normative ethic on managing the scale of activism will be developed with the ‘public attention’ considered as a scarce public resource. The various modes of internet-facilitated activism will be critically evaluated with the ethics in mind.

A Comparative Study on the Inter-Professional Collaboration Among Actors Involved in Active Ageing Programmes: Lessons from Denmark and Taiwan

This research aims to investigate the inter-professional collaboration among actors involved in the collective actions of Active Ageing campaigns, from NPOs to the state, the media, political parties, and commercial companies. It asks how do actors interact with each other and to what extent can inequality be eliminated? Denmark and Taiwan, with their differences in welfare regime, population ageing process, development of democracy and union movement, can be good cases to be compared. With the theoretical framework developed by Nahapiet and Ghoshal (1998), this study examines the relational dimension of inter-organizational social capital. Strikingly, three patterns of perceived relational social capital can be concluded in both the Danish and Taiwanese organizational fields, and each has its implication of obstacles to collaboration.

In Pattern 1 where actors continuously measure who needs whom more and for what, an unequal power relation can be noticed. Actors at a more disadvantageous position are more vulnerable to collaboration availability and they identify with their partners in exchange of their trust. Moreover, when a collaboration project is accepted, actors’ identification of being in the same community is formed. However, with numerous back-and-forth circumambulations, actors keep asking if they should trust their partners. This is the Pattern 2 in this study and its kinetics can be categorized as follows: a) toward mutual trust because of cooperation, b) toward mutual trust for the sake of identification, c) toward distrust with problems of obligations and expectations as the crucial reason, and d) toward distrust with imperfection in norms as the basic problem. Last but not least, Pattern 3, which features in harmony and stabilization, differentiates itself from other two patterns by harmonized conflict of interests among actors and a shared enemy—usually the state. Overall, embedded trust, which is weighted with identification, can act by a set of links of relations. ANT offers tools to grasp how alcohol dependence is understood as an effect of network where both human and material elements have a tendency to detach action described in life stories from its material and bodily mediations and overemphasize the importance of psycho-social and cultural factors in action. ANT action is understood as an effect of network where both human and material elements can act by a set of links of relations. ANT offers tools to grasp how alcohol dependence, for example, is produced and mediated by a network of material, bodily, psychological, social, conceptual and cultural entities that transforms the action in an unforeseen way.

The paper uses empirical examples from the life stories on alcohol dependence to see if different material entities like physical spaces, material resources and bodily reactions, may trigger a dependency to alcohol, stabilize it, prevent it or abolish it as part of networks that connects human and non-human material entities. It proposes that as we follow the mediations of action and their conglomerations in many surprising sets of agencies, we should focus on situations/events and their concrete processes. That is, cultural meaning structures, like narrative functions or categories should be considered as mediators among other mediators, acting as part of complex actor networks that include also material elements.

Women’s Responsibilities, Freedoms, and Pleasures: An Analysis of Italian, Finnish and Swedish Women’s Magazines’ Alcohol-Related Advertisements from the 1960s to the 2000s

Since the 1960s, feminist movements have emphasized that men and women should be seen as equal in their roles as parents, breadwinners, and citizens. This conception is not confirmed by the images produced by advertising. The article presents an analysis of alcohol-related advertisements published in Finnish, Italian and Swedish women’s magazines from the 1960s to the 2000s. The advertise-ments are approached as representations of gendered performances in which gender is made visible “here and now” by placing women in particular subject positions (identities, gender roles) that are related to private or public spheres and associated with specific kinds of gender expectations and norms reflecting women’s shifting responsibilities, freedoms, and pleasures. The article asks what kind of drinking-related subject positions have been portrayed as desirable in women’s magazine advertisements over the past few decades and how those positions have changed as we move closer to the present day. The analysis reveals both continuity and variability in alcohol-related subject positions in Finnish, Italian and Swedish women’s magazine advertisements. It shows how women’s responsibilities, freedoms, and pleasures have expanded from the traditional domain of the private to multiple new areas as Finland, Italy and Sweden have developed from modern societies to late-modern societies. However, the expansion of women’s identities has occurred differently in each geographical area. Furthermore, the analysis shows that the expansion of women’s identities does not mean that the traditional gender norms have disintegrated and been replaced by equal gen-

How to Include Material Elements in the Analysis of Life Stories? Applying Actor-Network Theory to the Analysis of Autobiographical Narratives on Alcohol Dependence

Often the aim in the analysis of life stories is to identify cultural meaning structures that tell about the values and norms that regulate people’s life choices and to give access to their lifeworlds. Hence, the life stories are often approached, for example, by applying Vladimir Propp’s theory on narrative functions or William Labov’s theory on narrative categories. By applying actor-network theory (ANT) to the analysis of autobiographical narratives on alcohol dependence, the paper shows how the methods that focus on the identification of cultural meaning structures have a tendency to detach action described in life stories from its material and bodily mediations and overemphasize the importance of psycho-social and cultural factors in action. ANT action is understood as an effect of network where both human and material elements can act by a set of links of relations. ANT offers tools to grasp how alcohol depend-ence, for example, is produced and mediated by a network of material, bodily, psychological, social, conceptual and cultural entities that transforms the action in an unforeseen way.

The paper uses empirical examples from the life stories on alcohol dependence to see if different material entities like physical spaces, material resources and bodily reactions, may trigger a dependency to alcohol, stabilize it, prevent it or abolish it as part of networks that connects human and non-human material entities. It proposes that as we follow the mediations of action and their conglomerations in many surprising sets of agencies, we should focus on situations/events and their concrete processes. That is, cultural meaning structures, like narrative functions or categories should be considered as mediators among other mediators, acting as part of complex actor networks that include also material elements.

It’s Time to Change: How Does Kid-Focused Business Survive and Benefit from Population Ageing?

Ageing is a dynamic process involving responses at both individual and societal levels. Theoretically, the existence of an organization is a consequence of temporal societal demands. This study asks why and how kid-focused business can survive and benefit from ours ageing society. Particular emphasis is on their strategy in terms of legitimacy and organizational social capital. Japan and Taiwan, with their similarities in filial piety and inter-generational solidarity, can be good cases to study this issue. Various methods, such as in-depth interviews and content analysis of publications and government statistics, are applied to identify the underlying governing social structures. Social innovation across institutional boundaries can be recognized. Charities for the elderly and cram schools both recruit senior volunteers to teach children after school hours. Institutional re-design can also facilitate social innovation. Examples include kindergarten and nursing homes to be set in the same building, and public school campus turning into tourism resort. Vague vision is another strategy for actors to find legitimacy and incorporate as many projects as possible. Moreover, institutional reframing based on institutional reproduction but with actors’ minor modification due to institutional leaks and personal interests, can create alternatives for those whose jurisdiction is territorially defined. A good example is public schools in the cities with students changing their household registration from the countryside but in reality commute everyday.

To sum up, actors’ agency and conditioning of institutions can both pave the way for kid-focused business. The concept of New Institutionalism can explain actions within a given institutional environment while the notions of organizational transformation and social innovation can help to understand why Active Ageing campaigns are widely utilized. This study ends with suggestions for re-thinking the meaning of Active Ageing campaigns and if the elderly are hence empowered or exploited.
der norms. Rather, it seems that traditional gender norms continue to be reproduced in alcohol-related advertising.

**Changing Consuming Behaviors By Designing Eco-Efficient Green Products**

People continue to create and consume more innovative technology products in order to make life more convenience and comfortable than the past. However, huge industrial processes bring significant changes in the Earth. Natural resources are getting to dry up; ozonosphere has been destroyed; environment has been contaminated and so on. These environmental changes cause serious threats to the survival of the Earth's species.

Therefore, in recent years, environmental awareness began to be respected, and researchers explore green issues hoping to make living things can be survival sustainable. Many countries have implemented environmental protection laws to reduce the environmental impacts of industrialized society. For instance, WEEE (Waste Electrical and Electronic Equipment Directive), RoHS (Restriction of Hazardous Substances Directive) and EuP (Energy Using Product) organizations under the auspices of the European Union try to limit the environmental pollution caused by products. Laws and regulations seem to be a "pushing" force on changing consuming behaviors.

On the contrary, this research examines the possibility of a "pulling" force on changing consuming behaviors by designing eco-efficient green products. The present study attempts to integrate 39 engineering parameters of TRIZ (Theory of Inventive Problem Solving, developed by Genrich Altshuller) with 7 eco-efficient elements (Reduce material intensity; Energy intensity minimized; Dispersion of toxic substances is reduced; Undertake recycling; Capitalize on use of renewable resources; Extend product durability; Service intensity is increased. REDUCES, in short) proposed by WBCSD (World Business Council for Sustainable Development) to construct a green product design matrix, and use patents to verify the validity of this innovative green product design process. The green product design process of this research may allow designers to generate green products by improving eco-efficient elements as well as resolving conflict design issues. Hopefully, eco-efficient products may attract consumers' attention and thus unconsciously change consuming behavior, and approach sustainable goals.

**Industrial Food Pollution: A New Perspective on Food Safety Risks Beyond the Current Legal Definition**

This study proposes a new perspective on food safety risks, with reference to the 1968 Kanemi rice bran oil poisoning in Japan. This poisoning was brought on by Polychlorinated Biphenyls and dioxins, which are hormone-disrupting chemicals. As a result, the victims had chronic illnesses and passed on the poisoning to their children. Despite the victims' ongoing need for compensation and relief, no adequate policies as yet exist.

Similar to the Kanemi case, East Asian society has experienced many other food contamination, e.g. the 1955 Morinaga arsenic milk poisoning in Japan, the 1979 Taiwan rice bran oil disease, and the contamination of food with melamine in China and Korea in the 2000s. These cases show that salient issues regarding food in East Asia have changed from security to safety. Furthermore, they indicate that this study can be applied to other contamination cases.

In contrast to neglected those cases, environmental pollution incidents such as Minamata disease - caused by the methylmercury contamination of Minamata Bay in the 1950s - were officially recognized as 'public nuisance'. The victims of them therefore received public compensation in accordance with the law. However, the government denies that serious food poisonings are 'public nuisance', leaving victims without compensation.

From the sociological perspective, the social damage structure of the Kanemi was not similar to typical cases of food poisoning. Rather, with regard to the victims' possibility of recovery, the negative effects on daily life and community, and the cause of the contamination, it was similar to 'public nuisance'.

In conclusion, I propose a new perspective of 'Industrial Food Pollution, beyond the Japanese legal definition of 'Food poisoning' and 'Environmental pollution as public nuisance'. Based on this perspective, I recommend the establishment of 'Relief Fund for Industrial Food Pollution', which institutionalize compensation systems for victims.

Rights and Responsibility - Investigation of the Emergence of Entitled Children and the Amendment of Juvenile Law in Japan from the 1990s into the Next Century

In Japan during the 1990s, concepts of childhood changed, both within the domestic and international contexts. The emerging notions of self-determination, freedom, and responsibility, being debated on several fronts, were applied to children. The materialization of these notions extended into the functionality of juvenile law. The questions to be raised are: Is the child considered as an object in need of protection and guidance? Should the child be viewed, similar to the adult, as an independent being who has an innate ability for self-determination? How has Japanese society perceived the child? These questions form the core for investigating social, political, and legal transitions within Japanese culture in regards to its entitled children who newly emerged in the 1990s and started emphasizing their rights as they thought they were rightfully theirs. In this research, entitled children are defined as those who consider themselves as an independent adult holding the rights concerning the choice of their actions. This research aims at reconsidering and reconstraining Japanese society during this time concerning the topic of entitled children and their degree of self-determination as conceptually developed by their observers, such as educators, psychologists, sociologists, legal professionals, and others. This research also enables the production of interdisciplinary discussions between areas of law, sociology, cultural studies, media studies, and qualitative fieldwork. Investigating the developed observations of multiple disciplines is beneficial for formulating a broader context in order to analyze and comprehend the topic (235 words).

Facebook Activism By Foreign Domestic Workers in Singapore

Studies of foreign domestic workers are now numerous in the social science literature, with much attention paid to left behind families. Since new research is required to contemplate the latest change, this paper uses authentic accounts related to the current explosive growth of social networking by live-in domestic workers in Southeast Asia. Evidence was gathered through 54,000 posts on a Facebook group, most from Filipina domestic workers in Singapore. Interviews were held with Facebook group members, including a founder of the NGO responsible for starting the social network group. Findings confirm that internet technologies are an integral in the lives of foreign domestic workers, enhancing their social interactions and mobilizing their self-expression. There is evidence that Facebook reduces psychological and physical costs for live-in workers, making it relatively easy for them to participate in activist social networking. Evidence suggests that, in addition to providing entertainment for foreign workers, Facebook motivates an increasing number of distantly scattered individual workers to engage in social activism.

How Japan Imports Social Problems from the West: Child Abuse from Early 20th Century to the Present

For more than a century, Japan’s approach to the child abuse problem has been stimulated and shaped by developments in western countries, particular in the US. Early in the 20th century, a national discussion of child abuse was initiated by influential Japanese who had been exposed to western philanthropy. In the 1970s, Japanese medical professionals raised awareness of battered child syndrome proposed by a leading American pediatrician. Starting in the 1990’s, a massive discourse on child abuse problem emerged from various professional groups who admired prevention and treatment measures from the US. Official data show that child abuse cases in Japan are most common for people of lower economic class. However, social policy on child abuse problem downplays the importance of economic stability and attributes the problem to individual families. Thus, government policy prioritizes identifying settings where there is a risk of child abuse and counseling parents instead of focusing on bringing families out of poverty. A child abuse risk assessment tool from the US is applied to every Japanese family in which there is an infant. The present study shows evidence of increased social panopticism and shows that risk technology morally penalizes mothers, leading to social exclusion.

Moral Identity in Friendships Between GLB and Straight College Students

People make moral claims about sympathizing with and providing support for stigmatized individuals, but past studies tended to focus on this type of moral identity construction within formal organizations. The present study seeks to extend the literature by identifying the process of moral identity construction in a personal setting—friendships between gay, lesbian, and bisexual (GLB) people and straight people. Analyzing data from in-depth interviews with college stu-
Facing An Unequal World: The 1967-70 Civil War In Nigeria, Its Causes, Consequences and Implications On The Biafran Side Of The War In Contemporary Nigeria

SHORT ABSTRACT: The paper examines the causes and effects of the 1967-70 Civil War on the Biafran side of the country, even decades after the actual war.

LONG ABSTRACT: Violent conflicts of inter and intra state wars of myraid causes have become ever-present in the contemporary world. The Nigerian-Biafra war of 1967-70 took a genocidal dimension in which the killing of people on the Biafran side of the war became a state industry. These decimations took the features of a pogrom against the “Biafrans” which resulted in millions of people of that side of the country examined in the war.

This paper, therefore, analyses the causative factors of the war, the consequences of the war in terms of the massive human deaths, the refugees' problems and the excruciating economic and social aftermath of the war on the then citizens of Biafra and Nigerians in general. The paper argues that even in the contemporaneous globalization world, the war and its trajectories cost-included victims of the secessionist war still suffer from unequal treatment in the present Nigerian socio-political context, being a hangover of the Nigerian-Biafran civil war of post-independence Nigeria.

The Social Meaning of Racial Humor Among the Police

This paper explores a controversial side of police culture: the use of ethnicized humor and its implications in the context of police work. The empirical material consists of twenty-two interviews in which police officers were asked to describe the meaning and implications of humor and race in the context of police work. The interviews were conducted in order to understand the social context and implications of police humor.

The results of the interviews show that police humor is used as a way to maintain social distance and to cope with the challenges of police work. The use of humor is also seen as a way to maintain social solidarity among police officers. However, the use of humor can also have negative implications, such as reinforcing racial stereotypes and stereotypes about minority groups.

The paper discusses the implications of police humor for diversity work in the police force and the need for police officers to be aware of the potential implications of their use of humor. The paper also discusses the need for further research on the topic.

China's Involvement in Africa: New Approaches of Solidarity in Economic and Development Policies or Just South-South Rhetoric?

The increasing Chinese activities in African countries are often stated as different or competing against Western approaches of development aid and economic relations. Not only regarding quantity but also quality, the Chinese involvement seems to have specific patterns of a development model, for example the principle of non-interference. This paper analyzes Chinese conceptions of economic and development policies towards African states. By putting these policies and their implications in the context of historical structures and social relations of forces, the asymmetrical power relations, the counter-hegemonic potentials as well as the interests and strategies of the stakeholders involved within this “third way” between (Post)Washington Consensus and South-South-Cooperation can be identified.

However, there has not been much research on African perspectives on characterizing and patterns of Chinese involvement. Therefore, in its second part, the paper focuses on the perception of Chinese activities in Ghana and the impact on local developing role models. Being the “darling” of Western donors and simultaneously experiencing a rapidly increasing Chinese involvement on different levels of its society, Ghana presents a crucial case study with conflicting constellations of interests. According to (neo)gramscian concepts of hegemony, a sustainable way between (Post)Washington Consensus and South-South-Cooperation can be identified.

Gender Representations in Occupational Descriptions

The Swedish labour market is to a vast degree segregated by gender, likewise as in many other nations. Women and men work in different occupations, branch-es and even sectors and a majority (73 percent) work in occupations where 60 percent or more of the employees are of the same sex. Women are engaged in oc-cupations such as nurse, social worker, teacher, assistant nurse and child minder, while men primarily work in manufacturing or with diverse technical occupations. The separation of men and women in the labour market can be explained by the structural differences which result between the sexes and it contributes to stereotyped gen-dered images of occupations. Both tasks and occupations tend to be sex-typed and we associate them with being either female or male. “Female” occupations include different aspects of caring for other persons and thereby correspond with disposi-tions assumed* to be held by women. “Male occupations” are associated with physical strength, technical skills and logic – dispositions traditionally asso-ciated with men. Sex-typing is an ongoing process, part of the overall gender sys-tem in society, and is related to hegemonic cultural beliefs about gender.

This paper draws on empirical data consisting of occupational descriptions produced by the Swedish Public Employment Service (Arbetsförmedlingen). It presents the results from the on-going research project that studies whether descriptions of occupations are a mechanism for social reproduction of gender, social class and ethnicity. The paper focuses on how gender is represented in the 30 most common occupations for women and men respectively. The aim is to find out whether these occupational descriptions reproduce stereotyped images of gender, and how. The study was conducted through a qualitative content analy-sis. Preliminary results reveal that they both reproduce and break stereotypes by emphasizing that nurses need to be technical and that a janitor must have social skills.

Information and Communication Technology (ICT) and “Isolated Child-Rearing” in Japan

This paper explores how ICT affects social movements for dealing with “isolat-ed child-rearing” through analysis of political documents and qualitative interview-data, especially focusing on the relation between ICT and neighborhood relation-ships or regional networks for families. In Japan today, these social movements for dealing with “isolated child-rearing” have been active. They problematizes “isolat-ed child-rearing” from the urbanization, the increasing number of nuclear families and the dilution of neighborhood and family relationships, mainly on the assumption that the isolation relates to “child abuse” and “child-rearing anxiety.” For this reason, they try to strengthen supports for parents by neighbor-hood or special local agencies. On the other hand, recently some governmental ICT projects for preventing “isolated child-rearing” have been promoted, such as building a social networking service site for parents and developing e-learning environments to foster advisors on child-rearing. These projects enable parents to seek advice or to talk with other parents on their smartphone or personal com-puter without leaving home regardless of their regional contacts. So, how does the promotion of these ICT projects affect the need for developing a sense of community and building regional networks for preventing “isolated child-rearing”? In conclusion, the governmental ICT projects in Japan are rigidly focusing on “local community,” so in the name of “community informatization,” many local govern-ments are engaged in developing ICT to strengthen neighborhood relationships and regional networks. Similarly in a real-life situation, most of the parents who replied this investigation prefer to ask for help and talk with someone they know by sight rather than only online. For these parents, the primary objective of using ICT in their child-rearing lives is to communicate with their family or neighbors. Thus, in Japan the utilization of ICT for preventing “isolated child-rearing” is direct-ed to strengthening neighborhood relationships or regional networks.

Producing Economic Knowledge: An Ethnography of Newsrooms in Brazil

Producing economic knowledge: an ethnography of newsrooms in Brazil

In line with recent ethnographic research concerned to shed light on knowledge production in advertising agencies (Arzita, 2013), trade floors (Beunza & Stark, 2010) and news agencies (Bower, 2011), this investigation considers the newsroom as site of economic knowledge production in Brazil. In particular, this paper pres-ents the early results of a multi-site ethnography of economic news production in the mass media in Rio de Janeiro and Sao Paulo in 2013. It draws from more than fifty interviews with economic journalists, media commentators and economists, as well as from participatory observations of journalistic practices within news-rooms. The paper looks at how relationships – both competitive and collaborative – between the following four entities help create economic knowledge, and how this knowledge interacts with the generation of news. The entities in question are: 1) opinion (individual actors and groups e.g. journalists, economists, com-men-tators, editors, etc.); 2) non-human instruments (devices, models, rankings); 3) structures (classes, professions) and 4) networks (relationships between actors, instruments, structures). The paper pays special attention to how news about the economy is constructed and circulated, and how this news in turn draws upon, contests, and helps to produce economic knowledge. This research forms part of the ERC funded ECONPUBLIC project, which study how the ideas about the econ-omy have been produced in the mass media in the UK, US, France, Argentina and Brazil in the post-war period. http://www.econpublic.hps.cam.ac.uk

Democratization of Local Leadership---- the Role and Function of Local Governance in the Disaster-Processes of the Great East-Japan Earthquake and the Tsunami

The gigantic earthquake of magnitude 9.0 which occurred on 11th March, 2011 caused tremendous damage to the huge coastal area around Northeast Japan. The tsunami was of historical record in terms of its height and area affected. As of the end of March, 2012, over 20 thousand people were reported as dead or missing related to this disaster.

Moreover, serious accidents at the Fukushima Nuclear Power Plants that hap-pened sequentially had a great impact on the huge area. The catastrophic dam-aged communities had been in financial difficulties with a high percentage of aged people, revealing various types of precariousness in the social structure of the communities and the vulnerability individual resident groups have.

In terms of mitigation, temporary living, restoration and reconstruction pro-cesses, the role of local political leadership that could listen to requests and meet the demand of the residents on the one hand and that could negotiate with the central and prefectural governments in order to get necessary assistance to help people in the disaster areas on the other hand, is getting more and more important. Based on the in-depth interviews to local leaders of the hard hit areas we explore the role and function of local leadership and its effectiveness, as well as the condition on which they are doing well with these tasks.

Among the democratic countries Japan has a rather centralized political and social structure with a strong central government in terms of budget-control, regu-lation of prefectoral and local government system etc. Furthermore after the earthquake we experienced the change of governing party from the Democratic Party of Japan to Liberal Democratic Party, which seemed to mean that it is nec-e ssary to consider deeply the way of the political leader, not only at national level but also at local level.

An Ethnomethodological Explication of the Usage of Diagnostic Categories: On the Relation Between Diagnosis of Autism Spectrum Disorder and Self-Identity (2)

Through the lens of medicalization in sociology, the relations that people have with medical categories are considered subordinate to medical professions. Therefore, how individuals with autism spectrum disorder (ASD) come to terms with the category of “ASD” is considered a manifestation of that subordination (Conrad, 2007). However, this perspective prevents us from understanding ac-tual situations in which those individuals come to terms with the diagnosis of ASD. Many studies have investigated the various relations people actually have with their diagnostic categories (Hacking, 2009; Jutel, 2011). Based on these preced-ent studies, this presentation examines the sessions of tohjisha-kenkyu (which roughly translates as “sufferers’ first-person study”) and explains the interactions of the settings in which participants refer to their own diagnostic categories. The Japanese word tohjisha-kenkyu refers to a collaborative activity in which the indi-
viduals suffering from social isolation due to their impairments talk about their troubled experiences and study the structures of these experiences in their own words. Tojisha-kenkyu began in a mental patients’ group in the town of Hokkaido, Japan and has since been utilized in many other groups of individuals with various impairments (Ayaya and Kumagaya, 2008; Ishihara, 2013). The sessions of Tojisha-kenkyu in this presentation examined were for individuals with ASD and conducted by these individuals. Using ethnomethodology and analyzing audio recordings of the sessions, we focused on the following questions: (1) What is the significance and what are the roles of the participants’ self-reference to diagnostic categories? (2) What relationships do these usages of diagnostic categories make possible between participants? (3) What consequences do these usages give to the meanings of these diagnostic categories?

**How Diagnostic Categories Influence the Self-Description of Person with a Diagnosis: On the Relation Between Diagnosis of Autism Spectrum Disorder and Self-Identity (1)**

Previous studies have revealed that there is a mutual relationship between the self-description and social cognition/interaction (Spreng and Mar, 2012; Nelson and Frith, 2004). These studies have found that to infer the intentions, feelings and beliefs of others from their behaviors requires the structured self-description which serves as a reference frame. On the other hand, self-description is structured through the social interaction.

The persons with Autism Spectrum Disorders (ASD), the medical definition of which is qualitative deficits of social cognition/interaction, are suggested to have difficulties in semantically organizing their own autobiographical memories through social interaction, which gives atypical structure of self-description (Crane et al., 2010; 2011; Bon et al., 2013; Lind et al., 2010; Williams et al., 2010; Uddin et al., 2011). However, performance of social cognition/interaction and self-description depends on 'how' to interact 'with whom', and may not be reduced to individual characteristics (Crane and Goddard, 2008; Bruck et al, 2007; Crane et al., 2012).

As a practice in which alternative self-description and social recognition/interaction are generated simultaneously, we focus on Tojisha-kenkyu. 'Tojisha' means first-person in Japanese, and 'kenkyu' means research. In a nutshell, Tojisha-kenkyu is studying oneself through communication with others who share similar experiences. Tojisha-kenkyu is a novel method of self-help and intellectual exploration born in Japan, which neither accepts without question nor rejects completely existing technical terms and diagnosis, but rather uses and customizes them to make more suitable descriptions for each experience.

In this presentation, the speaker, who is diagnosed with ASD and is a facilitator of Tojisha-kenkyu meetings for ASD, will introduce 7-year experiences of Tojisha-kenkyu. She also talks about how she has utilized technical terms to change her own self-description, which ranges from implicit body schema to explicit self-narratives, and the relationship with others (Ayaya, 2013).

**Social Policy in the Context of New Global Actors: How Far Is China's Developmental Model in Africa Impacting Traditional Donors?**

China’s role as an emerging donor and its conceptualization of social policy in Africa has generated polarized reactions in the West. Many argue its ‘productivist’ approach is driven less by notions of citizenship and social rights, and more in terms of accumulation functions. Social investment is justified for broader economic development goals in contrast to current safety-net or ‘welfarist’ models of western donors. While some international organizations perceive the Chinese approach as antithetical to Western goals and practice, others welcome it as an opportunity to develop new ideas about social development.

This qualitative research explores to what extent and in which direction Chinese aid to Africa is influencing Western ideas about welfare policy in developing countries. The study comprises a systematic review of Sino-African and Western policy documents and semi-structured interviews with senior Chinese, Western and African stakeholders. It investigates how social policy is conceptualized by those involved in Chinese aid to Africa, to what extent this differs from traditional Western perceptions of welfare, and what it means for Sino-African social development policy. The implications for understanding the drivers of global policy development and links between the economic and social dimensions of welfare will be explored.
For the first time in modern history and with the region's turn to multiculturalism, most Latin American censuses now ask respondents to identify by race or ethnicity. These new data allow researchers to systematically examine ethnoral racial inequalities, which have long been ignored or denied. However, reliance on census ethnoral categories could be problematic because of classification ambiguity in the region and because the categories themselves may hide racial heterogeneity. To overcome this, we modeled the relation between skin color as well as census ethnoral categories and educational inequality, using innovative data from the 2010 America’s Barometer from the Latin American Public Opinion Project (LAPOP) and 2010 surveys from the Project on Ethnicity and Race in Latin America (PERLA). We found that skin color was strongly related to educational inequality in all examined nations (Bolivia, Brazil, Colombia, Dominican Republic, Ecuador, Guatemala, Mexico and Peru), even after controlling for parental occupation and other factors. On the other hand, ethnoral identification was a weaker and less consistent predictor.

USMANOVA, LARISA* (Kazan Federal University, USMANOVA@GMAIL.COM)

**Between Europe and Asia; Cross-National Marriages in JAPAN (RUSSIAN CASE)**

The paper focuses on modern Russian diaspora in Japan and based on research conducted in 2012 in Kyoto (Japan). Although Russians in Japan have more than 100 years history, in fact the Russian-speaking Diaspora has formed just last decade. There were only 322 Russian (Soviet) citizens in 1985, but in 2004 the Russian community in Japan has counted more than 7 000 members. This shows an account that Russian-speaking community can include the CIS citizens, it is understandable how many Russian-speaking foreigners in Japan now - about 10 000. All population of the Russian community in Japan can be divided into two groups: labor migrants and members of cross-national marriages. I pay attention to the second, larger group of the Russian community in Japan, because it is still studied a little. It is a marginal community, still not Diaspora in due its small and dispersed numbers. Having many problems of identification, they want to keep their transnational identity, influence on cultural environment of host country and to be a root between it and homeland, between two cultures - Europe and Asian. This study (interview with Russian women married Japanese men) shows us an impact on Japan of many new ethnical communities and how Japan is becoming the society of multi-cultural coexistence. So, under influence of the small Russian community, Japan will take a new identity as a multicultural state, but not homogenous one. To prevent depopulation, Japan has to accept 17 million immigrants between 1995 and 2050, immigrants and their descendents would total from 18 up 30 percent of the total population of the country by 2050. There are two main state’s coalesce policies – assimilation (melting pot) and multiculturalism (the salad bowl). In case of Russians, they don’t want to assimilate and prefer the multiculturalism (diasporic) model.

**Japanese Teenagers' Perception of Their Mothers' Employment and What They Do in after School**

Japanese junior high school students and high school students (age 13 to 18) are rarely reported internationally regarding their behaviors after school and attitudes towards their mothers' employment. I interviewed approximately 40 these teenagers, 20 each from relatively wealthy area, Setagaya and the down town, Taito in Tokyo. The result showed that most of their mothers were working part-time regardless of their areas and this affects family supper. Some of them were suffering from neglect or somewhat of neglect by mothers particularly concerning supper. The difference was teenagers in Setagaya are more likely to complain about their mothers' employment and other factors. On the other hand, ethnoral identification was a weaker and less consistent predictor.

**RUSSIAN CASE**

**Whistleblowing and Intervention: A Role For The Clinical Sociologist**

Whistleblowing takes place when a present or past member of an organization dare to report suspicions about organizational wrongdoing to those they believe to be in a position to take action. Whistleblowing could occur internally when the whistleblower communicates the message inside the organization (using prescribed or non-prescribed channels) or externally when the whistleblower resorts to an external agency, which could include the media. Regardless of how the disclosure is done, it remains as illegal, regardless of the whistleblower's motivation. The disclosure of information about organizational wrongdoing, especially if it is placed in the public domain, is regarded as a form of betrayal and often leads to retaliation by the organization. Acting as "loyal and caring" employees, whistleblowers generally do expect the severe negative responses they receive as a result of disclosing irregularities in their places of work.

This paper discusses whistleblowing in the USA and South Africa and considers the role clinical sociologists could play in designing and/or implementing interventions that would ensure better outcomes for the whistleblower as well as the organization and clinical sociologists. Clinical sociologists can attempt to improve people's quality of life by designing and/or implementing interventions based on an analysis of problem situations. In the case of whistleblowing their role could include advising the organization with regard to the implementation of confidential reporting systems that would pre-empt whistleblowing; developing support systems for whistleblowers before, during and after the disclosure is made; developing support systems for whistleblowers before, during and after the disclosure is made; mediating between the organization and the whistleblower and advocacy to improve legal protection for whistleblowers.

**Public Religious Activities of Muslim Women in Turkey**

This paper aims to analyze the effects of Sunni Muslim women's increasing public religious activities on their everyday lives and social status within their close relationship circles such as family and neighborhood. The analysis is an account of a two-year-long ethnographic field study in two state Quran courses and one informal Quran course in Ankara and twenty six interviews with the participant pious women. Muslim women's public visibility has been increasing in the world as well as in Turkey. This is firstly due to the increasing rates of public participation of women in Turkey (there is positive development in women's employment and education rates). Since working women spend most of their time outside their homes, pious women choose to fulfill their religious obligation of daily prayer (salat) in the mosques and mesjids which are public spaces. Secondly, more and more pious women claim their right to the public religious places such as mosques which have traditionally been male spaces and public religious activities such as Friday prayer which have been dominated by men as male religious activities. As a result, more women attend public religious activities at public religious places. This paper argues that pious women reorganize their everyday lives according to their public religious activities and that pious women's public visibility elevates their social status within their families and among their neighbors and friends. They are seen as the "people in charge" of the religious affairs by their families and by their friends.

**Building "Ethnic Ghettoes" or "Intercultural Bridges"? the Use of ICTs in Migrant Organizations in Spain**

The use of the Information and Communication Technologies (ICTs) by migrant organizations is a relevant factor for the enhancement of social cohesion. Migrant associations develop in-group solidarity, and this often generate the group mistrust. There is a general consensus regarding the value of ICTs in maintaining both strong and weak ties, but there is not any consensus on whether ICTs are
useful in forming new ties and whether those are strong or weak. This study aims at explaining the impact of ICTs use in the migrant associations' social capital. Are migrant associations using ICTs to expand bridging social capital or to reinforce homogeneous networks? In depth interviews to the representatives of 25 immigrant associations in Spain, from five different origins, namely Romania, Morocco, Equator, Colombia and Bolivia, have shown that the use of ICTs is increasingly essential for their organizations. Furthermore, ICTs are used to access to information on both the origin and the host country. However, the organizations' communications, both online and offline are mainly addressing their local communities. On the other hand, there can be no doubt that the associations that use more diverse ICT tools are those who are more oriented to social cohesion. The study shows that, indeed, bonding social capital is essential for migrant associations and that the use of ICTs helps maintaining strong ties, while fostering the creation of new weak ties and political participation of their communities in the host society. In sum, ICTs come up as an opportunity for migrant associations to improve their public image, collaborate with other public, private and non-profit organizations and thus to enhance social cohesion, in general. Therefore, an effort should be done from public and private initiatives to facilitate this digitalization. This paper is part of a larger research financed by the Spanish Ministry of Economy.

UZZELL, DAVID* (University of Surrey, d.uzzell@surrey.ac.uk)

Workplaces In Tncs: Can Green Practices Be Transported Across The Home-Workplace Border?

Just under 50% of the world’s GHG emissions in 2004 were attributable to energy supplies and industrial production (IPCC, 2007). The demand for manufactured goods is expected to rise by at least 100% by 2050 (from 2006 levels), with a consequence that industrial emissions, if unarrested will lead to a 90% increase in CO2 emissions by 2050 compared to 2007. Following new EU regulations, national governments have created policy instruments designed to reduce or compensate the level of emissions of specific organizations. However, these regulations have not proved to be effective, neither in terms of production nor consumption. The research project: Low Carbon at Work, attempts to understand the drivers for and barriers to environmentally sustainable practices at work and at home, and recognises not only the crucial contribution of industrial production to GHG emissions, but also that consumption is an inseparable driver of production. Investigating two TNCs (vehicle production and oil industry) in Sweden and the UK, we have asked under what conditions workers and managers are encouraged to transfer “green practices” from work to home and/or vice versa. We have also investigated how relationships between managers, employees and trade unions might encourage or prevent the adoption of “greener” production processes. Both case studies include informational and life-history interviews to understand changes at different times of their life course. Our findings explain why workers are often unable and unwilling to carry practices between home and work, why they draw borders between those areas and under which conditions they become permeable and “green practices” are carried from home to work and vice versa. We have found how limited communication between hierarchical levels within companies as well as inflexible management practices discourage workers to suggest and implement environmentally valuable changes.

Population Ageing and Distributional Concerns

This presentation will look at the transformation of the welfare state from the perspective of increasing spending on various elderly and health care services. One of the main arguments of the presentation is that a new distributional paradigm put forward through demographic and structural changes is emerging. The presentation has two objectives: 1) It examines the distribution of elderly and health care spending across the Finnish population with register data on the use of services in 2011. 2) With macro-level data from the EU countries, it analyses policies and social spending targeted to different age groups in the society and discusses how their balance has changed in the past two decades.

The increasing spending on elderly care services raises distributional concerns as the welfare state paradigm shifts to new forms of spending and new types of beneficiaries. Countries already display considerable imbalances in the distribution of public spending for today's young and old generations. If we spend more money on old age in-kind benefits, who benefits the most? Do all ageing citizens benefit equally and to what extent this development in spending patterns digs a gap between generations? Are there signs of proportionally more pro-elderly spending as the median voter's age increases? The topic is politically even more relevant in the midst of the current economic crisis when social budgets are being cut, welfare state policies recalibrated and intergenerational justice is emerging as a significant policy issue.

The preliminary analyses with the Finnish register data indicate that the distribution of old age in-kind benefits has a remarkably pro-poor pattern. The final article will investigate further if this is explained by the greater morbidity of the elderly in lower income classes or if the result is connected to other socioeconomic factors, such as living alone or older age.

VAALAVUO, MARIA* (National Institute Health & Welfare, Maria.Vaalavuo@thl.fi)

Welfare Dependence, Accumulation of Social Problems and Marginalization

9.2 per cent of the population in Helsinki claimed social assistance in 2011. Media often portrays these people as a homogeneous group while the evidence tells otherwise. This presentation contributes to the development of a typology of social assistance recipients and focuses on those worst-off. Is there a new group with multiple needs that should be targeted with specific policy measures? But also, are there new claimants recruited from middle classes? 40 per cent of recipients claim social assistance for less than 3 months. These short-term recipients can hardly be called the core of destitution – especially if we consider long-term deprivation as a characteristic of destitution.

An entirely different type of subgroup includes those who receive the benefit long-time or recurrently. Indeed, long-term social assistance receipt has increased and a growing share of claimants faces many problems simultaneously. Health problems, substance abuse, long-term unemployment and housing problems often accumulate and make these people more vulnerable to marginalization.

In order to develop better policies and actions by social workers, information on the heterogeneity of clients and the depth of the various problems they face is of profound importance. Should we improve the accessibility and content of health services, to whom should the rehabilitative work be targeted and who still have the potential to re-enter the labour markets?

The presentation analyses social assistance clients in Helsinki with register data from 2006–2011. The data is complemented with information on the use of health and social services and pharmaceuticals. Using factor, latent class and descriptive analyses, the objective is to locate the core of destitution and classify clients on the basis of their background, benefit dependency and welfare problems. This categorization can facilitate the design of actions, setting of realistic objectives of policies for different subgroups, and analysing social assistance data in general.

Educational Inequality and Social Mobility: A Two-City Study in India

Patterns of intergenerational mobility provide an indication of the equality of opportunity and “openness” of a society. This paper studies the impact of educational attainment on social mobility chances in India for both women and
men. India presents a novel case to test theories of inequality and to examine social change given its diversity and the pace of recent growth that has excluded a significant proportion of the population, and due to persisting educational and gender inequalities. Specifically, large cities in India that have expanded both in terms of population and economic growth are ideal contexts for such a study of social mobility. This paper analyses primary data collected through a survey of over 1800 respondents in two cities, Delhi and Patna. In-depth interviews with some of the surveyed respondents provide the much needed context to this study of persisting inequalities.

**Bearing Witness to Social Suffering: The Emotional and Social Complexity of Social Documentary Photography**

There is a highly contested debate in the social sciences and the humanities about the artistic bearing of witness to social suffering. If we take the paradigmatic case of social documentary photography, does prolonged exposure of individuals to images of social suffering have de-politicizing effects, dulling empathy and leading to compassion fatigue or does it spark an empathetic imagination and ethical reflection, and thereby stimulate an active solidarity and sense of shared responsibility that constitutes a cultural pathway to an active citizenship. Although we sympathize with the latter judgment, we admit this is based more on wilful optimism than persuasive evidence because, in actual fact, there has been very little rigorous social science research investigating this debate.

We are attempting to redress this oversight through an ongoing research project with the Side Gallery in Newcastle, UK. For over 35 years, the Side has hosted exhibitions of social documentary photography, many of which have been dedicated to exploring large scale social and political transformations with a special focus on social suffering and hidden injuries. For each exhibition, the gallery has kept a comments book and we have codified and analysed a sample of 25 exhibitions across three decades featuring diverse forms of social suffering and distinct subjects.

We use these contemporaneous comments to trace how the images impacted on individual emotional states (what kind of emotions were triggered, whether particular images generated specific responses). We also explore whether these exhibitions acted as a force for social learning; increasing people's understanding of social complexity and power; recovering people in the photos as proper subjects, worthy of dignity in their own right; and enhancing knowledge of possible alternatives. Finally, we are interested in whether we can observe how individuals employ distinct ethical, emotional and critical judgments when encountering these kinds of images.

**Fatherhood and Doing Gender. How Challenging Can Institutional Changes be?**

Transition to parenthood in Switzerland takes place in a particularly gendered welfare state. It is the only European country where men do not have access to any kind of statutory parental or pregnancy leaves. Following a conceptualization of gender as a social structure, we consider that parenthood is shaped by social mechanisms producing difference and inequality between fathers and mothers at the institutional, interactional and individual levels. This paper investigates empirically the extent to which institutional change - such as the introduction of a paternity leave - can challenge the construction of gendered fatherhoods. It is based on a case study conducted in a public sector organization which implemented in 2010 a one-month paid paternity leave. Sequence and cluster analyses are performed on register data about the patterns of employees’ leave uptake (N=95). Interpretive analysis of interviews with fathers who took paternity leave (n=22) and with married female counterparts in their team (n=8) is conducted.

Results indicate a limited challenge of the gender structure. At the interactional level, although paternity leave enables fathers to spend more family time, a gendered division of childcare tasks is observed: fathers still have a secondary role with the newborn child. The majority of interviewees adopt a modified male family model, similar to the dominant norm in Switzerland. As regards interactions in the workplace, paternity leave contributes to make fatherhood more visible, but informal norms about the legitimate leave pattern are observed. On the individual level, paternity leave uptake contributes to men’s appropriation of their fatherhood identity and to increase their sense of competence and duty as fathers. However, their conception of fatherhood is structured according to contradictory discourses which highlight change in gender relations and persisting differences between motherhood and fatherhood.

**Highly Skilled Migration As a Structuration: What Is New?**

This paper examines the role of interaction between social structure and human agency in the process of international migration of the highly skilled professionals. The discussion draws from Giddens’ structuration theory and Bourdieu’s forms of capital. It revisits Giddens’s analysis of duality of structure and relates this migration in a field shift. This presentation is devoted to explore second questions: Why do highly skilled professionals migrate even they are financially satisfied? Why others do not consider migration? What kinds of forces in migration decision process do participate? This paper is based on results from twenty in-depth open ended interviews with highly skilled professionals of Lithuania in the fields of natural and technological sciences. Migration and social status is seen as endless process constructed from set of events passed on micro, meso, and macro level.

In the view of structuration theory migration is seen as recursive process formed and transformed by active agents and itself shaping and structuring subsequent social behaviour of agents. Both structural determinants in the countries of emigration and immigration and acknowledgment of migration as efficient strategy for life betterment creates new cultural element in the social structure that influences migration-decision making of other peoples. International migration is a continuous interaction between migrants and economical, political, social, and cultural contexts on macro level in the sending and receiving countries.

New insights shed light on deeper than just economic considerations layers involved in forming attitudes towards international migration. The structural and socio-cultural context where individual is acting, migration experience in parent family, seek for higher social status, personal freedom, and need for professional recognition are just several pieces of the puzzle, the outcome of which is decision to (not) migrate.

**Mexico: Democracy and Inequality in the States**

In Mexico only electoral democracy has been developed. There is no growth, neither social nor political important presence from social and civic organizations that show developments on social democracy and that allow an effective control of the government by the society. The elections alternation in every aspect has a proof of the presence of electoral democracy.

Mexico’s ranked place 61st on the Human Development Index. Nevertheless, inequalities on the 32 national entities are quite evident.

This paper analyzes the evolution of the electoral democracy on the 32 Mexico’s states and relates it with inequality according to the HDI.

The unit of analysis is the alternation on municipal governments during 10 years. Identifying those entities with a greater percentage of municipalities with alternation in their governments and searching the relation with the evolution of the HDI and the evolution of income poverty.

**Mexico: Electoral Geography from the States View**

Ever since year 2000, Mexico has had very competitive presidential elections. Two of these electoral processes, have been pinpointed as fraudulent, because of several irregularities that have happened.

The electoral geography has introduced the states behavior in the three elections to be studied (2000, 2006 and 2012), showing more or less territorial aggregation.

This paper introduces the electoral geography based on the electoral results from the capitals of the 31 states of the country, taking into consideration, that generally, the states capitals concentrate the higher amount of voters, and have the major political diversity from each state.

This paper also presents the political-governamental evolution from each entity, as a political and geographic context that supports the explanation.

**All Mixed up: Defining Mixed-Income in Public Housing Redevelopment**

Since the 1980s, politicians, government officials, and real estate developers have popularized the strategy of building mixed-income housing to replace trou-
bled public housing projects in the United States. Although the term is used to describe a growing number of developments, “mixed-income” has never been officially or consistently defined. Drawing upon a newly-constructed database of income-mixing in projects completed under the HOPE VI program since 1993, as well as on other initiatives, this paper investigates selected public housing sites that have moved into so-called mixed-income housing in order to understand what qualifies as mixed-income and to develop a more analytically precise way of describing these projects. We reveal that the mixed-income label is applied to a wide range of income mixes, from projects that try to minimize the presence of low-income (less than 1/3 of the total unit), to those that attempt to preserve a substantial majority of units for low-income households. In addition, we develop a new way of identifying and categorizing mixed-income developments in terms of how income mixing is implemented: 1) mixing in a few low-income residents into a mostly high-income project or vice versa, 2) mixing together the low-income and high-income residents into a single project, 3) mixing in new high-income residents around low-income residents living in an existing project, and 4) mixing in low-income residents by spreading them out into a larger neighborhood, rather than a project. The categories reflect divergent ideological positions about both the physical and social place that low-income people should have in mixed-income communities, and by extension, the role of public housing in American society. Although mixed-income developments can be a useful tool to insert affordable housing into tight housing markets, we argue that these developments are too often used to displace formerly all low-income communities.

Domestic Violence As Eigenvalue in Contemporary Society: A Sociocybernetic Approach to the Construction of a Form of Gender Based Violence in Chile

Domestic violence, including several forms of gender based violence, does not exist independently from an observer, neither is this observer limited to a domestic realm. In contemporary society, domestic violence is constructed as such in a network of operations that encompasses both private and public realms. This network involves a diversity of human and non-human agents – questionnaires, photographs, medical instruments, etc. – and coordinates public policy, their observation and diffusion. Their arrival and diffusion was induced by several social factors in the 1990s and 2000s, respectively. Social science knowledge plays a major role in these processes, both in a universalizing way and in a way that is associated with development and its reproduction. It is a family where the key elements of human development and its reproduction. It is a family where the key elements of human development and its reproduction. It is a family where the key elements of human development and its reproduction. It is a family where the key elements of human development and its reproduction. The Circulation of Two Epistemic Objects That Carry Social Science Knowledge: Domestic Violence and Bullying

This presentation follows the circulation of two epistemic objects, namely domestic violence and bullying, in Chile, from their appearance in this country in the decades of 1990 and 2000, respectively. Social science knowledge plays a major role in the configuration of both epistemic objects. Also, both objects have important normative and emotional contents, making them relevant for the orientation of actors. In this manner, domestic violence and bullying are part of performative processes through which social science knowledge shapes reality. The definitive positioning of domestic violence and bullying as part of everyday reality in Chile resulted largely from State-led processes of measurement, diffusion and regulation. Their arrival and diffusion was induced by several social processes. In the case of domestic violence, the feminist movement, with its claims during the 1980s, was a crucial lever. Bullying, instead, has a more diffuse arrival, being mass media, particularly television, its fundamental driver. International organizations such as the World Health Organizations and UNESCO played a key role in the circulation of both constructs. They have provided conceptual and methodological tools, as well as facilitated and disseminated research and provided funding. Moreover, international organizations have incorporated in these constructions a decisive normative framing that is associated with developments in Human Rights.

Some repercussions of these processes are analyzed regarding the globalization or universalization of these realities or cognitive objects and to the respective effect of perceptual and normative shaping. The empirical study is based on interviews to relevant agents (state functionaries, policemen, educators, psychologists, physicians, etc.), ethnographic work regarding measurement and classification practices, and revision of documents related to processes of constitution of these constructs.

The Atmospheres of Chilean Copper Morailities

From ancient times copper mining has been a key element for the materialisation of the civilization processes. From the weapons and ornaments of the Western Asian settlements 1.000 BC to the chips and wirings of contemporary high-end cars, copper has had a privileged position advancing human capacities with its versatility. However, intensive pollution derived from copper mining has also been a prevalent issue that can be traced twenty centuries back to the smelters of Roman Empire times, as some recent sediments analysis in Greenland have recently shown (Hong et al, 1996). Additionally, copper has been relevant in international disputes over natural resources, as can be seen in Chile in the middle of the Cold War, with a process that sought to recover national sovereignty over copper and ended up with the imposition of a dictatorship. Following an actor-network perspective, this presentation is focused on the role of copper shaping the institutional settings of Chile. The analysis is mainly based on the negotiation of all copper standards and emissions caps that lasted for more than twelve years (between the late 1990’s until 2012), and explores the different copper ontologies related to health, pollution, energy, and globalization among others, mobilised during that process. Reviewing the proceedings of the expert panels and public statements made by the bodies involved in these negotiations, the agencies of copper and the enabled visible and invisible actors are rendered as key agents and subordinating of Chilean institutions to the needs of the currently in place copper production schemes. This refers not just to the local schemes, but to its intimate connections with the global copper dynamics, which are currently dominated to a great extent by China. It is argued that a way out of this entanglement should be designed, cutting across the cause-effect relations that compose current Chilean copper morailities.

Contemporary Family and Human Development

Human development is the expansion of people's opportunities live long, healthy and creative lives; to advance other goals that are valuable for themselves and the entire society. Human development implies that people engage actively in expanding equity and respect for human rights. Family is not only an institutional cell but also is a micro-social basis of human development and its reproduction. It is a family where the key elements of human development (health, education, well-being etc.) originate from. The potential of these elements predetermine perspectives of socio-economic, scientific and cultural development of the country and ultimately of the person himself. It is a family where a person should be brought up to respect fundamental principles of equity, recognize human rights, interests and needs of other family members and people around. Family is the only social institution providing for redistribution of values and norms to the following generations; ensuring success, stability and sustainability of human development.

At present in many countries the family institution experience crisis, which is intensified by discrepant and often negative demographic processes. These tendencies affected Russia as well. Along with decrease in birth rates, there have been negative changes in marriage and family structure; in the number of incomparable families and illegitimacy. The most common indicator of the Russian families is poverty, which is deepen with each subsequent child. Responding to contemporary challenges in marriage and family processes the governments of developed countries realize explicit family policies. In Russia family-oriented measures were always regarded as a part of social and demographic policies. However nowadays National family policy, its statements, principles and priorities are being conceptualized. This is reflected in the work of experts' and scientists' communities; in broad public discussions of the draft project of the National Family Policy Concept.

A New Global Approach to Pursue Global Justice and Development

The liberalization of economy and global economy formation have fundamentally changed the mode of interaction between government, employees and employers; have greatly affected the employment structure, labor markets and socio-labor relations. Uncontrolled world capital markets, and as a consequence, risen instability, uncertainty and inequality in society have led to a weakened sense of common purpose of social partners in labor sphere.

At the same time, understanding that stability and considerable culture in socio-labor relations guarantee social and economic well-being, determined the need in a new base for consensus between tripartite partners in global scale. This role is performed by Decent Work (DW) concept, presented by Director General of The International labor organization (ILO) in 1999. In accordance with definition, DW involves contradictory: in Bosnia is it implemented through the cooperation program between ILO and Russian Federation. The timeliness and urgency of DC idea is proved also by The European Union’s Post Lisbon Strategy. The European network of 53 NGOs “SOLIDAR”, working to advance social justice in Europe and worldwide wrote: «We would like to see the quality jobs and decent work agenda translate into EU’s internal European legislation, policies and programs, with its key components and objectives reflected in the Post-Lisbon Strategy».

La Violencia Invisible: Acoso Sexual Callejero a Mujeres En Lima Metropolitana

El acoso sexual callejero comprende un conjunto de prácticas cotidianas como frases, gestos, sibilidos, sonidos de besos, tocamientos, masturbación pública, exhibicionismo, seguimientos, entregar, otras, con un manifiesto carácter sexual. Estas prácticas revelan relaciones de poder entre géneros, pues son realizadas sobre todo por hombres y recaen fundamentalmente sobre mujeres, en la mayoría de casos desconocidas para ellas. Las realizan hombres solos o en grupo. No se trata de una relación consentida, sino de la imposición de los deseos de uno (a) por sobre los de la(s) otra(s). Se realizan en la vía pública o en (desde) el transporte público o privado, de manera rápida e inesperada. Pese a tener impactos en la libertad sexual y el derecho al libre tránsito, estas prácticas no han sido normalizadas y hasta justificadas en nuestra sociedad.

Esta ponencia mostrará los resultados preliminares de una investigación en curso sobre el tema, realizada gracias al financiamiento de la Pontificia Universidad Católica del Perú (PUCP). Los resultados de la Encuesta Nacional de Género 2012 realizada por la PUCP muestran una mayor incidencia en Lima y Callao que en otros ámbitos del país, lo cual revela su carácter fundamentalmente urbano. Asimismo, el segmento más joven de mujeres (18-29 años) es el más afectado, lo que revela que estas relaciones de poder entre géneros tienen un componente de edad: a mayor juventud, mayor probabilidad de ser afectada. A nivel cualitativo hemos podido recoger también discursos que justifican estas prácticas.

La ponencia presentará también la experiencia del proyecto que dirijo: “Paremos el acoso callejero”, que desde el 2012 ha colocado el tema en la agenda pública peruana, logrando que medios de comunicación, municipios e, inclusive el Ministerio de la Mujer, se hayan pronunciado y estén realizando acciones para combatir el problema.

Territorial Politics and the Emergence of Sub-National Welfare Models in Italy, Spain and Great Britain: Regionalist Mobilization, Institutional Asymmetries and Left-Parties Portionality

This paper investigates the relationship between sub-national politics and the emergence of region-specific models of welfare governance in Italy, Spain and Great Britain. Data on spending, legislation and implementation of social policies in all the regions of these countries have been collected and analyzed. The main finding is that in all three countries territorial mobilization – through the creation of regionalist parties – has been an important factor in the development of well-structured and distinctive welfare models at the sub-national level. In countries with relatively flexible constitutional arrangements (Spain and, especially, Great Britain), regionalist parties have promoted distinctive models of welfare governance by engaging in bilateral bargaining with central authorities and obtaining special formal powers for the regions they represent. In the absence of constitutional flexibility (the Italian case), the intervening effect of formal institutional asymmetry is less relevant and what really matters is the fact that regionalist parties have used standard self-governing authority in distinctive and ‘creative’ ways. In this paper I also consider the ‘welfare effect’ of left-wing mobilization in Italy. I show that its importance varies depending on the role that mainstream centre-left parties play in national policy making and on their relationship with regionalist movements. In Italy the Left has been excluded from central government for many decades and has therefore acted as a ‘regionally-focused’ political force, which, despite not representing regional majorities, has used the regionalwordpress to promote distinctive social policies. On the contrary, in Spain the main party of the Left, the PSOE, has been a dominant force in central government and has therefore mainly focused on the promotion of state-wide, standardized social policies. In Great Britain, left-wing mobilization and ‘sub-state nationalism’ have been closely linked in recent decades, thus having a combined effect on welfare development in Scotland and Wales.

Ces rumeurs qui racontent les crises politiques

SourceURL/file://localhost/Users/aurore/Documents/PropositionISA2014.doc

L'avènement des nouvelles technologies de l'information et de la communication a contribué à la diffusion internationale et à l'accessibilité de discours informels d'experts, à l'éclatement et à la déhierarchisation des pôles d'information et de productions de textes et au journalisme influencé par l'utopie de l'information en direct. Dans ce cadre, de nombreuses informations non vérifiées (rumeurs, hoaxes, rosettes, légendes urbaines) circulent, font interprétant l'actualité et, plus particulièrement, les crises.

Depuis quelques années, le mot « crise » revient quotidiennement dans les médias pour désigner une situation économique, politique, sanitaire, socioculturelle ou organisationnelle. La crise intervient dans des situations d'imprévisibilité, d'incertitude et d'ambiguïté. Face à elle, les individus vont alors développer des techniques, des procédés pour la prévoir, l'aborder, la comprendre, lui donner un sens ou les aider à la traverser.

Les rumeurs et autres énoncés rumoraux font partie de ces procédés qui permettent de construire des règles à partir des expériences vécues et/ou de les évaluer collectivement. En tant que discours officieux, ce sont des informations non confirmées qui révèlent soit des informations véridiques mais non encore officialisées, soit des informations fausses, postulant une réalité non avérée ou une explication du monde alternatifs. Ils permettent aux individus d'évaluer leurs causes, leurs conséquences potentielles et les changements qu'elles amorceront.

The Social Transmission of Religiosity to Second Generation Migrants: An Interactive Model

In this paper, we examine the social transmission of religiosity to second generation migrants in cross-national perspective. We apply theories on cultural transmission and assess the influence of vertical interactions (i.e. through parents), horizontal interactions (i.e. through peers) and oblique interactions (i.e. through social institutions) and the religious context on the transmission of first generation religiosity to second generation co-ethnics. We use data from four waves (2004-2010) of the European Social Survey (ESS) comprising 8,123 second generation migrants coming from 102 origin countries and living in 26 European destination countries. We apply cross-classified multilevel analyses to examine subjective religiosity and the frequency of praying. Results indicate that the social transmission of religiosity is more successful in second generation migrants to be more religious than the religiosity among first generation co-ethnics. The transmission is more successful when interactions are favorable for this transmission process; however: when second generation migrants grew up in traditional families, are less socially integrated, have spent less time in educational institutions and in countries where religiosity is lower. Our research also shows important divergences between the transmission of subjective religiosity, which is more universal, and the frequency of praying, which is more susceptible to the influence of interactions. This could indicate a trend towards the privatization of religiosity among migrants in Europe in the long term.

Engendering Corporate Social Histories: Reflections of White, Afrikaans-Speaking Businesswomen in Gauteng, South Africa

Using a qualitative, gender-sensitive approach, this particular case study explores the narratives of a group of white, Afrikaans-speaking, women employed in the financial sector of Gauteng in South Africa. Based on semi-structured interviews this study has aimed to explore corporate women’s political and personal experiences and how this affects their career choices and ideals on how to ‘balance’ work and home life. This study shows how women make efforts to attempt to challenge out-dated but ‘embedded’ patriarchal norms and values. The study also illustrates how working women try to manage spending the little free time they have with family and their children and how most of them still have to assume the bulk of the responsibilities of the household. This particular group’s position is fairly ambiguous within the contemporary South African society, since they have been known to have enjoyed certain privileges in the past relative to other groups, but they have also suffered and still suffer gender discrimination and gender inequality under patriarchy. Recently some have come to question whether white women should also benefit from affirmative action policies. This is not an easy question to answer since it has been widely acknowledged that women experienced discrimination and gender inequality during the apartheid era differently (Kongolo & Bojuwoye 2006: 364). Thus, it is important to understand their accounts of the past, as well as, the future.

Dilemmas of Combating Corruption: Afghan and Dutch Perspectives

Dutch troops in Afghanistan are confronted with situations in which the local population values values and norms, that the soldiers themselves take for granted and/or deem essential. As a consequence they regularly have to decide whether or not to intervene and try to stop and change undesirable behavior. This is not only a matter of operational feasibility, but also and especially of cultural and moral desirability. In Afghan corruption is one such ingrained practice that brings with it difficult dilemmas for soldiers.

Corruption weakens the trust in and the legitimacy of public offices and the government. Therefore, corruption has been identified as a major stumbling block to successful peace building. As Afghanistan ranks among the most corrupt countries in the world, the abolition of its widespread corruption has grown into a main concern of the international community.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
In principle ISAF is part and parcel of these efforts, but in practice it is not always self-evident how soldiers should act. Should fighting corruption be a priority in peacekeeping and training missions as well? Or should soldiers, in order to achieve their primary mission targets, sometimes tolerate it? How do Dutch soldiers solve culturally and morally critical situations in this particular area? What's more, what about the Afghan counterparts? How do they view the cultural and moral dilemma of the foreigners? Based on recent fieldwork in Kunduz, this presentation depicts and analyzes answers and opinions from both sides.

On Inequality and Physical Health: A Bio-Markers Based Test Of The Neo-Materialistic Argument In Low and Middle Income Countries

This paper re-examines the relationship between wealth inequality and two measures of physical health: anemia status of women and of the countries' resources relevant to health (i.e., the level of wealth of the country, the private financing of health and the efficiency of health services) for explaining the empirical association between inequality and physical health. We use data collected between 2000 and 2011 by the Demographic and Health Survey in as much as 52 low and middle income countries. Our binary logistic multilevel models reveal that higher wealth inequality is significantly associated with worse physical health, but this relationship is weaker and ultimately statistically not significant when individual and countries' resources relevant for health are taken into account. We conclude that at least in the low and middle income countries the relationship between inequality and health is mainly explained by compositional effects while the health institutions have a limited role for improving physical health. Based on our results we cannot endorse the idea of a true contextual effect of inequality on health, at least not in the low and middle income countries or in relation to physical health measures.

Are the Chinese Saving for Old Age? the Precautionary Motives of High Household Savings

The one-child policy in China, put in force in 1979, converged with the macro-economic developments over the last two decades. The Chinese GDP increased at an annual rate of 9% between 1995 and 2010. Poverty had declined from 65 percent of the population in 1981 to about 13 percent in 2010, lifting hundreds of millions out of poverty at an unprecedented rate. The share of household savings more than doubled to about 25% of disposable income, the highest saving rate in the world after India.

As the parents of one-child generations grow older, the steep demographic changes pose increasing insecurity. The old-age dependency ratio - number of people over 65 for every person of working age is expected to double over the next two decades. What kind of policies the Chinese central government initiated to prevent old-age poverty and the overburdening of the middle generation? And, is the high household saving quota an indicator that the Chinese are aware of the financial risks of longevity? Though the Chinese government launched various pension programs, these payments are not yet adequate for older Chinese to make a decent living. Therefore, we assume the high household saving quota has been an indicator of the awareness of the risk of longevity, though many other theories are proposed. We analyse the correlation between pensions and savings whereby those entitled to pensions are expected to save significantly less and hypothesize that these two are more or less communicating vessels.

First we analyze China's transforming economy and household income from the perspective of the growing dependency rate. Because we are interested in the question if the Chinese are preparing for old age, we analyze the data from the China Health and Retirement Longitudinal Study (CHARLS).

Active Aging in East and West Germany. Life-Course Influences in a Formerly Divided Country

When it comes to life courses of older people in Germany it has to be taken into account that they had been living in different countries and political systems for decades. Next to highly different experiences of life in youth and middlelife, people aged 60 plus nowadays have been socialized within very different cultures of old age. Material living conditions of retirees, employment rates in later life, social images as well as social expectations towards older people were quite different in the former GDR and FRG. Whereas older people in the Western part were pictured as retirees, enjoying leisure and earned repose, elderly in the GDR were seen as veterans, who had fought against fascism and capitalism. They were continuously addressed as productive parts of the socialist society, while the living conditions were rather precarious at the same time. However, it is not just the different settings before 1989 that make a difference in people's life stories, but also the experiences following the re-unification, namely the wide-spread unemployment in the new federal states. At the same time, the Western model of early retirement and deserved disengagement has been challenging since the early 1990s, too, giving way to a re-negotiation of old age as a productive phase of life. The presentation asks, in how far the different experiences of life before and after re-unification influence how older people think of and cope with this development. Are we witnessing a diminishing East-West difference or even profoundly different age cultures? The presentation is based on empirical findings from the research project "From retirement to active aging? Images and practices of old age in the transformation of the German welfare state after reunification" – drawing on biographical interviews with elderly from the Eastern and Western part.

VAN DRYK, SILKE* (University of Jena, silke.vandyk@uni-jena.de)

Ageism in Times of Population Aging. Rising Awareness and New Forms of Discrimination

Age and aging have become highly popular issues in industrialized countries recently – namely in a twofold manner: Next to doom scenarios on population aging and increasing costs, older people have been discovered as active, productive and successful citizens, which is particularly true for the non-frail and healthy elderly. Each of the notions, no matter if it comes to activity, productivity or success, revolves around the idea that older people are capable of productive life, being able to contribute productively to the public good, serving for themselves and others. Though often instrumental with regard to elderly's resources in times of population aging, negative age stereotypes are challenged in new ways: We establish a rising awareness towards discriminatory effects of age stereotypes as well as various political and academic endeavors to foster positive images of aging and old age. However, this attempt turns out to be at least ambivalent when it comes to ageism: Since the rising awareness is mostly about the supposed "unjustified" negative stereotyping of capable "young retirees" and older workers, discrimination of aging as a social and cultural phenomenon is rather deferred to dependent and deep old age than fundamentally challenged. Moreover, the strong focus on achievement, productivity and success in old age generates new constraints for those who do not fulfill these criteria and who are indeed frail or demented and dependent on care. Against this backdrop it is the aim of the presentation to debate on whether and in how far the new appreciation of capable so-called "young-old" finally produces new age inequalities. Since awareness of ageism as age-based discrimination is much more advanced in liberal Anglo-Saxon countries than in continental Europe, the presentation opens up comparative insights to this ambivalent configuration from Germany and the US.

Normalizing Displacement: Cinematic Representations of Gentrifying Amsterdam

Focusing on recent cinematic depictions of Amsterdam, this paper discusses the relation between the socio-spatial processes of gentrification and their popular culture representations. Formerly taken as an exemplar of inclusive, democratic urbanism, in recent years Amsterdam has been characterized by increased socio-spatial polarization. Gentrification is evident in the rapidly growing middle-class residential polarization in the historical city center and in the associated assertion of consumptive and cultural middle-class practices. Drawing on popular Dutch films in which Amsterdam's city life is a central feature, we argue that these representations not only document or reflect the recent social transformations. In addition, they serve to normalize and even glamorize urban gentrification. This normalization of a classed and ethnicized urban order is produced through narrative structure and – even more forcefully – through visual techniques. In the recent productions on which this paper focuses, the city of Amsterdam plays an important role, not so much in terms of plot and decor, but as a spatial imaginary in which urban inequalities are mapped onto symbolic sites and landscapes. While the spaces and agents of gentrification are glamorized, peripheral, non-gentrifying neighborhoods and their inhabitants are visualized and stigmatized as underworld spaces of vice and squalor. The films portray middle-class, White protagonists, while Urban Others in terms of class and ethnicity serve mainly as a foil to these "normal" Amsterdammers. Parallel to the forms of social and physical displacement that gentrification causes in Amsterdam, these cinematic representations can be understood as effecting the cultural displacement of racialized
Workplace innovation increases the quality of working life and the organizational performance (Oeij e.a., 2012; Kramer e.a., 2008). Moreover, the European Economic and Social Committee (2011) underlines that workplace innovation is essential for the future of Europe. The sociotechnical theory stresses that workplace innovation need to take place by an intervention in the technical system and in the social system (De Sitter e.a., 1997). In the social system, workplace characteristics (e.g. job complexity and job autonomy) influence the quality of working life and the organizational performance (Kramer e.a., 2008). Consequently, workplace innovation needs to stimulate an optimal balance between workplace characteristics. Smith e.a. (2008) show that European countries differ in workplace characteristics.

This research examines, inductively, the conditions which cause different workplace characteristics in European countries. In addition, country level conditions such as welfare regime, union density, participation rate and varieties of capitalism will be used in the analyses. The European Working and Condition Survey will outline the aggregated workplace characteristics in the different European countries.

stood, secondly, in its 'singularity' (Foucault 2000). It will be argued that it is not simply the re-emergence of Lombokro and Homo Criminalis because the question that should be asked is precisely how the new biocriminological approaches problematize crime, criminality and contemporary crime control in radical new ways. This singularity of the bio-criminalological program will be analyzed, thirdly, by a study of the strategic case of ‘neurocriminality’ (Raine 2013). This paper explores its claims, assumptions and how this involves a change in the government of self, others and the state.

Who Benefits from Internet Usage? the Digital Divide of Mobilized Online Resources

Several studies have shown that the higher educated possess more or better Internet and computer related skills, such as the ability to find and process information. This implies that Internet usage should therefore also be more profitable for the higher educated, which is something that has not been studied often. We study this profitability of Internet usage in terms of the resources that people mobilize through their Internet usage, and we examine whether the higher educated mobilize online resources to a greater extent than the lower educated.

In order to learn more about these mobilized online resources we look at negative life events that are experienced by respondents and the way in which they dealt with those events. We analyze newly collected data from a questionnaire that was designed to test an inventory of online coping resources. This inventory consists of seven dimension of online coping (with 3 items each), such as emotional and instrumental support, active coping, and finding distraction.

We hypothesize that the higher educated mobilize online resources to a greater extent with regard to all seven dimensions. This challenges some of the insights of social capital research, which often finds the extent of emotional support to be unrelated to social status. Moreover, unlike what is normally found with regard to offline networks, the support comes from weak ties relatively often.

VAN KOPPEN, KRIS* ( Wageningen University, kris.vankoppenn@wur.nl)

Humans, Animals, and Morality in a Nature-Inclusive Sociology

Disruption of natural systems and depletion of natural resources have become major concerns in society, both in their global reach and in their local impacts. Natural science insights into human behaviour - particularly from the fields of neuroscience and evolutionary biology - have increasing impact on our understanding of the social world. Sociology has to embrace these insights in its analysis, but not by abandoning its hermeneutic method. Starting from these tenets, this paper sketches principles of a nature-inclusive sociology, building on studies of Moscovici and Foucault, and on earlier work of the author. In applying and elaborating these principles it explores the social implications of the commonalities of human and animal bodies. While similarities found in evolutionary, neurological and ethological research have profound impacts on the understanding of animal and human behaviour and the ethics of animal-human relationships, they fall short in supporting the environmental morality tied to these findings by Edward O. Wilson and other conservation biologists. The paper then sets out to describe a social practices approach to human-nature relationships that gives due attention to natural science findings and natural system dynamics while leaving intact the role of human agency and responsibility in protecting our natural world.

VAN KRIEKEN, ROBERT* (University of Sydney, Robert.van.Krieken@sydney.edu.au)

The Celebrity Logic of the Global Financial Elite

This paper examines a particular aspect of the development of a global financial elite, its organizing around the production of particular kinds of celebrity CEOs and financial ‘stars’ which then intersect and form alliances with those at the peak of other elite fields such as sport, entertainment, journalism, and science. The analysis looks at the workings of what Robert Merton called the ‘Matthew effect’, which concerns the ongoing accumulation and leverag of advantage, and how it works across a variety of fields including finance, to produce a global system of overlapping elites. In a sense the paper is an attempt to re-work C. Wright Mills’ ‘The Power Elite’ for the present day, looking at the performative aspects of the global financial elite and the competitive demands placed on the presentation of self and representation of elite status. The overall aim is to show how the process of ‘refeudalization’ outlined by Sighard Neckel has its core the production of global celebrity across a range of field, as the contemporary version of a global aristocracy.

Child Benefit Reforms and Principles of Redistribution

Child benefit systems embody objectives of horizontal redistribution (i.e. from families without to families with children) as well as vertical redistribution (from high to low incomes). These principles are reflected in the characteristics of the child benefit system: is it universal or selective, or a combination of both? In this paper, we use these principles to position the current system of child benefits in Belgium in terms of horizontal and vertical redistributive outcomes. As an indicator of vertical redistribution, we use the impact on income inequality and poverty, as well as how these benefits are distributed over income groups. We also present a measure for horizontal redistribution, trying to capture the fiscal flows from families without children to families with children, as well as between families of different sizes. Using the microsimulation tax-benefit model MEFISTO/EUROMOD, we calculate vertical redistributive effects of the current system (baseline scenario) in terms of inequality and child poverty reduction. Our approach is innovative in that we take into account actual costs of childrearing based on a normative budget standard, and not only rely on the modified-OECD scale. Next, we calculate the effects of a set of alternative scenarios of three extreme positional roles: a fully universal system, a strongly income selective system and a strong categorically selective system. What balance between horizontal and vertical redistribution is struck by these different scenarios, compared to the benchmark of the baseline? We conclude with the outcomes of a mixed system, and some generalizable recommendations for policy makers to combat child poverty.

The Doctor-Patient Relationship: Inequality in Pain Construct

The doctor-patient relationship refers to the quality of interaction process; also to the influence and control that role players have within the relationship. This signifies the notion of inequality of experience as well as the perceived and actual outcomes thereof. The objective of the research was to explore the assumption that there is a correlation between patient consultation and anticipated and actual levels of pain reported by males and females who were operated for knee and hip replacement in Libya. The research questioned the impact the doctor-patient relationship has on the ‘pain construct’ that allowed exploration of the ‘divide’ between the role players, amongst other variables the influence of gender and culture. Face-to-face in-depth interviews were conducted with medical doctors who undertook the surgery and with patients, while observations were carried out during doctor-patient consulting sessions. With reference to gender, more male than female patients experienced a higher level of organic pain than anticipated prior to surgery, and both male and female patients experienced higher organic pain levels who had not received ‘informing consultation’ prior to surgery. These findings indicate that ‘inequality’ of doctor-patient is still prevalent in some societies highlighting cultural factors at play, while it also poses the question to what extent congruence of ‘pain construct’ can be attained through a doctor-patient relationship that is characterised by actual and perceived narrowing of the divide ‘traditionally defined’ by control and influence.
acceptability of asylum applications, those of social scientists measuring immigration and integration, and those of criminal law judges deciding on verdicts. Based on ethnographic research into these sites, we explore these practices in the following ways. First, we will focus on the precise ways differences are made and remade, focusing in particular on the taken-for-granted classifications that are not 'looked at', but 'seen through', i.e. the figure of the immigrant, that of the asylum-seeker, and that of the deviant subject (Bowker and Star 1999; Mitchell 2012). Second, we will pay attention to the techniques, instruments, and inscriptions that allow for such difference-making. In particular, we focus on the visual material (graphs, charts, etc.) social scientists produce in their work practices, and on the visualizing technologies (case files) and truth-finding procedures (interrogations, court hearings) both judges and immigration officials deploy in their practices. Seeing and visualization, we argue here, are capacities concentrated in specific centers of expertise and are enabled by and produced in a knowledgeable engagement with the instruments and optical devices of the 'trade' (cf. Goodwin 1994; Haraway 1988). As such, they exhibit logics of visualization.

While theoretical discussions generally assume citizenship to be anchored in a particular geographic community, little attention has been devoted to how the geography of citizenship should be conceptualized. This paper argues that scholarly disagreement is rooted in the tacit assumption of citizenship having over the years displaced the question of how to think citizenship spatially. The result of this is that political sociology still silently draws on the outdated idea of citizenship as anchored in a national and homogeneous territory with clearly delineated borders. In an age of increasing cross-border mobility however, territory is no longer the only, nor necessarily the most important, spatial form citizenship can take.

In this paper I will therefore firstly propose a typology for understanding the multidimensional spatiality of citizenship. The typology stems from an engagement with social geography, and distinguishes four spatial forms of citizenship: territory, scale, place and network. Secondly, I argue that the different dimensions of citizenship each provide a specific dimension of citizenship, and that these dimensions can be remade, focusing in particular on the taken-for-granted classifications that are not 'looked at', but 'seen through', i.e. the figure of the immigrant, that of the asylum-seeker, and that of the deviant subject (Bowker and Star 1999; Mitchell 2012). Second, we will pay attention to the techniques, instruments, and inscriptions that allow for such difference-making. In particular, we focus on the visual material (graphs, charts, etc.) social scientists produce in their work practices, and on the visualizing technologies (case files) and truth-finding procedures (interrogations, court hearings) both judges and immigration officials deploy in their practices. Seeing and visualization, we argue here, are capacities concentrated in specific centers of expertise and are enabled by and produced in a knowledgeable engagement with the instruments and optical devices of the 'trade' (cf. Goodwin 1994; Haraway 1988). As such, they exhibit logics of visualization.

The Multidimensional Spatiality of Citizenship: Understanding Tensions in a Mobile World

While theoretical discussions generally assume citizenship to be anchored in a particular geographic community, little attention has been devoted to how the geography of citizenship should be conceptualized. This paper argues that scholarly disagreement is rooted in the tacit assumption of citizenship having over the years displaced the question of how to think citizenship spatially. The result of this is that political sociology still silently draws on the outdated idea of citizenship as anchored in a national and homogeneous territory with clearly delineated borders. In an age of increasing cross-border mobility however, territory is no longer the only, nor necessarily the most important, spatial form citizenship can take.

In this paper I will therefore firstly propose a typology for understanding the multidimensional spatiality of citizenship. The typology stems from an engagement with social geography, and distinguishes four spatial forms of citizenship: territory, scale, place and network. Secondly, I argue that the different dimensions of citizenship each provide a specific dimension of citizenship, and that these dimensions can be remade, focusing in particular on the taken-for-granted classifications that are not 'looked at', but 'seen through', i.e. the figure of the immigrant, that of the asylum-seeker, and that of the deviant subject (Bowker and Star 1999; Mitchell 2012). Second, we will pay attention to the techniques, instruments, and inscriptions that allow for such difference-making. In particular, we focus on the visual material (graphs, charts, etc.) social scientists produce in their work practices, and on the visualizing technologies (case files) and truth-finding procedures (interrogations, court hearings) both judges and immigration officials deploy in their practices. Seeing and visualization, we argue here, are capacities concentrated in specific centers of expertise and are enabled by and produced in a knowledgeable engagement with the instruments and optical devices of the 'trade' (cf. Goodwin 1994; Haraway 1988). As such, they exhibit logics of visualization.

The governmental management of mobility is a crucial way in which contemporary Europe is being made. Images are part and parcel of the increasingly elaborated network of organizations, expertise, legal codes and material infrastructures set up to manage the ‘desirable’ and ‘undesirable’ mobility across EU-borders. Visualizations of registered data, routes, maps, risks, opportunities and uncertainties are implicated in governmental attempts to gain overview, anticipate the future and authorize control. However, these images of governmental surveillance and security exist and become visible in a wider field of image production and dissemination. State institutions are far from alone in their attempts to see and disclose what’s going on at the border. This paper will analyze the relations between images implicated in border management and alternate visualizations of cross-border mobility. The latter concern the work being done by NGO’s, researchers, political actors and activists. More specifically, illegalized migrants themselves work to make themselves visible in circumscribed ways, often to claim rights and gain political agency in highly precarious circumstances. How are images and the craft of making them copied, translated, disfigured and redeployed within this field of images? How can we conceptualize affinities and contradictions between different visualizations in order to assess multiple ways in which ‘Europe’ and ‘not-Europe’ can become visually enacted? Images and their interrelations may both confirm, contest and confuse existing imaginaries of ‘Europe’ and its ‘outside’.

Obstacles to Housing Recovery for Socially Vulnerable Populations

Notions of resilience indicate that more resilient communities will experience less severe shocks to systems and will return to stasis more rapidly than less resilient communities. Concepts of social vulnerability suggest that different populations within communities have varying capacities to anticipate, resist, absorb, and recover from shocks. Consequently, different populations may be expected to manifest different recovery trajectories, both in terms of the magnitude of the shocks endured, and the rate of recovery to pre-shock levels of well-being. Therefore, differences in recovery trajectories may lead to long-term redevelopment, displacement, and demographic change in the affected communities.

We analyze these variations using longitudinal household survey data, coupled with damage assessment and tax appraisal data from Galveston, Texas collected since Hurricane Ike, which struck in September 2008, causing one of the costliest disasters and most widespread power outage in U.S. history. Previous analyses indicate substantial differences in the severity of damage incurred by socially vulnerable populations immediately after the hurricane, as well as differences in the rate of recovery of housing values.

Here, we assess the relationship between the recovery of housing values and actions taken by occupants and owners. Panel models of housing recovery are enhanced with household survey data regarding occupant characteristics, financial resources, and repair behavior. These analyses build on our previous findings to better understand the obstacles to recovery for socially vulnerable populations. Understanding the vulnerability of a community to social and physical impacts from disasters helps local governments and planners, as well as the agencies that aid them, to support the development of resilient communities that are able to respond effectively to hazard events and recover quickly after impact.

Inequality in Tertiary Education: The Case of Hungry Students in South Africa

Education is seen by many people, especially in the global south, as the route out of poverty, towards development and social mobility in society. However it has become apparent that many students at South African universities do not have enough food to eat on a daily basis. Much research, mostly in North America and Europe, has focused on the role of nutrition in learning capability and learning behaviour, and it is generally acknowledged that a healthy diet contributes to successful learning and performance. On the other hand, little seems to be known about food consumption patterns and the extent of hunger among students in developing countries. Research has been conducted, within a quantitative and qualitative framework, on the phenomenon of “hungry students” at the University of Johannesburg over the past few years. Since becoming aware of the problem in 2010, the University management has launched interventions of various kinds to assist students in need, in having at least one balanced meal per day. This paper will trace certain demographic and other characteristics of “hungry” students at the University of Johannesburg campus, as well as outline the institutional interventions undertaken to alleviate the problem. At a national level, the government, while cognisant of the problems experienced by tertiary students, particularly given South Africa’s apartheid history, has appointed a committee in 2010 to review the provision and conditions of student housing at South African universities. Their report included a section on a budget meal plan for students.

Global Vocabularies, National Outcomes: Latin American Youth Activist Strategies For Bringing Transnational Social Justice Rhetorics Home

This paper explores how youth in Latin America draw from global vocabularies of social justice to imagine and advocate for social change at home. The globalized circulation of media, interpersonal communication, and commodities has, we argue, shifted the cultural repertoires youth use to imagine citizenship. This is a heterogeneous phenomenon, but many examples point to a cosmopolitan sense of justice and ethics among youth. Youth draw on social media to engage with transnational publics to demand rights and new definitions of citizenship. They

1021
hybridize non-Latin and Latin musical genres to argue for pro-indigenous equality and student rights. Finally, they obtain information from global sources to argue for policy changes on issues pertaining to the environment, same-sex rights, and Latin American sovereignty.

Amidst this turn to what can be seen as globalized ethics, we draw from Latin American studies to argue that the outcome of this transformation requires scholars to pose young people's relationship to politics as a question in need of investigation rather than assuming a pre-defined relationship. As youth from Latin American imagine the future from global vocabularies, they seek to transform the nation-or the local, and the person! Rather than localities serving as a barrier to cosmopolitan outlooks, Latin American literatures on youth political activism indicate that an awareness of an unequal world is embedded in transforming the immediate spaces in which they live.

Life Course Pathways to Later Life Wellbeing: A Comparative Study of the Role of Socio-Economic Position in England and the U.S

A main paradox in comparative social epidemiology is that subjective wellbeing in the U.S. tends to be higher than in England in later life, although physical health is better in England (Haglund, 2005). One possible mechanism, the differential distribution of education and wealth in both countries, is at the core of this paper and will be extensively tested. Multiple measures of wellbeing, such as depressive symptoms (Radloff, 1977), satisfaction with life (Diener, 1984), and more eudemonic approaches to wellbeing such as CASP (Pye, Wiggins, Higgs, & Blane, 2003) and psychological wellbeing (Ryff & Keyes, 1995), will be considered. Using a growth curve approach that investigates not only differences between people, but also within people over time, we will investigate to what extent life course approaches to socio-economic position, such as accumulation, social mobility or latent period, explain baseline differences and rates of change in wellbeing in later life. This analysis will be conducted using multiple waves (2002-2012) of two sister studies of ageing, the U.S. Health and Retirement Study (HRS) and the English Longitudinal Study of Ageing (ELSA). Both panel studies have a large, representative sample (N=20000 for HRS and N~10000 for ELSA) of the community residing population aged 50 or more and contain comparable information on a wide array of life circumstances, among which gender, marital status, health, and both current and childhood socio-economic circumstances will be the most important for this analysis.

Leisure in an Unequal World: Assessing Causal Relation Between Resources and Leisure

Leisure in the global sense is an unfamiliar phenomenon in the toil-ridden lives of the marginalized and poor women in Indian villages, where moving out of homes in groups, into the open fields for prays is a leisure activity. Leisure for them is freedom from the restrictions on mobility outside the home. The multitude of toilets built with government aid, being used as storage places for fodder prove the argument of this deliberate choice of practice of leisure by women. Examining the data collected by questionnaire categorized in four leisure activities like reading a newspaper, listening radio, watching television and sitting at the computer. Study reveals with 30 married women age group of 18 to 40 in backward villages of Bundelkhand. Findings are that nearly 78% of women do not have access to all these activities, considered leisure activities indulged by men. The resultant recurring themes were of denial and lack of resources. The data confirmed that television is most popular mode of leisure and access to computer negligible. As a gender norm women practice enormous denial: whether in food, leisure time, questions of health, desire etc...They prioritize their tasks as wives, mothers, sisters and daughters and 99% of them adhered to the retrograde practice of purdah system. All these activities were directly related to the level of education and income of the household. The study reaffirms the implication of possibility for enjoying leisure activity – as defined globally is directly proportionate to one’s education and resource “instability and uncertainty that characterize the world today have their origin in the fact that an immense and vertiginous accumulation of wealth by a few has precipitated the dispossession, impoverishment and exclusion of millions of human beings in all latitudes of our planet.”

Controlling the Social Cost of Local School Markets?

Education policy is evidently in a state of change across industrialised countries. The fragmentation of modernity has manifested in a local government reforms, privatisation and agencification, whilst the core executive’s capacity to steer has eroded. In toto, a wide variety of endeavours to move away from the firm idea of state-funded, state-controlled and state-provided compulsory education have emerged. Along that trajectory the Finnish compulsory education system shifted during the 1990s from one of the most centralised to one of the most decentralised. Consequently, segregation between municipalities, residential ar- eas and families has emerged also in Finland, and the variation between schools, measured by PISA scores, has recently increased.

Our aim is to elaborate the Finnish local spaces for school choice, and the ways in which the negative outcomes of school choice and overall diversification are governed by contrasting three distinctive local contexts. By analysing administrative statistical and documentary data, we aim to model how local authorities respond to novel, local inequalities, and the demands of freedom to choose and equality of opportunity, simultaneously.

Our analysis models three different sets of policies in the municipalities in Metropolitan Area of Helsinki (approx. 1 million inhabitants), First (the municipality of Espoo), the local institutional space for school choice is constructed in favour for choice, without any current policies for positive discrimination. Second (Vantaa), school choice is more restricted, the policy is to prevent segregation by emphasising the uniformity of schools. Third model is ‘very pro-choice’ (Helsinki), where the policies to prevent segregation have included actions in regional policy and direct positive discrimination to schools located in sub-standard socioeconomic status neighbourhoods. By revealing the diversified policies concerning positive discrimination and other forms of control of negative externalities, we discuss about the formations and estimations of social cost for school choice.
Independent film production, characterized mainly by its low budgets and by the absence of a hierarchical division of labor, acquires increasing recognition by consecration instances of traditional Brazilian cinema. It is also notable a proliferation of specific instances – such as independent film festivals or distribution companies focused on independent production –, which may indicate the beginning of an autonomization process.

Here we bring empirical data to situate the contemporary independent production in the large Brazilian cinema field and especially to show how reputation and consecration here are constructed in opposition to the values/practices of industrial cinema. And it means not only the adoption of certain aesthetic positions, but also the adoption of some practices in terms of social organization of production. We also call attention to the fact that, among the independents, consecration sometimes brings the “reverse effect” of threatening the representation of independence – which is a subject of dispute.

How to understand independent agents, for which categories as dominant or dominated, established or newcomers, are all unsuitable in some extent? How to analyse the construction of consecration in a context where the many forms of institutionalization (including some kinds of recognition) may threaten the very condition of “independent”?

VARRIALE, ANDREA* (Bauhaus-University of Weimar, andreatvarriale@hotmail.it)
The Management of Public Spaces in Naples: An Essay in Urban Legal Geography

The main red thread crossing the debate about the disparity between Italy’s northern regions and their southern counterparts is the polarity between the categories of “modern” and “pre-modern”. This polarity has been used to portray the two regions as intrinsically different in their economies, politics and cultures. Although the use of this dichotomy has proved useful for emphasizing the gap between the two, this has been achieved, I argue, at the cost of exaggerating their differences: the South has been described with the categories of pre-modernity, community, informality. Symmetrically, the North has been associated to modernity, society and formality. The attributes of “developed” and “under-developed” have been assigned accordingly. I argue that a study of formality and informality can be helpful to understand how these territorial imbalances are reproduced, provided that the former are understood as simultaneous, not mutually exclusive systems of rules. To do so, I analyse how three significant public spaces in Naples, southern Italy’s biggest city today and its capital in the past, are regulated via formal and informal rules. With personal observation and interviews with local authorities, planners, local activists and users, I seek to understand how the interaction of formality and informality produces these spaces. Both formal and informal regulation, it is posited, exist in the city, and neither is intrinsically desirable or conducive to development. Rather, well-functioning public spaces are posited to result from a distinct mix formality and informality, whereby the two are both present and complementing each other. An explorative case study will be carried out in January 2014. There, the two sets of indicators (measuring the relative and the absolute strength of formal and informal rules) will be tested. At the RC21 conference I wish to present that case study and an assessment of the methodology adopted.

Diversity and Inter-Ethnic Marriage – An Agent-Based Approach

Inter-ethnic marriage, both a cause and a consequence of immigrant integration, is generally used to imply that the social distance between groups is low and, by extension, that community cohesion is high. The decision to marry outside (or even within) one’s group is often regarded as stemming from individual preferences and opportunities for contact. However, many anthropologists and sociologists have noted that culture-specific norms of kinship and reciprocity have a profound effect on who may be eligible partners (Ballard 2008; Gardner 2006), echoing segmented assimilation theory’s focus on the importance of community and family influences in shaping assimilation processes.

Using a descriptive agent-based modelling approach, we seek to investigate the processes of partner selection in diverse communities, focusing on individual preferences, opportunities for contact, and group norms to uncover how these may lead to differential rates of inter-ethnic marriage. Agent-based approaches provide an ability to study ‘global’ phenomena simultaneously with their causal ‘local’ processes (and vice-versa) in a dynamic setting. They allow us to investigate the development of population-level phenomena from a simulated ‘local’ social space of norms and values populated by acculturated agents familiar to sociologists, potentially providing insights into community cohesion and inter-ethnic marriage which would not be available from other sources. Whilst agent-based models of inter-ethnic marriage have been developed previously, they have overestimated rates of inter-ethnic marriage and largely ignored the group-level processes necessary for a global understanding of inter-ethnic marriage. Utilising research and evidence from quantitative and qualitative sources from across the social sciences, we thus seek to develop a complex model of emergent processes of differentiation and change in the marriage patterns and social cohesion of migrant communities.

VASILIEVA, LESSYA* (docent, lesyya-vasilieva@ya.ru)
The Quality of Political Elite and the World Crisis

The quality of political institutes of society depends from qualities of political leader as a representative of elite or ersatz-elite. The representatives of elite have such mental qualities as sophisticated cognitive intellect, diverse range of behavior and social attitudes and aims allowing them to bring maximum benefit to the society. The ersatz-elite have some common qualities with elite. But its representatives haven't diverse range of behavior and their ideas of values are mainly targeted at satisfaction of personal interests not regarding public ideas. The representatives of elite and ersatz-elite are presented on all levels of social hierarchic pyramid. The quality of political institutes of society depends from qualities of political leader as a representative of elite or ersatz-elite. Ersatz-elite introduce or develop social mechanisms depriving people of any control over political machinery. It turns out that in political and economic spheres of society deficient motivation and deficient satisfaction of basic needs are indifferent through political experience, social and economic frustration.

The present crisis does not have only economical but mainly social roots and cultural effects. It needs to specify the term Social Rent with new scientific definition. An equivalent formulation may be given in terms of the social parasitism when given such a status by government. Social rent is a form of uneconomical compulsion. It is necessary that such status must be admitted by productive, market and state forces. The power and economical monopolies are the social factors which are converted into settled rent factors. Institutionalization of social rental relationships destroys economic and social competition.
The main subject of social rentiers is the ersatz-elite. As they develop and become the ruling class, the economic and political systems either arise with seizure of new resources or destroy themselves.

Constructing Social Myths in the Modern Mass Literature (the Narrative Analysis of the Female American Novel)

Constructing Social Myths in the Modern Mass Literature (the Narrative Analysis of the Female American Novel)

The paper problematizes the literary text that becomes a subject of the sociological analysis when representing social processes and phenomena as well as social practices of certain groups. The narrative analysis reveals a deep structure of the text reflecting values, norms and social attitudes used for describing social groups and social processes. The analysis correlates with structural hermeneutics of G. Alexander implying sociocultural research of semantic structures of the modern mass literature where social myths and archetypes are updated, serving as interpretive models to explain and organize (construct) the social world.

The paper aims to show the results of the empirical research while proposing an original method of the narrative analysis of 18 American female novels, top rated in the largest specialized websites. The method synthesizes various courses in narrative analysis (event-structure analysis by D. Heise and L. Griffin), structural approach (R. Barthes, V. Propp, T. van Dijk) and K.Yung's theory. It consists in constructing a causal sequence of narrative events interpreting it in the context of the social myth. The method's steps include:
- studying the life course of the heroines;
- selecting significant events (based on structural indicators);
- narrativization of the chosen events using the grammatical approach (verbs as action highlighters);
- forming causal sequence of the events;
- detecting the general narrative structure interpreted in the context of the social myth.

The resulting narrative schemes form 3 basic archetypical female role-models within the cosmonogist myth and can be considered as interpretive patterns for describing gender role transformation in modern American society. The results of this empirical research can be verified in the context of feminist and post-feminist theories.

Modernization of Values and Its Implications

This work is based on the understanding of culture following the lines laid out in the works of L. White, P. Bohannan, A. Montague etc. and defined, loosely, as a system of non-biological regulators of human behavior (such as values, norms, attitudes, etc.). Just a few generations ago the majority of Russian population was rural, lived in the countryside environment and was engaged in natural-subsistence economy. Their culture corresponded to the low-level technological environment. The process of modernization has changed the environment in just a few dozen years, leaving the some cultural adaptors far behind. Some people experience conflict with impacts and challenges of modernization such as new women status, political democracy, market economy etc. We can see cultural differentiation on culture modernization continuation. Two poles of the continuation axes can be found. One of them is pole of modern culture accetpanction, another one is pole of modern culture rejection. The both poles are Weber's ideal types. The Likert scale was used for culture modernization measurement in our survey. The scale was validated by R.Indelhart's index and S. Schwartz's scale.

Socio-cultural types often differ according to the condition of socialization also corresponding to the generational differences. More modernized type of culture is adapted to the more modernized type of social environment. New generation has an opportunity to enjoy a more modernized culture than the old one. In this work, we attempted to evaluate the cultural changes between generations and polar socio-cultural types quantitatively. This longitudinal study was mostly based on a survey response data among university students in the city of Perm (Russian Ural) since 1991 till 2013. All samples covered more than 500 students. We can compare values of modernization between last Soviet generation and first Post-Soviet generation. The study also discovers the implications of these value changes.

Integracism At Work. The Case Of Germany

This paper further explores the notion of integracism, which has been introduced by the author briefly in a previous paper. The notion of integracism refers to a specific interpretation of the notion of integration with implicitly racist assumptions. This racially biased and ethnocentric notion of integration frames the meanings of managing ethnic diversity in Germany. Integration policies and management agendas are deployed to 'achieve the better integration' of ethnic minorities, who are widely seen as deficient and difficult to integrate, rather than adopting diversity management measures to foster equality, fairness and inclusion at work. In that frame, ethnic diversity is depicted as a source of potential problems.

There is a surge in the use of the concept of integration in management of immigration, not only in Germany, but also in France and in the UK in recent years. The notion of integration is the dominant concept in the management of ethnic diversity in Germany. The aim of this paper is to examine the corrosion of the notion of integration with racial bias, which undermines the overdue proposal of equal opportunities at work. Arrangements of integration for immigrants include requirements of extensive documentation, training, point based calculations based on qualifications, economic wealth and experience, citizenship rituals. Most of these requirements are highly variable, based often on racial profiling. It could be argued that these policies and practices of managing ethnic minorities and immigrants are not as innocuous as they may seem at first sight. This paper shows how ethnocentrism and racial bias influence employment practices, leading to the exclusion of highly skilled ethnic minority workers.

The paper operationalises Bourdieu's key concepts, field, habitus and symbolic violence and draws on a large qualitative study based on more than 40 interviews, a case-study, focus group as well as visual material and a research diary.

Teaching Ourselves and Reviewers Institutional Ethnography in the Process of Publishing

Methods textbooks in the United States often introduce institutional ethnography (IE) as one of a number of qualitative methodologies used by researchers, rather than as a mode of inquiry whose aim is to provide an alternative sociology. Institutional ethnography, as proposed by Smith (1987), is a much more radical departure meant to challenge the objectified subject of knowledge including the discursive practices of established social science discourse. This presentation focuses on how the work of institutional ethnographers differs from qualitative researchers who are often sympathetic to IE, but fail to recognize these differences in practice. Drawing on our experience of publishing our research in standard sociology journals, we explore how reviewers' comments and questions turn subjects into objects of investigation and explanation, standpoint into a subject.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
position or category within society, everyday world into the object of study, and generalize forms of consciousness into generalizations about people. We discuss the ways we have responded to reviewers and how this process has taught us more about the distinctive features of institutional ethnography as an alternative sociology.

La Adopción De Un Modelo Organizacional Como Estrategia De Comunicación Para La Transferencia Del Conocimiento y Tecnología En Centros Públicos De Investigación

El presente trabajo se plantea la necesidad de contar con un modelo organizacional como estrategia de comunicación institucional para la transferencia del conocimiento y de la tecnología en centros públicos de investigación de la región del Bajo, a fin de identificar la forma de comunicación más efectiva en materia de difusión de los procesos de transferencia de conocimiento y tecnología de cada Centro. Se parte de la premisa de que el conocimiento se presenta como el activo principal para la transformación y el progreso de toda sociedad, particularmente en organizaciones que se han creado con la intención de contribuir al progreso de la sociedad a la que se debe, fortaleciendo la economía del conocimiento, a través de la transferencia del conocimiento, y de la tecnología. Se conoce a los Centros Públicos de Investigación como sistemas vivos, en permanente movimiento, cambio, adaptación y evolución. La estrategia metodológica con la que se ha realizado la investigación, es desde un enfoque cualitativo, siendo el estudio de caso como uno de los instrumentos metodológicos. En este artículo se pretende mostrar formas para una adecuada comunicación institucional de los procesos de transferencia y tecnología en Centros Públicos de Investigación.

VEENHOVEN, RUUT* (Erasmus University Rotterdam, veenhoven@ese.eur.nl)

Why Sociological Theory of Happiness Falls Short

Happiness in the sense of life satisfaction is a psychological phenomenon in the first place. Consequently most sociological explanations draw on psychological theory, often implicitly and with little view on its limitations. A dominant perspective in sociology is that happiness results from comparison between perceptions of life-as-it-is and standard of how-life-should-be, which view fits with the notion that happiness is a social construct and as such culturally variable. Explanations in terms of universal affective appraisals and needs are marginal in sociology, as well biological sociology.

Though not suited for explaining happiness as such, sociological theory is apt for explaining conditions for happiness, societal conditions in particular. Empirical research shows that conditions for happiness are quite good in modern society, where its inhabitants live now longer and happier than ever in human history. Yet most sociological theorizing is about the miseries of modern society.

Some sociological explanations for this sociological short-sightedness are discussed.

Violence in Scholars Students in Latin America

Violence in Latin America has become into an issue that is growing and emerging new violent expression (Jiménez, 2009). Young people and teenagers are one of the social groups most affected by this problematic (See Youth Violence Prevention in Latin America and the Caribbean, 2013).

Mexico youth has been affected for this violence in the Latinamerican region violent dead between young people are growing more.

Prevention in Latin America and the Caribbean, 2013) are one of the social groups most affected by this problematic (See Youth Violence Prevention in Latin America and the Caribbean, 2013).

Objetivos: Analizar el comportamiento de la mortalidad por armas de fuego en el grupo de edad entre 15 a 24 años en México en los últimos 20 años e identificar factores socioeconómicos asociados a sus variaciones interestatales en el trienio 2010-2012. Conclusión: El aumento de la mortalidad por armas de fuego en el grupo de edad entre los 15 y 24 años se debe a cambios en las políticas del gobierno y las condiciones sociales de la región. La mortalidad por armas de fuego se incrementó en 62% entre 2000 y 2010. Las tasas más elevadas se encuentran en hombres entre 20 y 24 años. Variables relativas al narcotráfico y el consumo de alcohol están asociadas a las variaciones de la mortalidad por armas de fuego entre estados. Conclusiones: La mortalidad por armas de fuego es un problema social y de salud pública que debe ser abordado de forma interdisciplinaria.
VEIKHER, ANDREI* (National Research University, aveyker@hse.ru)

Social Norms of Morbidity As Specific Factors in the Demand for Health Services

Seeking professional medical help is caused not only by medical criteria health pathology. There is a complex system of health factors which are influenced by two external factors: emotional discomfort or psychological distress to get help from a professional medicine, i.e. make it socially relevant fact. This is the most important reason why the accounting treatment for medical help and true morbidity cannot match. The different access to health care for different social groups is the most active in studies of racial and ethnic diversity in countries and cities where the network of medical institutions sufficiently developed. The result was obtained in representative survey in St. Petersburg (2007-2011). The most part of them are the social attitudes/norms which give rise to refuse treatment in medical institutions and reduce the culture of health behaviors. This culture is very contrasting.

Improving education increases the tendency of self-medication. Massive short duration diseases (e.g. ARDS) are treated within the family without recourse to occupational medicine in 75% of cases. Social attitudes of non-professional care are supported by widespread corporate informal norms to continue work in diseases with partial loss of ability to work. Such practice is supported by other informal social contract employees with employers: rejection of the fixing of cases of the disease in the social insurance company. This and other identified dependencies suggest that the indices of morbidity are subject to change without unambiguous connection with the actual number of patients and the duration of their illness.

Methodological conclusion: for the considered social and medical conditions the survey are necessary for the correction usual morbidity data. Conclusions on the basis of registration of patients who seek health care may reflect the actual changes of many factors.

VEIKHER, ANDREI*

The Indication of External Validity As Aggregate Criterion Quality of Survey

The external validity criteria in sociological survey methodology and practice are used rarely. The exceptions are electoral polls. The well known Gallup and others polls obtained the trust of public and professionals due to external (predictive) validity, although the term had not yet been coined. The predictive validity is the simple and most convincing proof of the high quality of all elements and stages of the survey. The basis of application of the internal validity criteria is limited. Methods for assessing the external validity developed in psychology, medicine and experimental economics where in many research single target parameter and one external parameter analogous of an unbiased independent source are used. Therefore, in the most sociological survey various criteria of internal validity criteria are used for evaluation of survey quality. These methods allow to evaluate the common error for all variables of a survey under the condition that the sample is random. However the last few decades a number of difficulties with probability sampling have been cropping up in the expanding range of survey topics. The basis of application of the internal validity methodology has been shrinking too. The paper offers a few steps expand the application of criteria of external validity: - install for surveys on specific topics limit application of the criteria of internal validity - "unanswerable nonresponse rate" (nonresponse is the main factor that makes a non-random sample); - develop and apply external validity indicators for assessing the quality of a survey on selected topics - "item external validity"; - develop ancillary questions in the questionnaire, which will compare the survey data with data from independent external sources.

In our surveys of social settings in Saint-Petersburg (2007-2011) we used a measure of the external validity and simple distribution, and complex calculated indicator of latent social phenomena.

The Occupational Challenges of Female Architects in Iran

The Occupational Challenges of Female Architects in Iran

In the recent decades, Iranian women's access to educational opportunities increased. Currently, professional architects have an active presence in the architectural profession. However, these women are facing many challenges and obstacles.

The paper discusses the challenges faced by female architects in Iran. It argues that women architects are often excluded from the decision-making processes that affect their professional lives. The paper highlights the need for more inclusive policies and practices that support the growth and success of female architects in the industry.

Hierarchies of Middling Transnationals: Indian IT Workers in Singapore -- CANCELLED

This paper builds on emerging literature around ‘middling transnationals’ (cf Ho 2011). Drawing on empirical research among Indian IT workers in Singapore, the paper advances two propositions. It argues that there has been insufficient consideration of skilled migration in terms of national and racial hierarchies of opportunity, rights and conditions; and that so far, literature on skilled transnationals has been too receiving country-centric. It is an interesting example of a highly transnational skilled occupation that has become associated with workers from India. It is argued that IT has become associated with India in ways that naturalise precarious forms of employment and rewards that are often associated with White professional jobs. Using the example of Singapore, the paper argues that conditioning occurs via four intersecting factors. First, Singapore has a long-standing tradition of visa hierarchies which situate White, European transit elites at the apex of the occupational hierarchy, and dark-skinned workers from the Indian sub-continent at the bottom. Although ‘transnationals’ workers are often associated with White professionalism, perceptions of the recent flow of middling transnational skilled Indians builds upon this history of racial sorting. Second, we suggest consideration needs to be given to deeper social, cultural and historical analysis of how labour has been conditioned historically and in the present era in sending countries like India and how this in turn translates into conditions in receiving countries with regard to workers' acceptance as 'their due' and what they consider to be normal. Third, we suggest a more global circulation of colonial-era ideas of racial hierarchy continue to cast a long shadow even to the most modern of occupations like IT. Finally, IT as an industry has emerged as a quintessential post-industrial service industry characterised by highly precarious sub-contracting forms of transnational labour supply.

The Politics of Social Policy Expansion in Latin America  

Welfare systems in Latin American countries have been significantly expanded during the twenty-first century. After decades of a social policy based on social insurances programmes which tended to cover formal sector workers and their families, new social programmes have been introduced and coverage of existing ones has been extended to reach population groups previously excluded throughout the region. This expansion processes have been explained as an outcome of the consolidation of multi-party electoral systems, since parties in government now compete for the sympathy of the electorate by introducing policies that favour the majority, notably social policies. However, even if this perspective clearly demonstrates the effects of democracy on welfare policy, it falls short of explaining the variations in the expansion models adopted in different countries. This paper aims to contribute to the existing literature on Latin American social policy by attempting to explain such differences, combining institutionalist and interpretivist approaches. The chosen case studies are Argentina, Brazil and Mexico, the three largest countries in the region, where different expansion models have been adopted. The paper examines and compares the socio-political arrangements that enabled and triggered the changes in each country. Findings show that the variations can be explained in terms of the effects of democratic transitions and the party systems that emerged from them, the degree of social mobilisation around social policy issues and the capacity of social movements to break with the neoliberal hegemony established in the region during the last two decades of the last century. Social welfare expansion, as a consequence, contributed to temper gross inequalities as well as to displace and redefine the fault lines governing social conflict. The article concludes with an outline of the main features dominating post-liberal/corporatist social policy hegemony in the region today.

Professional Interests, Organizational Goals and the Mobility of Football Players in Europe  

The mobility of professionals has important repercussions for organizational performance and to some extent for subjective career success of the professionals involved. Within professional football, team quality is directly affected by the movements of players to and from the club. Transfers have a big impact on player careers as well, as footballers changing clubs increase their income or revitalize their career with a renewed chance on first team football. Whereas previous research examines these movements from the perspective of individual players, this study analyzes to what extent player transfers are shaped by the interaction between institutionally embedded organizational goals and the interests of footballers. Using event history analysis to estimate the probability that a player moves to a different team, I argue that player transfers are a function of the location of an organization in the field and the position of a footballer in his team. In general, fringe players are more likely to move. This is especially so for high status teams, where such players move to pursue their interest of first team football. Moreover, players of underachieving high status teams are bound to be transferred, as the club lets go of the players it blames for its relatively low performance. This contrasts with the transfer probabilities of players in low status teams. The key players of these teams have a higher probability to move, as they are looking to increase their career rewards by moving to a higher placed team. Moreover, key players in overachieving low status teams are particularly likely to be transferred, as such teams sell their best players to cash in on their hard earned status.

In sum, this study highlights how professional labor mobility is shaped by the interaction between the institutionally defined interests of professionals and the goals of the organizations they work for.

BELOVA, NATALIA (Russian State University)  

Gender Asymmetry As the Barrier of Political Modernization in Russia  

Considering activity of the women organization in the context of Russian political life we establish the fact of gender asymmetry in Russian politics. Representatives of women in Parliament (State Duma) vary from 10% to 14%. The main features of social context determining gender asymmetry are the following: feminization of poverty, latent labor discrimination; Social and cultural inertia accompanied with gender stereotypes; Ignoring gender interests in political sphere. As the result one can see marginalization of women in the political and economic spheres.

We consider Globalization as the factor inspiring political activity of women in Russia and analyze role of more than 1500 thousand women organization and pay attention to the positive dynamic of their activity. Most of them act in social sphere (Maternity and childhood protection (39%), The help to socially deprived groups (29%), Providing of public services and amenities to city environment (29%), Healthcare (21%) and Education (22%), Protection of social interests (13%), Human rights (10%)).

Main reasons of low representativeness of women in Politics can be described in different terms: Peculiarities of political socialization; structural factors (unequal distribution of resources owned by men and women; situational and biographical factors. For many years even the very consideration of the Law “On guarantees of equal rights and equal opportunities for men and women” was blocking. The Law about quotas for women in the party lists also was not adopted, despite the extensive discussion in the information and the public sphere. The trend of gradual increase in the proportion of women MPs in the federal and regional legislatures is very low still.

Hidden discrimination in the political sphere restricting activity of women leads to the different problems of social sphere.

Parliamentary Debates on Ritual Slaughter: a Contextual Discourse Analysis  

Parliamentary Debates on Ritual Slaughter: A Contextual Discourse Analysis

During the last three decades the visibility of religion has increased in the public sphere of many European societies. This has not only to do with the arrival and settlement of large numbers of Muslims and other non-western immigrants in these countries, government policies for managing religious and ethnic diversity, but also with political agenda setting of powerful secular forces. Illustrative for this is the political debate on ritual slaughter in the Second Chamber and the Senate of Dutch parliament in 2011, initiated by the Party for the Animals. In this presentation, the argumentation used in this debate will be analysed from the perspective of contextual discourse analysis. The arguments will be related to features of the main participants in this debate as well as to the wider context of Dutch politics in the wake of “9/11” and “the Fortuyn revolt” in 2001. These events have attributed to a reframing of Dutch identity in cultural and secular terms. Within the newly created frame religious issues such as Jewish and Islamic ritual slaughter are defined in opposition to secular Dutch identity.

Criminalizing Inequality: The Narratives of Women Formerly on Death Row in the Philippines

This paper delves into the pathways to prison of women who once received the death penalty in the Philippines. Drawing upon extensive participant observation at the only two existing women’s prisons in the country and in-depth interviews with 27 former death row inmates, I examine how the women framed the circumstances that brought them to death row, based on their understanding of their identities, relationships, and social worlds. I analyze the link between the women’s histories of victimization, social and economic marginalization, and substance abuse problems and their crimes. I also consider how the experience of deception and betrayal in close relationships, compounded by corruption in the criminal justice system, constituted a pathway to death row for the majority of the respondents. I discuss the implications of their narratives for the discourse on women and crime.

The women in my study were largely in marginalized positions in their families and relationships, at work, and in society in general. Their crimes resulted from their efforts to survive on a day-to-day basis and cope with their circumstances. Their narratives reflect many facets and social realities of low-income and working class culture in Philippine society. Their accounts of victimization, violence against specific men and even women and children, drug abuse and/or drug dealing in response to social and economic marginalization, cooperation with illegal activity as a result of relational responsibilities, corruption on the part of government and law enforcement agencies, and family dynamics and relational patterns, illuminate the contours and dynamics of their conflict-ridden world. My paper exposes the challenges to the dominant discourse on women’s crime, as illustrated by their narratives—as predominantly low-income women in a postcolonial, low-income nation enmeshed in poverty and institutional corruption.

Microblogging and Macro Weather: Climate Change Risk Discourse on Twitter

The social web represents a new arena for local, national and global conversations and will play an increasing role in the public understanding of science and the creation of risk discourses. This paper presents an analysis of climate change social representations on Twitter, analysing over 60,000 tweets collected using a random week method. The analysis includes a combination of web metrics, latent semantic analysis and semantic network analysis. Results indicate that most active users on climate change are distributed according to a power law distribution and that web metric indicators suggest a moderate conversation on the topic. In terms of content, there is a remarkable complex network of topics that hints to a rather multi-dimensional and complex risk discourse accounting for complex causality links between climate change and natural, social and economic consequences. Most of the tweets cluster around the domains of the effects of climate change, the measures that are proposed to adapt to it, the policy debate between policymakers and energy industry and call for actions for offline events. Moreover, the media ecology of the tweets, the web links shared in them, are from a wide set of sources with a major role played by traditional media but with a substantial presence also of scientific journals and NGOs websites.

Psychology and Learning Difficulties

In the context of a sociological thesis conducted in France in primary schools, the focus has been on the issue of the diagnostics and devices used to help children with learning difficulties. The purpose of this paper is to analyse the role of psychological approach in the management of academic difficulties. In the attempt to understand how the family, the mother figure in particular, are blamed for the learning difficulties of their children. It will be seen that the lifestyle and educational habits of families are analysed by teams of professionals, and that when considered as deviant, they suggest help to the family. Indeed, from the professionals perspective, these learning difficulties are due to family dysfunctions, and educational deficiencies of the parents. This would damage the mental functioning of the child and lead to difficulties in their learning. In schools where children are mainly or exclusively of modest background, it seems that these psychological methods are nearly exclusively the methods being used. Thus, children going to these schools are more likely to be diagnosed with mental illness than in a school with students from the upper-class. This psychological tends to put the responsibility on the family or the child for his failure, while ignoring the issue of the gap between the culture of the school and the one of children from modest backgrounds. (Bourdieu, 1964, Morel, 2012) It will be demonstrated that the psychological approach used by teachers allow them to suggest reasons for the difficulties faced by children and to put in place solutions. Indeed from a psychological perspective, the parents are seen as ‘actors’ of the success or failure of their children. The challenge for schools is then to accompany parents to transform their habits and their way of parenting.

VERDUZCO, GUSTAVO* (El Colegio de Mexico, gevurdz@colmex.mx)

Changing Trends In Migration Flows From Mexico To The United States

Although some observers tend to view Mexican migrations to the United States as a common socio demographic phenomenon due to the vicinity of the two countries in the context of unequal economies, late drastic reduction in migration flows from Mexico to the United States pose several questions. In the views of some analysts this is mostly associated to the security measures practiced by the U.S. government on its southern border after September 11, however there are other indications that point out in a different direction suggesting that these changes might be associated with a set of several factors in which demographic variables along with economic, labor market and political ones are closely interconnected, or if not is the case they coexist and interact in the same political arena.

Other variations of Mexican migration flows have to do with the repatriation to Mexico of huge numbers of irregular or undocumented migrants most of whom were previously residing with their families in the U.S. On another dimension there have also been some changing characteristics in the flows of Central American migrants crossing Mexican territory on their way to the United States. This new trend has been offering a challenge to Mexican authorities with new implications to the legal Mexican political framework.

One objective of this presentation is to offer data and information related to the kind of changes that have taken place lately not only in terms of Mexican migrants to the U.S., but with respect to the different political actions in the U.S. as well as in Mexico with reference to Central American migrants crossing the country and staying in the country.

A second objective is to interpret these new modifications at the light of other general changes especially those concerning the “management” of migration flows by other governments.

The World Bank and the Global Governance of Social Policy: A Strategic-Relational Approach to the Education Case

The World Bank’s original mandate did not include education, but its involvement in education policy and reform has grown substantially since the 1960s. Today it is widely recognized as the most powerful and hegemonic of the international organizations operating in the education for development field. The Bank is the largest single international funder of education for development in low-income countries, and its technical and knowledge-based resources tower over those of other international institutions. This paper develops a global governance approach for understanding how the World Bank’s agenda and policy outcomes in the education field have been constructed and have evolved with the passage of time. According to such an approach, research on agenda settlement in international organizations (IOs) needs to focus on three main dynamic: the political opportunities created by geo-political and ideological shifts among the most powerful member governments; the IO’s relationships with borrowing (or “client”) countries; and finally the internal dynamics and organizational culture of the IO’s own bureaucracy as it aims to reproduce itself and manage shifts in the previous two dynamics.

The paper explores how these three dynamics interact in the constitution of the Bank’s educational agenda and policies in four key periods: from the 1960s to the beginning of the 1980s, when the debt crisis exploded in many developing nations; from 1981 to mid nineties, a period marked by strategic uncertainty at different levels within the Bank.

VERLOO, NANKE* (university of amsterdam, n.verloo@uva.nl)
Learning from Informality? A Case Study to Rethink the Misfit Between Formal Policy Strategies and Informal Tactics of Citizenship

Dutch disadvantaged city neighbourhoods face a wide variety of policy strategies to regenerate housing and public spaces, integrate migrants, support families, and make these urban areas safer and more attractive to the middle class. Residents of these areas are aware of the effective tactics and bottom-up, informal practices – like everyday routines, tacit use of public spaces, and interactions at a square – tell much about the urban experience. Socio-economic disadvantages and a lack of linguistic skills make it hard for residents to engage in formal participation schemes. They experience the state through street-level interactions, but their stories do not find acknowledgement in the public sphere as governments hold on to formal repertoires. Recent needs for welfare creation and for violent escalations make local governments eager to rethink citizen's involvement. How could sociologist but also policy practitioners learn from informal performances of citizenship in relation to the dominant actors and institutions? This paper analyses the misfit between informal tactics of residents and top-down strategies of government in a neighbourhood in Utrecht. An ethnographic case study of performed interactions between citizens, welfare practitioners, and policy makers unravels how strategies to involve residents paradoxically disrupt informal mechanisms and thereby disengage residents from taking part in the political process. Latent tensions deepen in the unhandy mismatch between well-intended strategies and everyday tactics. Could local governments use tacit knowledge without ‘taking over’ or ‘disrupting’ the tacit fabric of the neighbourhood?

Relative Deprivation, Affirmative Status Generalization and Social Identities

The paper is based on caste-based graded inequalities and social identities emerging from the perceived relative deprivation by the socio-economically and educationally backward castes and affirmative actions based on identification of backwardness by the State agencies in India. The emerging social identities are discussed under a new concept ‘Affirmed Status’, besides, Achieved and Ascribed, as explained by Ralph Lynton. The affirmed status characteristics generalization are empirically verified to reconstruct the social structure, in modern Indian context. The process of such generalization and thereby emerging identities are explained with the help of a theoretical assumption, ‘Social Devolution’. Affirmed status is explained as the social identity of an individual or group (s) of individuals who has acquired a status higher than their ascribed status albeit, positively discriminated by the state in their favour but mainly because of their perceived relativistic success. The group, having achieved, whatever level, could not have been possible without such support from the state. Thus, the social identities of the affirmed status group(s) are resultant of aspirations and achievements of individuals belonging to a group(s) but due to support of the state. The status and mobility among affirmed status group(s) required to be higher could only increase with the implementation of the policy of positive discrimination, as more and more opportunities and benefits would become available and could be redirected to them. “Social Devolution” is construed as a process of elevating social power, prestige and dignity to relatively deprived, socio-economically and educationally low status groups by way of positively discriminating them to provide opportunities by a central agency (state in the case of India) without redistributing supremacy and awareness of so-perceived higher-status groups which also now, aspire to achieve the affirmed status for perceived fairness given by that agency.

CHILD Abuse in India : Navigating the ZONES of Silence

A growing body of text have begun to furnish information and data on the widespread pervasiveness of child abuse in India. The paradox is that the perpetrator or the offenders are often someone known to the child and more often someone from the extended family. Though in some situations it is beyond their control, but many times the family fails to protect the child from sexual abuse given to the cultural tradition of family being a ‘private space’ where no one can intervene unless it is very explicit. Moreover, social stigma makes it difficult to talk about child incest in public. However, there is still an absence of in depth understanding and empirical evidence to support general observations because of the lack of the sensitivity to the issue and the failure to acknowledge it in the first place. This paper assess the perception of child abuse among young college students in the age group of 17-20. The focus of the paper is the in-depth case studies of 10 victims of child sexual abuse and incest. The purpose is not only to get quantitative data on the issue as understood by young girls but also get an insight into the manifold dimensions and meaning of abuse to the victims through case studies which is mostly anecdotal. It reflects on the excessive influence of normative standards of families but also looks into the long term consequences of this in the lives of the victims.

YOUTH , Social MEDIA and Emerging Alternative Spaces for Socio-Political Movements : Analysis of ‘nirbhaya’ IMPACT

With the swelling proportion of youth population, India today is becoming one of the biggest Social Media market. The emergence of youth as new actors empowered with the technology - mobiles, facebook twitters and the like have resulted in organized demonstrations/protests developing an intercultural platform to build solidarity. This new 'youth brigade' by engaging in political conversations for collective action has not only ignited mass social movements but also challenged the academia to reposition itself on the role of youth and social media as active partners of social change. This paper analyzes the role of social media as perceived by the youth in the age group of 18-30 years in the city of Lucknow. The case in study is the December 2012 New Delhi Gang rape case - ‘NIRBHAYA’ Movement. This paper attempts to gain in deep understanding of youth activism at the intersection of multidimensional identities and their unified perception towards transformative socio-political change through social media campaigns. It also focuses on why and how the youth organize in to online social movement tirelessly and bring in a faceless movement for collective political action by actively engaging in dialogue and building public opinion thereof creating strong youth pressure. The paper examines how far such campaigns have been successful not only on focussing on punishment but challenge the cultural assumptions which creates spaces for violence against women.

Hospital Management and the Contribution of Non-Sector Expertise

A belief in the value and superiority of private sector management expertise has been central to NPM reforms (Ferlie et al., 1996; Hood, 1991; Pollitt & Bouckaert, 2000), leading to concerted efforts to re-structure public organisations and recruit senior managers from the commercial sector, including accountants (Clatworthy et al., 2000; Ferlie et al., 1993). It is assumed that such expertise will have a transformative impact on public organisations, moving them away from models of professionally dominated ‘custodial’ or consensus administration. Commercial managers will emphasise the importance of resources, the need to meet performance targets, and have the ability to implement change. However, while these assumptions and expectations lie at the heart of policy making worldwide, there is little research that has tested them directly. Some work has been done on the impact of senior leaders in local government (Boyne, 2005: Boyne et al., 2011) and school districts (Meier & O'Toole Jr., 2002; Moynihan & Pandey, 2005). As yet however, there continues to be a dearth of evidence supporting the assumption that diversifying the skill mix of senior managers in public organisations will lead to enhanced performance.

To address this deficiency, we focus on the impact of this non-sector specific commercial expertise on the boards of acute hospital trusts in the English NHS. Drawing on the governance literature focusing on the human (and social) capital of board members (Haynes & Hillman, 2010; Kor & Sundaramurthy, 2009), we first investigate whether a more commercial board has a different effect and if so, under what conditions. Given the dominance of clinical logics in the fields of health care (Ray & Hingins, 2005), we, then, look at the nature of performance outcomes and whether other factors, such as tenure and autonomy, mediate the impact of commercial and accounting expertise.

Professionalism and Managerialism: How Do Teachers and Physicians Deal with Management Measures

The implementation of reform measures in public administration has conducted to critical changes in the functioning of services and had a great impact on several professions. Changing to a management culture, oriented by efficiency, results control and meritocracy affected this professionalism. For instance, the management measures applied in the Portuguese health sector, such as corporatization of hospitals, organizational decentralization and deregulation of the labor market conflicted with the interests of the medical profession, opposing to its core values (i.e. caring and altruism) and ethos code, leaving to a loss of autonomy and power in decision making related to its duties. Besides this, the attempt to implement a performance appraisal system led to resistance from physicians, saying that the model doesn’t take into account the specificities of medical profession. In the education sector, there was also specific conflicts between managers and teachers due to the application of this model to professions dealt with the same management policy in different ways. While physicians (through their main trade unions) negotiated with the government the necessary adaptations of the model and guaranteed it wasn’t implemented before that, teachers showed a collective resistance to its implementation in schools since the beginning, and failed to get an agreement with the government.

Thus, we observe different ways of dealing with the same management measure by two different professions, and even more, we can ask if physicians hold greater bargaining power than teachers to protect the profession interests.

Of course, these differences, there has been effort of trade unions and professional associations to maintain the status and interests of the professions, resisting to NPM policies. Kindlack and Randall (2008) call it a postprofessionalization process (instead of deprofessionalization). Moreover, the management measures, although opposing to the interests of these professions, seem also to contribute to reinforce professionalism.

Free Software Workers and The Myth Of a Deteriorialized Knowledge Production

Software and Information Technologies of Communication have an important place in the development of globalization (Castells, 1998). Since the mid 1990’s, in opposition to capitalist globalization based in intellectual property, we have seen the rising of Free Software (Linux, Firefox…). This new way of producing software, thought internal communities involve a free participation, and give the image of an happy deterioratorialization of production. This social model of knowledge production is presented as having many virtues that potentially eliminate geographic and social determinants related to a territorialization. From a critical perspective, we propose first to describe the main discourse features of the actors of Free Software supporters and then from an empirical study, we will compare these to the quantitative study of data that we have collected. Using social network analysis on a large sample (N = 10,494) of free software developers, belonging to hundreds of different free software projects, we therefore chose to study the coupling between coordination and territoriality, including investigating the homophilies (Lazarsfeld and Merton, 1954).

While we might expect a territorial decoupling, we also consider the other social and cultural homophilies: universalist, but also in terms of skills. This setting light of homophily phenomena allows us to question the perspective and deterioratorialization present in discourses.

Also, we can realize a strong embedding of these communities in the elitist academic institutions, as well as a strong professionalization of the activity.
Results support the oft considered health gradient that access is based on the perception of finances. This becomes the main barrier for women to seek sufficient antenatal care and medically-trained personnel as well. Also, seemingly counter-intuitive findings had lead to having initial interviews with mothers in selected provinces in the country. What is supported by this approach is that traditional views on healthcare shape their views but perceptions of gradients that some types of care are only suitable for those who can afford them.

Food Security, Rural Livelihoods and Agricultural Change: Evidence from a Case Study of Potato Contract Farming in Maharashtra, India

Despite decades of sustained economic growth, food insecurity remains a seemingly intractable problem for many households in rural India. In recent years, food security has been elevated to pre-eminence in the political discourse of India with the passage of the much-debated National Food Security Bill (2013). At the same time, there has been a growing recognition among researchers that achieving food security in rural areas is not simply about solving food production or distribution problems, but rather addressing broader questions about household livelihood security (Pritchard et al, 2013).

Concurrently, the majority of rural Indian households continue to rely on smallholder agriculture as their primary livelihood activity. The nature of agriculture, however, is changing in India, as liberalisation policies open up the sector to domestic and foreign capital. One such change has been the spread of contract-farming schemes. Where they operate, contract-farming schemes are changing the dynamics of smallholder agricultural production, as land tenure households are increasingly exposed to modern inputs, technology and markets. These schemes present new opportunities for some households, yet it is unclear how these changes will influence patterns of social differentiation at various scales.

This paper discusses the nexus between household livelihoods, food security and modernising agriculture in rural India, using evidence from a case study of a potato contract-farming scheme in Maharashtra. The paper argues that by understanding agricultural change through a rural livelihoods lens, we can reveal the nuances of how rural households negotiate change specific to time and place, and who is in a position to benefit from such change. If we understand food security as primarily a livelihoods issue, then understanding how modernising agriculture is influencing patterns of social differentiation will be critical to the long-term food and livelihood security of India’s most vulnerable rural households.

Subjective Functions of Participation in Sports or Games: A Comparison of Findings in Israel, Japan, South Korea, Taiwan and the Philippines

Using the 2007 International Social Survey Programme (ISSP) Surveys on Leisure Time and Sports, this research paper looks at sports, games and physical activities most frequently participated in by selected Asian countries. More importantly for this study, it examines the subjective functions that taking part in sports or games serve, i.e., as a means of social interaction, competition with others, or for the betterment of one’s personal well-being. On the topic of subjective functions of participation in sports or games, the study specifically compares the importance of 1) physical and mental health, 2) meeting other people, 3) competing against others and 4) looking good as reasons for taking part in sports. Cross-country comparison of the findings focus on Israel, Japan, South Korea, Taiwan and the Philippines, in particular.

Is Poverty a Key Aspect of Ageing?

The poverty in old age is one of the most persistent stereotypical images of ageing. Due to the significant differences between income before retirement and pension benefit, there is an objective drop in the income with the retirement. However, with the individualisation of pension provision and weakening the link between pension age and labour market exit, the connection is no so straightforward anymore and the image gets even more colourful when social class and different forms of capital are taken into consideration.

Using the secondary analysis of different surveys carried out in last decade among the Czech population aged 40 years and above, I will show the attitudinal data on the role of poverty and financial exclusion in old age definition. I will address issues such as expected (sources) of income after the retirement, marginalisation in consumption, indebtedness, age discrimination in financial services provision and subjective poverty. I will use the paradigm of a serogeneity of older population to show how these differ in different age, gender-, income-, and social capital-groups.

Transferability of Successful Cooperativist Actions: The Case of Albacete’s Cooperatives

The Integrated Project INCLUD-ED (FP6 of the European Commission) identified Successful Actions (SAs) in diverse social domains. In the field of employment, the successful case of the cooperatives of Mondragon in the Basque Country was analyzed. The Mondragon Corporation (MC) has proven to be a non-capitalist alternative to the traditional organizational and governance models of capitalist firms, combining democratic principles, values of solidarity and strong competitiveness that allow it to achieve both efficiency and equity. In this organization, five successful cooperativist actions (SCAs) were identified and considered crucial in explaining these accomplishments. In order to analyze the transferability of the SCAs, some of them have been recreated in the poorest and most marginalized neighborhoods of Spain: La Estrella and La Milagrosa in Albacete. In 2011, a cooperative was created on the basis of developing the SCAs to provide decent, stable and sustainable employment to people from these neighborhoods. This paper aims to explain the success of the transferability of the latter to the cooperative in La Estrella and La Milagrosa and the ways in which this successful actions approach is contributing to overcome inequalities while contributing to generate alternatives to the capitalism. This work is developed in the framework of the international network of research on cooperativism coordinated by Erik Olin Wright and Ramon Flecha.

Sustainable Consumption Practices in Brazil’s “New Middle Class”

In recent years, Brazil and other emerging economies are showing a significant change in their socio-economic composition, which highlights the increasing income of the poorest sectors of the population. Some Brazilian authors claim that such economic improvement fosters the emergence of a “new middle class”, prompting a debate on such socioeconomic changes, and on the very concept of social class, as this concept is not consensual within the Brazilian social scientists.

Regardless of the classification which assigns to this stratum of the population, this represents a profound change in Brazilian society, with implications for the consumption patterns. This phenomenon occurs in a scenario where environmental issues gain public notoriety and the discourses that advocates the responsibility of the State, enterprises and non-governmental organizations to address them now include the role of the individual in their daily practices, including that related to consumption. So, it sets up a paradox between the possibility of increased levels of consumption and access to material goods by this economically emerging stratum (labeled as the “new middle class”), and the diffusion of the discourse and the proposals that advocate sustainable consumption and the need to reduce the consumption patterns as a way of coping with environmental problems.

Given this paradox, the paper will present results of an ethnographic study that aims to map the debate about the economic rise of the phenomenon of the less affluent in Brazil and the trajectory of environmental thinking until the moment this research was conducted. This study was developed in a scenario where environmental issues gain public notoriety and the discourses that advocates the responsibility of the State, enterprises and non-governmental organizations to address them now include the role of the individual in their daily practices, including that related to consumption. So, it sets up a paradox between the possibility of increased levels of consumption and access to material goods by this economically emerging stratum (labeled as the “new middle class”), and the diffusion of the discourse and the proposals that advocate sustainable consumption and the need to reduce the consumption patterns as a way of coping with environmental problems.

Mortalidad Juvenil En América Latina: Factores Asociados y Desafíos Pendientes
En las últimas dos décadas América Latina presentó importantes resultados en la reducción de la pobreza, aumento de la esperanza de vida y reducción de la mortalidad infantil. Sin embargo, el incremento de la incidencia de muertes violentas, sobretodo, entre los jóvenes en este mismo período sigue siendo un desafío pendiente. Así como ocurre con la mortalidad infantil o el embarazo adolescente, las tasas de homicidio inciden diferentemente sobre los individuos de acuerdo con su posición en la estructura social. Los estudios demográficos evidencian que hay una alta selectividad en la mortalidad juvenil por sexo, color/etnia y clase social. Irónicamente, las vidas ahorradas en los primeros años de vida en los países más pobres por medio de políticas de saneamiento y cuidado en la niñez continúan siendo interrumpidas prematuramente en la adolescencia o juventud por causa de la violencia. En los países latinoamericanos, la sobremortalidad masculina alcanza considerable magnitud. En muchos de nuestros países los chicos mueren de 4 hasta 6 veces más que las chicas de la misma edad. Es inseguro si las pautas de un pasado tan violento pueden ser comprendidas dentro del marco cultural de una cultura que aun sostiene fuertes rasgos machistas y una visión muy arraigada de la mortalidad infantil. En las últimas dos décadas América Latina ha hecho importantes avances cuantitativos en la educación no pero también de ética y condición de vida. Nuestra línea investigativa enfatiza el rol de la educación. Los avances cualitativos alcanzados en la educación no son acompañados por elevación de los niveles de calidad. La baja calidad de la educación en América Latina que se observa en algunos de los países con la mayor inversión en educación no ha sido lo suficientemente valorada por la comunidad educativa. Este trabajo discute las relaciones existentes entre las elevadas tasas de mortalidad violenta entre los jóvenes, especialmente los homicidios, e indicadores de condición de vida. Recent scholarship has de-exceptionalized sex work and positioned it within the theoretical framework of intimate labor (Borís and Parreñas 2010). However, academic studies of sex workers’ activism as laborers remain scarce (Jennex 1990; Kempadoo and Doezezama 1998; Hardy 2010). What tensions emerge when a labor framework for sex work serves not only as an analytic, but also as a basis for collective action?

This presentation, a scholar-activist collaboration, examines the trajectory of the Karnataka Sex Workers’ Union (KSWU) in India, drawing on 8 focus group discussions, 50 in-depth interviews, and our experiences. KSWU organizes sex workers using a trade union model. Rejecting state practices that either criminalize or pathologize sex workers, especially after large-scale HIV prevention programs directed at sex workers in India, KSWU has attempted to articulate an alternative claim on the state, positioning sex workers as citizens and workers.

We argue that KSWU has provided a meaningful alternative to existing relations between sex workers and the state. It has built alliances with other informal laborers and feminist and Dalit rights groups, and developed an independent trade union–like funding approach. However, traditional trade union models have not always been adequate in the face of stigma; dispersed spatial patterns of work; no fixed ‘empirical’ fluid identities of those who move between sex work and other informal work; systematic violence; and differences among women, men, and transgender sex workers in their relationships to sex work. Many sex workers in Karnataka prefer the safety of invisibility, but KSWU’s politics pull toward greater public visibility. KSWU’s experiences highlight the inseparability of claims for recognition and redistribution, and suggest the need for strategies of organizing that respond specifically to intimate labor spheres–strategies that draw on the insights of Southern labor and feminist movements and develop creative, safe spaces for solidarity.

The debate about the concepts of the body is justified by the fact that the noviciate is a key element for the formation of the body conception of undergraduate students, this is the first step to consolidate how to think and act in different fields. We aim to discuss the conception of body from teachers of a philantropic University of Goiás. The research is a cross-sectional study of a group of teachers. Made sure a case study with a questionnaire developed and validated specifically for this study. Was distributed approximately 20 questionnaires and one teacher refused to answer. The study was approved by the Ethics Committee of the PUC Goiás under No. 1256/09. identifies the fact that 26.7% of teachers working with sexual activities, 40% with the humanities, and 33.3% with the area of biology. About the body conceptions that prevail among teachers, nine replied the question, 66.67% consider the body as a machine, or as an organism, comprising separately from other components. Was also questioned whether teachers read authors such as the issue, 88.9% read. Was also asked if teachers talk about the body in their classes and again 88.9% said yes. The completion marks the fact that teachers’ conceptions of body can be considered traditional, since there was no overcoming the dualism of body and soul, or the condition of a body “thing” (machine or organism). This conception among university teachers can affect the thinking about the subject among academics, fact that is shown by other researches.

VILLALON, ROBERTA* (St. John's University, villalor@stjohns.edu)
Argentina's Dirty War: Counter-Hegemonic Collective Memories &
Frame Analysis
In this paper, I analyze the contentious and long-lasting collective process to
document, understand and reach justice for victims of Argentina’s Dirty War, based
on fundamental texts produced after the end of the last military dictatorship. By
looking into Ana María Mas (Never Again) report prepared by the National Com-
mission on the Disappearance of People (CONADEP), which included hundreds of
testimonies by survivors of torture and acquaintances, reading scholarly analyses
on this matter, and finding testimonies published in other venues, I discuss how this
report became a master narrative from which subsequent interpretations of the
Dirty War emerged. I apply Goffman’s (1986) frame analysis theory to under-
stand the complexities and nuances of processes of collective memory-making,
and identify how hegemonic and counter-hegemonic frames were used to create
meanings and organize experiences of the Dirty War. Then, I propose alternative
frames (an “intersectional frame” and an “emotions-conscience frame”) with the
aim of contributing to ongoing and long-lasting collective efforts to comprehend
this phase of history. While this use of frame analysis may be considered unorth-
oxous given that scholars do not generally impose a frame on a document, I intend
to demonstrate the power of framing and reframing as tools to animate what
existing frames may be masking and thus reach deeper levels of understanding
through furthering the production of counter-hegemonic knowledge.

VILLANI, MICHELA* (Institut Universitaire de l'Histoire de la
Médecine et de la Santé Publique, Michela.Villani@ehess.fr)
Excision and Migration: Between “Legality” and “Loyalty” in the
Transmission of a Traditional Practice in Migratory Context
Female genital mutilation (FGM) is forbidden in many countries of the North
(Europe, Nord-America) and of the South (Africa). However, this traditional prac-
tice is still transmitted from generation to generation by women.
If medical and pathological consequences of FGM are well-known, the social
and symbolic implications in the intergenerational process of transmission of the
practice and its history in a migratory context are often overlooked. The social
and symbolic universe of the countries where sexual mutilations persist, implies
that women who are not excised are considered “dirty” or “obscene”. Non-excised
women are stigmatized in their sexual identity and within African community. On
the other side, young women living in a migratory context are confronted with
other sexual models and may starting to feel a sexual disability. Communication
around the practice of excision is almost absent in the families where women
and girls are nevertheless excised. The perpetuation of the practice is intrinsically
connected to the gender system of the country. States and in particular to the unequal
status between women and men in those of these societies (Zimmermann, 2001).
Introduction to sexuality can become one moment of distance between the pa-
rental and family standards and the social standards of the local society (Andro,
Lesclingand, Pourret, on 2010).
This qualitative survey involves both social sciences and biomedicine. To seize
the meaning and the political aspects connected to sexuality and to health, a series of semi-directive detailed interviews have been conducted with
women living in Switzerland and have undergone FGM. On one hand, transmission of FGM on the second generation of immigrants in the migratory
context, is the way for keeping memories and traditions alive. On the other hand,
teenager’s sexual socialization becomes a ground of resistance against the west-
ern colonization, which takes place in the field of the sexuality.

“Jai Peur Du ‘Kongossa’ (commérage) : Stigmatisation Et Contrôle
De L’information Sur Le VIH/Sida Auprès De Migrants D’origine
Subsaharienne Et Séropositives En Suisse”
Trente ans après l’identification du virus du sida et l’apparition d’une nouvelle
épidémie, la séropositivité reste stigmatisée et difficile à dire. Quel que soit leur
statut, origine et contexte socioéconomique, les personnes concernées tendent à
taire leur infection, craignant d’être discriminée, persécuté (Holtz, 2006). Cela
est particulièrement vrai pour les migrants-équid séropositifs qui souvent
rétent d’éviter de révéler leur séropositivité en dehors du système de santé (Ande-
son, Doyal, 2004 ; Calin et al. 2007 ; Dielemann, 2010).
Fondée sur une étude qualitative financée par le Fonds national suisse de la
recherche scientifique portant sur 30 entretiens approfondis avec des femmes
séropositives d’origine subsaharienne vivant en Suisse, cette communication
montre comment le stigmate rattaché au VIH/sida place le contrôle de l’informa-
tion au cœur de leur quotidien et oriente leur construction des liens sociaux.
Selon les représentations de la maladie dans les différentes sphères sociales
d’origine africaine (« maladie de putes », « punition de Dieu », « sorcellerie » ou autre), les femmes choisissent de taire ou révéler leur infection.
Le cloisonnement des relations sociales découle de la peur que le secret ne soit dévoilé et que le stigmate, perçu, devienne vrai (Green, 1995). Les femmes se confient peu à leurs proches,
craignant le rejet. Seuls quelques membres de la famille, partenaires ou ami-e-s,
sont soigneusement sélectionné-e-s. Le VIH est gardé strictement secret dans les
communautés Africaines et religieuses, par peur de l’exclusion. En revanche,
les hôpitaux et les associations de lutte contre le VIH/sida sont perçus comme les
lieux sécurisants pour parler de l’expérience de l’infection, et prônent une
transparence sur la santé et la vie sexuelle : la peur et la nécessité de se cacher augmentent la vulnérabilité des femmes subsahariennes en contexte migratoire.

La coopération scientifique a été étudiée sous différents aspects ces dernières années. Il s’agit d’une approche qui permet de comprendre comment les chercheurs s’associent pour travailler ensemble et de quelle manière ces collaborations peuvent être optimisées. En particulier, l’étude de la productivité dans les équipes de recherche a montré l’importance de la communication et de l’échange d’idées. De plus, la coopération internationale a permis de faire des avancées significatives dans plusieurs domaines, y compris la santé, l’environnement et la technologie.

La coopération scientifique est souvent influencée par des facteurs tels que les politiques gouvernementales, les réseaux locaux et internationaux, ainsi que les défis environnementaux. Elle peut également être affectée par des considérations économiques et financières. Pourtant, elle est essentielle pour la progression de la science et la résolution de problèmes complexes.

VINCENT, FANNY* (université paris dauphine, fanny.vincent73@yahoo.fr)

Dans nos sociétés prises dans ce que le philosophe allemand Hermut Rosa appelle l’« accélération sociale du temps », et face à la dégradation des conditions de travail et de santé due à la poussée d’autorité, maîtriser son temps de travail est un enjeu. Et ce d’autant plus dans le milieu hospitalier où temps de travail est souvent synonyme de don de soi et de sa personne.

Depuis une dizaine d’années, une forme de travail atypique se développe, à la limite de la légalité, dans les équipes soignantes des hôpitaux français : le travail en 12 heures d'affilée. Présenté par les directions des hôpitaux comme une solution pour pourvoir les postes vacants, le travail en 12h permet aussi à court terme d’économiser des postes en supprimant les temps de chevauchement entre les équipes.

Mais pour les soignants eux-mêmes, ne travaillant plus que 12 heures sur 28, les 12h permettent d’avoir plus de temps pour sa vie privée. En effet, à la différence des plannings traditionnels en 8h, travailleur en 12h permet d’obtenir un roulement fixe et de dégager mécaniquement du temps pour cumuler une deuxième activité face à au gel des salaires.

Notre exposé s’appuiera sur les premières conclusions d’une enquête ethnographique de plusieurs mois menée dans divers services d’hôpitaux parisiens, ainsi que d’entretiens avec les soignants, dans le cadre d’une thèse engagée depuis octobre 2012. Nous montrerons que ce qui apparaît comme un consensus inébranlable dans les équipes soignantes autour de l’uniformité et de l’équilibre entre travail et famille, est en fait un moyen pour les soignants de fuir un travail qui s’est intensifié depuis que les politiques de restriction des dépenses et de maximisation de productivité se sont imposées dans les hôpitaux.

Private Lands, Collective Values? Framing of Food Security in a Norwegian Land Use Conflict

The principle of food security is an integral part of agricultural policy documents in Norway. Used to be re-legitimize increasing neo-productivist farming policies and systems. Thus conservation of agricultural land is once again prominently positioned on the political agenda. With only very limited availability of farmland, only 3% of Norway’s land area is productive agricultural land used, the issue of agricultural land conservation and food security have become more or less inseparable in Norway. Further, as a non-EU member, has insisted internationally on maintaining a very protectionist agricultural policy to meet the objective of being 50% self-sufficient in calories produced from agriculture.

A large proportion of the best quality farmland is within the vicinity of the country’s major cities. While Norway was urbanised relatively lately by European standards, there is now a very strong centralisation tendency with migration from rural areas. This, combined with increasing in-migration from abroad, is placing considerable pressure on the remaining farmland – particularly fertile land on the outskirts of major cities. Conflict between agricultural policy objectives and the increasing financial interest following the demand for housing, infrastructure development and urbanisation is thus becoming a major issue in the public and political arenas. Based on a Norwegian case study, this paper will show how food provisioning and food security as collective goals is framed and positioned in discursive struggles on land between financialization, climate concerns and urban growth.

VINKOV, SERGEY* (National Research University Higher School of Economics, svinkov@hse.ru)
Russian Housing Care for Orphans: Equal Rights in Unequal Opportunities

A great number of decrees, regulating various aspects of social security for orphans (including housing), have been adopted by the Russian government in 2013, which put Russian Orphan Care among the paramount issues of social policy. This paper analyzes the housing care laws in relation to orphans in Russia, including federal laws, regional statutory documents and case law protecting the housing rights of orphans. At present, the Russian government has a duty to provide orphans with housing regardless of their age, which is made at the expense of both the federal budget and the resources of local authorities. At the same time, orphans are unequally allocated in regions with various levels of economy, which collides with their living space needing orphans have a certain quality of housing. For example, during the period of professional studies orphans are provided with a room in the university’s dormitory, thus their housing need is partly met by the funds of their educational establishment. However, after graduation orphans are required to have a permanent registration, i.e. living space of their own, in order to have a job and for other purposes.

In general, the paper combines the case study methodology with legal analysis of effective housing rights for orphans and young care leavers who are in need of housing. The study leads to the following key point: equally guaranteed rights to housing care are hampered by the lack of (i) a unified mechanism for different regions of Russia and (ii) appropriate economic resources to implement the rights.

From Right-Wing Violence to Racist Terror – Exploring Factors of Radicalisation

In November 2011 a racist terror group in Germany that claimed responsibility for the murder of nine migrants and one police woman was discovered by chance. For more than thirteen years security forces had no real idea of the activities of the group, assuming that the killings were caused by criminal motives. After the existence and activities of the racist group has become known several high-ranking security and secret service officers resigned and the security apparatus is still under reconstruction.

The paper addresses the attempts by researchers to locate the factors why a terrorist group developed from a much broader racist violence-prone movement and tries to weigh up the role and actions (as well as non-actions) taken by state actors towards the extreme right in Germany in general and against the right-wing movement in Thuringia from which the terror cell emerged in particular. In doing so, the investigation tries to find out if in the first phase restraint by the state might have encouraged right-wing violence while in a later phase adamant decisions by public prosecutors may have contributed to a radicalisation processes resulting in racist homicide.

The Identitarian’ Movement

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
In autumn 2012, the Génération Identitaire, a French group, launched a video message on Youtube declaring war on multi-culturalism. In order to gain a maximum of public attention and as an example of how the movement’s performance would look like the group occupied a mosque in Poitiers, chosen for the final victory of Karl Martell against the invading Moors in 732 AD. While, in France, the group’s roots date back into the early 2000s, the occupation of the mosque quickly inspired imitators in neighboring countries like Austria and Germany. Although presenting themselves as being non-racist its ethno-pluralist approach and public statements on several issues clearly indicate that the movement belongs to the spectrum of right-wing racist populism.

The paper will outline the emergence and the development of the Identiitarian Movement taking the variations in several countries into account. A focus will be given on the analysis of the movement’s claim of not being racist on the one hand and the de facto involvement of known right-wing protagonists on the other hand. First, the performance of the movement that is web-based to a large extent is investigated. In sum, the paper offers an analysis of a new political phenomenon and situates this into a broader understanding of more recent developments of right-wing populism as a whole.

Gendering Responsibility: Work Practices and Institutional Responses to Intimate Partner Violence in Finland and in Russia

This paper examines how the highly gendered phenomenon of intimate partner violence (IPV) is encountered in various institutional settings of social and health care services in Finland and in Russia. The empirical data comprise (1) 16 focus group interviews with staff members (n=73) in various social and health care units in Finland and (2) 74 interviews with staff members (n=56) and service users (n=14) in three public crisis departments and one NGO crisis center in Russia. Based on the analysis of this data corpus, it seems that one of the dominant institutional discourses is that of making the female victims responsible for dealing with the problem of IPV. According to the interviewed professionals, it is difficult or even impossible to address the topic of the responsibility of male perpetrators due to various reasons, e.g. inadequacy of existing work practices or insufficient legislation. This paper takes a closer look at the ways in which the above-mentioned discourse operates to organize work practices that result on “gendering responsibility” at the level of local activities. Following the ideas of institutional ethnography (Smith 2005), the basic assumption of this paper is that institutional discourses organize the ways of “seeing” and “knowing” the solutions to the problem of IPV in institutionally actionable ways. Of special interest here are the interconnections between the institutional processes carried out locally and those organized at state, national and even international level. In addition, this paper addresses some cultural differences between Russia and Finland in the ways in which the female victims are made responsible for dealing with the problem of IPV in the everyday work of the institutional settings under investigation.

Testing the Effectiveness of HRM Practices Among Expatriate Humanitarian Aid Workers

Abstract: Staff turnover has become a major concern for humanitarian organizations. On the one hand this can be seen as something humanitarian organizations have to live with, but on the other hand it has also been blamed for reducing effectiveness and efficiency due to discontinuity in staffing and loss of institutional memory. To generate public pressure for improved efficiency and accountability, Professionalization, and especially adopting for-profit management practices, for example regarding human resource management (HRM) was deemed to be key to achieve enhanced efficiency and accountability. In short, no sector is dependent on the employees and their loyalty and at the same time is experiencing a very high turnover. Therefore, this is the perfect setting to study the effectiveness of HRM practices. Yet, while much discussed, in-depth research on the consequences of human resources practices on attitudinal outcomes of employees, like trust in management, job satisfaction and intention to remain with the organization.

Trust in management is an important factor mediating this relation. HRM practices are conducive to building trust in management, which in turn is positively related to job satisfaction and intention to remain with the organization.

Les Droits Pédagogiques Chez Bernstein : La Normativité Sociologique En Questions

Cette communication vise à questionner ce qui apparaît comme le modèle normatif explicité dans la théorie de Basel Bernstein : le modèle des « droits pédagogiques » par lequel il introduit son dernier ouvrage et qui semble fonctionner comme un communautarisme. Bernstein, 2007 il s'agit d'adopter une perspective sociologique, au sens il affirme que ce sont les droits pédagogiques notamment au regard des institutions et des individus, et normatif au sens où il déclare que devrait être le dispositif pédagogique, et singulièrement le dispositif scolaire en rapport à son ambition démocratique. Ces deux dimensions associées permettent de poser l’un de la normativité objective. En relation avec quelques hypothèses simples permettant de penser les conditions de possibilité d’une démocratie minimale, l’auteur en vient ainsi à poser la nécessité pour les dispositifs pédagogiques d’instituer trois droits reliés entre eux : le Droit à l’Amélioration (DA), le Droit à l’Intégration (DI) et le Droit à la Participation (DP). Il est cependant possible que ce modèle ne joue pas encore totalement le rôle qu’il est appelé à jouer, et que Bernstein entend lui faire jouer dès l’introduction de son ouvrage : un modèle auquel je pourrai comparer tout ce qui se passe dans les divers systèmes éducatifs. Y compris dans les analyses de Bernstein lui-même, en témoigne d’ailleurs le fait que les trois droits ne sont plus jamais par la suite mentionnés tout au long de l’ouvrage. Ils semblent peu repris explicitement aussi par la communauté actuelle des bernsteiniers.

How Courts Must Act To Provide Democratic Access To Justice On Civil Disputes? The Experience Of Brazilian Federal Court In Slams Of Rio De Janeiro

The aim of this communication is to discuss how could brazilian federal court act in marginal urban communities with peacekeeping police forces units (UPPs) to promote democratic access to justice in civil disputes. A federal court in Brazil has the competence to judge the conflicts involving the Brazilian federal state, as well as their federal organs, as the mail office, the social security institute, federal banks, the national regulatory agencies and others. The field of research is the implementation of programs and projects of the federal justice in underserved communities, implemented by the federal court of Rio de Janeiro. These programs began in 2010 and last until 2013. The implementation of such policies was extremely heterogeneous and plural. Initiative began with a realization of hearings, production of expert evidence and offering agreements by the social security institute approved at the same time by the Federal Judges (judgment), and then began to extend to other events to provide legal advice and assistance, and legal education for citizenship, without rendering jurisdiction in strict sense. Presented through the analysis of Boaventura de Sousa Santos on the relationship between law and community and the tension between regulation and emancipation, I report the experience in Cidade de Deus, Rio de Janeiro. I conclude that pedagogical access to justice, which means, legal education for citizenship can offer a third way to rethink the relation between courts and communities for dispute resolution in civil conflicts.

Art Works and the Production of Knowledge on Cities

Artists work on the built environment mainly through the production of art works in the public realm. This implication has recently taken a new orientation where artists work in some cities, on issues related to urban projects along with the project team. They contribute to the early stages of urban projects and take part in field studies. Besides the use of urban planners’ and architects’ know-how, they collect data in various forms sound, images, objects, words, impressions and transform these data into art works which are qualified as territorial. They produce through this work and their actions, knowledge on the city, the project site and the local community.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
This paper presents the results of a research project based on five case studies where artists are invited by urban professionals to work and produce knowledge on cities and project sites in France. They are digital artists, sound artists, choreographers, visual artists, actors. They work mainly through intensive field work. Site immersion and (informal) interviews are singled out as the key elements that are used. We will first discuss in which way and to what extent artists produce knowledge that is different from that produced and used by city professionals. What kind of knowledge do artists produce? In which aspects is this knowledge different? Are these differences due to artists’ specific skills? To their methods? To their unique gaze? To their capacity to represent the reality? Then we will discuss, how can urban professionals use and work with this new kind of knowledge. How do they analyse it? What are the epistemological, methodological and analytical problems encountered in their understanding and their transposition in urban studies?

Young Graduates Self Entrepreneur: Searching for Job or Creating a Company?

Precariousness is a rising condition of high skilled and knowledge work. The implementation of new kind of work contracts is supporting this movement. In France, a new fiscal regime for self-entrepreneur had been created in 2009. This consists of lower tax rate and simplified administrative procedure for small companies (turnover under 33 000 euros).

This paper presents the results of a research on graduates (master or PhD in social sciences) who enter the labour market by creating this kind of self-entrepreneur. It appears that they didn't choose this scheme of work: it had been required by employers to lower their labor cost, flexibly the working relationship and externalise administrative procedures. While graduates are administratively independents, their conditions of work are mainly those of salaried: in the firm, with fix schedule, prescription from the superior, etc.

In these situation that fuzzed and hybridised working regime and working conditions of independents and salaried, how are these graduates (as specific population of knowledge workers) adapted? Their working conditions, activities, projects and discourses reveal different feelings about that situation. This paper will explore these three idea-types of young self entrepreneur: subordinated, independent, or in inclusion. To what extend does this situation trained them to become entrepreneurial worker?

VIVEROS-VIGOYA, MARA* (Universidad Nacional de Colombia, marya.viveros@gmail.com)

Masculinities, Violence and Multiculturalism in Latin America

Male violence has occupied a foundational place in Latin American history. Latin America's past has been marked by men's violent acts, such as the Spanish Conquest and Colonization in which not only colonized "women" were powerless within their communities, but also colonized "men" were subordinately placed within a hierarchy of masculinities. This societal structure was based on mechanisms of racial inferiority and gender subordination, which established relationships of exploitation and of complicity between the people and their colonizers. The postcolonial period manifested the consequences of such brutality and its difficult to speak about Latin-American social history where violence hasn't been present, not as a Latin-American cultural trait but as a social fact.

While I’ll reference the Latin-American context generally, I’ll particularly focus on the situation in Colombia, an area on which I have extensively worked. Due to the old and painful reality of the Colombian armed conflict, exceeded only by the Israeli-Palestinian and Indian-Pakistani conflicts, the need has become apparent to promote initiatives, which introduce discussion and action into the public and develop alliances of opposition and of complicity between the people and their colonizers. The postcolonial period manifested the consequences of such brutality and its difficult to speak about Latin-American social history where violence hasn’t been present, not as a Latin-American cultural trait but as a social fact.

This paper will first reflect on the relevance of social intervention programs developed with men oriented towards violence prevention. It will then address male resistance to change and the attempt to trivialize violence against women and reaffirm masculinity based on domination, in which some geopolitical and internal social hierarchical considerations are present. Finally, this paper will discuss the forceful effects that multiculturalism in the region may or may not have on gender violence and its eradication.

La Invisibilidad o La Falsa Visibilización Del Maiz Nativo En La Cruzada Nacional Contra El Hambre

As base sociocultural de la alimentación de la población mexicana, es de esperarse que el maíz tenga un importante papel político en el diseño de programas contra el hambre, pues se sabe que es el cereal que ha mantenido una importancia central en las economías de subsistencias rurales. Además, por la favorable relación entre precio y valor nutricional, el maíz cobró mayor relevancia entre la población de menores ingresos. Ciertamente, en México la contribución del grano a la dieta ha disminuido en las últimas décadas por una diversificación del consumo alimentario promovido por un proceso global y voraz de la occidentalización agroalimentaria, y aunque el maíz (nativo) sigue siendo un recurso esencial, la tarea de racionalizar la siembra, alentar la adquisición y nutricional, las complejas relaciones de complicidad que se han entrelazado en las tres últimas décadas entre monopolios biotecnológicos agroalimentarios, programas sociales de combate a la pobreza y políticas de desarrollo agropecuario, han dado como resultado que en México cada vez exista más población en situación de pobreza extrema, donde el hambre aparece como un elemento político fácilmente explotable para vender la idea “moralista” de dar de comer a quienes menos tienen. Bajo este contexto, el gobierno federal de Peña Nieto puso en marcha a inicios de 2013 un gran proyecto para alimentar a la población en situación de pobreza, llamada la “Cruzada Nacional contra el Hambre” (CNH). Aparentemente hasta el mes de septiembre de 2013, el maíz nativo no ha aparecido visible ni en la campaña mediática ni en las acciones derivadas de la CNH, por lo que esta ponecia tendrá el objetivo de mostrar si se trata de una omisión estratégica para posicionar nuevos actores en la CNH, condenando la pérdida de la bioseguridad alimentaria y junto con ello profundizar las desigualdades sociales existentes.

VLACHOPOULOU, EIRINI IOANNA* (University of the Aegean, socd12054@soc.aegean.gr)

Fisheries Cooperatives: The Solution to Fisheries Mismanagement?

As fisheries have a vital role in maintaining the social and economic cohesion in insular areas, where the majority of the population is employed within the fishing sector, regulation and control of the activity affect directly the fishing communities. Self-regulation has a significant impact on managing effectively Fisheries Protection Areas by gaining access to local expertise, resources and developing working relationships between the fisheries professionals and the local control and regulation authorities. In Greece, 18.8% of the territory consists of insular areas, enhancing thus the significance of fisheries communities for social cohesion. However, the notion of participation in regulation and control is still not widespread in the fishing communities as it is only practiced sporadically. Insufficient statutory control of illegal fishing heightens the need for promotion of self-regulation as a means to protect the marine resources, as well as promote local development, local employment and economic growth. Thus, creating incentives for fisheries professionals’ participation in regulation and control of the fishing activity is vital for the realisation of self-regulation. However, providing the fishers with incentives has its drawbacks, as they do not always guarantee the expected outcome, namely productivity coupled with sustainability. One of the most common issues with incentives is the enforcement of the legislation and the decisions. This research focuses on the potential of fisheries cooperatives as solution to the problem of legislation and decision enforcement and, thus, as promoters of self-regulation in the fish stock management sector. Through the examination of international case studies, the study gives suggestions for the promotion of fisheries cooperatives in the Greek national waters that greatly lack self organisation and the after effects that the adoption of such a policy would have in the area under examination.

VLACHOPOULOU, EIRINI IOANNA* (University of the Aegean, socd12054@soc.aegean.gr)

Living with the Sea: The Satoumi Concept

The importance of sustainable marine resource management through the Eco-system and the Participatory approaches is widely accepted and supported by contemporary science. Fisheries management based on the internal knowledge of the local artisanal communities, which operate with traditional techniques and tools, has considered the key to the realisation of the marine and coastal ecosystems. In Japan, the participation of fishermen in the decision-making process as well as the enforcement and realisation of conservation plans is being researched and promoted widely. The most promising conservation framework, the satoumi, is based upon the interaction between traditional human activity in fishing communities and ecosystem management. These ecosystems
still maintain high productivity and biodiversity, coupled with human activity. The satoumi is based upon traditional resource management techniques which aim at the protection of the targeted ecosystem. As the depletion of fish stocks and the degradation of marine habitats expand around the globe, the provisioning, regulating and cultural services that the marine ecosystems provide for the fishing communities are disappearing. Through extensive literature review, this paper explores the capacity of the satoumi concept for the sustainable use of the marine resources. The most important aspect of the research is the exploration of the significance of the implementation of the satoumi for the survival of the communities that have adopted it. The majority of these communities depend on the local marine resources for their livelihoods and maintain a strong bond with the sea, as their ancestors have passed down to them their maritime tradition. The satoumi practitioners have shown evidence of adaptability and resilience whilst maintaining high levels of productivity and sustainability.

Perceptions of Rising Powers: Are Russia and China Still Brothers Forever?

‘Russia and China are brothers forever’ was a popular slogan in the Soviet Union time, that perfectly shows how important it is for political science to understand differences in perceptions. While in Russian culture a brotherhood can be relationships of the equal, in mind of Chinese people an hierarchy is always formed and one of the brothers has to be elder, has to be a leader. Even though China has chosen for a new political system and a new type of superpower, that relays more on soft power than on hard, it is struggling with the China Threat theory and problems of misinterpretations of the Harmony World concept. In order to predict the role of China in the future many specialists turn to its imperial past, the tribute system and roots of the strategic culture, so processes of a politicization develops into a starting point of social inequality rather than being its paradigm develops into a starting point of social inequality rather than being its natural as a result.

Religious Heterogeneity and Civic Participation In Comparative Perspective

The effect of diversity on civic participation is a hot issue in social sciences during the last decade. While some authors point out that diversity erodes social capital and addresses political participation, other researchers prove that different type of diversity (namely ethnic or linguistic diversity) have different effects on political and civic participation. The current research focuses on the effect of religious heterogeneity on civic participation, taking into account the effect interaction between the religious heterogeneity and individual belonging to a particular religious denomination. The result of multilevel hierarchical models run on EVS 2008 data shows that religious heterogeneity has a negative effect on civic participation, but the moderate effect depends on the individual religious denomination.

Researching Young Ethnicities in East London and in Paris Banlieues: Methodological Challenges and Explorations

This contribution explores the methodological challenges I faced while carrying a qualitative study on ethnicity among young people (aged 15 to 25 and chosen because of their high level of diversity across gender, age, ethnicity, social class, education and type of housing) in the London Borough of Newham in East London and in the city of Bondy in Paris northeast Banlieues. The research aimed at investigating the impact of French republicanism and British multiculturalism on everyday life and identities of these young inhabitants. But how to study ethnicity, a deeply relational phenomenon, socially and symbolically violent, and often – especially in France – considered taboo?

The paper starts with positionality and how I dealt methodologically, ethnically and personally with the power relationships involved in the research. As a middle-class British woman I was perceived in opposite ways during fieldwork: a white rich middle class Parisian in Bondy; a strange, lost, and possibly East European young woman in Newham. It then shows how both the willingness to reduce symbolic violence and the choice for a constructionist approach defined my research design and the structure of my interviews. Two methods especially helped me investigate intersectionality while decreasing symbolic violence: self-portrait and mental maps. This fed a reflexion over the use of categories.

At last, I discuss how each method involved specific power relationships and results produced - different aspects of ethnicity, individual semi-structured interviews fostered the presentation of particular yet universal selves who rejected categorization and stressed a distinctiveness based on intimate experiences; focus groups (carried out every other week in secondary schools with the same participants for one or two semesters) politicized discourses and built collective actors defending group identities. At last, based on UsThem dichotomies. At last, observations disclosed autonomous, playful, situational and instrumental aspects of ethnicity and discrepancies between attitudes and practices.
Creativity & Creative Class in the Transformation of Russian Society

Russia is a country of creative minds, rich in talents. Creativity - is a fundamentally new state of Russian society, associated with the formation of the creative class, the integrated group, which unites representatives of various professions on the basis of a demand of self-realization and service to the public good. Investigation of the conditions - the vector of development and activity of the creative class shows that, despite the spontaneity of social initiatives steady trend of actualization of potential creative class occurs, which gives us hope for a successful modernization of Russia, the qualitative renewal of all aspects of public life. Today Russian society gets its second wind, gets rid of “post-reform fatigue syndromes and skepticism”. It requires the formation of the creative person, creative education, creative management of all aspects of Russian society. It is with the growth of creative trends and shaping the creative society, a society of social creativity the future of Russia is linked. What responsibility has society and what a social dialogue should be to implement a real historical breakthrough depends on the creative class.

Discourse of the Integration of Society in Latvian Sociology

If sociological theory considers social integration as a universal process which involves the whole society and all types of its diversity, the public consciousness in Latvia, as well as the scientific discourse, persistently relate this term to just one dimension - ethnic. The findings presented in the article demonstrate that scientific research on the integration processes in Latvia has become more critical towards the methodological assumptions which appeared in the 1990s, but in their theory there is a reconsideration of the values of those ideological approaches to the understanding of society integration which first were formulated in T. Parsons' conception. At the same time, the ideas of J. Habermas who considered it necessary to recognize a collective identity of ethnic minorities in the multicultural society and to become a significant ideological resource for the research on society integration in Latvia. The article presents some data from the sociological research carried out in the largest city of Eastern Latvia – Daugavpils, the city with an ethnically diverse population. The data obtained in the run of the research demonstrate the possibility to reconcile the liberal conception of society integration in Latvia with the recognition of the value of a collective identity of ethnic minorities.

The Formation Of Political Subjects

The Formation of Political Subjects. Tenant Protest in Berlin and New York

A crucial point in the development of urban social movements is their ability to form coalitions to overcome the deep entrenched structural and discursive fragmentation and particularisation of neoliberal societies. The urban seems to be the context in which this can be achieved. In current tenant protest in Berlin and New York, though highly specific in their issues and demands, we can see such an abstraction from personal interests making affiliations of broader political positions possible. In the process of legitimizing their right to stay put some of the protest groups go as far as to make universal claims to (represent) the common good. In the process of legitimizing their right to stay put some of the protest groups go as far as to make universal claims to (represent) the common good. But social movement research lacks concepts to fully grasp this process. To counter these shortcomings of social movement research I propose a re-thinking of social protest through the lenses of the formation of political subjects. Such an approach would offer the opportunity to overcome social movement research's one-sided focus on the actors of protest as merely strategically acting, identity-based and self-interested activists by shifting the focus to the impact of the interplay between structure and discourse on people's subjectivity, the subject positions they shape in the process of protest and the possible links they thereby offer to others.
such as age, income, employment, educational background and country of origin. However, even less is known about their individual motivations, decision-makings and experiences. In order to contribute to an understanding of who is moving on and why, results of a qualitative, biographical oriented study on serial migrants from different national and social backgrounds are presented. Therein the underlying structures of new governance patterns and given of their multiple migration movements are reconstructed and analyzed as constitutive elements of their transnational trajectories and social contexts.

Prostitution and The “Law-In-Action” – A Study Of Public Administration In Germany, Poland and Czech Republic

The table presents the results of a qualitative-empirical research project on public administration of prostitution in Germany, Poland and Czech Republic. Therein administrative practices of both governmental institutions and civil society organizations (e.g. police force; public order, public health and tax authorities as well as social work) will be described and analyzed. Using semi-structured expert interviews with organisational frontline-actors governance of prostitution is approached and investigated from a bottom-up perspective. Germany with the Regulation model on the one hand and Poland and Czech Republic with the Abolitionism type on the other hand follow different laws and policies regarding prostitution. However, concerning their “law-in-action” the role of social actors’ professional habitus formations revealed to be highly significant. Moreover, it can be shown how executives’ patterns of perception, thoughts and their crucial impact on legal changes and its implementation. Given the circumstances the study took place after an explicit legal and political paradigm shift of governing prostitution in Germany. Based on case reconstructions and contrastive comparisons a theoretical model on prostitution governance has been developed. It enforces the conceptualization of administrative actors’ professional habitus consisting of three general dimensions: their definition of subject, definition of self and definition of environment. Furthermore, empirically emerged challenges and ambivalences of governing prostitution in terms of an everyday practice attempt to explain the relevance of professional habitus formations affecting “law-in-action”.

Challenging New Governance: Evaluating New Approaches To Employment Standards Enforcement In Common Law Contexts

A mounting crisis in employment standards enforcement is prompting experimentation in common law contexts with new instruments aiming to improve workplace regulation. This experimentation across all stages of the enforcement process indicates the increasing influence of new governance. Focusing on reforms in five jurisdictions, this paper raises serious concerns about a “new governance” styled enforcement mechanisms, demonstrating that, put into practice, enforcement models envisioned in the new governance literature have fallen short in accounting for the power dynamics of the employment relationship. Furthermore, assumptions about the inevitable collapse of state enforcement capacity are premature and can impede strategies for more effective ES regulation.

What's the Best Way Forward for Immigrant Workers? the Dynamics & Efficacy of Building Unions and Building Social Movements

In 2000, the peak association of the U.S. labor movement, the AFL-CIO, reversed its longstanding opposition to the legalization of undocumented immigrants and committed itself to organizing immigrant workers. Only a handful of its 57 affiliated unions actually heeded the call, but those that did successfully unionized immigrant workers in some key cities and states.

Yet, the number of immigrant workers involved in these unionization drives pales in comparison to the millions of immigrant workers involved in a very different kind of action: the massive nation-wide rallies for immigrant rights that took place in the United States in the spring of 2006. There, too, a couple of labor unions played a critical role, both in the immediate lead-up to the rallies and 3 years earlier, in the push to help build a national movement for immigrant rights. Two unions (SEIU and UNITE HERE) sponsored the Immigrant Worker Freedom Riders (IWFR). Bus rides of immigrant workers and activists were used to bring publicity to the plight of undocumented workers in the U.S. and also to foster relationships among local labor unions, community-based organizations, and religious, student and immigrant-rights groups in the cities and towns where the buses stopped. Recent research shows that the IWFR laid much of the institutional foundations for the 2006 rallies, especially in new destination communities (Voss and Bloemraad 2011).

In this paper, I examine these very different types of campaigns—those focused on unionization and those focused on building alliances and a social movement—comparing their dynamics and effectiveness. This assessment is far from straightforward; as one has to take into account not only immediate impacts but also longer-term effects, including the backlash against them. In some of the new-destination communities that had rallies in 2006. Moreover, this backlash continues to be conditioned on state and local political climates.
The Effects of School-to-Work Transition Pathways on Economic Outcomes through the Great Recession

Whereas the term “school-to-work transition” (STW) implies a clear, discrete event, this increasingly prolonged transitional period is not always unidirectional and typically includes involvements in both school and work. Destandardization in the STW transition makes it difficult to assess the extent to which young people today “flounder” during this period. Using longitudinal data from the US Youth Development Study and hierarchical latent class analysis, this paper examines the interplay of educational and career attainment and its longer-term economic consequences. Four STW pathways were observed from age 18 to age 30: two groups that attain careers through postsecondary education (via Bachelor’s or Associates/Vocational degrees) and two floundering groups that do not (those with some college and those with no postsecondary experience).

Regression models demonstrate the negative effects of floundering pathways on economic outcomes and the heightened difficulties of those pursuing these pathways during a recession. While the High School Flounders were consistent-the worst off, the Some College Flounders (SCF) also experienced relatively poor economic outcomes. Both pre-recession (2005) and in 2009, respondents in the SCF pathway were less likely to have a savings account and own a home, and had more financial problems and lower job satisfaction than those who moved into the labor force with Bachelors’ degrees. Even starker were their circumstances in turbulent economic times, with the SCF pathway now more likely to be unemployed, receive financial help from parents, and to have recently lost a job. The SCF pathway also incurred greater student loan debt and more career uncertainty than those moving from high school to college.

The analysis also considered that the SCF pathway was less likely to have a savings account and own a home, and had more financial problems and lower job satisfaction than those who moved into the labor force with Bachelors’ degrees, even starker were their circumstances in turbulent economic times, with the SCF pathway now more likely to be unemployed, receive financial help from parents, and to have recently lost a job. The SCF pathway also incurred greater student loan debt and more career uncertainty than those moving from high school to college.
While civil violence is almost always countered by state violence, the opposite is not true. It is unclear, according to Christian Davenport, whether state violence triggers or contains civil violence. In fact, one of the most difficult issues in the study of contentious politics is to predict civil society actors' reactions to state violence. Will those who have witnessed state repression pick up a weapon in anger or quiet down in fear and despair?

This paper tackles this repression-dissent problem. The literature on collective violence emphasizes the importance of institutional and structural contexts—e.g., political regime characteristics, state capacity, ethnic, religious, and class cleavages, levels of socioeconomic development, etc.—to understand the repression-dissent dynamics. A major stumbling block in the effort to carry out such a research agenda is methodological. On one hand, small-N case studies, while good at revealing exact processes of state and civil society interactions, cannot measure adequately the effect of multiple contextual factors. On the other, typical quantitative analyses of annual event counts, while good at estimating the contextual effects, fail to detect interactive dynamics. By conducting a cross-national comparison of contentious event sequences, this study attempts to examine both the contextual effects and the interactive dynamics at the same time. We use a data set of 10 million events worldwide, reported by Reuters, between 1990 and 2004. This unique data set records event information at a daily—instead of yearly—basis and, thus, helps us detect interactive dynamics. Moreover, we distinguish the actors who are more likely to resort to violence after state repression from the actors who are more likely to give up any further attempts to make claims by using multilevel analysis of actor-target interactions. This paper presents an original analysis of national contexts, actor characteristics, and actor-target interactive dynamics.

Contentious events—such as the collapses of socialist regimes around 1990, the Seattle anti-globalization protests in 1999, and the Arab Spring since 2010—often catch many by surprise. It appears that future contentious events are totally unpredictable. The literature of repertoires of contention, however, suggests that future actions by contentious actors are highly predictable because actors’ selection of action forms is dependent upon their familiarity with these forms. In a word, people cannot perform if they do not know how. This paper explores such a cultural hypothesis about repertoires and asks to what degree we can predict future action patterns (violence, nonviolent protests, and conventional institutional actions). Specifically, we ask, what is the most important predictor of action patterns, (1) institutional regime characteristics such as degree of democracy and state capacity, as political process theorists have argued, or (2) actors’ familiarity with contentious forms, as the cultural hypothesis claims? To find an answer to the question, we conduct a cross-national comparison of action patterns using a data set of 10 million events world-wide, reported by Reuters, between 1990 and 2004. Using multilevel analysis, we estimate and compare the national-level effects of structural-institutional characteristics (e.g., regime characteristics, levels of development, etc.) and the actor-specific effect of cultural factor (actors’ familiarity with specific forms of contention, measured by action patterns in the past years). We also uncover the conditions under which new innovations of action patterns are likely to occur. This study contributes to the study of contentious politics both theoretically and methodologically by explicitly integrating cultural dimensions—rather than treating culture as a residual explanatory factor—into the analysis of repertoire selection. While the prediction of future events and actions is difficult and, therefore, is not a popular topic, this study makes an important step toward such a research direction.

In June 2013, a group of global justice activists occupied an abandoned police training academy in central London. The building became a “convergence space” from which a series of events were organised in protest against the G8 summit that was simultaneously taking place in London. The group were known as “Stop G8” and had an online presence with a blog, facebook group and a unique hashtag (#StopG8) on Twitter, which pointed to awareness by organising members of the group regarding the value of a presence on the Web.

This paper presents an ethnographic account of a week spent with these activists in the convergence space which was carried out in order to explore the position of the Web and of social media in the real-time process of protest participation. Through participant observation and interviews with activists, a picture emerged that runs in some ways counter to the mainstream understanding of the benefits of social media towards political activism.

It became clear during this study that these situated activists had a broadly apathetic, in some cases hostile view of using the Web. Two clear concerns noted during the ethnography were: the shift in recent years from public forums and well-connected networks of committed activists to a more fragmented network of individual social media profiles, a filter bubble effect which appears to have reduced the ability of activists to create coordinated alternative media for protest events and the clear adoption of social media by not only the public at large, but corporations and governments existing within clear power structures that present little opportunity for decisive political change. It may be that the opinions of these activists are a signal of a shift within activist networks away from corporate-controlled, mainstream social media towards more ideologically suitable Web services and virtual communities.

The recent Arab youth’s rebellion offers a valuable insight into new forms of online participation, alongside the role of youth culture, for political participation. For communicating their unease, for organising protest and for mobilising themselves young people utilise social media such as Facebook, Twitter, and YouTube. Furthermore, youth culture, also communicated through social media, played in inuring the ethno-demographic allure were: the shift in recent years from public forums and well-connected networks of committed activists to a more fragmented network of individual social media profiles, a filter bubble effect which appears to have reduced the ability of activists to create coordinated alternative media for protest events and the clear adoption of social media by not only the public at large, but corporations and governments existing within clear power structures that present little opportunity for decisive political change. It may be that the opinions of these activists are a signal of a shift within activist networks away from corporate-controlled, mainstream social media towards more ideologically suitable Web services and virtual communities.

Communities, Networks, Swarms. Internet-Collectivities As Supplements for the Notion of Society?

Sociological observations of social formations emerging with the internet have seldom pictured their object as a society; instead, there are many references to community, network, or swarm. These different notions are in many ways loose constructions and unrelated to the sociological theoretical discourse. They describe different phenomena: on the one hand, there is a sort of community feeling in online social groups. On the other hand, internet protocols produce social contacts between strangers. What is referred to as “internet communities” is fluid and diverse. They change all the time and combine different forms of networks. Thus, concepts switched to theoretical tools found in network analysis. Contem-
porary sociological writings go back to the concept of swarms to describe internet collectivities. The notion of society does hardly appear within the sociology of the internet. Instead of simply taking that as a sociological blind spot, this paper argues for an empirical perspective. Discussing different supplements (Derrida) of the notion of society within internet culture it thus addresses internet practices as social practices. Internet practices are social practices – and within modern society there has always been a typical figuration of proximity and distance, fluidity and diversity. But at the same time the different supplements for the notion of society could indicate that societal forms are changing (through the influence of new media practices), e.g. the figuration of proximity and distance or the figuration of privacy and publicity. For the special case of the internet, this might be an instance of “writing (society) into being” (boyd). The paper discusses the sociological discourse on internet collectivities from an empirical point of view. It emphasizes that internet practices take place within society. And it works out how the new supplements to/of the notion of society could be indicators for social transformations.

**WAGNER, ELKE** (JGU Mainz, wagner@uni-mainz.de)

**Internet Communities As Intimate Publics**

The culture of the internet has long been described as community culture (Rheingold, Wellman, Thiedeke). But what does community here actually mean? On the one hand there is a sort of community feeling and support in online social groups (Boyd, Hargittai). On the other hand internet communities are often communities between strangers who have never met or will never meet. Even in Social Network Sites like Facebook the Friend-Practices do not often mean true friendship but simply contacts between different addresses. Therefore Danah Boyd (2006) has suggested to describe community-building on the Internet as “writing community into action”: communities don’t exist per se, they have to be fabricated by writing practices. This paper wants to illustrate these community writing practices. It shows on the basis of screen-shots from Facebook and interviews with Facebook users how the special feeling of community does emerge here: On the one hand community means here an intimate sphere where contents between true friends are published. On the other hand contents remain indeterminate. One hand community means here an intimate sphere where contents between true friends are published. On the other hand contents remain indeterminate. True Finns and Non-True Finns: The Minority Rights Discourse of RC05-102.5

**WAHLBECK, Osten** (University of Helsinki, osten.wahlbeck@helsinki.fi)

**True Finns and Non-True Finns: The Minority Rights Discourse of Populist Politics in Finland**

This paper analyses the minority rights discourse found in political statements of the populist party called the True Finns. The party won a historic electoral result in the Finnish Parliamentary Election in 2011, increasing its share of the votes from 4 to 19 per cent. A theoretical framework for this paper is provided by research about the political and cultural approaches to multiculturalism in western democracies. Will Kymlicka (1995) distinguishes between the minority rights of two different types of minorities in modern nation states: on the one hand, old national minorities, and on the other hand, new minorities that have emerged as a consequence of immigration. Kymlicka (1995) argues that the international so-called backlash and retreat from multiculturalism has mainly occurred in relation to the acceptance of ethnic-cultural diversity among immigrant groups. In this paper, the support for a backlash against multicultural policies is found in the minority rights statements of the political party called the True Finns. The paper argues that Kymlicka’s assessment is not completely accurate in this particular case. The statements of the party are not only about policies relating to immigrants. In the political rhetoric of the party the basic principles of group-specific rights for minorities are disputed. Thus, any real or imagined minority who is not considered truly Finnish, or not considered sufficiently representing ‘Finnishness’, can become the target of the rhetoric.

**Variations and Continuities of Motives for Climate Protest: A Comparison of Cop-15 Protesters in Copenhagen 2009 with Cop-19 Protesters in Warsaw 2013**

In connection with the Fifteenth Conference of the Parties to the United Nations Framework Convention on Climate Change (COP-15) in Copenhagen 2009, many activists had (at least reasonably) high hopes about successfully pushing for a new international climate agreement. After the complete stalemate between different country positions in Copenhagen, many climate activists lost their faith in the possibilities of achieving substantially changed international climate policies through the COP meetings. Four years later, facing the COP-19 meeting in Warsaw 2013, the climate movement mobilizes protest in a political situation with ostensibly more limited political opportunities. How do participants’ motives for protest and sense of efficacy vary between two equivalent climate protests when political opportunities change over time? The paper also explores shifts between the two points in time regarding what political strategies the participants in transnational climate demonstrations claim to prioritize. This is analysed based on two surveys of protest participants, one collected at the largest demonstration during the COP-15 meeting in Copenhagen 2009, and the other one at the main climate demonstration during the COP-19 meeting in Warsaw 2013. The data collection is based on a strict standardized methodology established in the international research programme CCC (Caught in the act of protest, Contextualizing Contestation) which ensures reliability as well as comparability across protest events. Inevitably, the research design not only involves comparison of cross-sections of climate protest participants over time, it is simultaneously a comparison of two national mobilizing contexts. However, these two aspects can be sufficiently disseminated by controlling for demonstrators’ country of origin in the highly transnational demonstrations. The study aims to contribute to current scientific discussions about protest mobilization, as well as to tap into the contemporary developments of the (European) climate movement, from the perspective of individual climate protesters.

**Variations of Stressful Work and Effects on Health after Labour Market Exit. Results from Share and Elsa**

Recent research has highlighted the importance of former life stages in explaining social inequalities in health at older age. In this paper, we describe working conditions during adulthood and analyse their influence on health after labour market exit. Analyses are based on two longitudinal studies with comparable information across 14 European countries: the English Longitudinal Study on Ageing (ELSA), and the Survey of Health, Ageing and Retirement in Europe (SHARE). We measure working conditions in terms of psychosocial stress at work (as defined by the demand-control and the effort-reward imbalance models), as well as working careers are regrouped using sequences analyses. Moreover, - given cross-national dataset – we explore the relationship between specific indicators of social and labour market policies (e.g. expenditure on active labour market policy) and working conditions. Results show important variations of working conditions according to gender, socioeconomic position and countries. In addition, results illustrate the importance of work and employment for health among older adults, where effects of stressful work and unstable careers on later health were more consistent for men.

**Disaster Preparedness Among Older People with Long-Term Care Needs and Family Caregivers: Who Is Vulnerable and What Do They Need for Preparedness in Communities?**

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
Background: Hurricane Katrina in the U.S. highlighted the potentially fatal effects of a natural disaster on older individuals. This experience was reinforced by the Great East Japan Earthquake, where community-dwelling elderly were again at the greatest risk of mortality. Understanding the needs for and concerns of older persons with long-term care needs and their caregivers is vital to the development of public health programs for community level disaster planning.

Purpose: The preparedness of community-dwelling older people with long-term care needs were examined to identify characteristics of care-recipients and caregivers that are associated with worse preparedness and greater concern.

Methods: A self-administered survey among family caregivers of older Japanese with long-term care needs (n=952) were conducted in 2011. Logistic regression analysis was used to identify the predictors of disaster preparedness, including evacuation plans and caregiver’s concern about preparation. Data were analyzed in 2013.

Results: Most older people had no concrete evacuation plans, and those with dementia were 40% less likely to be prepared. Caregivers who were responsible for older persons with worse mobility, as well as those in worse health or poor financial situations, reported higher levels of anxiety about their disaster preparation. However, more experienced, wealthier, and better socially integrated caregivers in the community were more prepared.

Conclusions. Older people with long-term care needs are at heightened risk in disasters, and rely upon caregivers who may be ill-prepared to respond in emergencies. Education of caregivers and development of community support programs could provide important sources of assistance to this vulnerable group.

Class was determined using Florida's (2012) scheme; specifically: “super-creative” (n=99), creative professional (n=110), working (n=83), and service and sales (n=281). An ANOVA indicated that working class participants were employed significantly more hours (M=52.1) than super-creative (M=46.7), creative professional (M=47.5), and service or sales (M=45.7), employees. Dependent t-tests examined the discrepancy between the three needs during leisure, and during work, by class. Results indicated that autonomy was significantly greater during leisure regardless of class; competence was significantly greater during work regardless of class; and belongingness did not differ by class. A second series of dependent t-tests examined differences between the three needs during leisure, and during work, by class. Results indicated that: (a) during leisure, autonomy was significantly greater than belonging except for working class Chinese, and belonging was greater than competence for creative professionals and sales and service workers; and (b) during work, belonging and competence were both greater than autonomy, regardless of class.

These results are noteworthy because they: (a) do not support Florida’s (2012) contention that the super-creative class’s leisure and work overlap; (b) suggest that while autonomy is the primary need satisfied during leisure, it is tarry to competence and belongingness satisfaction during work, regardless of class; and (c) are not always congruent with findings from a comparable study conducted in Canada (Walker, & Glover, 2013).

Forgotten Estates: The Precarity of Neighbourhood Restructuring in Salford, UK

Since the 1980s, the Northern English city of Salford has undergone intense deindustrialisation and been subject to systematic waves of urban regeneration. A key aspect of these regeneration efforts has been to rebrand and reconstitute the city and its districts from ‘grimy’ and ‘old Salford’, to dynamic and cosmopolitan. Under the aegis of the ‘New Deal for Communities’ policy, one specific district in the mid 2000s was earmarked for a distinct process of redevelopment entailing the demolition of public housing stock and the construction of private housing developments within newly enclosed estates and along the profitable local riverside. Ten years on and amid a challenging fiscal climate, this redevelopment vision has largely stalled resulting in an amalgam of complex neighbourhood impacts and processes encompassing partially demolished public housing estates, threats of further eviction for housing tenants, the arrival of new private owners and a severely disinvested community infrastructure. Drawing on a programme of recent qualitative research, this paper examines the impact on new and established residents of this stagnated and disrupted restructuring process to unpack qualitative research, this paper examines the impact on new and established residents of this stagnated and disrupted restructuring process to unpack qualitative research, this paper examines the impact on new and established residents of this stagnated and disrupted restructuring process to unpack qualitative research, this paper examines the impact on new and established residents of this stagnated and disrupted restructuring process to unpack qualitative research, this paper examines the impact on new and established residents of this stagnated and disrupted restructuring process to unpack.

WALLENIUS-KORKALO, SANDRA* (University of Lapland, sandra.wallenius-korkalo@ulapland.fi)

VALKONEN, SANNA (University of Lapland)

This paper studies representations of women and women’s bodies in multi-dimensional intersections. An intersectional approach emphasizes the multitude of factors that distinguish people from one another, such as gender, ethnicity, age, religious conviction, or social class. These differences are manifested in the human body, and by studying the representations of bodies, the embodiment – as well as the social construction – of these categories can be examined. In visual media the shaping and materialization of these differences becomes visible through poses and gestures, costumes, make-up, staging and storytelling. Looking at the body allows one also to analyze control, the use of power, and possibilities of action and subjectivity.

We approach these questions through empirical study of two Finnish television series. ‘On the skin’ (iholla) is a documentary reality-TV in which number of ordinary Finnish women film their everyday life and thoughts for six months. Season two of the series portrays Sanni, a young woman with a background in conservative Christian revivalist movement, as she struggles with her identity and the different expectations and norms of religious community and secular society. ‘Wet leggings’ (Määt säpikkäät) is a comedy show created by two young Sámi women. The show can be characterized as self-reflexive parody wherein the stereotypes of both indigenous Sámi ethnicity and Finnish mainstream culture are tackled with brisk humor. In these TV-shows, the cultural conceptions and conventions related to gender, the female body, ethnicity, and religiosity are made visible – as are the projects of exclusion and inclusion leading to multi-dimensional inequalities. Reality-TV and parody allow both emphasizing and re-interpreting and deconstructing established understandings of these categories. Hence emancipation from the norms becomes possible and these shows can also be seen as producing models for new types of agency for women.

Film Screening 2: St Henri

On August 26th, 2010, sixteen filmmakers followed multiple stories in the Montreal neighbourhood of St-Henri. The result is a touching, funny and fascinating day-in-the-life of this eclectic community. Doris travels the streets collecting bottles; Belinda is a dynamic hair stylist from Togo; Babyface, the 15 year old Canadian feather weight boxing champion prepares for a match; Robert and Edmée enjoy their golden years together; Danielle, an urban explorer scales abandoned buildings and descends into St-Henri’s sewers. These are just a few of the characters we follow in “St-Henri, the 26th of August”, a film that asks what community participation does not live up to scientific and political expectations.

Explicating Individual Training Decisions Based on Instrumentality Theory

Participation of individuals in continuing vocational training (CVT) stagnated or even declined since the late 1990s in numerous countries. In light of the long-standing predictions of an increasing need for CVT, this development is puzzling.

Several theories exist to explain CVT participation. Nevertheless, most empirical studies use merely personal and occupational characteristics as the main predictors of CVT participation. Also, many studies scrutinize the decisions of either participants or non-participants relying on ex-post survey data. Respondents, however, may rationalize their past behavior and give distorted assessments of their ex-ante training motives. Hence, these works do not provide an integrated explanation of individual training decisions and give no answer as to why participation does not live up to scientific and political expectations.

We apply instrumentality theory to explicate individual training decisions. Based on novel individual data, we estimate the effect of subjective expected utility (SEU) from CVT, the effect of restrictions, and the effect of personal characteristics on the willingness-to-pay for CVT. To construct individual SEU-scores, we confronted interviewees with a specific training scenario and gathered information on

- importance-ratings of nine potential CVT-outcomes,
- the perceived probabilities that successful training would actually help achieve each outcome
- the perceived probabilities of training success.

Results show
- SEU is a main driver of training decisions.
- Financial restrictions are most decisive for persons with higher training tendencies.
- Lack of time helps explain why some individuals are entirely unwilling to participate.

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
The regional infrastructure is a crucial training determinant. Age and vocational degree do not directly affect training decisions. Yet, persons in specific occupational settings do exhibit a lower training tendency. Also, training behavior of these persons appears to be more rigid and less likely to react to changes in their cognitive training attitudes.

The Immigration Museum in Melbourne, Australia launched the Identity: Yours, Mine, Ours (IWM) exhibition in 2011. Aimed primarily at young adults and secondary school students, this major long-term installation seeks to foster reflection on identity and belonging as well as dialogue about racism through a reflexive, empathetic and interactive museum experience. Drawing on findings from three secondary schools, this paper reflects on a multi-method approach that included narrative interviews, video diaries and focus groups with Year 11-12 students as well as key informant interviews with principals and teachers.

While focus groups were a catalyst for dialogue about everyday experiences with cultural diversity and racism, the ‘identity’ lens privileged in these groups could not account for the complexity of embodied experiences of belonging that were, at least some extent, captured in narrative interviews and video diaries. For example, the narrative interviews allowed students to talk about themselves in relation to aspects of the exhibition rather than directing and framing their experience as a priori, thus capturing a complex understanding of the student’s IWM experience through an entanglement of their life worlds, at home and school. Overall, the combination of qualitative methods revealed the ways in which an interactive and immersive museum space can support students to encounter and engage with individual stories and faces, move beyond the abstract tolerance of cultural diversity, unsettle the Self and destabilise stereotyped and prejudiced interpretations of ‘the Other’. We conclude by discussing the potential of multi-method qualitative approaches to draw upon students’ meaning-making, including the narrative barriers experienced in multilingual contexts, in order to provide a rich emic perspective on multi-sensory exhibitions.

Internet Public Sphere Under Construction: A Grounded Theory Analysis to Sina Netizens’ Comments on “Toilets Standard”
The dilemma for China to construct its internet public sphere does not result from the lacking of the same physical foundation as the western world has. On the contrary, the structural constrains such as no clear boundaries between public and private, the inner-circle communication oriented caused by “Chau Guj”, as well as the non-stand against as the “weapons of the weak” do matter, that finally prevent from the opinions transforming from personal to public. To break through the deduction circulation that whether the virtual or physical public spheres should make the first move, this paper try to get the answer from the induction from the Comments on “Toilets Standard” by Sina Netizens using the constructed grounded theory as a research method. It is easily to find out after a series of coding that, the public all agree that this standard has very bad operational and management, likely to be power rent-seek, and really approach to what we call formalism and projectism. This regulation of course didn’t answer the call for putting decision-making on a more scientific and democratic basis from the central government, and couldn’t solve the real problem bothered in the toilets. What’s more important is the practice of online speech doesn’t consider the stand as it stands. More “hidden transcripts” like mordacity, ambiguity and metonymy are conducted to pierce into the political forbidden area to make the dissident loud and clear.

The (Im)Possibility of the “East Asian Community”: Reflections on Nationalist Sentiments and the “Structures of Feeling” in East Asia
The recent development in East Asia has witnessed two contradicting trends: on the one hand, there have been reviving interests in Asiamism (especially inspired by Takeuchi Yoshimi) and/or the so-called “East Asian Community” in both official and intellectual discourses; on the other hand, there has been an escalation of nationalist politics in the region, manifested in such incidents as territorial disputes (between Japan and China over the Senkaku/Diaoyu islands, as well as between Korea and Japan over the Dokdo/Takeshima islands) and the debates over the so-called “historical consciousness” and history textbooks. How can we make sense of such a seemingly paradoxical situation, and what are possible outcomes of this contradictory development? This paper is a modest attempt to explore the answers to the above questions from a sociological perspective. Drawing on the theoretical insights from British cultural critic Raymond Williams and German social thinker Max Scheler, this paper provides a preliminary examination of what can be called “structures of feeling” in East Asia. Three dimensions of these structures are outlined for analysis: (1) grievance and the politics of memory; (2) resentment (or resentiment in Scheler’s terms) and value systems; and (3) power relations and the multi-layered structures of resentiment in East Asia. It is argued that the true reconciliation among different people in this region has to be reached before any ideal of Asianism or East Asian Community can be carried out. Towards the end of the paper, the implications for the reconciliation in the region will be further explored.

The Quest to “Overcome Modernity”: War, State-Building and Nationalism in Japan and China
Drawing on Japan and China as two illustrative cases, this paper intends to shed new light on our theoretical understanding of modernity by articulating the relations between war, state-building and nationalist discourse in the non-Western context. From its very burgeoning, the historical formation of modernity in East Asia has been intertwined with the experience of the defeat of war (or war threat) that, in turn, gives rise to nationalism. Moreover, understood as originating from the West, modernity to the East has been regarded as something to be achieved and overthrown at once. On the one hand, it is considered that the East has to catch up with the West in terms of material achievements (particularly economic performance and military power); on the other hand, it is also contended...
that Western modernity has intrinsic contradictions that will eventually lead to self-destruction, of which the only redemption is through the alternative path provided by the East. Such a dichotomous view of modernity has been dominating nationalist discourses in many instances in East Asia. Thus, nationalist projects in East Asia often have a double task: to pursue modernization through state-building, on the one hand, and to “overcome (Western) modernity”, on the other. However, due to the legacies of war, which leads to a lack of reflection on state ideology and violence, such nationalist projects often fall into the trap of modernity itself without being able to become the genuine critique of the latter. This paper will use the attempt to “overcome modernity” in wartime Japan and the search for “anti-modern modernity” in contemporary China as two examples to examine such a paradoxical situation. It is concluded that, to better theorize (and critique) modernity, the intertwined relationships between war, state-building, nationalism and global inequality have to be taken into account.

Feeling Good about the Iron Rice Bowl: Economic Sectors and Happiness in Post-Reform Urban China

Situated in China’s market transition, this study examines the relationship between economic sectors and individuals’ happiness in post-reform urban China. Based on pooled data analysis of restricted urban samples from the China General Social Survey (CGSS) 2003, 2006 and 2008, the subjective premium enjoyed by workers in the state sector is noteworthy: individuals working in the state sector have significantly higher levels of happiness and better counterparts in the private sector, other things being equal. After considering selectivity in mobility into the private sector, differences between those remaining in the state sector and those moving from the state to the private sector are highlighted: those remaining in the state sector are significantly happier than former state sector workers who moved into the private sector, whether the move was voluntary or involuntary. Possible underlying causes of these psychological costs are further explored: institutional segmentation in the allocation of social welfare benefits rather than psychological factors serves as the primary nexus linking state-to-private mobility and happiness. On the one hand, those who moved voluntarily experienced a trade-off in enjoying higher paid-offs while losing a sense of security. On the other hand, involuntary, downward mobility leaves long-term psychological scars to those who experienced layoffs or unemployment after controlling for social welfare benefits. People who experienced sectoral mobility, whether voluntary or involuntary, suffer from loss of the iron rice bowl. Results from robustness checks indicate that neither observed nor unobserved confounding factors, if any, would bias our conclusions. This study emphasizes the role of social security as an important dimension in determining individuals’ happiness that should be explored in future research.

Re-Territorialization and Social Resistance in the Remaking of Dafen Village, Shenzhen, China

After exhibited in Shanghai EXPO2010, Dafen Oil Painting Village has been advocated as an innovative “best practice” of governing that has transformed urban villages with low-skilled labors and chaotic landscape into a cultural cluster. Many scholars have noted that, in China, couples of famous cultural clusters have emerged and prospered in places with a near vacuum of governance, such as villages or remote suburbs, only to drastically change upon the extension of state governance. Nevertheless, there seems to be a marginalization of scholarly attention to the trade-painting community of Dafen Village, perhaps due to the common critiques on authenticity of trade-painting industry and thus, negligence of everyday life of trade-painting workers and their struggles.

What comes up is changing landscape of social relations when a particular area is demarcated as a special cluster subject to the state’s regulation in name of objectifying the imagined economy. Instead of debating the nature of trade-painting industry, we argue that the remaking of Dafen Village into a cultural cluster is a project of re-territorialization, driven by the state with a market mindset. The fabrication of the cultural cluster thesis into the settlement of the trade-painting community entitles the state to try new logic and new forms of inclusion and exclusion. More specifically, we are concerned about the differentiated treatment given to different social groups through calculated policies and the corresponding social struggles of various social groups for their rights. Particular attention is given to two major calculation rules: spatial planning for land use regulation and differentiated welfare access rights. Through the study, we attempt to offer a critical yet nuanced perspective toward the heterogeneous society and changeable alignments or blurred boundaries between the state and society in the dialectic process of re-territorialization and counter-territorialization.

Gender Differences in Social Quality in Taiwan

This paper will try to explore the social quality through gender lance. Taiwan is a city of transition in terms of democracy and social progress. However, unstable and anxious social atmosphere tend to occupy the society quite often. This paper is going to see whether there in gender difference in perception of social quality.

The data is derived from 2nd wave SQSS survey done by National Taiwan University. This questionnaire has been designed by the National South University and modified by ACSQ network and Taiwanese SQ team member. Here are about 1200 sample are collected and CATI system has been utilized during data collection. Stratified random sampling has been used for sample representation purpose.

The data will address that here is gender difference in subjective feeling about social inclusion and social empowerment. Women compared their counterpart tend to be more satisfied in those area. More detail will be discussed in this paper.

Effects of Social Capital on the Psychosocial Development of Children in Middle Childhood in China

In this analysis, the effects of social capital (including family, school, and community social capital) on the psychosocial development of children from two-parent families in China have been investigated. And five dimensions of psychosocial development are analyzed, including social competence, emotional competence, self-esteem, resilience and pro-social behavior. In total, 140 children studying in grades 4 to 6 from two primary schools in Tianjin have involved. And all of the participants are selected randomly. The outcomes suggest different effects of social capital on the five dimensions of psychosocial development. The interaction effect between family and community social capital significantly affects children’s social competence, emotional competence and resilience at the same time. School social capital and peer social capital are interacted, influence emotional competence. Meanwhile, the interaction of school and community social capital has significant effect on resilience. However, except for the direct effect of family social capital on social competence, no other direct significant effects of social capital have been found surprisingly. It is also surprising to find no significant effects of social capital on self-esteem or pro-social behavior, which is conflict with the current literature from Western culture. The outcomes from empirical analysis suggest that, simple social capital can not promote the psychosocial development of children in middle childhood in Chinese context. To strengthen the interaction between family and school, school and community, and family and community, will be very important to improve children’s psychosocial development level. Furthermore, more potential predictors are supposed to be used to function to promote self-esteem and pro-social behavior in Chinese context, such as cultural capital.

The Guanxi Hierarchy - Family Ties and Finance in China’s SMEs

In his seminal work, From the Soil, Xiao-tong Fei found that solidarity in social ties fades with distance from primary group relations. Thus the power of guanxi (i.e., connections or relationships) would differ according to it’s source. Most powerful would be guanxi based on kinship, with the power of such connections fading as one moved down the scale from kinship, to regional locality, thirdly to school ties, and finally to business ties.

Fei’s early work has returned to prominence in analyses of group ties in private enterprise, following market reforms over the past four decades. For instance, Yu-sheng Peng (2004) highlighted the economic benefit of kinship networks in China’s rural industrialization programs. He found that kin solidarity played an significant effects of social capital on the five dimensions of psychosocial development. The interaction effect between family and community social capital significantly affects children’s social competence, emotional competence and resilience at the same time. School social capital and peer social capital are interacted, influence emotional competence. Meanwhile, the interaction of school and community social capital has significant effect on resilience. However, except for the direct effect of family social capital on social competence, no other direct significant effects of social capital have been found surprisingly. It is also surprising to find no significant effects of social capital on self-esteem or pro-social behavior, which is conflict with the current literature from Western culture. The Guanxi Hierarchy - Family Ties and Finance in China’s SMEs

In his seminal work, From the Soil, Xiao-tong Fei found that solidarity in social ties fades with distance from primary group relations. Thus the power of guanxi (i.e., connections or relationships) would differ according to it’s source. Most powerful would be guanxi based on kinship, with the power of such connections fading as one moved down the scale from kinship, to regional locality, thirdly to school ties, and finally to business ties.

Fei’s early work has returned to prominence in analyses of group ties in private enterprise, following market reforms over the past four decades. For instance, Yu-sheng Peng (2004) highlighted the economic benefit of kinship networks in China’s rural industrialization programs. He found that kin solidarity played an important role in protecting the property rights of private entrepreneurs. In the absence of credible market institutions or a legal order protecting property rights, kinship ties reduced transaction costs during the early stages of market reform. Yan-jei Bian (2009) broadened the thesis, arguing that the emergence of private firms can be traced back to guanxi networks. However, He and Jia (2005) discovered a reverse hierarchy in the strength of guanxi ties. They found business-based guanxi gaining prominence more recently in the management and operation of domestic private firms.

I look then to the pattern of guanxi ties, and relevant hierarchy in the strength and significance of such ties among owners of private enterprise. Data were drawn from about a thousand SMEs between October 2008 and March 2009. I found that strong kinship network ties were correlated with positive effects on

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
the financial support provided for private rural enterprise. At least regarding investment, the original hierarchy dominated by kinship-based guanxi appears to remain at the center of most enterprise.

The Influence of Early Trauma on the Quality of Life in Taiwan: The Moderating Impacts of Religiosity?

A growing body of life course research based on the Western societies has displayed the long-term negative effects of childhood and teenage trauma on life conditions in later life stages and has pointed out that religion plays an essential role in moderating or buffering the critical impact of early trauma. However, whether similar patterns appear in Asian societies remains largely unexamined. It is especially ambiguous whether the effectiveness of religion's coping impacts applies to Asian societies where religious compositions are more diversified with non-Christian beliefs. As a result, this research regards Taiwan as an ideal setting to elaborate the associations among early trauma, religiosity and two indicators of adulthood life quality: happiness and self-reported health.

With the utilization of the data drawn from two nationwide representative samples: the 2009 Religion Module of the Taiwan Social Change Survey (TSCS) and the Survey of Religious Experience in Taiwan (REST), three sets of questions are investigated. The first sets of analyses enable this research to ascertain the impacts of diverse dimensions of early trauma on the life quality, including quantity views (as measured by the number of early traumatic events); category views (as classified as parent-related, sibling-related, self-related, and economic early trauma), and juncture views (as sorted into childhood trauma and teenage traumas). Furthermore, this research discusses whether the Taiwanese with higher level of childhood and teenage traumas tend to display higher level of various types of religiosity during adulthood, including belonging aspect (as grouped into no-religion, diffuse-religion, and institutional-religion), belief aspect (as measured by attitudes toward supreme god and spirituality), and behaviors aspect (as determined by public religious attendance, private observance, and religious techniques). Last but not least, this research gauges whether the negative influence of early trauma on adulthood life quality is moderated and buffered by religiosity during adulthood.

Immigrant Wives As Volunteers in Taiwan: Their Characteristics and Experiences

The prevalence of transnational marriage can be witnessed in Taiwan in the late twentieth century where Chinese and Southeast Asian women, mainly from Vietnam, dominate numerically. Most of the women got married to Taiwanese men through the operation of profit-pursuing marriage agents. These immigrant wives, contracting “commodified transnational marriage”, are labeled in Taiwan as “foreign brides”, a derogatory term that implies exclusion and discrimination. It has been recognized that immigrants can improve their economic, social and emotional well-being, civic participation and integration in the host society by undertaking volunteering activities. Nevertheless a variety of factors can prevent them from voluntary work. In other words, it is significant to disclose immigrant wives’ experiences of being volunteers in Taiwan. However, the studies to date on the issue of these women have largely concentrated on adaption; little attention is paid to their participation in volunteering. Thus this paper aims to learn about the characteristics and experiences of immigrant wives who participating in volunteering in Taiwan by conducting qualitative research. The major questions raised for this paper are: 1) What are their factors for volunteering? 2) What are reasons keeping them from volunteering? 3) What types of volunteering work do they do and why? 4) What does volunteering work mean for them? The research results can put forward recommendation to policy-makers and mainstream organizations with a hope of promoting volunteering participation of immigrant wives in order to improve their well-being in Taiwan.

Cooperative Marriage: Queer Politics of Chinese Lalas and Gay Men

Being a new and under-researched phenomenon since 2005, cooperative marriage attracts attention and generates debate in and out of the mainland Chinese LGBT community. Cooperative marriage is a heterosexual marriage performed and negotiated by two non-heterosexual parties, a lalas (lesbian, bisexual and transgender woman) and a gay man.

Being a popular coping strategy of lalas and gay men in contemporary China, in facing the institution of family, marriage and heteronormativity, cooperative marriage offers great insights into Chinese families, tongzhi kinship and alternative forms of intimacy and queer alliances. Filial piety, compulsory heterosexual marriage and potential housing, legal and financial benefits in heterosexual marriages are major momentum for this type of highly ritualized marriage. In cooperative marriage, both parties are fully aware of the obligations and nature of the marriage, however many of them struggle to make a balance between the conjugal family, natal family and their same-sex desire.

Various strategies are developed in finding and sustaining the (superficial) harmony of such families: different family practices, new family arrangement, the performance of masculinity and femininity in their conjugal houses and relevant public spaces. Friendship and even family bonds are thus developed and strengthened, forming new sexual alliances in the society.

Like all heterosexual marriages, cooperative marriage is also a gendered experience; therefore the study is especially interested in lalas’ experiences and narratives, their definition of love, family and intimacy. This research studies cooperative marriage from multiple aspects of family practices including domestic, consumption, kinship, marriage, emotion and parental practices, in order to understand their lived experiences and how they do gender and families. Feminist, interpretivist qualitative approach is adopted in the research. Semi-structured interviews were conducted and participant observation as well to gain insights of such marriages, 13 lalas and 7 gay men were interviewed, as well as activists from the LGBT community.

The Embeddedness of Corruption in Contemporary China: The Bo Xilai and Lai Changxing Cases

Economic corruption cases are a window into networks linking state office holding with wealth accumulation. This paper draws on the concept of embeddedness (Granovetter 1985) to examine two prominent cases in contemporary China. The cases are, I claim, ideal typical of agents and their networks coming to shape the political economy. One is “corruption from below”. Its agent is an entrepreneur from a humble background, Lai Changxing, who forged networks with hundreds of officials in an immensely profitable smuggling operation that was exposed in Fujian Province in 1999. The other is “corruption from above”. Its agent was a high-level official born into the political elite, Bo Xilai, who accumulated great wealth through networks in his social circles that were revealed in 2013. This paper’s analysis centers on how the agents select, monitor, and sanction others in their networks. There are two key findings. One is that the networks are organized through third-parties (proxies). The other is that the networks’ institutional basis is constituted not only by trust, but also by coercion. The paper’s subsequence considers from some mirrored differences reflected in the humble and elite position of the agents, and how their two kinds of networks can interact. In the conclusion, I use the paper’s argument to stress the need to develop an economic sociology of corruption.

Cool Towns for the Elderly - Protecting the Health of Elderly Urban Residents Against Heat Stress

Background: The 2003 heat wave in Europe resulted in 70,000 deaths. Particularly at risk were socially disadvantaged persons over the age of 65 years. The STOPHOT project explores how the elderly Viennese population perceives their behavior to heat. Of specific interest are the behavior patterns of older persons with lower SES living in socially deprived urban areas.

Methods: Using a standardised questionnaire, a telephone survey was conducted in number 2: 2011. 400 subjects (>65y) living in four different residential area types in Vienna were interviewed. In addition, face-to-face interviews with residents of retirement homes (n=200) and 15 in-depth interviews with stakeholders were carried out.

Results: Heat primarily affects the elderly's energy balance. Most frequently mentioned conditions are fatigue (58%) and sleeping problems (48%). Older people adjust their behavior during a heat wave mainly by wearing lighter clothes, increasing liquid intake and staying indoors during daytime. High-risk groups are persons with a lower socio-economic status and activity level as well as poor health condition. This group is also more likely to withdraw from the public for the duration of the hot periods. Those who don’t withdraw suffer from fewer heat-induced ailments. Factors that increase the likelihood to stay at home are a disadvantaged neighborhood, dissatisfaction with and lack of neighborhood networks

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
and age discrimination in the residential area. Whether older socially deprived individuals go out during a heat wave period is not so much a result of available green spaces, but rather of existing socio-spatial conditions.

**Conclusion:** The elderly are particularly vulnerable towards heat stress. With urban populations ageing, and urban temperatures rising, designing of urban areas must increasingly consider the interaction of social and climatic factors to increase age-friendliness. Vulnerability towards heat is not natural, but produced by socio-spatial conditions and can be counteracted by community-building initiatives.

**RC43-720.5**

**WANKA, ANNA*** (University of Vienna, anna.wanka@univie.ac.at)

**Older People in Public Space(s) – Engagement or Disengagement?**

**Background:** Public spaces are in transition, and it doesn’t head towards age-friendly cities. Instead, spaces are turned into functions of mobility – lacking opportunities for social interactions and integration. This tendency intensifies in times of economic crisis with the withdrawal of public maintenance and the fortification of socio-environmental injustice. Older people are particularly affected as they are highly dependent upon their immediate residential environment for maintaining their quality of life.

**Methods:** The main research question is how older people cope with the deprivation of public places and what role the specific localities play in their strategies. A comparative case study of contrasting residential areas in Vienna, Austria, will be presented. A mixed methods design combining both quantitative and qualitative methods is deployed.

**Preliminary Results:** The quality of the residential area significantly correlates to older people’s outdoor behavior. Factors that reduce the likeliness of spatial engagement are a disadvantaged neighborhood and age discrimination in the residential area. Who owns little resources is even more affected. However, older people also own specific resources that can contribute to the revitalization of public spaces, increasing not only their quality of life but also the quality of city life in general.

**Conclusion:** The intersectionality of old and new dimensions of inequality – like age intersecting with education and gender - poses new challenges for environmental justice discourse. Hence, environmental justice can be discussed under the keywords of age-friendliness. Without counteraction, environmental deprivation and the corresponding withdrawal of older people from public space will increase the latter – both in regards to health and significance. Who withdraws from public space becomes invisible in society. However, older people are also a highly competent group that is yet hardly targeted by urban revitalization initiatives. Here lies potential for inclusive ‘gentrification’ of urban areas.

**WARING, JUSTIN*** (University of Nottingham, justin.waring@nottingham.ac.uk)

**The Contingent Legitimacy of Professional-Managerial Hybrids: Towards a Relational Sociology of Hybridisation**

Despite increased interest in professional-managerial hybrids, the unit of analysis for most research remains on the hybrids themselves, i.e. practices, interests and identities, or the processes of hybridisation, i.e. moving into the role. There is limited consideration to the experiences or influences of other professional or managerial actors with whom these hybrids must relate and achieve their hybrid legitimacy. This highlights a relatively neglected aspect of professional-managerial hybrids and requires a shift in analysis from the hybrid to the wider constellation of relationships and stakeholders. Drawing on theories within relational sociology, especially the work of Bourdieu and Crossley, the paper examines the relational ties of 36 medical-managerial hybrids working in different areas of service organisation, including executive management, clinical leadership and clinical governance. Each of these hybrids exhibits different relational networks and points of ‘professional-organisational intersection’, which are drawn up, developed or dissolved when they are seeking to legitimise their new hybrid roles. It examines the relationships of co-workers, from both medical and management communities, to these new hybrid roles, where co-workers are often found to question hybrids in terms of their expertise, inter-occupational relations, strategic alignment, and reputation with colleagues. The study shows how hybrid managerial roles are contingent upon the relationships and sanctioning power of both other doctors and managers, and in fulfilling their hybrids roles and this involves drawing upon different forms of social, symbolic, cultural and, increasingly, economic capital. The paper concludes by calling for greater attention to the relational dimensions of professional work in organisational contexts and the relevance of Bourdieusian social theory within the sociology of professions.
New Approaches to Sociospatial Network Analysis: Understanding and Responding to Neighbourhood-Level Poverty and Disadvantage

While socio-economic-spatial divisions within cities and towns have long been evident, in post-Fordist society they are generally considered to be growing sharper and differentiating at the scale of suburbs and neighbourhoods. This produces effects in which the poor and non-poor increasingly live apart from each other and is referred to as ‘sociospatial polarisation’. These socio-economic-spatial processes have significant implications for the ways in which poverty and socio-economic disadvantage is being reproduced through converging socio-economic and spatialised processes. Drawing on a series of studies conducted in Victoria, Australia, and exploring social network structures and experiences of community in disadvantaged and non-disadvantaged neighbourhoods, this paper explores the implications of converging socio-economic and spatialised processes with particular focus on settings of place-based neighbourhood disadvantage. Issues addressed are: 1) discussion of findings from network analyses that show contrasting patterning of social networks between residents of poor and non-poor neighbourhoods; 2) consideration of the implications of divergent network patterning for experiences and potential of community in place-based settings for poverty reduction strategies. Network analyses use a range of methods to collect network data on residents’ networks including contact diaries, CATI surveys and ethnography and, more recently, mobile phone and Global Positioning System (GPS) technology. Evidence from these and other studies suggests that residents of socioeconomically disadvantaged neighbourhoods are likely to have more local networks and fewer extra-local networks, than residents living in other kinds of neighbourhoods. These findings have significant implications for poverty reduction strategies that assume neighbourhood ‘community’ to be potentially transformative mechanisms for driving socioeconomic change at local levels. Rather, efforts should focus on understanding macro processes that are contributing to socio-spatial disconnections among vulnerable populations and developing poverty alleviation strategies that include efforts to connect residents into extra-local and socioeconomically diverse networks.

Entrance Examinations As a Tool for Socialization and System Maintenance: Comparisons Between the United States, Japan, and France

Examinations have visible and invisible functions in education and society. In particular, entrance examinations for higher education have a great impact on shaping compulsory education, and they reveal the types of abilities and attitudes that each society is attempting to nurture. Moreover, the immutable modes of entrance examinations inevitably reproduce indigenous education, its system, modes of knowledge and pedagogy, although the influence of globalization on education is apparent and educational reforms are continually introduced. Thus, entrance examinations function as a form of system maintenance, even when alien elements are grafted onto education. Since the modes of these examinations are often consistent in both schools and the wider society (e.g., in employment and civil service exams), examinations contribute to the maintenance of much bigger systems, outside schools.

This paper examines the various functions of examinations by comparing three countries, France, the United States, and Japan. Special attention is paid to the socialization patterns in each country. The Japanese National Center Test for University Admissions was modeled after the American SAT (Scholastic Aptitude Test), but what each test examines is quite different in terms of modes of knowledge and students’ faculties. Unlike the SAT and the National Center Test, the French Baccalaureat employs entrance examinations. The Baccalauréat is accepted as a rite of passage to becoming “French” through the acquisition of a dialectic for writing and talking that is based on an idea of a shared culture. With this analysis of three types of examinations (contents and systems) and the preparatory education involved, the paper attempts to model different types of socialization and the links between education and society.

Gender Difference in Network Homophily By Parental Status Among Faculty at a Research Intensive University

Increasing attention is paid to work-family conflict among faculty members. Generally, however, women faculty tend to have a heavier share of family responsibilities and experience greater work-family conflict than men faculty. Previous research suggests that faculty, especially women faculty, are often hesitant to bring up concerns about personal life or discuss work-family conflict in the workplace because they are afraid that their colleagues might doubt their commitment to work. The purpose of this study is to better understand the academic work culture by exploring informal (non-work related) social networks of faculty focusing on parental status and gender. Social identity theory predicts that we tend to form homophilous social networks that are following our salient social statuses such as race, gender, and social class. This is because when we meet someone with the same status characteristic, we expect the person to have similar viewpoints and interests and thus find it easier to talk with them. This study considers parental status as a status characteristic and examines if there is a gender difference in
the tendency to have informal social interactions (e.g., discuss personal matters, share free time) with departmental colleagues who share parental status (parents or non-parents). We use social network data on about 380 faculty within the natural and social sciences at a large research-intensive Midwestern university. For the preliminary analyses, we ran OLS with permutation tests and did not find a significant gender difference in parent homophily, which was measured using the point bi-serial correlation (PBS). The next step is to run Exponential Random Graph Models (ERGMs) and test the gender difference controlling for dyadic dependence.

Why Do Organizations Form Groups?: Complex Structure and Behavior of Japanese Groups from 1977 to 1998

Although it has been a well-known fact that Japanese business groups have consisted of two types of network, the structural difference between them has not been paid enough attention to by researchers. Applying the techniques of network analysis and regression analysis to data on a total of 2,972 large Japanese firms over a 22-year period, this paper demonstrates the correspondence between network structures and the three different goal-pursuing behaviors of firms:

Corporate Complexes (i.e., the largest six cross-industrial corporate networks with a circle pattern of bilateral equity ties) had a significantly positive effect on member firms’ status-oriented behavior as well as on firms’ technology-orientated behavior. However, the effect on firms’ efficiency-oriented behavior was not confirmed with the same dataset. Meanwhile, Corporate Groups (i.e., the seven corporate networks in the automobile industry with a tree or star pattern of unipolar equity ties) had a positive effect on member firms’ economic behavior as well as a negative effect on member firm’s technological behavior. In the case of the economic effect, however, only superordinate firms benefited from corporate groups. The effect of corporate groups on member firms’ social behavior was not confirmed. The patterns of group structures and member firms’ behaviors did not change throughout the observation period despite the fluctuation of the macro economic environment.

From the analyses, these findings suggest that Corporate Complexes were a system of resource-acquiring by means of firms’ high social status, while Corporate Groups were a system of making profits to sustain the costly system for superordinate firms. (For subordinate firms, corporate groups were the system for bare survival). Both structures were thus complementary to each other. Shielding the member firms against environmental fluctuation and technological uncertainty, Japanese business groups, by virtue of their complex structure, simultaneously pursued multiple goals as a united body.

Worlds of Nurses in the Care at Home, a Comparison France-Japan

Most of the Japanese nurses in the care at home in the regions Fukushima and Nagano are married, having children, but they had an interruption in their careers, longer than the French nurses. So we observe it in difference between length of having D.E. (Diploma of State) and experiences as nurse in the care at home. In France, the nurses in the care at home stress the activity and more explicitly on her condition of exercise, at the levels of motivation and difficulty, unlike the nurses in hospitals, who like working in team, emphasize the cooperation with another professionals. The French nurses mention practically never the relations with patients’ families. So, the professional world of the first ones focuses on the market model, while that of the second on the industrial agreement. In Japan, the nurses in the care at home, quite as the hospital, suggest the relations with patients in terms of motivation and difficulty; but it is the intervention of the family of the patient. The professional world of the nurses in the care at home is characterized by the proximity or domestic convention. However, the nurses in the care at home in Fukushima differ from those in Nagano. The second criticize care managers in the points of view of cooperation. The first ones suffer from the difficult situation after the disasters to improve the quality of life of the patient, but they think of the role of the professional associations in terms of civic convention. This requirement of collective organization comes along with a bigger autonomy and, doubtless, with a grip of more important responsibility. This will have important and positive consequences on the image of the profession.

Communicating the Discrepancy: Operational Outcomes of the Activation Policy in the Field of Local Support Activities for Migrant Residents in Germany

This paper addresses the question of how migrant residents and local welfare organizations experience the recent political changes to the “activation” welfare policy in Germany. Because of a radical transformation of the political landscape in the last decade in Germany, people with migrant backgrounds are subjected to activation policies in two ways. Since there are twice as many jobless migrants compared to Germans, these policies are necessary for the beneficiaries in the new job placement measures, which may be well compared to the workforce policies in the United Kingdom. Furthermore, migrants are involved in the activation scheme through the formation of an integration policy in Germany that strongly reflects the concept of activation by requiring total engagement, self-responsibility, and willingness to get involved in the life and norms of the host country.

To assess the practical outcomes of such a political arrangement in diverging rounds of the involved actors, the author conducted narrative interviews with migrants and local actors who are either in charge of job placement measures in the job centers or are working as support programs in elementary schools in migrant-dense city areas in Munich. A wide range of administrative documents were also referred to.

On the basis of these sources, this paper demonstrates the cognitive discrepancies among the actors and discusses that one of the most significant outcomes of these activation measures may be achieved by promoting a reflexive mindset among local institutions and migrant residents. The discussion is concluded by indicating that the operational interest of local welfare organizations is paid increasingly to enhance their communicational sensitivity so that they could deal with the highly complex demands of their individual clients; i.e., the sensitivity that relativizes the predominant distinction between Germans/non-Germans in the traditional welfare community.

The Death or the Reinventing of the Social? A System-Theoretical Contribution to Changing the Semantics of Inclusion and Exclusion in Activation Welfare Strategies

This paper addresses the question of how the landscape of inclusion and exclusion can be recast in the light of Luhmann’s systems theory by referring to narrative interviews with local actors from migrant support organizations.

The ongoing discussions about social inclusion and exclusion, which are mainly conducted in socio-political studies on poverty and inequality, represent a normative understanding of “the social” that is reflected in the notion of solidarity, social policy, and welfare state. On the contrary, Luhmann’s systems theory concerns another tradition of “the social,” i.e., the tradition of social action, interaction, and community. In a particular way, according to his definition of inclusion/exclusion, neither membership in the legal rights nor a status in the central labor market is crucial: only communicational relevance matters. Taking this definition seriously, even a bankrupt or jobless person is economically “included” insofar as (s)he is communicatively relevant in the economic system, which finally leads us to the conclusion that there is no “social exclusion” in the social system.

Applying the systems theoretical understanding of inclusion/exclusion, this paper assesses how the communicational form of migrant support organizations is changing because of a radical shift in the activation policy of the last decade in Germany. The range of political reforms is generally considered as a move from a neo-liberal arrangement of the welfare state, which would be comparable to the diagnosis of “the death of the social” (N. Rose 1996).

This paper presents another scenario by highlighting that operational sensitivity is increasingly enhanced in local welfare organizations; this enhancement is meant to deal with the highly complex demands of individual clients and to ensure their cooperative engagement. Finally, it calls for “reinventing the social” (S. Lessenich 2008), particularly by aiming at a constructive contribution to link the very different assumptions of the social.

The Interactional Accomplishment of “Impairment and Disability” in a Sport: From Game Analysis in Wheelchair Basketball Games

* denotes a presenting author. Abstracts are organized by first presenting author’s last name.
How can the Impairment and Disability be accomplished in the sports games? Answering this question, I apply interaction analysis and game analysis to the Wheelchair Basketball games.

The social model of disability is very important in the way that “disability” is “the Social”. But this model is rarely used for the studies of the sports sociology. The social aspect is simply used as a factor to block personal sports participation. However, from a viewpoint of the Ethnomethodology, we can regard the severity of the impairments and the disability as the cooperative accomplishment in / by the interactions of people. The purpose of this study is to illustrate “the sociality of disabilities” from experiences in the sports practice. In this study, I classify games of wheelchair basketball, the top-level, middle-level, low-level and examined the play in each game.

The game analysis of sports paid attention to the result of a game and illustrated each play related to the result of the game for an index. However, the game analysis does not consider that the performance of the game “achieved” something.

In the wheelchair basketball, it is empirically-known that a competition power of the team is closely concerned with the skill of the low-point player (a player with severe impairments). In the team having high competition power, the implication of a player with severe impairments may be different from a low team. In the logic of the wheelchair basketball rules, “impairments” is indispensable. The game performance shows it. While, “impairments” is experienced as difficulty in the game when the low-point player does not function effectively by the team. The negative “impairments” are achieved and maintained as a result of play interactions. “impairments and disability” are accomplished as a play interaction in a game.

Provision of Flexible Services

For many individuals living with mental health and substance abuse problems, it is difficult to obtain the safety and security that are necessary components of recovery. This is because they do not have access to resources such as food, housing, transportation, and employment that are needed to begin the process of stabilizing their lives. When these resources are available, they are often are attached to a variety of caveats that make it difficult to exercise personal agency, another important component of recovery. Recognizing this, new approaches to mental and behavioral health care have begun to emphasize the importance of immediate access to resources through the provision of flexible services that give individuals the latitude to establish their own goals and plans for obtaining them. This presentation will focus on this emerging paradigm and the effect it is having on the health and well-being of people with severe mental illness and substance use disorders. The paper uses Census and other data to examine the dramatic rise private renting in London since 2001, a rise which is predicated on the buoyancy of the buy-to-let mortgage markets, foreign capital inflows which generate build-to-diver developments, and also the increasing outflows of ex-public housing into the private rental market. The Coalition Government’s recent welfare and housing reforms, such as the ‘bedroom tax’, overlay these longer-term trends. The net result in Lon- don is that the housing market restructuring which has occurred as a result of longer-term shifts in tenurial patterns, and shorter-term impacts of the 2008 credit crunch aftermath and the Coalition Government’s welfare and housing policies. The impact of this restructuring is that the tenure boundary between social and private renting, in terms of rents and security, is becoming increasingly blurred, while home- ownership is being transformed via shifts in mortgage finance availability. The result of these trends is the end of both social renting and home ownership as we know it. Secondly, the paper focuses on London and it demonstrates how the national trends are exaggerated in the capital, partly as a result of the central London housing market providing a ‘safe haven’ in relation to global capital flows, and partly as a consequence of urban regeneration schemes which have had the net effect of reducing the proportion of social housing throughout much of London.

Reducing Uncertainty and Improving Recovery through the Provision of Flexible Services

This paper sets out a framework for understanding how state-led gentrifica-
tion has occurred in London with reference to public (council) housing and urban regeneration policies. It argues that these policies, which are representative of a more general trend in British cities, create a ‘buffer’ against gentrification in London from the 1960s to 1980s, with certain inner Lon- don councils such as Camden and Islington, using the municipalisation of private housing as a deliberate policy strategy to counter gentrification. However since the 1980s, this ‘buffer’ role has been diminished under neoliberalism, firstly by the Housing Market Reform, then by the sale of council houses to council tenants, and finally by the recent buy-to-let mortgage market restructuring, which has resulted in ‘hot’ landlords, and bondholder competition policies, not only increasing the rental market for property, but also a significant increase in the number of floating homes, increasing the uncertainty that parallels and arguably reinforces the labour-market based ‘precari-
at’ identified by Guy Standing (2011) and Loic Wacquant (2008).

Gender, Homelessness and Social Capital: Young Women’s Management of Disrupted Housing Transitions

Mainstream understandings of young people’s housing transitions inade-
quately reflect the diversity of experiences and social processes that shape the course to independent living. By only recognising normative pathways for young people leaving the family home significant experiences are either being misrep- resented or lost. In Australia, a largely hidden aspect of youth housing transitions is the presence of homelessness. Many young people in need of accommodation are faced with a difficult housing market where there is a short supply of safe and affordable properties. For young people, to be without a home is not only to be homeless but also to be removed from all the subjective meanings a home car-
ries. In addition, increasingly globalised economies and deindustrialisation have had serious implications for young people’s transitions to secure accommodation due to employment insecurity and financial instability. I argue that the complex relationship between disrupted housing transitions and youth homelessness needs to take into account structural factors relating to gender, race/ethnicity, class, location, sexuality and disability. Accordingly, the variety of young people experiencing homelessness in Australia demands new ways of conceptualising the phenomenon. The application of a gendered lens to homelessness research is one possible way to challenge dominant discourses of youth housing transi-
tions. In this paper I explore young women’s experiences of homelessness and the utilisation of intimate relationships as a form of context-specific capital for accessing material support, particularly access to stable accommodation. To this end, I draw on theoretical perspectives of social capital developed by Pierre Bourdieu.

at’ identified by Guy Standing (2011) and Loic Wacquant (2008).
of the paper), the paper shows the initial organizational and cultural obstacles to the institutionalization of the discipline and to the transnational exchange of ideas. Then, it moves to the case of Czarnowski's student Nina Assorodbraj-Kula (1908-1999), showing how she combined the Durkheimian thought with Marxism. Although the results of this unusual merge were interesting, the question arises whether they could be considered Durkheimian anymore. Finally, the works of a third generation (represented by Assorodbraj-Kula's students) show that what was still left from the Durkheimian core was more and more undermined by a reception of American sociology. Several tentative conclusions are drawn from this overview. 1. Although relatively influential in Poland, the Polish Durkheimians were internationally unknown, which already forms one of the dead ends of the school; 2. The way Durkheimian thought was reinterpreted, provokes the question whether it was still Durkheimian; 3. There has not been a conceptual innovation starting with the third generation. These observations can be extrapolated for the sake of future comparisons.

WAYACK PAMBÈ, MADELEINE* (University of Ouagadougou, wayack.madeleine@yahoo.fr)
Interrogating Female Household Headship from Women Heads of Household Perspective: Findings from a Qualitative Study in Ouagadougou

Background and Objective
Despite its extensive use, the notion of female headship is a matter of constant controversial debate among scholars. This study analyzes how women household heads in Ouagadougou perceive themselves, versus the ways in which female household headship is conceptualized by researchers. Studies on female headed households are scarce in Burkina Faso, and it is our expectation that this study will contribute to fill the gap.

Methods
Semi-structural in-depth interviews were conducted to explore women’s view of and experience on household headship, in relation with domestic power and decision-making. A sample of 20 female household heads was derived from a previous quantitative survey by using a purposive sampling method, in order to have women of different marital status and educational levels. Data were analyzed using a manual grid.

Findings
Findings show that all respondents acknowledged themselves as the current head of their respective households, even though all women mentioned the absence of a male partner as the reason why they defined themselves as the ‘head’. In terms of authority on family matters, the respondents made no spontaneous association between their being head and having domestic power nor making decisions in the household. It emerges from the responses that for female heads of young children, the consistency of authority on household matters was mediated through women’s relationship with in-laws, mostly men. Conclusion
The study reveals that women’s experience of household headship differ significantly with the conceptualization of female household headship by researchers, in terms of control over family matters. While the husband/wife transition in the occupancy of household headship seems quite ‘natural’, the authority tied to this position seems to be when held by a woman. The study challenges key conceptual understanding of female headship and current debate around the dynamics of domestic power in their household.

WEBER, CLAUDE* (French Military Academy of Saint-Cyr, claude.weber@st-cyr.terre-net.defense.gouv.fr)
Lessons Learned about Different Experimented Researcher Positions within Military Organization

This paper will focus on ethnographic methods used to analyze military organisations and groups and, more precisely about immersion which has been – and still is – a privileged tool use during my research within military universe during the last twenty years.
Four positions will be questioned. A first one, as member of the Army when I was drafted and when I realised my very first research in order to complete my master's degree (study about incorporation and instruction of a draftee). A second one, one year later when I was a researcher completely outside the institution. A third one, as PhD student financially supported by the French MOD but also in a technical way to realise my immersions in the Army, in the Navy, in the Air Force and in The French Gendarmerie. At least, my current position as a researcher and a teacher on secondment from the French University within the French Military Academy of Saint-Cyr where I conducted a research on the socialisation processes of the French Army officers through a class of cadets. Each one of those positions presents its own advantages or disadvantages, inevitably associate to the intelligible dimension of each study produced. The presentation will consequently stick to consider aspects which appear to me as most important: those relating to the posture of the researcher and his statute; those of the delicate question of the professional and experience on household headship, in relation with domestic power and decision-making. The first is changes in the power of labor and capital. A decline in the strength of labor may have led to a decline in the wages of ordinary workers and an increase in profits and the wages of top management. The second is a combination of deregulation, especially in financial markets, and the degree to which the political system facilitates “rent-seeking”. Where the “rent-seeking” is possible, the top managers may have been able to shape the regulations in ways that worked to their advantage. The third is changes in social norms. There has been a good deal of discussion of the influence of social norms on pay, but most of it has focused on lower-level workers. However, it seems possible that the same factors also influence top earnings. On the one hand, a concern for reputation might put some restraint on top earnings. On the other hand, social comparison might lead to a “race” for relative position among top earners. It is possible that the increase in top earnings reflects the degree to which the forces that produced stability were weakened or disrupted. The paper will discuss the implications of these three hypotheses and offer a preliminary test using data for OECD nations.

Policy Actions for Securing Computers
Societies rely on information technology, be it for business operations, private life, or for critical infrastructures. However, IT systems are not reliably protect ed against attacks on data integrity or confidentiality, as the debates around the Stuxnet worm and the NSA have shown. It is expected that powerful organizations, such as foreign competitors or secret services, will launch significant attacks on businesses or infrastructures in the future.

Industry cannot invest large sums to create highly secure systems, as users who did not yet suffer large damages will not be willing to pay for their development costs. Therefore, only a slow migration takes place towards, e.g., the use of virtualization to isolate sensitive or risky applications. Moreover, the paths to highly secure systems are not clear. One path would be to have careful specification, implementation and evaluation. This path is known to be expensive but would provide a level of protection so far unknown. However, even such implementations might be hacked. Therefore, a path towards provably secure systems might be preferable. Though significant progress has been made, the development of provably secure computing systems faces three challenges: first, a large open source software base needs to be created. Second, matching hardware needs to be designed and ultimately an entire secure system. Third, means need to be explored to make sure that actual implementations match the system design, without insiders planting Trojan horses, and without having any implementation errors.

In either case, a policy push is needed which must take place in at least some economically significant countries. It is needed (1) to make the problems and solutions better known, (2) to explore the costs and benefits of the paths, and (3) to make some path mandatory. The latter could be done in a gradual way, starting with some devices and applications.
that the reported suicide statistics in the Berlin Health Report require a closer inspection because the zones used in reporting are not sensitive enough to provide a robust picture of the articulation of social status and suicide. For example, in 2009 the Berlin health report suggested that there was no relationship between elderly suicide (individuals over 60) and social status. Although Germans have never been healthier, or had such high life expectancy, social inequality continues to rise. While the population as a whole is experiencing this positive social development, it runs counter to the findings that people who are on the periphery, those who are socially and economically disadvantaged, experience less of this good health and extended life. Often these people are clustered together geographically.

The identification of these zones or socially weak areas is based on the research of the working group "Monitoring Soziale Stadtentwicklung" in Berlin. They aim to describe and analyse the socio-structural transformation of parts of the city and different districts through a statistical indicator system. Their very precise development index for smaller spatial areas was correlated with the comprehensive coroner data we collected. Then, by ranking the districts with the highest suicide statistics and comparing them to the Berlin health report, we detected a strong correlation between social status and elderly suicide. This suggests that incorporating the legal and medical records from the coroner and altering the definition of a municipal district to capture this fine level of detail establishes a real and concerning trend.

*Is Suicide a Question Of Social Standing? Elderly Suicide Rates In Cosmopolitan Berlin*

Although Germans have never been healthier, or had such high life expectancy, social inequality continues to rise. While the population as a whole is experiencing this positive social development, it runs counter to the findings that people who are on the periphery, those who are socially and economically disadvantaged, experience less of this good health. International studies have shown that these people are often clustered together geographically.

We argue that the reported suicide statistics in the Berlin Health Report require a closer inspection because the age groups and zones used in reporting are not sensitive enough to provide a robust picture of the articulation of social status and suicide. For example, in 2009 the Berlin health report suggested that there was no relationship between elderly suicide and social status. We will introduce our comparative study which aims to test whether there is indeed no correlation between elderly suicide and districts when (a.) more comprehensive data from coroner statistics is being deployed and whether there is indeed no correlation between elderly suicide and specific spatial areas when (b.) more comprehensive data from smaller heterogeneous urban zones beneath the district level are being accounted for.

The identification of these zones or socially weak areas is based on the research of the working group "Monitoring Soziale Stadtentwicklung" in Berlin. They aim to describe and analyse the socio-structural transformation of parts of the city and different districts through a statistical indicator system. Their very precise development index for smaller spatial areas was correlated with the comprehensive coroner data we collected. We detected a strong correlation between social status and elderly suicide. This suggests that incorporating the legal and medical records from the coroner and altering the definition of a municipal district to capture this fine level of detail establishes a real and concerning trend.

WEBER-NEWTH, FRANCESCA* (University of Aberdeen, f.webernewth@abdn.ac.uk)

*The White Building: Integration or Commodification of East-London Culture?*

A key aim of the London 2012 ‘Regeneration Games’ was the integration of deprived and marginal working-class areas of East London into the global city London. Urban regeneration in Hackney Wick, a neighbourhood directly adjacent to the Olympic Site, embodied this goal of direct intervention into everyday cultures. The neighbouring was re-defined as a ‘cultural quarter’ and is now experiencing less of this good health and extended life. Often these people are clustered together geographically.

The identification of these zones or socially weak areas is based on the research of the working group "Monitoring Soziale Stadtentwicklung" in Berlin. They aim to describe and analyse the socio-structural transformation of parts of the city and different districts through a statistical indicator system. Their very precise development index for smaller spatial areas was correlated with the comprehensive coroner data we collected. We detected a strong correlation between social status and elderly suicide. This suggests that incorporating the legal and medical records from the coroner and altering the definition of a municipal district to capture this fine level of detail establishes a real and concerning trend.

ing in photographing experience on the film set of Korean TV drama ‘Couple or Trouble’.

As the second German Village is now in the process of being built elsewhere in Korea, we need to ask even more so, how the notion of ‘place’ is reproduced through spatialities in which embodied performances and practices are facilitated within complex infrastructure, networks and mobilities. This paper incorporates reflexive and visual methodology to explore how identities are being configured through local narratives and practice, and questions how we identify the ‘tourist’ in this era of transformative change as exemplified by the German Village in Korea.

Home Away at Home: Tourism Narratives of the German Village in South Korea

‘Where do you come from?’ is a question that haunts tourists. Here, places are conceived as fixed spaces in the same way destinations are considered an end in tourism. In the context of multi-strata mobilities, places are increasingly being reproduced through embodied relationships in a world that is never quite finished. They are performed on unstable stages as they are being reimagined. It becomes apparent that spaces are emergent and need to be considered alongside the sedimentation of identities.

Places emerge as tourist places when they are appropriated and made part of memories and narratives through the experiences of people engaged in embodied social practices. They are not only packaged for touristic consumption, but are also constantly redefined especially in terms of spatial identities located through everyday tourist practice. This paper focuses on the German Village on the island of Namhae in South Korea, which was built over a decade ago as a tribute to the Korean workers who lived in Germany as Gastarbeiter. It explores the question of identity of the locals as portrayed in the film, ‘Endstation der Sehnsüchte’ by Cho Sunghyung and juxtaposes this alongside the huge influx of ‘tourists’ indulging in photographing experience on the film set of Korean TV drama ‘Couple or Trouble’.

As the second German Village is now in the process of being built elsewhere in Korea, we need to ask even more so, how the notion of ‘place’ is reproduced through spatialities in which embodied performances and practices are facilitated within complex infrastructure, networks and mobilities. This paper incorporates reflexive and visual methodology to explore how identities are being configured through local narratives and practice, and questions how we identify the ‘tourist’ in this era of transformative change as exemplified by the German Village in Korea.

Las Tendencias De Polarización Social En El Conurbano bonaerense De La República Argentina. Su Impacto En El Trabajo De Los Jóvenes

En la República Argentina desde fines del siglo XX han surgido nuevas formas de desigualdad social. Una de sus consecuencias es la polarización social y su relación con el trabajo. A pesar de que, en el año 2008, disminuyó la incidencia de trabajadores insertos en empleos precarios o indigentes en un 12.7%, el problema persiste e impacta preocupantemente en el trabajo de los jóvenes.

En este trabajo presentamos un ejemplo paradigmático de la polarización social y su repercusión en el trabajo de la juventud. Del universo de jóvenes hemos seleccionado como objeto de estudio los jóvenes de zonas suburbanas que bordean la ciudad de Buenos Aires. Tomando en cuenta este universo se realizaron encuestas semi-estructuradas sobre una muestra no aleatoria a individuos de entre 18 y 25 años del partido de Pilar y sus zonas aledañas (Campana, Exaltación de la Cruz, Luján, Gramado, Moreno, José P. Paz, Malvinas Argentinas y Escobar) y del Partido de Lomas de Zamora (Barrio Santa Marta y El Ceibo). La brecha social que se observa dentro del mismo partido de Pilar se exacerba entre Pilar y las villas de emergencia de Lomas de Zamora. El resultado de las encuestas muestra claramente esta brecha social en el conurbano bonaerense de la República Argentina, así como su impacto en el trabajo de los jóvenes que sigue sin lograr una solución. La juventud, en un universo desarrollado o con empleos precarios continúa sufriendo las consecuencias de las políticas sociales de los años 90.

Frente a este contexto de desigualdades plantearon el debate en torno a la aplicabilidad del desarrollo de las capacidades en el contexto de la política social de Amartya Sen. Brevemente, se trata del desarrollo de las libertades positivas, voluntad política mediante.

The stories found in a nation's history textbooks are profound statements about the way the nation sees itself. Textbooks that exclude certain groups alienate these children and may lead to disengagement from education and lower levels of educational attainment. The Netherlands is known internationally for its tolerance and multiculturalism, particularly towards immigrants, and sees these elements as critical to their national identity. However, historical and contemporary policies and social attitudes towards immigrants reveals levels of racism not unlike their European peers who, like The Netherlands, have experienced increased immigration and xenophobia in the last decades. In the educational domain, multicultural policies of the 1990s have shifted to those emphasizing assimilation, with immigrants often blamed for low educational attainment. This paper examines how immigrants, multiculturalism, and tolerance are represented in all Dutch primary school history textbooks published since 1980 to identify trends to determine whether or not they reflect larger political discourses and speculate as to the potential effects of these depictions on the children who read them. Preliminary analysis suggests that immigrant groups are depicted as culturally different outsiders from underdeveloped, poor, and violence nations who cause problems for the Dutch society that benevolently allows them entry. Textbooks fail to meaningfully address discrimination in The Netherlands suggesting that immigrants' failure to integrate is due to cultural differences, which likely enhances social alienation among the many immigrant students encountering these texts. Findings are of relevance to multiple nations with large immigrant populations.

The Role of Preferences and Attitudes in Film Consumption

The sociological analysis of cultural consumption is usually situated in the field of social stratification research, identifying the way how cultural consumption is related to social position and examining the role cultural consumption plays in social boundary formation. Much less attention has been given to the theory of action underlying cultural consumption. Broadly speaking, there are two major perspectives that come into consideration here: The first conceives cultural consumption as the result of a deliberate (rational) decision making process, based on the weighing of aesthetic preferences and situational opportunities. In contrast, the second perspective points to the importance of culturally and aesthetically shaped attitudes and dispositions guiding cultural consumption in a rather automatic way, given relevant situational cues. Since either of these perspectives focuses on both: theoretical and empirical problems, it seems reasonable to conceptualise cultural consumption as a joint process of conscious preference weighing and automatic attitude following. This in turn asks for a “dual-process”-model of action which is assumed here to offer a more accurate picture of the individual foundations of cultural consumption.

Drawing on recent survey data from Switzerland (conducted in February 2013), this assumption will be tested in the domain of film consumption. This dataset includes measures of the frequency of attendance to various types of films, and measures of the respondent's preferences for as well as attitudes towards these types of films. This allows for (1) comparisons between the effects of film preferences and film consumption, (2) the identification of the relationship between film preferences and film attitudes, and (3) the examination of the interplay of film preferences and film attitudes in the process of film consumption.

From School to Work and Back – Inequality in Late Postsecondary Education As Part of the School to Work Transition in the US, Germany and Sweden

Varieties in the school-to-work-transition are often discussed against the background of general education and labor market systems. The focus of most studies is the integration into the labor market. In this paper, I take a different perspective and compare differences between education systems in a. the patterns of school to work transitions with particular focus on non-traditional education and b. the decision to re-enroll into postsecondary education. In order to explain country differences, I refer to the openness and institutional flexibility for non-traditional students of the postsecondary education system.

Non-traditional patterns, such as late re-enrolment after an initial phase of work, vocational training or motherhood differ by country in their relevance for the tertiary education system. Variations are related to the openness and institutional flexibility for non-traditional students of the postsecondary education system. The concept of nation in Max Weber: A new reading.

You Snooze, You Lose? Returns to Interrupted and Delayed College Education in the US

Postsecondary is frequently not acquired straightforward, but through detours and along with initial phases of labor force experience. This circumstance raises the question of the role of timing for higher education in the returns on the labor market. It is further a fortunate situation for separating the role of work experience and education for labor market returns. Since educational detours are more often taken by minorities and young adults from lower social origins, this question also has implications for social inequality in postsecondary education.

The research question is whether delayed entries into and interruptions of educational careers of varying type and duration affect employment outcomes upon labor market entry. The situation of graduates and college-goers never completing is analyzed separately applying propensity score matching. The labor market outcomes studied are whether a job could be found which offers medical insurance, the logarithmized wage and occupational outcomes measured as Hauser and Warren’s 1997 version of the Socio Economic Index (SEI). Results show that graduates with a B.A.-degree are not affected by their educational pattern. For incomplete college, the timing matters more. While there are small penalties for interruptions in general, small bonuses can be gained if the time out of the education system was spent with full-time work. The dataset analyzed is the US National Longitudinal Study of Youth 79 (NLSY79).

Third Culture Kids and Intergenerational Challenges in Migrant Communities: Korean Christians and Tamil Hindus in Germany

After several decades of coexistence, the research fields migration studies and the sociology of religion have built a strong theoretical and empirical exchange. The impetus was a sociological conceptualization of migration as a decisive factor of religious dynamics in modern societies. This idea, in turn, triggered interest in the dynamics religious dynamics within migrant communities as they transmit religious knowledge to second generations and their way of adapting religion (doing religious culture). We propose, that intergenerational dynamics in migrant communities are reflected in areas of tensions between and among generations.

The paper presents the results of two research projects on intergenerational dynamics in Asian migrant communities in Germany: Korean Christians and Tamil Hindu. The parental generations of both communities were highly engaged with re-establishing a religious life in a foreign land. They created a “home away from home”, not least to transmit religious knowledge to their children in an authentically Christian setting. However, the second generation, who will inevitably take over the community, was raised in two cultures. Do these youngsters still relate to their parents’ beliefs and practices? Which kind of intergenerational tensions challenge the transmission and reproduction of religious identities and thus institutionalized religion? We will discuss such questions in the paper. Special attention will be given to three areas of research that affect religious continuities and discontinuities in the Korean and Tamil milieu: (1) religious practices now considered “obsolete,” (2) differing ideas of religion and gender and (3) critique of religious organizations.

In accordance with the topic of this panel, the main focus of our comparative analysis between second generation Korean Christians and Tamil Hindus will be drawn to dynamics, which emerge during the transition to adulthood phase.

The Concept of Nation in Max Weber: Back to Gemeinschaft?

The Concept of Nation in Max Weber: Back to Gemeinschaft?

The Concept of Nation in Max Weber: Back to Gemeinschaft?

The paper will be centered in Max Weber’s concept of Nation and, more specifically, it will try to focus on it through the categories posed by Tönnies and, in his own way, used by Weber: Gemeinschaft and Gesellschaft. The different uses of these concepts by Weber in both parts of Wirtschaft und Gesellschaft have been
sufficiently explained, as well as the turn to Gemeinschaft while referring to the relations established in the battlefield, as it is mainly developed in the famous “Zwischenbetrachtung” of his sociology of religion. While in the historical frame of the First World War there are deep coincidences between Weber and Tönnies on the national issues, many differences can be found in the way the latter's referred to the relation of Nation and modern societies in his most famous work of 1887. Our aim will be to depart from these differences to develop in which senses Weber's much more deeper and longstanding commitment to the German Nation –in comparison with Tönnies- can be read in terms of Gemeinschaft (the national perspective) and Gesellschaft (the examples provided by Weber’s “Sociologische Grundbegriffe”), as well as to put forward a relationship between his emphasis in the Nation and his desperate intention to sustain a communitarian feeling against the historical-universal tendency -in an ideal-typical sense- towards the bureaucratization of societies.

That will lead us to analyze Weber’s use of Tönnies' categories, in order to be able to tackle from this standpoint his political positions in relation with the Nation, which are boldly stated from his early studies on East-Prussia onwards. The tensions between Gemeinschaft und Gesellschaft will be confronted with this author’s prospective on the rationalization process, and his positions on the Nation looked through this prism.

WEISS, ANJA* (University of Duisburg-Essen, anja.weiss@uni-due.de)
Social Layers in a World of Territorial Containers, Political Closure, and Socially Differentiated Functionings

The sociology of social stratification is caught in a dead-lock: Data and concepts remain bounded by the nation-state while recent theorizing as well as popular debate focus on the global level.

Based on a theoretical book project, but illustrated by results from two inter-and transnationally comparative research projects on skilled migration, the paper suggests a novel approach to the challenge. Building on individualist traditions, this refers to Weber’s “Sociologische Grundbegriffe” as well as to put forward a relationship between his emphasis in the Nation and his desperate intention to sustain a communitarian feeling against the historical-universal tendency -in an ideal-typical sense- towards the bureaucratization of societies.

Our aim will be to depart from these differences to develop in which senses Weber's much more deeper and longstanding commitment to the German Nation –in comparison with Tönnies- can be read in terms of Gemeinschaft (the national perspective) and Gesellschaft (the examples provided by Weber’s “Sociologische Grundbegriffe”), as well as to put forward a relationship between his emphasis in the Nation and his desperate intention to sustain a communitarian feeling against the historical-universal tendency -in an ideal-typical sense- towards the bureaucratization of societies.

The ambivalence of the „Hauptschüler“ as a stranger appears in all three perspectives. How are “Hauptschüler” made into strangers? How could one describe the ambivalent positions and position-ing of the students? And how do the students themselves deal with their situation? In the first part, based on a media analysis of a public debate about the “Hauptschüler”, I will show how structural problems of the school system are constructed as problems of ethnicity and religion. In the second part, I will describe the actual intermingling of class, ethnicity and gender in school. In the third part, I will turn the view on the question how the students themselves deal with negative stereotypes and racial or social classifications of being inferior.

The ambivalences of the „Hauptschüler“ as a stranger appears in all three perspectives. In the media debates ambivalence appears as a problem, in the ethnographic section ambivalences and interactions are treated as a challenge for sociological analysis and in the subversive practices of the students ambivalence is used to resist negative ascriptions and processes of self-victimization. The morally loaded processes of constructing, reproducing and deconstructing ambivalence are thus at the core of understanding the Berlin “Hauptschüler” as a stranger. The task of sociology is to show these processes are functioning and what kind of subjectivities they produce.

WEISS, ANJA* (University of Duisburg-Essen, anja.weiss@uni-due.de)
The Glocalization of Professional Knowledge and Practice

Current debates about migration and high skilled labor markets are characterized by an ambiguity: On the one hand, knowledge, especially in the natural sciences, appears to be globally accessible. On the other hand, the application of this knowledge in professional practice is inhibited by many factors, not the least of which is the state of national education systems that are poorly connected to each other.

A review of newer theories in global studies (neo-institutionalism, migratory transnationalism, field theory, cosmopolitanism and social studies of science) first shows that their concepts of knowledge diverge: Knowledge is seen as (a) codified and explicit or as (b) comprising tacit and incorporated components. The latter perspective implies that knowledge (c) must be recognized in order to function. Also, knowledge should be able to solve socio-material problems (d) embedded in situations (e). The review secondly identifies a diversity of ways in which knowledge may be localized, namely: the setting and emulation of standards, the migration of professionals, transnational homologies in habits, the formation of transnational communities, field specific struggle, and the “local universality” of solving socio-material problems embedded in specific situations. By reviewing diverse but mutually complimentary theories the paper expands on Robertson's notion that cultural forms can be part of universalizing and localizing processes simultaneously.

The Social and Institutional Context of Decision-Making in the Case of Sickness

The issue of disrespect and misrecognition will be discussed both on a conceptual and an empirical level and shown to be part of a neoliberal logic. 1) According to Honneth, people experience misrecognition as a deprivation of the requirements for a positive development of the self. In Germany, Honneth refers to these deprivations as Missachtung (misrecognition), while I prefer the slightly different term Verachtung, which better captures the emotional dynamics of this process and also has a more active connotation: in the sense that the students are not only deprived something but that their human dignity is actively harmed. The most appropriate English translation of ‘Verachtung’ is ‘contempt’. The social production of contempt defines forms of exclusion via processes of social ascription in which low socio-economic status is linked with disregard, in turn ‘producing’ a disrespectful or contemptuous treatment of others.

2) In an ethnographic study of “Hauptschüler” in Berlin, Germany, I have shown the problem of misrecognition as a deprivation of the requirements for a positive development of the self. Illness has a major influence on people's lives. Studying healthcare-seeking is therefore of vital importance. Patients' decisions about healthcare fundamentally influence the performance of the overall healthcare system in terms of a population's health, the quality of healthcare services, and the level of expenditures. Even though illness behaviour has been an intensively studied research topic over the past five decades, previous work has largely overlooked the embeddedness of these decisions in social and institutional contexts. We will present first insights from a project that aims at theoretically, methodologically, and empirically enhancing previous research. It contributes to the development of an integrative theoretical framework of illness behaviour and provides an important test case for institutional theories and the theory of frame selection.

For analyzing healthcare decision-making a new survey is constructed to collect data on the basis of 2,000 face-to-face interviews in Germany that will provide a unique data source covering the healthcare needs and the way these needs are managed. At the conference, we will provide first results from the survey. We will analyze people's decision making when having a medical condition with a particular focus on the influence of healthcare providers and cultural aspects. Our paper covers how social networks and institutional features of the healthcare system influence the decision making of healthcare seeking.

Capital-Labour Relations in China's Car Industry - What Is “Chinese” about Them?

Facing shrinking profit margins, and driven by a quest for cost-efficiency and market access, manufacturing enterprises intensified their expansion into the global South since the 1970s. It was especially the automotive industry that was eager to venture into promising markets, first and foremost China. Though global car manufacturers have been present in China since the 1980s, research on their operations is still limited - especially when dealing with sensitive issues such as labour relations and unrest.

The presentation thus sets out to shed light on workers’ reactive and pro-active agency in relation to enterprise strategies, trade union culture and developmental policy managed. At the conference, we will provide first results from the survey. We will analyze people's decision making when having a medical condition with a particular focus on the influence of healthcare providers and cultural aspects. Our paper covers how social networks and institutional features of the healthcare system influence the decision making of healthcare seeking.

Comparison and Topicality of Three Classical European Concepts of Community

Without any doubt, community is one of the most central sociological terms and concepts - particularly in the German/European sociological tradition, where Ferdinand Tönnies might be seen as the forefather of this concept. Taking relevant sociological literature regarding this issue into consideration, one may come to the conclusion that there are two traditional main ideal types of community: in one tradition, community is theorized as a collective with specific relationships; in the other tradition, community is conceptualized as a collective with a shared consciousness of kind, a collective identity (this questions the section of the social reality, which is emphasized). Furthermore, there are two main types of the intended use of the concept: theoretical ideal types on the one hand and terms for the apical social research (this questions the interest, which is tight to the conceptualization of community).

Taking these basic categories, three classical concepts of community will be analyzed and compared: the ones of Ferdinand Tönnies, Émile Durkheim, and Max Weber. Afterwards the question of the topicality of their concepts of community will be dealt with. Especially the possible application of the classical terms of community to new forms of communityisation, presented by the example of so called brand communities, will be discussed.

WENZEL, MELANIE* (Technische Universität Berlin, melanie.wenzel@tu-berlin.de)

The Discursive Construction of Risk

In the past few years, an intensified discussion and dispute about the existence and extent of risks of anthropogenic organic micropollutants (OMP) and pathogens in drinking and surface water is taking place in public or semi-public discourses. These discourses influence how one perceives possible risks, what risks one states as true or false, and finally how one acts and behaves in everyday life and in times of risk-based uncertainty and crisis.

In this paper, discourses are understood as social practices of producing, reproducing and stabilizing social reality. These practices are usually controversial and conflictive – moreover they are always guided by specific interests. Discourses about the existence and extent of risks of anthropogenic OMP and pathogens in the water occur in and in-between the following main different discourse fields: media, public sector (the “normal” consumer of water in everyday life), topic-related sciences (engineering, biology, toxicology, ecology, medicine ...), politics, and water supplier (including their representatives).

This paper aims to analyse, how knowledge about and attitude towards the existence and extent of these risks are being produced in the mentioned discourses above and how these discursively constructed “truths” effect social actors. Especially the role of the media will be emphasised.

An extensive survey was conducted to cover the different discourse fields and to explore how these risks are produced in and in-between these fields, which discourses are most powerful and dominant. For the analysis of the empirical data, methods of qualitative content analysis are used to extract different lines of arguments, the various levels of the discourses and the diverse discourse positions from the empirical data. Data include in-depth qualitative interviews with “normal” consumers and professionals from science, industry and politics; press articles; TV and radio broadcasts of regional and national media; and documents from scientific, political, non-profit, charitable, educational, and economical organisations.

HILGERT, CHRISTIAN* (University of Bielefeld, christian.hilgert@uni-bielefeld.de)

The National Society As a World-Societal Model

The concepts of national ‘societies’ and of a single ‘world society’ are often presented as mutually exclusive alternatives. While sociological theorists take pride in having left national concepts of society behind, the latter still dominate the popular usage of the term. This paper transends this impasse by taking a sociology-of-knowl­edge perspective, asking how globalization processes have contributed to the plausibility of these diverging connotations. Informed by world society theories (neoinstitutionalism, systems theory) and recent approaches to ‘banal nationalism’, we (1) analyze the sociod­ectic–political–econom­ic–cultural–soci­dological con­textual factors which produce and stabilize the popular usage of the term. This approach allows us to (2) account for the nationalization of risk and danger in global fields such as economy, mass media, arts, sports or tourism (the global banalization of the nation). Both trends have fuelled the current association of national identities and state borders that is captured in the mainstream understanding of the term society. The second trend, however, also points to (2) the subordination of national identities to global fields, transcending the image of the nation-state as a spatial container of social processes and thus rendering the idea of a single world society no more plausible. The analysis suggests that conceptual ambiguities of ‘society’ not only reflect differences between theoretical approaches and between an everyday and a scientific understanding of the term. Rather, these ambiguities indicate the complex interaction and mutual enforcement between two different social processes: global nation-building and the differentiation of global fields. Since the pattern of this interaction can be traced to the mid-to-late 19th century, we suggest studying it in a historical-sociological perspective.
amines international tourism at the Cu Chi Tunnels in South Vietnam by focusing on the narration of the war by Vietnamese tour guides and its interpretation by young American, Australian, British and European tourists. While the oversight of tourism in Vietnam by the state sees tourists at Cu Chi presented with some strong anti-American rhetoric, this is offset by a strong dialogic narrative of the war presented by local guides. It is argued that guides are important reputational entrepreneurs who in order to account for post-Fordist tourists privilege the local while also drawing together different national traditions. For Western tourists this typically results in a greater recognition of Vietnamese suffering and a questioning of the anti-authoritarian and post-heroic narratives that have dominated Western projections of the war. However, the dialogical dimensions of the tour and their experience of everyday life in Vietnam also commonly provides tourists with greater agency to mourn the death of Western soldiers. It is argued that through media portrayals and word of mouth such ‘dark’ tourist experiences have a broader influence on understanding of history and in shaping debate within the cultural public sphere.

Social Networks and Subjective Wellbeing in Australia

Previous research into social networks and social wellbeing has tended to examine objective aspects of well-being such as employment and socioeconomic attainment, physical security, and political participation. Fewer studies have examined everyday social networks and subjective wellbeing, and those that have tended to emphasise limited aspects of social connectedness, such as social support. This paper develops a comprehensive theory of the relationship between social networks and subjective well-being, with the latter concept defined in terms of cognitive (life satisfaction) and affective (happiness) evaluations of one’s own life. The theoretical framework defines social networks precisely, specifies different mechanisms for positive and negative network effects and also attempts to account for mechanisms and selection processes whose omission some critics argue undermines much previous social networks research. We examine this theoretical model empirically using data from a new national Australian survey currently being undertaken that is specifically designed to investigate social networks and subjective well-being. In the paper we describe our theoretical framework and the cross-national comparative project we are undertaking on the relationship between social networks and subjective well-being in Australia, China and the United Kingdom. We then present early results from the Australian survey, including measurement models of key scales and constructs, and substantive models examining some of the central relationships posited by the theory.

Alternative Lifestyles in Growth-Critical Societies – Conceptual Reflections on Social Movements

This paper attempts to give some conceptual reflections about the ongoing debate in social philosophy/social theory with regard to the conditions and the possibilities of an embodiment of the good and the right in sociological research. To look more closely and empirically to the outcomes of these debates, the focus lies on the conceptualization of lifestyles which are taken from different social movements/thoughts in Switzerland dealing with questions of (post-)growth (e.g. Décroissance), concerning these lifestyles for the actors it seems to be not so much whether or not the GDP is growing, but for them it is all about the rejection of growth as the dominant social imaginary (Castoriadis 1990, Latouche 2009) and instead of thinking about the design of alternative lifestyles. Two main themes will be presented:

(1) Social-theoretical focus: From the background of a discourse analytical approach the genealogy of growth will be examined and how this concept is treated in different movements. Besides the study of social and cultural practices, the (value) beliefs are primarily considered from an overall theoretical perspective.

(2) Empirical focus: Some hints can be given concerning the (sometimes disproportionate) designs or experimental lifestyles that are compatible with the requirements of a post-growth society. The central intuition here is that a successful life management depends not only on ethical and aesthetic ideas of a singular individual, but includes as well moral and political justice considerations (Sandel 1995, Nussbaum 2010).

Higher Response Rates - at What Price? Effects of Different Strategies to Increase Participation By Motivating (Un)Motivated Participants

Different approaches – e.g. normative explanations, rational choice models or social exchange frameworks – have been used to explain motives on survey participation. This paper deals with one of them, the rational choice theory. However, both commitment (e.g. triggered by appeals to attend to social norms (Misra et al, 2011)) and consideration of benefit/cost ratio (e.g. positively influenced by incentives) are regarded as decisive for survey participation – at least for the initial items. These strategies may result in higher response rates but also in satisfying “Instead of generating the most accurate answer, respondents settle for merely satisfactory ones”(Krosnick, 1999). Consequently, the longer a survey takes to finish “Non-Opinion-Responses” (ibid) but also “Non-Responses” are expected to be more likely and both may affect data quality.

The central issue of this paper is to examine the effect of different motivating strategies on referrals to answer. For this reason experimental arrangements were included in a survey dealing with student participation at university. The survey population was randomly divided into several groups. The information provided to each group differed concerning the presence and combination of the following “triggers”:

- they) the possibility to make profits (incentives),
- ii) appeals to social conscience (commitment) and
- iii) information on duration and progress (related to effort/burden).

Additionally the answer categories of several questions varied with regard to including a “No-Opinion-Option” to control for satisfying. Finally, pros and cons of the presented “manipulations” in order to gain higher response rates will be discussed.

WETZELHÜTTER, DIANELA* (Johannes Kepler University, daniel.wetzellhuetter@ku.at)

“I Haven’t Got a Clue!” Do Clueless Respondents Affect Data Quality through Response Behaviour?

Several papers are dealing with the effect of different numbers of response categories (e.g. Preston & Colman: 2000; Lai et al: 2010). However, irrespective
of the number of categories it can be assumed that respondents are facing difficulties in answering questions if they do not already have an opinion for the topic. If a “don’t-know-option” is offered the participant might tend to choose it even if it were possible for him or her to form an opinion. This is “making survey researchers reluctant to offer this option unless absolutely necessary” (DeDeujoy & Cooper, 2002).

However, if the “DK-option” is missing, respondents may skip the question and increase items missing. Offering a middle category in rating scales may even enlarge biases if perceived as “neither-nor-option”. In this connection personal characteristics and the type of question (e.g. opinion, attitude or behaviour) are expected to influence corresponding ad hoc decisions. According to these consideration, the paper i) focuses on the effect of different numbers of categories in combination with “don’t-know-options” on missing values; ii) takes several question types into account and iii) considers effects of personal characteristics on scale quality.

The results are based on methodical experiments included in three online surveys in Austria and Germany.

The Racial Divide? African American College Students: Mitigating Digital Visual Culture
The most important development in terms of Internet users between 2000 and 2005 was the radical increase in the number of women, ethnic and racial minorities online. In the early years of the Internet's massification, cyberculture scholars discussed online with only marginal references to online media produced by Afri- can Americans, Asians and Latinos, instead focusing on representations of racial and ethnic minorities produced for consumption by white users and audiences (Nakamuro, 2002).
Notably, social media, such as Facebook and Twitter, are platforms of web and mobile-based technology that enable consumers to turn communication into interactive conversation, much of which is widely consumed by college students today. Demographic studies on Internet use emphasize African American’s position as consumers. But surveys of access, race and the “digital divide” that fail to measure digital production in favor of measuring access or consumption, cannot tell the whole story. This suggests that minorities are more or less successful consumers of a commodity, rather than producers or active audiences. But how might African American college students use the Internet and mobile technology as sites of resistance?
This study will visually document the level of Internet/social media usage, the propensity and style of Internet user-created content, as well as its effect on cultural and social capital for African American college students. The project will gather visual data (videotaped interviews, focus groups and cyberspace photo mapping) on students who are engaging in content creation (e.g., developing Web sites, posting music, images and videos, managing and contributing to Listserves, or adding content to other textual sites). The study will demonstrate how these students are not only active consumers of the Internet, but also Internet content producers and creators.

Australian Fathers’ Use of Leave for Parenting: Changing Patterns and Policy Implications
In the absence of policy measures widely-recognized as conducive to fathers’ parental leave-taking, such as well-remunerated and non-transferable leave arrangements, a relatively low proportion of Australian fathers (around 30%) use paid paternity or parental leave, although around half take some paid annual leave in association with the birth of a child. These figures suggest persistent bar-
riers to more gender egalitarian divisions of parenting and raise questions over the pace of change in Australia. Using survey and interview data collected over the past three years we examine fathers’ leave usage in detail, analyzing the factors that influence leave uptake and duration and seeking evidence of changes in patterns of use. Change might be expected in part as a reflection of evolving expecta-
tions and behaviors associated with changes in the labour force engagement of mothers and/or as a result of a greater awareness and legitimacy of parental leave stimulated by recent policy initiatives. Our surveys suggest a complex picture in which the overall duration of leave taken by fathers increased somewhat in recent years, although the duration of leave specifically designated as ‘paid paternity leave’ decreased. We test these results for consistency when controlling for sample differences. The data also illustrate different patterns of leave usage among fathers, with a significant group taking leave for parenting purposes after their child was six months old. We use interview data with mothers and fathers to probe further into influences on fathers’ use of leave arrangements around the birth of a child. Overall our analysis provides an assessment of changing patterns of leave usage by Australian fathers over a period of policy innovation, as well as a more nuanced picture of fathers’ leave usage to inform future policy development in the interests of more gender egalitarian family outcomes.

Parenthood and Career Mobility: Implications of Transitions to Part-Time Work Among Australian Mothers
One of the main strategies adopted by Australian mothers to minimise work-life interference is to work part-time hours. The prevalence of this working pattern in Australia underlines contradictions between gender equality and care and raises questions about the contrasting possibilities for career retention and advancement associated with the transition to part-time work, particularly in the context of austerity pressures. In this study we examine the employment patterns of Australian mothers and assess the career implications of transitions made on return to work. Our analysis draws on data from the first two waves of a longitudinal survey of Australian mothers who had given birth to a child in 2010 (Wave 1, n=4,201;Wave 2, n=3,487).
Our analysis regards for our analysis we map employment trajectories among these women, illustrating the prevalence of transitions from full-time to part-time work: 77% of those who had returned to work in Wave 2 of the survey were working part-time, and among those who had been working full-time prior to the birth of their child, 75% retained part-time. We use multivariate models to examine the impact of these and other transitions on indicators of career mobility, utilising changes in hourly earnings and occupational mobility as objective measures and responses to a question on perceptions of career prospects as a subjective measure.
Our analysis identifies some risks associated with the transition to part-time: for example, around 40% of mothers making this transition attempted that their career opportunities had declined compared with only around 20% of those who maintained their pre-birth working-time status. Our models explore the complex relationships between these and other potential influences on career mobility, including the type and duration of paternal leave taken. The analysis establishes a baseline from which longer-term effects may be examined and the contradictions of the Australian context explored.

WHITTAKER, ANDREA* (Monash University, andrea.whittaker@monash.edu)
From intimate industry to rotten trade: reproductive travel in Southeast Asia
Intimate processes of conception and reproduction have become increasingly global in expectation and practice. They have become the focus of a new form of global commercialized reproductive trade, often termed ‘reproductive tourism’ whereby people travel to seek reproductive health care services in other countries. This can involve the movement of patients, but also of service providers, ova donors and surrogates, as well as ova or embryos across the region. In this paper I concentrate upon the intimate industry of cross border IVF involving the move-
ment and in some cases trafficking of women for reproductive services. The social and medical beliefs in many parts of the region complicate attempts at ‘regula-
tion’ of the trade. Examples of the internet advertising for Thai surrogates and test-imonials of commissioning parents illustrate the ways in which Thai surrogates are marketed and constructed as willing and available to service the needs of foreigners. Implicit presumptions of race privilege are woven through exchanges between farang and Thai often glossed within the discourse of ‘Asian service val-
ues’. In parallel to the legal circulation of these bodily commodities has arisen an unregulated market, a ‘rotten trade’, in which ‘bioavailable’ women and their body parts are trafficked to feed the demand for their reproductive capacities.
How should intergenerational inequality be explained? A common idea is that parents transfer resources to their children and that parental investments influence their children's attainments. Most studies have emphasized the effects of parental investments in education. It is easier for parents to directly influence their children's attainment of education than their success in the labor market. Therefore early parental investments are considered to have the largest impact on their children's life chances. This is not the case for wealth transfers between generations. Wealth may be easily transferred during the whole life course, and in many cases transferred quite late in life.

In this paper, we measure intergenerational inequality through the life course using sibling correlations. A sibling correlation provides an omnibus measure of family background and neighborhood influences, a measure that includes both observable and unobservable characteristics. There are no prior studies to our knowledge that assess life course changes in sibling correlations using wealth as measurement.

Following recent theoretical developments, we explore the consequences of different parental investment strategies. Put simply, one strategy is that parents make equal investments in their children, something that leads to the expectation that sibling correlations in wealth should decrease over the life course. If, however, the parents seek to compensate for initial differences in talents and attainments among siblings, by transferring most to the least successful siblings, we expect an opposite trend. We discuss how these patterns may be influenced by children's labor market success and savings, and by variations in parental strategies in different socioeconomic layers.

We use register data from Norway for brothers and sisters born 1955-1960, tracked annually 1993-2010. Our measures include earnings and capital income, as well as two measures of wealth (net and gross wealth). We also take into account sibling differences in education.

Increasing immigration poses a serious challenge for many countries. Empirical studies from around the world indicate that immigration and increasing diversity increase in social cohesion and increases in social withdrawal, particularly in disadvantaged areas. Less understood, however, are the mechanisms that explain these relationships. We contend that these associations are at least in part due to two key factors: how residents perceive the neighborhood composition and how these perceptions influence residents' own social identity. Further we suggest that these relationships will differ in cities with different immigration histories. In this paper we integrate census data and the Australian Community Capacity Study survey data from approximately 10,000 residents living across 298 neighborhoods in Melbourne and Brisbane, Australia. Using a multiple level analysis model, we first consider the cues that lead individuals to distort the presence of non-whites in neighborhoods. Here we focus on recent immigration increases, ancestry, language and religion as important cues of difference. We then employ multi-level models to test if these distortions influence residents' subordinate or subordinate identities. Finally, we consider the independent effects of these distortions and social identity orientations on residents' reports of social cohesion and interactions with fellow neighbors.

Children and young people's civic engagement has occupied the attention of researchers and policy makers globally during recent decades, but there is a common idea that young people's political engagement can only be understood in the context of wider social cultures and practices. This paper explores the social dynamics of civic engagement, in the context of one community's democratic practices and targeted activism, involving the 'nannas' as central players as well as mothers, children and young people. In the Dandenong Mountains near Melbourne, Australia, a small community has taken up a prolonged battle with a multi-national fast food giant. The battle is a symbolic one as much as it is about a capital and a building site. The picket line, the on-line world, the legal system and mass media are the different fronts of the battle, providing multiple sites for experiences of political engagement, confronting ideas about political issues, power inequalities, social justice and the role of the state.

In facing an unequal world, one of the challenges for global sociology is about creating the conditions where the systemic drivers of injustice can be recognised. Analysing material from the campaign's social media pages, this paper identifies critical moments where activist sensibilities are awakened and identified, within, despite and against the inorganism. It shows how the processes of fear and anger, humour and hope can be heightened when elements of difference in power, class, gender and generation are named and mobilised as resources.

Voluntary Association Involvement Among First- and Second-Generation Immigrants in the Netherlands: Addressing the Role of Different Layers of Social Context

Voluntary association involvement is both a cause and consequence of immigrants' integration into their host societies. Yet, while previous work has demonstrated that immigrants generally lag behind in civic participation as compared with native-born citizens, the causes of these differentials and especially any differentials between immigrants of different ethnic origins and migration generations remain far from fully understood. This study analyses immigrants' selection into voluntary associations, both as members and volunteers, in order to examine the scope for voluntary association involvement to fulfil its alleged role as vehicle for social integration.

Recognizing the importance of social networks for explaining civic behaviour, I pay particular attention to the influence of various layers of social context. More specifically, I look at the impact of personal networks (the characteristics of parents, partners and friends), local living environments (the affluence and ethnic diversity of neighbourhoods and municipalities), and the ethnic composition of voluntary associations. Finally, I contrast the observed associational involvement patterns for different immigrant groups with their engagement in informal volunteering.

My analysis employs data from The Netherlands Life Course Study (NELLS). The first wave of this panel study was carried out in 2008-2010 and the second one in 2013. Its oversampling of respondents from Turkish and Moroccan descent helps to overcome the statistical power problems that usually haunt research on ethnic minorities. Moreover, its panel design allows me to shine a light on immigrants' involvement trajectories over time. Exploratory analyses of the NELLS yield intriguing results. Most notably, I find that, given all immigrants being less likely to volunteer than Dutch natives, second-generation Moroccans are in fact catching up as compared with their first-generation counterparts, whilst Turkish immigrants exhibit the exact opposite pattern (controlling for amongst others educational attainment and religiosity). This puzzling finding invites the question of what is behind these differentials.

Intra-European Labor Mobility from Post-Socialist Countries: The Example of Hungarians, Slovaks and Czechs in Austria

This paper deals with job-search strategies and related labor market outcomes of cross-border commuters residing in the regions of the Czech Republic, Slovakia and Hungary bordering on Austria. This European core region has a long history of cross-border mobility and job search exchange, from Habsburg to post-war period and after 1989. Several years after the fall of the Iron Curtain a process of European re-integration began which led to the accession of post-socialist countries into the EU. However, substantial social inequalities between Central European countries still exist in terms of wages and unemployment. Cross-border commuting on an emerging transnational labor market therefore can be seen as an “individual response” to massive transformations in this region.

So far the given circumstances for participants in this transnational labor market have not been investigated in depth. Our paper aims to close the research gap by pursuing the following research questions: What job search methods do cross-border commuters from Hungary, Slovakia and the Czech Republic use in order to find employment in Austria (1)? What are the labor market outcomes of these job search methods in terms of wages (2)? Theoretically, we build upon a model developed by Aguilera and Massey on the nexus of social networks, job search methods and related labor market outcomes. Methodologically, we use a longitudinal survey on employment careers of cross-border commuters conduct-
ed in 2012 (N=2,550). Our results show that human and social capital resources serve as key factors for job finding strategies and successful labor market inte-
gration. There are also substantial gender differences and differences related to
previous occupational status and migration experience within the group under
study. Overall, our results reflect cross-border commuting as a renewed form of
social practice in this European core region, which may reduce structural unequal-
ities between Central European countries in the mid-run.

l'Homme, wiew@msh-paris.fr)

The Limits Of Multiculturalism

1. Multiculturalism and transculturalism are concepts that belong to the
present historical era. They have been produced in western countries, and are
used often, with a deep unconscious ethnocentrism. Aren’t they part of the in-
tellectual hegemony of the west, and in the same time, maybe, of its decline?
2. There is in some parts of the world at least a feeling that multiculturalism, if
not a failure, is at least in a difficult situation, and there are important criticisms of
the idea of transculturalism
3. The political concrete limits of multiculturalism are connected with the rising
importance of globalization, including transnational phenomena. But globaliza-
tion does not necessarily mean the decline or the crisis of the Nation and/or the
State, which is the natural framework for multiculturalists policies and institutions.
And the limits of transculturalism are given by States that still control borders, de-
lever passports, authorisations for transit, visas, etc. If societies are not entering
in an era where multiculturalism and transculturalism are stronger and stronger,
how will they deal with cultural differences, on the one hand, and with identities
and practises that are not lited to one national state?

From Web Surveys to Online, Multi-Device Surveys

Unintended mobile survey completion rates have risen largely in the past
couple of years, with around 7% of the online respondents attempting to access
surveys using tablets and 2% using smartphones (LSS panel, June 2013). While
these rates are expected to continue to grow, the question arises whether one
can speak of traditional web panels as we know them anymore. Especially the
tablet user group has become too large to ignore anymore.
While regular web surveys can be accessed via mobile browsers, this can be
burdensome if the layout has not been adapted. To avoid coverage, nonresponse
and measurement error, new strategies are needed for offering web surveys
which can be properly accessed by the most common online devices.
We present the strategy for the Dutch LISS panel to develop from a web panel
towards a true multi-platform compatibility to the different online re-
dpondent groups. We start with presenting the latest rates of unintended mobile
response in online panels and provide a profile of the mobile respondent. We dis-
cuss the advantages and disadvantages of different multi-platform approaches
and report the latest experimental findings from the field.

Visual Narrative and the Internet: Ethical Approaches to Engaging
Australian Aboriginal Participants on Their Experiences of Ageing

Aims: The wider accessibility of video equipment and the internet provides new
possibilities in involving culturally diverse participants in research. We explore
the benefits and challenges of using visual methods to engage remote-dwelling
Aboriginal elders about their experiences of ageing in Australia.
Methods: We interviewed 50 people from throughout Australia, including three
Aboriginal elders living on a remote island in the Northern Territory, using DIPex
methods (Alexander & Zeibland, 2008). This involved narrative interviews record-
ed in a documentary style format on film, thematic analysis, and findings present-
end via video clips on the www.healthtalkonlineaustralia.org website. This was the
first DIPex project to include the experiences of Australia’s first people in their
own language.
Findings: Using these methods had benefits for individuals, communities, and
the research project. On an individual level participants’ personal stories were
documented, leaving a record for future generations. They could express their
personal agendas and have their voices heard via a public internet platform.
Video narratives recorded in the Indigenous language provided an ethnographic
record in a rapidly changing culture, thus benefitting the community by making
the narratives more widely accessible to other speakers of the language. These
methods benefitted the research project as they provided more information about
participants and their environment. Visual narratives are also a powerful edu-
cational tool for healthcare providers and students. Challenges of this approach
included additional equipment and technical expertise; gaining community per-
mission; interview and translating across languages; and negotiating cultural
processes around the use of images after a participant dies. These were mitigated
by working closely with Aboriginal researchers from the beginning, and building
additional time and funding into the project budget.
Implications: Video and the internet are more engaging for a lay audience than
academic writing and provide a more reciprocal way of involving traditionally
marginalised people in qualitative research.

Which Form of Organizational Governance Supports Freedom of Teaching and Increases Their Perception of Relevance? Empirical
Evidence from Two Types of Higher Education Institutions

New Public Management caused an ‘economic turn’ in universities to mana-
gerial governance. The leadership literature distinguishes two modes of gover-
ance, which can also be applied to the governance of universities: transactional
and transformational modes of governance. Transactional governance encom-
passes all forms of managerial governance, which includes managerial incentives
and monitoring capacity. The theoretical underpinning of this mode can be found
in Principal-Agent Theory which is the theoretical underpinning of New Public
Management. Whereas transformational governance covers, on the one hand,
the means of restructuring the roles of principals and agents in the interaction
situation in the organization, on the other hand, it also addresses all the means
of restructuring the relationship between perceived environment and motivation,
as can be seen in Self-Determination Theory. Other elements of transformational
governance are social norms such as those that inform the quality of research or
approaches to teaching. As dichotomous, the main research question is: What has
more impact on professors’ perceptions of the significance attributed to academic
teaching in Germany – transactional or transformational governance? Two hy-
potheses for transactional and two hypotheses for transformational governance
are tested in this paper. We present the strategy for the Dutch LISS panel to develop from a web panel
towards a true multi-platform compatibility to the different online re-
dpondent groups. We start with presenting the latest rates of unintended mobile
response in online panels and provide a profile of the mobile respondent. We dis-
cuss the advantages and disadvantages of different multi-platform approaches
and report the latest experimental findings from the field.

WILKINSON, LORI* (University of Manitoba,
lori.wilkinson@ad.umanitoba.ca)

A Longitudinal Examination of the Intersections of Ethnicity and Sex and Their Influence on Perceived Racism Among Newcomer
Youth in Canada

Perceptions of racism and discrimination are powerful forces influencing social
cohesion of members of any society. Real or not, those holding a perception that
they are victimized by discrimination feel marginalized and ostracized socially
and may experience the instrumental forms of discrimination in various aspects of
their careers, access to education and health care and others. The consequences of
the belief that racism affects life chances mean that many people are unable to
achieve their potential in employment, school, and health. This has a significant
impact on their feeling of belonging. This paper uses data from a longitudinal
study of newcomer youth in Canada to examine the extent and factors influencing
discrimination and changes in this perception over the eight year study period. The main control variables are
sex and place of birth. Findings indicate that female newcomer youth are signifi-
cantly more likely to feel marginalized than their male counterparts regardless
of their place of birth. Other factors influencing perceived discrimination include
educational attainment, social support network, and family income. The study finds
that young people’s perceived discrimination and post-arrival employment. These findings have significant influence over
the sense of belonging in Canadian society among immigrant and refugee born
youth and are interpreted through a lens of intersectional and identity theories.
The presentation concludes with a discussion of policy and practical implications.
In this paper we explore the ways in which women are creating spaces for economic and political participation in South Africa. The post-apartheid South African Constitution has been hailed as one of the most progressive constitutions in the world with its entrenchment of socio-economic rights and recognition of equality along various cleavages such as gender, race, and sexual orientation. There are myriad policies and legislation entrenching women’s rights. Despite the conditions of poverty and policy environment, the state has not created spaces for women’s political participation at local levels. Nevertheless, women are creating their own spaces of political and economic participation, linking up with the state when and where it is possible, and forging ahead when it is not possible to link with the state. In this paper, we look at a township north of Johannesburg and a rural area in the Eastern Cape to see the ways in which are creating and engaging economic production within their communities. Are these simply survivalist strategies or do they represent an emergent alternative that is rooted in economic equality and social justice? Are they practicing economic democracy? What role has the state played in this process?

**Cosmopolitan Spaces in Non-Cosmopolitan Places**

Encounters are an important part of the texture and form of social life, in a global world where opportunities for people to foster positive cosmopolitan outcomes are increasingly visible and accessible. The concept of cosmopolitan encounters offers a grounded way to understand the everyday dimensions of cosmopolitanism through considering certain practices and performances that people draw upon to negotiate situations of diversity. Questions of the spatiality, configurations and locations of where encounters take place, in both likely and unlikely places, are also central to understanding how cosmopolitanism may emerge and flourish, or falter, fade and fail. But while places can serve as a vector of cosmopolitan possibility, the distinction between ‘place’ and ‘space’ is also important.

Drawing on empirical, qualitative research as part of a three-year project into cosmopolitan encounters, our paper argues that both cosmopolitan and ‘unlikely’ non-cosmopolitan places are central to understanding how cosmopolitanism may emerge. As such, we are witnessing the novel intersection of clinicians, charitable bodies, patient advocacy organisations and private enterprise. These stakeholders come together in collaborative meetings to discuss barriers to development, produce policy documentation and foster further discussion to a wider field of stakeholders. In this way, it is a case study of an emerging collaborative governance model that hopes to add to this burgeoning theoretical development in South Africa.

**Rescaled Citizenships and Vernacular Cosmopolitanism in Sydney, Australia**

In the Australian context, notions of cosmopolitanism have had less airtime than the nationally sponsored program of multiculturalism. Cosmopolitanism has emerged in academic theories of living together with difference in Australian society, and are usually synonymous with notions of ‘everyday multiculturalism’ (Velayutham and Wise, 2009). However, these theories have been less explicit about how such everyday, intercultural exchange might be part of a rescaling of belonging for migrant residents, and how this might impact on the nation-state (Kay, 2000). In this regard, I suggest drawing on notions of urban citizenship as a form of post-nationalism can complement and augment the potency of everyday cosmopolitanism – which is easily appropriated by the state and commercial interests. Also, arguments about emergent urban citizenship should draw on ethnographic understanding of ordinary cosmopolitanism to better understand the multiple ways migrants negotiate identity and socio-spatial belonging in urban settings.

**Cosmopolitanism through collaboration between parties seemingly separated by impermeable boundaries of profession and politics. This paper explores the means through which expertise and interest are brought together toward opening policy discussion to a wider field of stakeholders. In this way, it is a case study of an emerging collaborative governance model that hopes to add to this burgeoning and theoretical development in South Africa.**

The presented data, including interviews with stakeholders and observation of parliamentary meetings, also investigates the manner through which a recognised ethnicity-based health inequity can be strategically deployed for specifically professional, political or civic interests; that is, how socially charged notions of race and ethnicity can be mobilised toward potentially beneficent ends (St Louis 2010; Benjamin 2013). Finally, the paper also brings into relief the tenuous position of the “expert” within a widening forum of stakeholders.
of Australians to shed light on various ‘spaces’ of cosmopolitanism that provide the opportunity for cosmopolitan encounters. Rather than revealing a linear pathway to a final, utopian cosmopolitan destination, we highlight various gradations of opportunities enabled by certain spaces, and in a range of places, that may or may not nurture the seeds of cosmopolitanism to their full potential or permanency. We conclude with recommendations for deeper understandings of the relationality between space, place and performance into what constitutes cosmopolitan encounters. We then propose particular research strategies for uncovering cosmopolitan encounters, and highlight unlikely contexts worthy of investigation in future research.

Fitness As Leisure - Exploring Physical Activity through Consumption and Lifestyle

Drawing on the discussion on the commercialization of the fitness culture, this study examines fitness as a leisure activity. Fitness is prominent both in media and consumer culture, and it plays an important role in individuals’ everyday life as everyone is surrounded by the social world of the fitness culture, its meanings and signals. Fitness activities are practiced in numerous ways and due to various reasons. Also the fundamental aims of the activities have changed; they have become commodities of the leisure industry.

The core of leisure is in the production of value, and it can thus be associated either with freedom from work and responsibility, or as freedom for self-production. Fitness is understood in relation to both health and appearance, which have become central not only to the social order, but also to individuals’ occupational success and social status. Fitness has both instrumental and non-instrumental value, but the rationale for fitness is still instrumental; fitness is seen as an investment in the body’s physical capital.

This study takes a quantitative approach to examining how consumption and lifestyle are related to the motives for physical activity. The data is derived from The National Student Health Survey (n=4403) conducted in Finland in 2012. The results revealed three consumption styles/lifestyles: hedonistic, healthy and sustainable. Moreover, four main motives for physical activity were found: sociability, health, target-orientation and appearance, which all correlate with the appreciation of well-being emphasizing different aspects. Hedonistic lifestyle correlated with all fitness motives, the strongest relation being with the motive of appearance. Also healthy lifestyle was related to all fitness motives, emphasizing the motives of sociability and health the most. Sustainable lifestyle, on the contrary, had no correlation with any other fitness motive than health, even having a slightly negative correlation with the motive of appearance.

Glorious Mission: Social Media, Video Games, and Propaganda

Governments and social movements have long used information technology to promote their causes. In the past books, songs, radio, and television where used to persuade people that political and social actions were necessary. With the growth of information and communication technologies there are now new media that can be used for propaganda and persuasion. Technology such as Twitter, Facebook, and Video Games have emerged in the past decade as growing forces in protest movements and government propaganda.

This paper will discuss how new technologies have been used for purposes of propaganda around a number of political issues in Asia. Analysis is based on content review of Twitter archives, online newspapers, blogs, and Video Games associated with political issues in East Asia. The issues to be addressed will include territorial disputes such as the Dokdo/Takeshima islands, North and South Korea, and internet censorship. Results suggest that governments in East Asia have been quick to recognize the propaganda power of new media and have quickly organized to provide a government perspective on ongoing disputes. Protest movements may have had an initial advantage in recognizing the power of new technologies and new media, but government quickly responded to remove or reduce the political advantage they had. Even though new information technologies have become common the issues of public discourse and propaganda remain fundamentally the same. Propaganda through Twitter and Video Games has the same motivation as in the past, but presented using current and emerging technology.

Does Newsworthiness Influence Construction of Food Risk? Views of Media Actors

In modern society, many risks are invisible and are brought to the attention of the public through the mass media. This is particularly relevant for food, where the widening gap between producers and consumers in the developed world has increased the need for consumer trust. Therefore the media play a crucial role in how food is constructed and presented to the public. It is pertinent to gain an understanding of the construction of food risk as this is likely to influence consumer trust in food. This paper presents empirical data from research investigating how the media construct food risk and ultimately affect consumer trust across three countries: Australia, the United Kingdom (UK) and New Zealand (NZ). Interviews were undertaken with media actors from each country including 20 from Australia, 10 from the UK and three from NZ. First, our findings identify that newsworthiness is important when constructing a story about food risk. This followed a hierarchy, with risks affecting children and babies perceived as the most newsworthy. Second, risk reporting follows a cycle with precedence given to the dissemination of any information about the risk, regardless of the severity of the risk to public health and safety. This is followed by tempering of the risk, coverage of new angles to keep the story going and seeking to uncover the ‘truth’ such as the source of contamination that led to the food incident. Third, working conditions of media actors, including limited time, limited space and short deadlines were found to diminish the ability to report a balanced story, hence adding to newsworthiness and augmenting construction of risk. Our findings indicate that the construction of food risk by the media is influenced by newsworthiness and this is likely to impact the ways in which consumers regard the food risk presented.

Managing Risk in a Complex Food System: The Importance of Inter-Personal, Professional and Organisational Trust

A challenge of managing food safety risk is the multi-sectoral nature of the complex system set out to do so, with responsible actors from both food industry and food regulation. Amidst this complexity, a unified message must be conveyed to consumers so that food risks are managed. This paper presents research conducted to navigate this complex system. We investigated the role of expert actors from the food regulatory and food industry settings in developing/breaking/reparing maintaining trust with consumers about food. Qualitative interviews were undertaken in Australia (n=30), the United Kingdom (n=15) and New Zealand (n=5). Respondents identified that risk management, including increased consumer trust, could only be established if trust existed within and across the expert actors. As such, the nature of the trust between actors became central to the research. Inter-personal, professional and organisational trust between these actors was observed. Interpersonal trust and relationships were developed between actors through transparency, good communication and regular phone and face to face informal meetings. Organisational trust was developed through meetings and maintained through documents such as memorandums of understanding and regular, formal meetings. Professional trust was particularly apparent between actors within the regulatory and industry systems who both had responsibilities for managing food risk. Some actors indicated that they did not understand the perspective of the other system, because of the different processes and systems in which they worked. Despite this, each system had a common goal (to avoid foodborne illness). When this common goal was recognised by industry and regulatory actors, stronger trust was formed which enabled a unified message to be communicated to consumers. Therefore one way to manage the complexity of the food regulatory system, and ultimately better manage food risks, is to develop inter-personal, professional and organisational trust between expert actors in the food system.

A Walk through Memory: Urban Interventions and the Sensual Battle Against Oblivion

In the years following the Latin American military dictatorships of the 1970s and 80s, historians and activists noticed a disappearance of documentary evidence that paralleled the disappearances of human beings. Decades of activism by the Mothers and Grandmothers of the Plaza de Mayo, human rights groups, and political institutions that value human rights, has fueled an archive of memory: an ongoing city-wide network of projects and museums dedicated to remembering the Dirty War years throughout Buenos Aires.

This paper explores the roles of mural art and street flagstones in the production and reception of two post-conflict memory projects in Buenos Aires. The Olimpo memorial for an unknown torture victim and the Buenos Aires x Memoria y Justicia collective flagstones project (traversing upper and lower-class neighborhoods, to form a city-wide visual map of disappearance) both represent attempts to inscribe memory onto public spaces.

The Olimpo project began in 1995 in the City Council of Buenos Aires. The building housed the automobile registration office of the Federal Police before being converted into a torture facility. Many Argentines wanted the facility razed to the ground once democracy returned. The museum owes its existence to an ongoing local community struggle to manifest the identities and experiences of individuals made absent and invisible by the military dictatorship. The Flagstones project, created by the Barrios x Memoria y Justicia collective began as an ongoing endeavor to replace parts of sidewalks with small, colorful plaques, in front of places where victims of state terrorism were born, lived or were kidnapped.

We consider two-decades of historical data reflecting the struggles to establish memory projects that bring into conflict state authorities, human rights organizations, neighborhood groups and university students. These concrete visual reminders of state-sponsored violence are both memorials and fuel for the battle against forgetting and/or rewriting history.

The Origin of the World: Analysis, Representation and Performance

This paper focuses on an artistic experiment or performance, The Origin of the World, in which over a two year period, 50 male artists were provided with charcoal, paper and instructions quickly to draw a vagina (only) with no human or other model. 20 of the drawings were later re-presented in a video in which the drawings slowly morph together and apart consecutively to music. Later, the drawings and video were exhibited in a university space. This paper explores this process and these data from a methodological perspective, discussing their potential as both representation and performance. First, the drawings were analysed interpretatively in relation to Lacanian psychoanalytic theory and feminist critiques of the same. This analysis highlighted the notable lack of consensus in the shapes produced, the extent to which the artists stuck to or deviated from the instructions given, and the clues they provided as to the artists’ responses to the exercise (anxiety? disgust? humour?). This work raised further questions as to the nature of the data analysed and the potential contribution to such analysis of interviews exploring the artists’ perspectives on the exercise, its distance from their habitual artistic practice and perhaps their own gender/sexual identities. However these data are also performative (Law 2009) in that they enact multiplicities, thereby interrogating categorisations and, in more general terms, illustrate the potential of such methods and data to provide an opening to the uncertain and less defined. Further the video itself constitutes an interpretation and interrogation of the drawings, as well as an absurd argument to the artist and audience as to a state in which conventional, commercial representations of female bodies become strange. The later presentation of the artefacts produced (drawings, video) in a university exhibition produced a further space in which to open dialogue, debate and alternative understandings.

Trends in Wealth Inequality

This paper will present new estimates of inequality in household wealth in the Netherlands 1993-2011. Changes in this recent period will be connected with long-term trends in Dutch wealth inequality (from around 1900), which will be compared to trends in other Western countries. Preliminary findings are: there has been an overall tendency of partial collectivization (a shift from personal to collective wealth) and diminishing wealth inequality in the Netherlands and other Western countries during the greater part of the twentieth century, followed by a tendency of decollectivization and growing inequality since the 1980s. The latter trend will be explained by connecting it with processes of deindustrialization, globalization and politico-institutional change. The paper will give special attention to recent changes under the impact of the financial crisis, and discuss the question to what extent national government policy can be used to modify wealth inequality.

Legal Costs Insurance (LCI) – an Attempt at Comparative Analysis

Legal aid systems are best conceptualised as complex entities, comprising different institutional and non-institutional mechanisms enabling the individual to obtain legal advice. In this perspective, commercial, public-subsidized, pro bono or prepaid legal services are all one method of providing access to legal advice, just capitalising on different resources. The same can be said about private/informal mechanisms of dispute resolution, self-help, and unbundled legal services. Yet another widely-recognized mechanism for providing legal aid is legal costs insurance (LCI). Despite relative prevalence of this channel of access to legal advice in some countries (such as Germany, Netherlands or Austria), legal aid literature (with some notable exceptions) does not devote much attention to LCI. In particular, it by and large neglects the interactions between the LCI as a channel of access to legal aid and other types of provisioning such services. Not much is also known about the institutional and cultural conditions of establishment of LCI systems.

This paper aims to contribute to filling this gap. It undertakes an attempt to answer the question of the factors driving emergence, prevalence and stability of legal costs insurance and the interaction it enters with other channels of provisioning of legal aid. To this end, the paper does two things. First, it analyses the hitherto scattered literature in the search for theoretical explanations of said phenomena. Second, it juxtaposes theoretical explanations with the outcomes of an comparative study of LCI in Europe, utilising existing data on LCI, legal systems, disputing behaviour as well as values and culture.

WINCZOREK, JAN* (University of Warsaw, janwin@janwin.info)

Why Do Procedures Have Unexpected Outcomes?

According to a famous statement by Adam Przeworski, the difference between democracy and dictatorship lies in the fact that in a democracy the content of a political decision cannot be known in advance; democracy, not dictatorship, institutionalizes uncertainty. Sociology has largely ignored the institutionalized uncertainty thesis that follows from this observation. In particular, one has to be careful not to confuse Przeworski’s argument with that of Robert Merton, which has animated the sociological discussion about unintended consequences and those of “institutionalized uncertainty”, a la Przeworski. It aims to do this by translating the intuitions of both authors into the langue of Niklas Luhmann’s systems theory. The particular field under investigation is akin to what Przeworski found remarkable: procedures and their outcomes. Yet, against Przeworski’s theses and some theories of procedural law and democracy, it is argued that procedures are not necessarily outcome-neutral and that they do contribute to certain outcomes of political and legal processes. Against Merton’s observations, but in accord with these of Przeworski, it is demonstrated that macrosociological and indeed deeply institutional factors exist, which contribute to the production of unintended consequences of individual actions. Finally, against theories of procedural justice in sociology and psychology of law, it is argued that procedures do not provide individuals with a sense of ontological security, but to the contrary, are but one form of “institutionalized uncertainty”.

The paper has been published in Mica, Peisert, Winczorek (eds), Sociology and the Unintended. Robert Merton Revisited, Peter Lang 2012.

WINTER, BRONWYN* (The University of Sydney, bronwyn.winter@sydney.edu.au)

(In)Visible and (im)Mobile: Lesbians, Exile and Global LGBT and Women's Rights Movements

In a world that is supposedly more and more mobile and in which globalised LGBT rights claims are now firmly on the UN and many national agendas, lesbians often remain, paradoxically, invisibised and immobilised—but to varying degrees. This paper will consider this paradox with reference to the issue of political asylum.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
On one hand, social movements campaigning nationally, transnationally and internationally for both women's and LGBT human rights have facilitated access to asylum, mostly in Western countries, for lesbians from the many countries where homosexuality remains illegal (76 countries), or where the state fails to protect homosexuals from abuse, despite decriminalisation (another 60-70 countries). The European Union, for example, now explicitly includes references to the specifics of LGBT experience and needs in its new standardised asylum procedure.

On the other hand, continued cultural taboos and in some cases political backlash have, in many countries, maintained or even exacerbated the isolation of lesbians, depriving them of easy access to global LGBT rights networks (including the very important online networks that have proliferated over the last decade, but which frequently continue to privilege gay men). Moreover, the significantly lower levels of financial and cultural autonomy for women in many countries have meant that access to escape routes is much more limited than for men—a problem that lesbians share with heterosexual women but can be even worse in their case. Yet, access of lesbians to asylum presents as one of the world's most urgent human rights issues, as almost without exception, lesbians seeking asylum have suffered multiple forms of physical and psychological torture.

The paper will discuss the above issues with reference to the importance of transnational social movement activism and support that specifically addresses the situation of lesbians, as well as to case studies from France in particular.

WISSELGREN, PER* (Umeå University, per.wisselgren@soc.umu.se)

Alva Myrdal, Unesco, and Cold War International Social Science, 1951-1955

The paper is concerned with the international organizing of the social sciences during the early Cold War era. Empirically it is focused on UNESCO's Social Science Department (SSD) during Alva Myrdal's directorship, 1951-1955. The SSD was set up in 1946, as part of the wide family of intergovernmental organisations that emerged with the United Nations in the aftermath of the Second World War. When Alva Myrdal (1901-1986) became the Director of SSD, it has been suggested that she "set the department on its feet". But what difference did she actually make? What ideas, visions and hopes did Myrdal have regarding the SSD? How did she try to realise them? Which projects did she initiate during her time as director? Which issues lay closest to her heart? What did she oppose? How did she view her own role as Director of the SSD? With which people and organisations did she collaborate? By employing a STS-perspective and analyzing the everyday practices at the SSD during these five years, the paper intends to discuss the above mentioned questions in relation to the contemporary geopolitical setting.

Beyond Generic Urban Theory? Grand Narratives, Assemblages, and Urban Critique

In the late 1970s, in his well-know proclamation, Lyotard announced the end of grand narratives. Nonetheless, thirty years later, urban studies research remains strongly structured by a selection of generic storylines. Developed in specific—mostly Anglo-Saxon—settings, these narratives are used to interpret and critique urban developments in cities around the world. This paper questions the implicit relationship between the narratives of urban theory and urban realities. It argues that some of these storylines can play an important role as ‘sensitising devises’, but that they should be critically confronted in urban research. The paper underlines this argument with an analysis of the relevance of two grand narratives in two Asian cities: the ‘end of public space’ in Mumbai, and ‘splintering urbanism’ in Bangkok. The analysis shows that both storylines are relevant, but in ways other than the theory suggests. A direct translation of theory to specific urban settings will therefore lead to mistaken interpretations and inadequate critique. Unfortunately, urban studies research rarely incorporates such a critical confrontation of urban theory. From this observation, the paper draws conclusions on the practice of urban research, the value of urban theory, and the possibility of urban critique.

A Typology and Analysis of "World-Changing Management Concepts": Beliefs, Unanticipated Consequences and Anomie

I develop criteria for and analyze consequences of what I call "world-changing management concepts" (WCMC), drawing on Lean, TQM, BPR, JIT and coaching. To qualify as a WCMC, the authors claim that the concept: 1) yields specific, predictable results if implemented correctly; 2) enables fundamental, groundbreaking changes leading to a superior competitive advantage for the organization, regardless of the context; 3) is a more humane form of management practice, making previous approaches obsolete, and 4) will change the world for the better. I.e., they are presented as grand theories. However, the knowledge content in these concepts is based on studies of distinct or disparate cases, industries, or cultures (e.g., the Automobile Industry in Japan), or they are based on ideas from other fields of practice (e.g., sports).

I draw on translation models (by Lilirink (1995) and Røvik (2007)) to show how treating management concepts as theories of the middle range, rather than grand theories (like WCMCs), is likely to greatly enhance the local translation of management concepts and reduce unanticipated consequences. I further show how the claims of WCMCs logically require changes to basic underlying assumptions in the organizational culture (Schein 2010). Such requirements create a situation where the culture is at odds with what employees are asked to do, potentially creating anomie (Merton 1968), and in a further sense creating a double bind for employees (Bateson et al 1956).

Although theoretical in scope, the presentation builds on ethnography from management consultancy.

Lean between Practices and Ideology: the diffusion of a “World Changing Management Concept”

In my international review of quantitative studies of lean diffusion, surveys indicate recurrent problems with the implementation of lean: managers report that a “lean culture” is difficult to attain. Furthermore, positive outcomes are scientifically unsubstantiated (Freytag & Arlbjorn 2011). Lean is an example of what I call a “World-Changing Management Concept,” characterized by holding ideological ambitions to create a better world, while claiming that practices work regardless of the context. I use the seminal texts of Womack et al (2007) (1990) and Womack & Jones (2003) to show how lean is in part a theoretical construct, inspired by “Japanese management”, but ideologically aimed at creating a sustainable management practice in a global economy.

I draw attention to the distinction between the adoption of a management idea as a practice and as an ideology (Guillén 1994). I then use Guillén’s neo-institutional...
al framework to show how lean draws heavily on practices and ideologies that do have a long standing in Japanese history, including ideologies of co-prosperity (Goto-Jones 2005). I show how institutional factors in the organization adopting lean will be decisive for whether lean will come across as Taylorism in disguise or something closer to the original ideological intentions. In keeping with my argument, recent research on work environment issues in lean projects gives a mixed picture of consequences for employees (Edwards et al. (eds.) 2010).

Information Et Participation Politiques En Ligne: Inégalités Ou Fracture ?

Dans les recherches interrogeant les rapports entre politique et numérique, l'une des thèses les plus discutées porte sur l'existence d'une "fracture cognitive" entre citoyens, mais également la difficulté croissante à trouver l'information pertinente, dans un contexte de profusion, de flux d'informations démultipliés par les réseaux numériques. Autrement dit, les individus qui seraient déjà motivés et intéressés par les questions politiques bénéficieraient pleinement du web comme ressource d'information, mais ceux qui seraient peu motivés n'en tireraient pas réellement profit, ce gain d'information serait donc marginal. Cette fracture cognitive reposait sur l'inégalité de répartition des compétences d'individus disposant de manière variable de capitaux culturels et cognitifs. A cette fracture, viennent s'ajouter d'autres thèses sur la contribution des médias, de masse et numérique, à soutenir voire à accroître l'apathie civique. En effet, la multiplicité des thématiques numériques ou câblées et la personnalisation des contenus permettraient aux individus qui préfèrent le divertissement de profiter d'opportunités encore plus nombreuses de ne pas être exposés à l'actualité politique. Les technologies de l'information et de la communication apparaissent dès lors comme les auxiliaires du désengagement civique d'individus auxquels faisaient de plus en plus défaut un niveau même basique de connaissances politiques. Le caractère alarmiste de cette proposition a été récemment contrepéché par plusieurs récents travaux qui incitent notamment à appréhender de manière modulable l'intensité des effets de l'information en ligne sur les internautes certes en fonction de déterminants classiques (âge, sexe) mais aussi de leurs préférences à l'égard de certains types de dispositifs numériques. Nous proposons de discuter ces différentes thèses à partir de données recueillies par questionnaire durant les trois semaines qui suivirent en France l'élection présidentielle de 2012, auprès de 827 internautes français ayant utilisé Internet à des fins électorales (recherche d'information ou prise de parole en ligne) pendant la campagne.

The analysis demonstrates how not only those directly interested in micro data from official statistics but also survey researches benefit from the efforts of “Data without Boundaries” and the improved access to Eurostat’s data.

WOLF, CHRISTOF* (Leibniz Institute for Social Sciences, christof.wolf@gesis.org)

Problems of Survey Measures of Social Networks

Since Fischers (1982) and Burts (1984) seminal contributions to collecting egocentric network data in social surveys the method has been employed in numerous studies and can be regarded as standard in this field. Recently this approach has been severely criticized. Several authors have pointed out that the standard approach to measuring egocentric network data suffers from strong interviewer effects which may lead to misleading conclusions (Paik/Sanchagrin 2013; Bruderl et al. 2013).

The presentation will discuss the methodological problems with the standard approach to collecting egocentric network data. Several adjustments to the standard approach will be discussed and alternative methods to capture aspects of “social capital” will be presented. The presentation ends with a plea to use a combination of several independent measures of social embeddedness thereby overcoming some of the major drawbacks of the existing measures.

WOLFSON, TODD* (Rutgers University, twolfson@rci.rutgers.edu)

Democracy and Autonomy: The Contradictions of Global Social Movement Networks

Scholars of emergent global social movements and other transnational activist and new media networks have hailed the coming of horizontal, flat, democratic networks tied to new communication technologies. The shared claim is that these networked organizational forms, and accompanying cultural practices, are creating a new more egalitarian social world. At the foundation of this argument is the unexamined embrace of the twin concepts of local autonomy and participatory democracy. However, within transnational networks these dual aspects of the cyber age, democracy and localism, are often in tension with one another.

In this paper, I use the indymedia movement as an exemplar of a transnational media network where the dynamics of global democracy and local autonomy come into tension, offering a more nuanced look at the intersection of the global and the local in global networked social movements. Founded during the WTO protests in 1999, indymedia is a global-spanning media network, with over 200 active nodes on six continents, where news and journalism is produced in multiple media networks in over 30 languages. In specific, in this chapter I look at the decision of the global indymedia network to reject a large grant from the Ford Foundation because of Ford’s history in the Argentine dirty wars. The heated episode almost forced the young dynamic network to shut its doors, and brings to the fore the complex tensions of local autonomy and global sovereignty, highlighting the conservative and oft-times reactive nature of transnational communication networks. Moreover, this episode and indymedia in general, brings to light the inability of decentralized networks to build proactive power, highlighting the disorganizing and at times debilitating organizational logic of contemporary social movements.

A Public Sociologist in (Post)Colonial Korea

K. D. Har: A Public Sociologist in (Post)Colonial Korea

K.D. Har (1897-1951) is one of the first pioneers of Korean sociology, and may be the first Korean public sociologist. He was the student of Richard Gabot and James Ford at Harvard, and his book <Social Laws: A Study of the Validity of Sociological Generalizations> was published by the University of North Carolina Press in 1930. In his book, he argued that sociology is not science like natural sciences, but we should see it more as “social arts.” Sociologists can not separate ourselves from the society, but only parts of the society that we are studying. In this sense, he argues for the need to engage in the public action to reform the society.

However, his hope to become a public sociologist in Korea was not possible due to the Japanese Colonial rule and the authoritarian post-colonial South Korean government. Japanese colonial government regarded sociology as a disci-
pline to teach the ideas of communism and social action, thus banned teaching sociology at universities in Korea. K. D. Har was not able to teach sociology, and eventually kicked out of the university. After liberation from Japan, he pursued the career in journalism, but his newspaper was not allowed to publish due to its critical report on post-Colonial South Korean government. Using K.D. Har as a case study, this paper discusses the potentials and limits of public sociology in (post) colonial context, and explores the challenges of global sociology in (post) colonial context.

**Passing and Crossing: A Study of Transgender Embodiment in Hong Kong**

Issues of transgender and transsexuality provide a new impetus and a practical need to problematize assumptions about bodies and identities and to rethink the categories of women and men. While transgender studies have exposed the artificiality and mutability of sex/gender/sexuality categories, a tension exists between the transgender/transsexual discourses which are oriented toward a search for a gendered home and the queer emphasis on creating trouble for the gender order through non-normative, unintelligible embodiments. This paper seeks to address the debates through an examination of the embodied practices of passing and crossing in the transgender community in Hong Kong.

For many gays and lesbians, passing or acting straight is a strategy for coping with stigmatization in a hetero-normative society. For many transgender people, passing, that is, to blend into society both socially and visually in accordance with their preferred gender, is a goal rather than a means. They want the society to see them in their desired gender. The emphasis on passing is reinforced by the “Real Life Test”, which requires trans to dress and live in their gender identity successfully for a period of time in order to be eligible for hormonal treatment or surgery.

Questions will be raised as to whether a hierarchy based on the ability to pass has been created in Hong Kong's transgender community; to what extent the practices of passing entail compliance with dominant standards of dress and behavior which are grounded in the class privilege and compulsory heterosexuality. Similarly, questions will also be raised with regard to incoherent embodiment. Who can afford incoherent or unintelligible embodiment? Whose incoherence is strategic, and whose incoherence is necessary or unlivable? This paper argues for the importance to subvert dominant codes, yet without losing sight of the materiality, complexity and ambiguity of the lived experiences of transgender people.

**Biographical Experience, Desires, and Interests: A Case Study of Individual Hong Kong Fans of Japanese Boy Love Comics**

This paper is an ethnographic attempt to understand the relationship between individual Hong Kong fans of Japanese Boy Love (BL) comics, the general image of modern consumers in BL through the fans' derivative creation of BL. The key concept here is the desire. We show that while Hong Kong fans of Japanese BL comics share a collective meaning of the general image of male characters in BL, each of them tends to maintain a unique interest in it. We further argue that the unique interest in the general image of male characters in BL comics is closely related to the biographical experience of each individual Hong Kong fan. The biographical experience itself is a product of many social factors, among which family is the most important one. Following Sangren (2002), we argue that in order to understand how biographical experience shapes unique interest of each individual fan, we should understand how family as a social institution underlies the desire of individual fans toward BL comics in general and the general image of male character in BL comics in particular. The desires instituted by family in turn will be shown to motivate the unique behavior of individual fans toward BL comics in particular. The desires instituted by family underlies the desire of individual fans toward BL comics in general and the general image of male characters in BL through the fans' derivative creation of BL. The key concept here is the desire. We show that while Hong Kong fans of Japanese BL comics share a collective meaning of the general image of male characters in BL, each of them tends to maintain a unique interest in it.

We argue that the unique interest in the general image of male characters in BL comics is closely related to the biographical experience of each individual Hong Kong fan. The biographical experience itself is a product of many social factors, among which family is the most important one. Following Sangren (2002), we argue that in order to understand how biographical experience shapes unique interest of each individual fan, we should understand how family as a social institution underlies the desire of individual fans toward BL comics in general and the general image of male character in BL comics in particular. **A Spectral Existence: Living in a Chinese Ghost City**

With more than half of the Chinese population now urbanized and 75% expected to be in the next two decades, the proliferation of new, ‘instant’ cities in China can be understood as the efforts of the Chinese government to house and provide employment for the fast expanding urban population, inducing them into ‘modern’ forms of production and consumption, thus fueling the wheels of global capital and China's own rapid ascendance as an economic power house. However, of late, an emerging phenomenon that arises from this ceaseless urbanization is the sprouting of ghost cities and towns across the country. These are defined as cities and towns which lie largely under-populated and under-utilized, and where housing projects serve mostly as vehicles of real estate speculation rather than domestic accommodation. Ordos City (or Kangbashi) in Inner Mongolia, one such product of Chinese hyper-urbanization gone wrong. Contrary to the local government’s ambitions to build a global, modernized city in the midst of the desert, residents in this new city are living in the mirage of a future which is promised but has yet to arrive. With the collapse of the local coal industry and China’s own impending economic slowdown this future of Ordos’s modern morphosis into a global city looks even more bleak. Discussing the ethnographic data collected from my fieldwork in Ordos City, I will attempt to show how residents manage this dissonance between the promised and the realities of life in a ghost city through their production and consumption activities—informal or otherwise; and thereby rekläing the embedded meanings of class, gender and status which have been simultaneously overcome or exacerbated in this rapid process of urbanization.

**From ‘Reds’ to Riches: Contemporary Changes of Educational Assortative Mating in China from 1949 to 2000**

Ever since the Chinese Communist Party took full control of the country in 1949, massive institutional transformations shattered and reshuffled traditional norms and structures, including individuals’ mate selection by deprecating the role of education, valorizing the importance of political loyalty (“red”), and thereby reducing the extent of educational homogamy and overall association. Between 1949 and 1979, political capital and class origins are paramount in determining individual’s position in the society. However, with the advent of economic and market reforms since the late 1970s, the tide has changed again. Under the new environment, de-collectivization, industrialization, and the rise of market economy all point to the rise of human capital and economic success as major determinants of one’s socioeconomic position.

Through the use of 1982, 1990, and 2000 China Population Census and 2005 Chinese mini-census, our results indicate that (1) massive political upheavals between 1950s and 1970s generally decrease the strength of educational association (ρ) and increase the propensity of hypogamy; (2) the downward trend was abruptly halted since market reform and the strength of association has reversed its direction to sharply rising trend instead; and (3) assortative mating patterns in rural and urban areas are distinctly different from each other.

To further investigate whether sent-down experiences may have differential impacts on mate selection, additional analyses based on the 1995 and 2002 Chinese Household Income Project are included. Indeed, we find that the impact of sent-down experiences varies by gender, educational levels, and couples’ joint experiences.

**Gender-Oriented Statistical Discrimination Theory: Empirical Evidence from the Hong Kong Labor Market**

This paper proposes a simple search model to shed light on the role of aggregate fertility as a form of statistical discrimination against young working women in the labor market. Our proposed theory assumes that workers generate identical production value that does not differ by gender. When matched with a female worker, the firm bargains over the wage rates. Since men often have lower fertility than their heterosexual counterparts and thereby resolve the puzzle of the existence of the lesbian earnings premium found in the economic literature.

Can the Industrial Relations in Japan be Reconstructed in the Long-Term Perspective?

More than ten years have already passed since it was first proposed that Japan's corporate management and labor relations should be reformed to keep pace with globalization. After the financial crisis of 1997, especially, corporate governance changed, and management began to shift emphasis to short term rather than long term profits and shareholders' rather than employees' concerns. In addition to the general reduction in labor costs, replacement of regular employees with non-permanent employees rapidly proceeded. The wage system became more performance-based as well in accordance with emerging HR policies that sought the immediate competence of employees. However, some scholars argue that, in the long term, such changes in business strategy and HR policy have negatively affected Japanese industries' productivity and quality. Moreover, Japan's industrial relations have been affected as well. Labor unions have failed to cope with problems such as wage reductions, growing numbers of non-regular workers, and the decrease of collective bargaining power. These problems exist against a backdrop of increasing wealth disparity. This paper aims to elucidate the possibility whether the Japan's industrial relations could be reconstructed or not in the long-term perspective, focusing on the mechanisms by which globalization and changes in corporate governance are influencing industrial relations at the micro level.

Welfare Support Attitudes in Korea, Taiwan, Germany, and Italy: Focusing on the Influence of Institutional and Political Factors

Previous studies have shown that welfare attitudes are determined by various demographic, economic, and social factors in Western countries. Class is found to be one of the most influential factors in explaining individual welfare attitudes in Western countries. On the contrary, no clear factors have been found to be significant in differentiating individual welfare attitudes in Asian countries, particularly in South Korea so far. To understand welfare attitudes in comparative perspective, we will analyze the <Life and Society> survey data collected from Korea, Taiwan, Germany, and Italy in 2012. Two Asian countries are small emerging welfare states, whereas Germany and Italy are already mature welfare states. However, these countries have some communalities in that their welfare systems were constructed by the principle of Bismarckian insurance system. It would be very interesting to check changes in welfare attitudes in Western countries, finding out differences and commonalities between Western mature welfare states and Asian emerging welfare states.

The first purpose of this article is to explore whether there are different social cleavages in welfare attitudes in Western and Asian countries. The second purpose is the main part of this study. The study focuses on the issue addressed by institutionalists in the analysis of welfare attitudes. That is the importance of institutional and political factors. We expand the concept of 'political trust' to measure an evaluation of the 'political world'. We argue that institutional and political factors that measure individual evaluations of the political system are important in explaining welfare attitudes such as individual support for welfare states. At the same time, we will show that there are variations among four countries, and particularly differences between Western and Asian countries in the direction and significance of institutional and political factors.

‘Presentism’ and Youth Research: Methodological and Historical Oversights

A key incentive for many young researchers undertake research is the hope we can 'make a difference' for the young people. No more so than in community participatory research when we are invited to participate in 'transformative' change for marginalised young people in particular. However, while we know that social change takes time, we are constrained in such research by timeframes imposed by neoliberal institutes that compel quick research turn-arounds and rapid outputs. Moreover, such constraints also encourage a very 'presentist' view of the young people at the focus of our research, thus overlooking historical legacies, continuities and discontinuities that are embedded in communities and how these shape their social worlds. In this paper I examine a participatory community youth research project that 'failed', forcing me to confront my own presentist and short-sited views, as well as those imbued in methodological choices. Drawing on Hannah Arendt (1986), I re-examine the 'web of relations' (p. 150) which these narratives of 'failure' are situated in, thus highlighting the complex and intertwined historical and contemporary factors at play when we conduct research. The paper critiques presentist tendencies in youth research and raises questions about collective ethical responsibilities toward sustainable actions of change through youth research.

Towards a Method For Activist-Scholar Research Collaborations: Taking Inspiration From The Tradition Of The Workers' Inquiry

This paper will argue for a method for collaborative research projects involving academics and workers that takes inspiration from the tradition of workers’ inquiries. It draws on my own experience of conducting an inquiry in a UK call centre. In Marx’s (1938: p379) attempt at an inquiry he stated that workers ‘alone can describe with full knowledge the misfortunes from which they suffer,’ and crucially that ‘only they, and not saviors sent by Providence, can energetically apply the healing remedies for the social ills to which they are prey.’ The innovations of the Johnson-Forest Tendency in the USA, in examples like The American Worker, highlight how collaborations between workers and intellectuals can be used to develop an understanding of society. The Italian Operaismo in the 1960s developed the methodological component of inquiries as a form of ‘co-research.’ The aim was to simultaneously develop a form of knowledge production and new organisations. The debates in their journals discussed the difficulties in this approach, seeking to move from inquiries from ‘above’ to those that involved workers self-organisation – an inquiry ‘from below.’ Romano Alquiati argued that in many ways this was not simply ‘political militant’ amateurs have always done co-cerca [co-research]. We would go in front of the factory and speak with workers; there cannot be organization otherwise’ (quoted in Roggero, 2010: p3). This paper will argue that inspiration can be taken from previous attempts to develop workers’ inquiries. They represent particular discourses and academic projects that engaged with the changing conditions in the world alongside groups of workers. Although the location of the factory gates has changed in many ways, the current context of austerity necessitates the engagement of researchers with workers’ struggle, both inside of universities and in different workplaces in society.

The Rise Of The Precarious Class? Conceptualising Inequality Among Young People In The Context Of Labour-Market Change

Casual, insecure and variable patterns of work are rising across the developed world, particularly for young people. Academics and policy makers have...
used a range of terms to capture the ‘grey zone’ that falls between worklessness on the one hand, and relatively secure full-time employment on the other. This ‘grey zone’ varies significantly in size across first world countries and is likely to expand under the current turbulent economic conditions. Although sociologists have both introduced and critiqued various terms used to represent insecure and fragmentary forms of work, there have been few attempts at a theoretically driven conceptualisation that ties the new conditions to broader processes of change in advanced capitalist societies and links structural change to new forms of consciousness. While the idea of a framing the experiences of fragmented and casu- alised work in the new economy as a new class, for example the precariat, has some attraction, there are also difficulties with the conceptualisation. One of the core problems relate to the fact that not all young people who are structurally located in the precariat by virtue of their employment in casual or insecure forms of employment represent a disadvantaged or marginalised group. For some the experience of precarious employment is alleviated by access to other resources, such as family support, and they escape some or all of these precarious work con- ditions as they get older. Drawing on evidence from a number of countries, and primary data from an ongoing mixed-methods study of youth in Australia, in this paper we describe some of the ways in which changes in the labour market are affecting young people, consider the adequacy of representations of precarious and fragmented positions as the basis of a new ‘class’ and propose an alternative way of conceptualising ‘individualised’ structured inequalities in the new econo-

**Balanced Advice? Appointments to Advisory Boards and Gender Quota’s in the European Union**

Advisory councils and boards play an important role in countries with corpo- ratarist decision-making processes. Appointments to these boards are controlled by political actors but regulated in a bureaucratic framework. Feminist movements identified these decision-making bodies as both crucial gatekeepers and easily malleable venues for a quick fix of gender balance. Given that many of the bodies are appointed by the state, boards and public committees seemed to offer the opportunity to quickly change the gender balance in decision-making, even as electoral sectors were changing slowly. Countries such as Belgium and Norway adapted legal gender composition rules for appointed bodies by 2005. Later quota’s in electoral politics became more widespread. Today many Euro- pean countries have also started proceedings to implement gender quota’s in advisory bodies and corporate business boards with state participation. To what extent has the increasing integration of Europe led to adaption of gender regul-

Neoliberal metropolitansm and the remaking of welfare systems: The rise of professional projects in the government of the biopolitics of the metropolis

European research on the linkages between professionalization and political systems has focused either on the role of the state in professional projects or, more recently, on the relevance of transnational developments for a globalisation of professions. This paper extends the analysis of political systems to a new scale, that of the metropolis, and identifies the recent discourse of metropolises as ‘landscapes of power’ in global economy as a meta-level turn to ‘neoliberal metropolism’ in public policy. The paper further argues that the new discourse has helped to constitute metropolises also as important landscapes for professional projects.

The analysis examines urban planning focusing on the Greater Helsinki region as a ‘world-class centre for business and innovation’, focusing on the professional projects that rise in the intersection of government and scientific expertise. I employ Patrick Carroll’s ideas about how the role of scientific expertise for ‘material design’ of the metropolises. Carroll highlights how the key boundary objects of land, people and built environment are transformed into ‘techno-territoriality’, ‘bio-population’, and ‘infrastructural jurisdiction’. Employing Carroll’s framework to my analysis of role of expertise for the biopolitics of the metropolis, I argue that expert professionals are key agents of this transformation work, forging expert knowledge into institutional practice.

The findings show that like the old liberal state that gave rise to new sciences such as public health the market-conscious metropolis also supports expert projects anchored in the public sector. The reported analysis of policy documents finds four expert professional projects: innovation policy and innovation professionals; new public management and efficiency professionals; transnational human resource management and recruitment professionals; and integration policy and diversity management professionals.

Child Abuse and Public Inquiries: Historicizing the Imperative for Openness and Disclosure

By the late twentieth century, an imperative for openness and transparency - what might fruitfully be called a ‘culture of disclosure’ - was increasingly evident across all spheres of social, political and personal life in the West. While this can be identified in disparate domains, it has been particularly striking in relation to discourses of child abuse. This paper explores the imperative for openness and disclosure about the abuse and neglect of children against the backdrop of emergent constructions of childhood vulnerability since the 1970s. It takes as its focal point a key instantiation of societal openness over the last several decades: public inquiries into childhood maltreatment. While official inquiries have a number of functions, a key purpose is acknowledged as ‘learning lessons’ from the past in order to prevent future recurrence. Given it is now widely accepted that people who have suffered abuse and neglect as children often face lifelong challenges, including poverty, social isolation and poor mental health, there is a strong warrant for investigations that throw light on cases of past abuse. This paper first considers the rise of public inquiries in a number of countries, including the United Kingdom, Ireland and Australia, as exemplars of increasing societal concern about childhood vulnerability and abuse. Second, it examines inquiries against the backdrop of emerging theories of human development and psychological research that shaped how childhood experience, and the effects of ill-treatment, came to be understood. Finally, it explores the public pedagogical function of inquiries, and makes a case for the use of official inquiries in understanding broader processes of social change; in this case, changing concepts of childhood vulnerability and the emergence of social and educational policies aimed at safeguarding children and promoting their wellbeing.

A Sociology of Real Utopias

On Marx’s tomb in Highgate cemetery is one of his most quoted passages: “Philosophers have only interpreted the world in various ways; the point is to change it.” Usually this is taken as a call to action. But it is also a call to produce a certain kind of knowledge, knowledge that is relevant to the task of social transformation. Such knowledge needs to grapple with four broad problems: specifying the values that drive our search for a better world; developing a rigorous diagnosis and critique of existing social structures and institutions in terms of those values; elaborating models of emancipatory alternatives that better realize those values; and understanding the conditions and strategies for transformations that move us towards these alternatives. Sociology, in its various critical traditions, has focused mainly on the second of these—the diagnosis and critique of the way existing social structures and institutions generate harms in the world. It is now especially imperative that we engage the rest of this agenda. The idea of “real utopias” is one way of doing this. It is a way of connecting ideas about emancipatory destinations beyond the existing world to practical transformations that prefigure such alternatives. The “utopia” in real utopias insists on developing visions of alternatives that embody our deepest aspirations for a world in which all people have access to the conditions to live flourishing lives; the “real” in real utopia means taking very seriously the problem of the viability of institutions that could effectively move us in the direction of that world.

Digital Contention: Anonymous and the Freedom of Information Movement

The main task of this paper is to analyze the online community known as “Anonymous” as a case study using the theoretical framework of traditional social movement studies. I outline this framework in the literature review section of this paper as nine distinct characteristics, each pertaining to a different aspect of social movement research. My purpose in doing so is to argue that Anonymous is part of a larger, loosely-connected new social movement, which I call the Freedom of Information Movement, as well as to show how its unique characteristics, which have developed out of new digital technologies are making it necessary for sociologists to update and expand upon our existing theories and concepts of social movements. Some of this work has already begun. There have been several, though not many, studies of cyber-activism, hacktivism, digital repertoires of contention, cyber diffusion, online activist networks, and decentralized organizational forms of online movements. Through a combination of historical and qualitative content analyses of news articles, websites, operational fliers, and other written materials associated with Anonymous, I am attempting to build upon and expand this new and growing paradigm concerning online social movements and digital forms of contention.

The Role of Official Inquiries in Understanding and Preventing Child Maltreatment

"Table of Contents"
The 1970s saw both the emergence of child abuse as a recognised social problem and the rise of public inquiries to investigate issues of major social concern, including childhood maltreatment, in a number of Western countries. In the United Kingdom there have been more than 80 inquiries into various aspects of childhood abuse and neglect over the last four decades. In Ireland, 14 reports published since the 1990s have examined abuse in schools and institutions. Similarly, in Australia, growing concern about the welfare of children in out-of-home care has prompted a number of official investigations, the most recent being the current Royal Commission into Institutional Responses to Child Sexual Abuse. It is one of the largest public inquiries in Australia’s history and like the Irish Ryan Commission before it, is likely to be one of the most significant inquiries into historical instances of child abuse internationally. Through examination of a number of prominent inquiries, this paper first explores the role of official inquiries in social and educational policy reform, and in shaping public understandings of the problems of child abuse more broadly. It then considers the cathartic function of inquiries for victims and for societies more broadly, through exploration of the notion that inquiries reflect an open and transparent society in which ‘the voices of the powerless are heard’ and the powerful are held accountable. Finally, the paper analyses the fraught social justice issues at play in the investigation of past instances of abuse, and the promise of social and institutional change aimed at better protecting young people today.

Choreographing Risk: Multiple Sociotechnical Networks of Multiple Pregnancy

This paper creates the concept of “choreographing risk” to explore the socio-scientific networks of multiple pregnancy, mostly caused by assisted reproductive technology. I argue that during the processes of assisted conception and multiple pregnancy, elements of technical, legal, financial, emotional, political and gender, are coordinated around risk. Data includes in-depth interviews of women and medical professionals, and archival data. I find that in the stage of getting pregnant with assisted reproductive technology, doctors tend to use multiple embryo transfer and ovarium stimulation medication to increase the pregnancy rate. Both doctors and women perceive failure of conception as the major risk, and tend to disregard the risk of multiple pregnancy. In the case of multifetal conception, fetal reduction becomes a technical model to reduce the risk of multiple pregnancy. However, some women and doctors refuse this technique for reasons of health risk; network of fetal reduction often collapses. High prevalence of multiple pregnancy in Taiwan exists. Pregnant women of twins and triplets take embodied responsibility to avoid risk of premature birth, including diverse bodily work, and negotiation between productive and reproductive labor. This paper shows that as women vis-à-vis medical professionals become more and more the central choreographer in the multiple networks of multiple pregnancy. For policy implication, I suggest adjusting assisted conception methods, such as reducing the number of multiple embryo transfer during in-vitro fertilization, to relieve women from the hard labor of multiple risk choreography.

How Scenes Drive Housing Prices in Beijing

Wu (2011) proves that Scenes heavily influence the urban residential choices in China. In this paper, an analytical framework is constructed to study 375 counties of 32 large cities in China. The objective of this paper is to improve on the previous analytical framework and delve into an examination of neighborhood level housing markets. Specifically, we focus on the city of Beijing in this paper and collect a dataset which includes three-year housing prices data and 85 types of amenities from 220 neighborhood areas in Beijing. In addition, we develop a novel technique to overcome the drawbacks of the usual theory in spatial datasets due to strong spatial autocorrelations among housing prices. We also employ geographically weighted regression and Kriging mapping to support our analyses. Our conclusions are the following: (1) the distribution of local culture and amenities is polarized in Beijing; (2) housing prices in Beijing are significantly influenced by neighborhood level culture and amenities; (3) the distribution of housing prices in Beijing has the shape of a comet, corresponding to the distribution of local culture and amenities, and with tails spreading towards the northwest.

Micro and Macro Conditions for Happiness in Urban China

Despite the large literature on happiness research, sociological studies on the social determinants of happiness in China remain rare. This study examines not only micro conditions for happiness but also the potential interplay of micro and macro conditions in urban China. Specifically, we focus on some wide-studied micro conditions, socioeconomic achievements (what you get) and non-cognitive skills (who you are), respectively. However, the happiness effects of micro conditions may well differ across macro contexts. We thus investigate how the happiness effects socioeconomic achievements and non-cognitive skills depend on the level of economic development in urban China. Our data are drawn from the urban sample of the 2011 Chinese General Social Survey, a nationally representative social survey. Socioeconomic achievements refer to years of education and annual total income. Non-cognitive skills refer to conscientiousness, operationalized by indicators of consistency, dependability, and deferral of gratification in performing the student role. Macro conditions refer to urban areas in the urban development process, realized by provinces, as indicated by provincial-level GDP per capita. We obtain three main findings: (1) Both adolescent conscientiousness and personal income, but not education, enhance personal happiness. (2) The happiness effects of education and income are highly contingent on the level of development, with education having a positive effect in less developed areas but a negative effect in more developed areas. (3) The happiness benefit of conscientiousness is robust across urban areas of high and low economic development. The evidence thus suggests that the micro conditions for happiness do depend on certain macro conditions in China. Thus, a penalty on happiness for high achievers of education and income in the most developed urban areas, but the happiness effect of adolescent conscientiousness is uniform across development contexts.

Personality Traits, Socioeconomic Inequality and Subjective Well-Being in Urban China

This paper brings together two literatures: a large literature of health inequality that has long documented the robust health benefits of socioeconomic status (SES) and a new human capital theory that emphasizes the health benefits of certain personality traits. We examine the potential dynamics between psychological functioning (personality traits and competitive pressure) and socioeconomic inequality in the context of subjective well-being (SWB). Specifically, (1) does adolescent conscientiousness (one of the “Big Five” personality traits) affect socioeconomic status (measured by education and income) in the transitional economy of
urban China? (2) Does adolescent conscientiousness also modify (interact with) the SWB effect of SES? (3) Are the SWB effects of conscientiousness and SES contingent on the degree socioeconomic competition of an urban area?

Drawing on the urban sample of the 2011 Chinese General Social Survey, a nationally representative survey, we measure SWB with multiple indicators of positive and negative affect and conscientiousness with consistency, dependability, and deferral of gratification in performing the student role. We obtain three main findings: (1) Adolescent conscientiousness enhances education and income. (2) There is no interaction between adolescent conscientiousness and SES in predicting SWB. Each has independent effect on SWB. (3) However, psychological functioning and structural inequality interplay in a more complex way. We use level of economic development as an indicator of the degree of socioeconomic competition. While the SWB benefit of conscientiousness on SWB is robust across urban areas of high and low economic development, the SWB effects of education and income are highly contingent on the level of development. The evidence suggests that there is a penalty on SWB for high achievers of education and income in the most developed urban areas. Thus psychological functioning does not only affect socioeconomic achievement, it also critically determines the SWB benefits of socioeconomic achievement.

Perceptions on Hurricane Information and Protective Action Decisions

Tropical storms and hurricanes have caused extensive casualties and damage in past decades. Population and economic growth in the vulnerable coastal areas have made hurricanes a serious problem and created the potential for a catastrophic loss of life. The existing research literature lacks a sufficient scientific understanding of how protective action decision-making during events in which additional behaviors become increasingly time-consuming. Emergency managers and residents in the risk areas are most likely to make decisions on their protective actions based on National Hurricane Center's hurricane forecast advisories. This study uses the DynaSearch program to conduct a computer-based experiment that the understanding of hurricane strike probabilities. The results suggest that the understanding of hurricane strike probabilities and their choices of protective actions recommend during four different hurricane events escalated as hurricanes approached to their counties; (2) people realized that hurricane could make turns and might not always follow the forecast track; (3) risk assessment variables are correlated with people's disaster responses; (4) hurricane experience has a significant effect on protective action recommendations; (5) participants failed to evacuate appropriate risk areas in timely manner; and (6) participants had difficulty interpreting strike probabilities. The results suggest that participants were able to utilize the available hurricane information to make reasonable judgments about each city's relative strike probability. However, their failure to be left-behind by both parents at the time of study tended to experience less depressive symptoms, demonstrated both as the direct effect of their unique left-behind experiences and through the mediating effect of social capital in the family. Implications of these research findings were further discussed.

Ethnic Autonomous Policy and Ethnic Inequality in China: An Evaluation

China's 55 ethnic minorities constitute about 9 percent of the national population, and most are concentrated in remote areas and disadvantaged in social and economic development compared to the Han majority. To promote ethnic inequality, Chinese government has instituted the ethnic autonomous jurisdictions at different levels: 5 autonomous regions, 30 autonomous prefectures and 120 autonomous counties/banners, covering 71 percent of ethnic minorities and 64 percent of the territory as of 2005. This paper aims to employ China's census (from 1982 to 2010) and the mini-census data in 2005 to evaluate the effectiveness of such a policy on ethnic disparities in educational, occupational attainment and income. Specifically, we will employ the causal inference methods to investigate the experience of ethnic minority (relative to Han) living under their own autonomous jurisdiction and their counterparts otherwise. The findings will have important implications for China's policy towards ethnic minorities.

Trends in Intergenerational Social Mobility in China

This paper studies the intergenerational social mobility pattern in the People's Republic of China over half six decades, based on an analysis of 5 cohorts (born between 1932 and 1988) from a series of national representative surveys conducted in 1966, 2005, 2006, 2008, 2010, 2012, respectively. In the context of rapid economic industrialization since 1949, the absolute mobility rates in China increased over time, but the level is much lower than other countries. The relative mobility patterns were largely stable for both men and women except for the youngest cohort. Education played an important role in intergenerational social reproduction: the effect of origin on educational attainment did not change over time, and but the effect of education on destination does. The household registration (hukou) system that the Chinese government installed to curb the rural-urban migration in mainland China. Some of these children even have dual experiences of being migrant and left-behind at various occasions due to their parents' return migration as a consequence of the economic downturn or other family decisions. Despite a growing body of literature on the experiences of either migrant children or left-behind children, no previous study had ever tried to distinguish the various experiences of being migrant or left-behind, or both, that might contribute to children's well-being. This study was aimed to investigate how the left-behind experiences of children living in the rural context of China influenced their mental health status, with their potential migration experiences being taken into account. Moreover, it investigated how the effects of left-behind experiences on mental health might be mediated by the stock of social capital in their family and neighborhood.

Data of this study came from a questionnaire survey with 701 children ages 11-18 living in the rural counties of Guizhou province, China. The structural equation modeling results suggested that, compared to those rural children who lived with both parents and never had any experience of being migrant or left-behind, children who were currently left-behind and had some previous experience of being a migrant appeared to exhibit higher levels of depression. Children who used to be left-behind but lived with both parents at the time of study tended to experience less depressive symptoms, demonstrated both as the direct effect of their unique left-behind experiences and through the mediating effect of social capital in the family. Implications of these research findings were further discussed.

The relative mobility patterns were largely stable for both men and women except for the youngest cohort. Education played an important role in intergenerational social reproduction: the effect of origin on educational attainment did not change over time, and but the effect of education on destination does. The household registration (hukou) system that the Chinese government installed to curb the rural-urban migration in the course of socialist industrialization created a unique pattern of social mobility in China that deviates from core models of social mobility found in other countries. The market reforms has altered the pattern of social mobility: the effect of origin on education increased and the market-oriented reform seems to enhance the inter-generational transmission.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
About one hundred years ago, William Bagley put forward several controversial issues on different trends of education concepts. One of them concerns the debate between two opposite values in pedagogy: the individualism and the collectivism. If these two values represent and distinguish two different notions in diverse civilizations, especially during this transitional stage and the context of globalization, China's youth are the first generation whom simultaneously contact with various cultures from the Western world and from their own tradition, thus directly confronting this dilemma during their socialization.

On one hand, Chinese social convention attaches importance to the strategies needed in maintaining a collective life, in which individuals should adhere to the Confucian notion of “Xinren” because China is not only governed by an authoritarian regime but it also involves serious corruption and large wealth inequality. The high trust exhibited within the Chinese context is therefore questionable.

In this study, we argue that there are at least four key points that need to be considered when using survey data to examine political trust in China. First, the Chinese notion of “Xinren” commonly used in surveys such as the World Values might be different from western concept of “trust.” Second, questions about political values are sensitive, especially in China, and therefore the distrust in interviewers and political fear may lead Chinese citizens to overstate their trust in the authoritarian government. Third, the political system and culture of imperial China could have had a greater bearing than those of the Confucian Confucianism. Fourth, the collective nature of Chinese cultures and the cultural tradition of being modest may encourage Chinese people to hide their political values.

Using the Chinese General Social Survey (2005 & 2006), in this study we explore how traditional cultures and interview contexts impact the expression of trust values. We use alternatives to the standard question asking directly how much confidence one has in his or her public responsibility. However, civil society introduced from western cultures, stresses the importance of the individual but, meanwhile, promotes integration into the communal solidarity and the sense of civic duties. Today's Chinese youth is growing up in this very conflict and the amalgamation of these paradoxical values.

How then, do they evaluate their own identities and their family relationships? How do they consider their civic responsibilities and their social connections? Which values represent, for them, justice in their own lives and others'? By means of a survey focusing on adolescents and conducted in a Chinese city, we try to discover, by still having an impact on their Chinese, the students who hold traditional values. Fourth, the collectivist nature of Chinese cultures and the cultural tradition of that of the impacts of the individualist civic innovation.

The Persistence of Gender Inequalities in Australia Workplaces: An Analysis of Two Generations

Drawing on the two-decade Life Patterns longitudinal study that follows the lives of two generations of Australians (popularly known as Gen X and Gen Y), through their transitions from education into the workforce, this paper investigates the factors contributing to gender equality in workforce participation and in the labour market. Focusing on female participants in the Life Patterns study, we draw on qualitative and quantitative data to examine the micro and macro explanations that underpin discrimination. Firstly, we briefly analyse the impact of social and cultural values in the development of egalitarian approaches to the field of education that have contributed to the expansion of the participation of women in tertiary education and, subsequently, the workplace. Secondly, we focus on neoliberal sensibilities and values underpinned by the concept of choice to understand the egalitarian values that exist alongside persisting gender inequality. Finally, we argue that while institutional arrangements are needed to address persistent inequalities around women's roles and participation at work, there is also a need to scrutinise social and cultural beliefs about work and gender to achieve greater equality.

Discrimination Facing Immigrant Job Applicants in Poland - Results of a Field Experiment

In the 'global race for talent,' many factors can affect the attractiveness of a particular country for migrants, including the likelihood of securing employment commensurate with their qualifications. Empirical data, however, show that immigrant status and/or ethnicity act as stratifying mechanisms, and can contribute to inequality in the chances of migrants’ securing adequate employment versus those of native workers. Whether this inequality is affected by factors related to the labor supply side (e.g., differences in skills) or by the labor demand side (e.g., discrimination by employers) often remains unclear. It is also an open question whether migrant status plays a similar role in homogeneous nations where there are no established foreign-born ethnic or immigrant groups as it does in nations with a long history of immigration. In order to investigate whether and to what extent there is an ‘immigrant and ethnic hiring penalty’ in the primary labor market of one of these ‘new immigration’ countries -- Poland -- we conducted a natural experiment. On the basis of potential employees, we sent over 3,500 applications in response to job advertisements. The candidates were equivalent in their human capital, but differed in their ethnic and national backgrounds. The results show a statistically significant net discrimination against immigrants. However, contrary to our predictions, discrimination against ‘white immigrants’ is stronger than that against ‘ethnic immigrants’. We also observed different levels of discrimination against immigrant men and women, depending on the type of the job and the size of the company. Specifically, there is greater discrimination against immigrant females applying for typical female-type jobs, whereas the likelihood of discrimination is higher among immigrant males applying to large companies. We discuss possible explanations of the observed effects, with particular focus on predictions from economic theories of statistical discrimination and from the status characteristics theory of double standards.

Multilingual Education of European Union – Backstage of Ideology

The image of state education, together with visions of its main functions, priorities and expected results are constantly being reshaped under the impact of various social, economic, political and cultural changes. Being a powerful tool of influence, education is often becoming the battlefield of different interests, the most powerful of which have their reflection in educational policies and practice. This paper concentrates on the case of Poland, which faced several important transformational processes during last decade, among most important of which is joining the European Union (2004). What impact on educational system and its actors did it have? This paper investigates how EU’s directives and recommendations influenced Polish educational system, using the example of foreign language proficiency. In 1995 the European Commission published a White Paper on Education and Training, which states that each citizen of European Union must speak at least two foreign languages, which would enable mobility and competitiveness on the labor market. This is the starting point of the analysis of the paper, which will present the insight to EU recommendations concerning foreign languages and relate this data with the actual educational reforms in Poland in 2004-2013. Further on, the paper will concentrate on the analysis of the foreign language skills characteristics of Polish citizens in 2013, using the data gathered in Polish Panel Survey POLPAN and European Survey on Language Competences (2011). Interpreting the results, the paper confronts the dominating idea that Poland should “catch up” in learning foreign languages (Poland National Summery ESLC, 2011) and opens the questions of whether foreign language proficiency is an unavoidable condition of modern world and to which extent the multilingual pressure creates the new marginalization, unequal relationships and uneven chances.

Contested Control: Irregular Transit Migrants in Europe

This presentation is about young migrants’ journeys with low chances of receiving asylum or any other type of residence in Europe. These migrants exhibit a highly complex migration pattern. First, these migrants are frequently in durable “transit” across Europe, moving back and forth between different states. Second, transit migrants must exhibit a high degree of flexibility, as they have to respond to suddenly changing conditions, such as work opportunities, rejection of asylum claims, detention or deportation. Third, transit migrants often switch between different legal statuses, such as asylum seeker, rejected asylum seeker, illegal worker or detainee. This throws them into a general state of uncertainty between different legal statuses, such as asylum seeker, rejected asylum seeker, illegal worker or detainee. This paper investigates how EU’s directives and recommendations influenced Polish educational system, using the example of foreign language proficiency. In 1995 the European Commission published a White Paper on Education and Training, which states that each citizen of European Union must speak at least two foreign languages, which would enable mobility and competitiveness on the labor market. This is the starting point of the analysis of the paper, which will present the insight to EU recommendations concerning foreign languages and relate this data with the actual educational reforms in Poland in 2004-2013. Further on, the paper will concentrate on the analysis of the foreign language skills characteristics of Polish citizens in 2013, using the data gathered in Polish Panel Survey POLPAN and European Survey on Language Competences (2011). Worker Agency In Chinese Internet Companies

This paper examines the role that workers in Chinese internet companies play in relation to potential transformation of both online and offline China, by examining how workers in the organisations negotiate the gaze of the allegedly authoritarian state, and how they use the internet to create meaningful, expressive and resistant spaces. This paper outlines the complicated context of Chinese internet industries, in which Chinese state plays a significant role, and the difficulties that workers in internet companies face in their efforts to create alternative online spaces. The paper then discusses the various ways in which workers mobilise their agency, such as acts of negotiation and resistance, in order to respond to interference from the state. This paper also discusses how workers’ acts of negotiation and resistance in workplace, the internet companies in this research, contribute to creating a new online space which gives voice to diverse classes in contemporary Chinese society.

On the one hand, this paper contributes a valuable perspective to explore the shaping of the new and socio-cultural space of online China, by suggesting a focus on workers in internet companies. On the other hand, this paper also contributes to debates about workplace agency. I argue that the tradition of understanding worker agency as workplace resistance is limited. As an alternative, some forms of worker agency can be characterised as negotiation, which might open up possibilities for online China in different ways. Meanwhile, I also argue that the tradition of understanding worker agency in the context of workplace is limited; rather, it is necessary to discuss such worker agency in the socio-cultural context, such as the resistant space of offline China.
University, analyzing two key factors of variable quantity, marketing and word of mouth, we research China’s audience of animated film and try to discover facts about it. We find that marketing is the weakest competence for China’s Animated Film (CAF), university students is the strategic audience of CAF and middle-aged group with higher education is the target market of CAF.

Chinese Animated Film and its Audience; An Empirical Research on Chinese Cultural Wave

In this presentation I will take up the case of Chinese animated film and its audience as one of those examples of new cultural waves from Asia. Institute for Cultural Industries at Peking University has been conducting a survey research on the issue as a part of the survey program called Cultural Consumption Program. The program (survey project) has been one of the rare attempts of such kind in China and we are now analyzing the data gathered by the project. In the presentation of this session, I will show the results and the facts of the survey and I will try to connect the outcomes to the other cultural ‘waves’ from Asia in locating it in the broader picture in Asian settings in the whole. In doing so I shall commit the dialogues with other presenters who deal with the findings from other areas of Asia.

Who Becomes Registered Urban Resident during China’s Massive Urbanization: Assessing the Roles of Human, Political and Social Capital

Background

Over the last half-century, registered urban residents persistently occupy an advantageous position over rural residents or rural-urban migrants in obtaining good jobs, health care, housing and even education for their children. Therefore, transforming one’s household registration (hukou) status from rural to urban is a very effective path to upward social mobility. Prior research shows that education, Party membership and military service are the three most significant predictors of hukou conversion. However, the finding does not have the necessary data to address the statistical problems of reverse causation and unobserved heterogeneity, and the role of familial ties in hukou conversion.

Question

We re-examine the roles of three types of predictors in hukou conversion: human, political and social capital.

Data and Analysis

We draw on the 2008 Chinese General Social Survey that provides crucial timing data for life events, including the timing of hukou conversion for both the respondents and their spouses, first marriage and joining in the Communist Party.

Empirical Findings

(1) Education is a far more powerful credential than expected, facilitating the use of not only educational channels, but also a wide range of state sponsored conversion channels, such as military, employment in state sector or cadre; (2) when reverse causation is thoroughly eliminated, we show that Party membership actually impedes, not facilitates, hukou conversion, and thus wholly contrary to the view of the prevailing literature. By controlling for the impact of unobserved heterogeneity, we found that making hukou conversion for the urban town appears to undermine the incentive for mobility to urban areas by enhancing the chance of one’s local success; (3) marrying an urban husband is rural women’s social capital for hukou conversion, almost completely offsetting the human capital advantages of rural men, resulting in overall gender difference in becoming registered urban residents.

A Differentiated Community: Chinese Journalists and Their Interest-Driven Professionalism

Professionalism of journalism has been debated in China in the past decade, partly because of the commercialization of the mass media and emerging elite media. It still remains a question whether there is a journalistic professionalism in China, or whether such professionalism is a fragmentary one instead of a coherent one. However, it is clear that traditional mouthpiece role of Chinese mass media has no longer been able to offer enough explanation to portray the current change in such a profession.

This paper focuses on one special phenomenon in Chinese journalistic activity usually named “red-envelope journalism” or paid journalism. Journalists routinely accept money and other gifts from news source including government officials, industries and even foreign companies, which in Western journalism is viewed as bribe. However, in Chinese social context, it should be considered more complicated rather than merely a violation of professional ethics.

In this paper the transition of function and structure of paid journalism from the mouthpiece era to the current party-market corporatism situation is historically reviewed and analyzed. Then by participatory observation and interview, it is concluded that professionalism is interpreted mainly according to differentiated interests such as fame, market and political capital within journalist community and by other participants in the institution. It is also noted that journalists use interpretative discourse to explain and defend such interest-driven professionalism.

Consequently these developments may have profound implications for the transformation of Chinese media from a lapdog perspective to a guard dog perspective, while the traditionally defined perspective of professionalism as a watchdog is dismissed.

Legacies of the Sichuan Earthquake: Disasters As Past and Present Political Events

This paper examines legacies of the 2008 Sichuan earthquake in China in politics of subsequent disasters, particularly Yushu and Ya’an earthquakes. The legacies are manifested in three political realms: state leaders’ compassionate performance, the state’s cooperation with the civil society, and mourning rituals for disaster victims. While the Sichuan earthquake provided a cognitive template for people to interpret subsequent disasters as well as a political action patterns for political actors to follow, its legacies’ features and effectiveness varied across events and realms. First, while leaders’ compassionate performance in subsequent disasters resembled Premier Wen Jiabao’s in Sichuan, it was much less effective. Second, the state’s cooperation with the civil society organizations was politically selective and biased. Third, the mourning ritual for disaster victims was institutionalized but deprived of its substantive meaning, and the spontaneous mourning for student victims of the collapsed schools was suppressed. This paper explains the variations by examining both situational and structural dimensions of state-society relations. I argue that structural tensions between the state’s moral legitimation and its other political interests as well as contextual factors alter the shaping power of the Sichuan earthquake’s legacies. More broadly, I propose a state-society relations perspective to theorize political legacy.

Hermeneutics and Cultural Sociology

Hermeneutics and Cultural Sociology: A Discussion between Alexander's 'Strong Program' and the 'Cultural self-awareness' of Chinese Sociology

Jieffery Alexander's concept of cultural sociology is closely related to hermeneutics, and hermeneutics has been built continuously as well as cultural sociology. He and Philip Smith's 'strong program' takes Diethey's hermeneutics as its philosophical resource and late Durkheim as its classic sociological resource (Alexander and Smith, 2003). What is the relationship between the two resources? My viewpoint is that both of them are inspired by Wilhelm von Humbolt' metaphor of "the web of language" in German Romantic Philosophy, which plants the seed of modern hermeneutics (cf. Taylor, 1986: 21). "The web of language" is expanded from text to text-like actions by Diethey, and from text-like action to social structure by Durkheim. Durkheim articulates his approach to reach beneath the symbol to grasp the social reality around 1920, which has hermeneutical implications (cf. Durkheim, 1995: 2). This approach has been transformed into structuralism in the French tradition in early 20th century, and has been extended by Alexander between French structuralism and American pragmatics as "cultural pragmatics" in the turn of 21st century.

Chinese sociologist Xiaotong Fei (2003) argues that hermeneutics is a powerful approach for the "cultural self-awareness" of Chinese sociology, because the profound thoughts on mind in Neo-Confucianism of Song and Ming Dynasties has hermeneutical implications. I would argue that hermeneutics can be developed in this exploration, and in return, the exploration can be pushed forward by the expanded hermeneutics. The hermeneutics in this context is different from that of Alexander but can be inspired by the latter.

Aspirations, Motivations and Immigrant Children's Unexpected Success in Education

Evidences have shown that despite their undesirable family background, immigrant children are doing unexpectedly well in education when compared to their native counterparts. Previous studies have failed to prove that strong motivation towards better life and high aspiration for upward mobility may contribute to their academic success. To fill this gap, I use Hong Kong PISA data to identify four types of incentives that theoretically would cause immigrants' outstanding achievement, and educational aspiration seems to be the relatively more important one. For immigrant students from families with low socioeconomic status, although their academic advantage is especially large, but that does not mean they have stronger motivations and higher aspirations.

Factors Associated with Subjective Well-Being in Chinese Elderly People

This paper used the data from China General Social Survey to examine factors related to Subjective Well-Being (SWB) in Chinese elderly people. I constructed a conceptual model adapted from Anderson's health behavioral model and probed the associations between SWB and predisposing, enabling, need and health behavior factors. I discovered that higher SWB is more likely to be found in elderly people who have spouses accompanied, maintain good quality of relationship with family relatives and friends, have stronger need for recreational activities, have better health status, exercise more, perceive an increase in their current socio-economic status compared to previous situation, and remain optimistic about their future socio-economic status. Results also suggested that enabling factors (socio-economic status and quality of social connections) can impose more influence on elderly people's SWB. Thus, policies that maintain or boost the perception of upward socio-economic mobility and that enhance harmony between older people and their relatives and friends should be given special consideration in future.

Socio-Political Crisis and the Language of the Media: The Case Study of Russian "Snow Revolution"

This paper is devoted to the analysis of the Russian Media during the "Snow Revolution": the period of a political crisis in Russia between December 2011 and March 2012. The falsification during the parliamentary elections caused numerous demonstrations and street actions, which continued till the presidential elections.

The social networks played undoubtedly important role at that time: as a source of information, as a medium of mobilization and as an environment for the discussion and reflection. As a consequence, several recent studies of the "Snow Revolution" have been focused on social networks, such as Twitter or Facebook. Unlike these previous studies, this paper focuses on more traditional sources, such as newspapers, information agencies and news feeds on the Web. We address two interrelated research questions: first, how the socio-political crisis affects the content and language of the Media, and, second, to what extent their view of the events represents the public opinion.

To answer these questions we use various types of evidence. First, we collect a large corpus (52 millions tokens) of Russian news, published both during the "Snow Revolution" and before this period; we automatically extract the statistically significant keywords that characterize the investigated period. Second, we conduct the experiment among 104 informants who were asked to recall words and phrases that they associate with the "Snow Revolution".

We compare the results of these experiments and discover the correspondence between the news and the survey responses; this demonstrates that the traditional news still have an impact in mind-shaping of certain strata of people. Unlike the previous studies, this paper focuses on more traditional sources, such as newspapers, information agencies and news feeds on the Web. We address two interrelated research questions: first, how the socio-political crisis affects the content and language of the Media, and, second, to what extent their view of the events represents the public opinion.

An Emerging Energy-Focused Community in France: A Local and Social Innovation

Can we talk about “communities” in the field of energy in France? Local and citizen-led initiatives relating to energy are developing strongly in Anglo-Saxon countries and a growing body of research is examining the innovative potential of these grassroots initiatives, known as “community energy”. In France, similar initiatives – albeit with certain specificities – only began to emerge recently (in parallel of and related to the Degrowth Movement and the Transition Towns), and so far, very few studies have dealt with them. The purpose of this communication is therefore to propose an exploratory and in-depth analysis of one advanced French case, that of Le Mené, a pioneer in local energy autonomy.

We examine the conditions under which the initiative emerged, and the processes through which a grassroots innovation is formed and developed. In studying this case (interviews with key actors and inhabitants, analysis of documents), comparing it with other sources of data (interviews with experts, comparative observation of other on-going initiatives) and taking stock of various social sciences studies, we show that a social innovation was produced in Le Mené through the hybridisation of actors, sociotechniques and discourses. This local initiative was innovative not only in terms of the scope of the implemented equipments, but also in terms of the social organisation behind the development of the projects and the capacity to use energy production as a social resource. Finally, the case study highlights the emergence of a new form of collective action and reflects on its possible diffusion in France.

Why so Weak?: The Social Conditions of Labor Insurgency in Malaysia

Many Asian countries have experienced rapid industrialization and developed manufacturing for the past several decades. Given that manufacturing was traditionally one of bases of labor activism in many countries, the growth of manufacturing can activate the labor movement. In fact, as a result, some newly industrialized countries including South Korea and China have also experienced labor upsurge in a large scale. However, in Malaysia, which has also been remarkably industrialized since the 1970s, there does not necessarily exist a strong labor movement. This paper seeks to explore the reason why the labor movement in Malaysia is so weak even though manufacturing has clustered. Firstly, the brief history of Malaysian labor movement is reviewed and the labor movement in Malaysia used to be very active in the past. Secondly, taking into account various social factors such as class relations, organizations, institutions, networks, and the state, the cause of the weak labor movement in Malaysia is clarified. Thirdly, examining the recent process of the enactment of minimum wage law in Malaysia, this paper clarifies that the labor movement did not necessarily affect the enforcement of minimum wage law but the government primarily took the initiative to decide its enactment. Lastly, this paper tries to examine the possibilities to support the labor movement through various measures for resource mobilization, and to analyze how the recent deterioration of economic inequality can affect workers and their movement in order to define the social conditions of labor insurgency in Malaysia.

Japanese Challenges Towards the Sustainable Society — the Recovering Process from the Earthquake and Tsunami, and Establishing New Industrial Relations —

After the serious earthquakes and tsunami in 2011, Japanese society, mostly in Tohoku area, had been damaged horribly and the accidents of Fukushima nuclear power plant are still on-going. Japanese central government had established “Reconstruction Agency (http://www.reconstruction.go.jp/english/)” for reacting to them. The task is “leading and managing the reconstruction process”, and the role is “to accelerate structural reconstruction and revitalization in the affected areas by supporting implementation of government policies and managing and coordinating of reconstruction strategy and initiatives between various branches of government at a national level and with local municipalities”. However, the reconstruction process is not sufficient for the local communities.

Following this situation, at a municipality and a community level, we could consider two distinctive changes as hints for new Japanese working features. This presentation tries to examine whether these changes will shed their skin and become new industrial relations or conditions.

The first case would be an excellent collaboration between fishermen and NPOs in Iwate prefecture. Traditionally, the cleavage between fishermen and leisure divers was deep, because of their miscommunication. Currently, a NPO is proposing a cooperation aiming at recovering the sea both for fishery and diving. Through the collaborative works, fishermen have gradually presented their positive attitudes to divers and both of them have been able to understand each philosophy of work.

The second case would be a citizens’ participation toward local administrations. For the aim at reconstructing a community, most of all municipalities are requesting citizens’ participation to set their future plan. In this case, the working style of municipality’s staff had changed to deliberative and negotiating process. Under this pressure, the staffs of municipality office have been forced to think how they can work with citizens and how they can realize the policies through deliberations.

An Attempt to Analyze the Narrative World of the Life-Stories of Doctors and Patients Involved in the HIV Tainted Blood Product Incident in Japan

A n: attempt to analyze the narrative world of the life-stories of doctors and patients involved in the HIV tainted blood product incident in Japan.

We have conducted the research projects started in 2001 ended 2010, which aimed at collecting and analyzing the life-stories of doctors and patients involved in the HIV tainted blood product incident in Japan. This endeavor culminated in the final reports consisting of 3 volumes which amount to 1358 pages. Against the simplified bipolar model of the perpetrator and the victim of this incident, we found more complicated and individualized world of life-stories which would reflect the differences of social and historical context where each interviewee was situated at that time. First, the doctors had been thrown into the uncertainty and indecisiveness toward the then unknown disease of HIV infection, which would result in refraining from taking a clear-cut attitude concerning the use of non-heat treated concentrated blood product. For most doctors, the change from cryoprecipitate to concentrated product meant undoubtedly a quantum progress of medical care treatment for hemophiliacs; to return to the old method of treatment looked retrogression and might run the risk of disregarding the lives of hemophiliacs by the higher rate of intracranial bleeding.

Second, the older generation of hemophilia in Japan unanomously experienced the unbearable painfulness of bleeding and was told by parents that they would die young. For them, the anti-hemophilia factor concentrate was regarded as the miracle medicine to ease the pain and to endow a long life. However, facing up the occurrence of HIV infection, they felt being kept separated from every trustworthy information sources. Although, the frank communication between doctors and patients should be acutely demanded at the time of confusion and uncertainty, we found little evidence of any interchange between them.

The “Vocabulary of Motives” of Worker’s Suicide in Japan

Recently, Worker’s Suicide has emerged as a serious social problem in Japan. According to the governmental statistics, the number of application for insurance and the total amount of payout about “karo-jisatsu” in the worker’s compensation insurance system in Japan have gone up significantly last ten years. The purpose of this presentation is to examine how worker’s suicide is understood among Japanese people now through the interview researches with bereaved families. Japanese government reported the number of the people who committed suicide per year in Japan has been more than 30,000 from 1998 to 2011. This presentation especially focuses on worker’s suicide, what is called “karo-jisatsu” in Japan. Kari-jisatsu its a Japanese word that means working person oneself after too much working or moral harassment in workplace. This word has been popular in our country since 1990’s, while “karo-shi” which means death from overwork has been known since 1970’s. Some lawyers and doctors who are engaged in labor problem or industrial hygiene have claimed that too much working and stress make worker exhausted, so he/she injures his/her mental health, in the worst case he/she kills him/herself. That is called “karo-jisatsu”.

But I point out there is a logical leap between overworking and committing suicide. I clarify how they have been connected in the discourse of “karo-jisatsu” by reconsidering “medicalization” of suicide. My empirical analysis shows that suicide is regarded as one of the symptom of depression today, while “harakiri”, “seppuku” and “kamikaze” have been traditionally regarded as heroic suicide in Japan. Medical terms constitute a major “vocabulary of motives” (Gerth & Mills, 1953) of worker’s suicide. So when bereaved families decide on the significance of their member’s suicide, they tend to use these types of vocabularies.

Decomposition of Inequality By an Extension of the Dinardo-Fortin-Lemieux Method: An Application to an Analysis of Gender Inequality in the Proportion of Managers in Japan

As a method for analyzing how inequality in one dimension is explained by inequalities in other dimensions, this paper introduces a method for the decomposition of a group difference in the outcome into several components, explained by differences in the covariate values among groups and a component unexplained by them. The method is an extension of the decomposition method introduced by Dinardo, Fortin and Lemieux (DFL) based on propensity-score weighting. An application of this method focuses on the amount by which gender inequality in the proportion of managers is explained by sex differences in human capital variables. The regression-based Blinder-Oaxaca decomposition cannot be employed for a decomposition of the difference in proportion because the linear probability model cannot be specified as a regression model. Unlike the BO method, the DFL method can be applied to decompose a difference in proportion, but the latter does not permit a simple further decomposition of the explained component into elements explained by each covariate. The method introduced in this paper enables alternative sequential decompositions to assess the contribution of each variable to the explained component.

Suppose we denote by C, birth cohorts, by E, the educational attainment, and by D, the employment duration, and the causal order, C→E→D. The decomposition in gender inequality in the proportion of managers by the forward order of equating the conditional distributions of C, E, and D between sexes leads to a sequential application of the DFL method and identifies the effects of C, E, and D including each variable’s indirect effects through causally posterior variables. The decomposition in the backward order of C, E, and D assesses the unique contribution of each covariate’s effect on gender inequality requires an extension of the DFL method, however. This paper demonstrates the usefulness of this extension.

The Determinants of Gender Inequality in the Proportion of Managers in Japan

This paper analyzes linked data of employer and employee surveys from the International Labour Organization's Comparative Surveys on Work-Life Balance conducted by the Research Institute of Economy, Trade, and Industry to find the determinants of gender inequality in the proportion of managers among white-collar workers in Japan. The high job quit rate among women is a common reason given in employer surveys conducted by the Ministry of Health, Labor and Welfare for "having few new jobs." This cannot be the true cause underlying gender disparity. The proportion of managers among female college graduates is far below that among male high school graduates even when the female employees have worked the same number of years as the male employees at their current companies. The fundamental problem is the institutionalized managerial practices of Japanese firms through which sex is given greater weight than educational attainment in evaluation for managerial potential.

Using the decomposition method of DiNardo, Fortin and Lemieux, this paper shows that the difference in human capital between men and women only explains 21% of the gender disparity in the proportion of managers. It also shows that in order to become a manager, long hours of work are required even more for women than for men and that the proportion of managers increases for men and decreases for women depending on the age of their last child in a way suggestive of the reinforcement of traditional gender roles by employers. The analysis also shows that firms with 1000 or more regular employees and firms with centers dedicated to the promotion of work-life balance have smaller gender equality, and that gender inequality in those firms decreases more rapidly than other firms as the quit rate of female employees decreases. Policy measures to eliminate gender inequality in attaining managerial positions are also discussed.

The Impact of the East Japan Great Earthquake on Community in a Small Village

This article explores the impact of the East Japan Great Earthquake on the sociocultural aspects of community based on 40 in-depth life history interviews and a survey administered to more than 1200 villagers in a small seaside village. Noda village, which is located in northern Japan and has a population of 4500, is characterized by close interpersonal ties, a traditional patriarchal system, and an ethic of mutual aid. During times of economic prosperity, many male villagers moved to the Tokyo metropolitan area to work as carpenters due to the lack of jobs in the village. When a 37-m-high tsunami hit this village, 37 people were killed and almost 30% of the houses were damaged. The tsunami caused not only material damage and life-threatening situations, but also changed the sociocultural character of the community. For instance, people were initially reluctant to accept support from outsiders, such as volunteers, and talking about the tsunami experience has become almost taboo among villagers. We explore the processes by which sociocultural changes occurred and discuss the goals of post-earthquake community reconstruction in the context of data from small village.

Lay Responses to Radiation Contamination of Food

The possibility of radioactive contamination of food presents a threat not only to health but to autonomy. Radioactive contaminants cannot be seen, smelled or tasted, and the extent of any possible danger is not easy for the lay public to assess. Consumers are thus forced to depend on external sources of knowledge, such as government oversight and advice from experts. In the aftermath of the Fukushima disaster of 3/11, the Japanese public has experienced an increasing diminishment of trust in the government's ability to ensure the safety of the food supply. Consumers are not convinced that “the experts” (e.g., government officials) are providing sufficient information to enable them to avoid the threat. Beck (1986) suggests that in such a situation, individuals are forced to find “individualistic approaches” to the systemic contradictions, such as making their own private decisions about which foods to buy and dealing with any health issues as their own problem. However, there are indications that new social coalitions are emerging in Japan, motivated by shared fear of a common danger and/or by shared bonds of sympathy and empathy. This paper is going to argue that these phenomena – in which individuals seek and create “societal approaches” to deal with the contradictions created by the emergence of this new set of risks and the perceived failure of experts to fulfill their roles and ensure safety – is an indication that experiences that concern safety or risks at the local level can motivate a response that is much more social and less individualistic than the theoretical formulation would predict. The data used come from a series of focus group discussions; separate groups were created by gender, by households with and without children, by educational background and by type of work.

Impact of the Natural Disaster Recovery Process on Multicultural Community Areas on Homeless People: The Case of Yokohama, Japan

This presentation discusses the impact of natural disasters on foreign nationals in Japan and the process of recovery that they undergo. The data were collected through interviews. The Great Hanshin-Awaji earthquake of 1995 had a major impact on both newcomers as well as early immigrants in our society. Most of the affected people were family units who shared the same heritage, and aids were accordingly designed to support these families. In the area affected by the Great East Japan Earthquake, foreign brides of Asian origin in Japanese families posed a major problem. Although they belonged to a different culture, they expected to be treated like their Japanese counterparts as they believed they played an important role in passing down traditional Japanese family culture just as a Japanese family member would. However, circumstances have changed their lives after the disaster; they have started using their mother tongue, and find many ways of giving expression to their culture. The experience of the disaster and the recovery process has created a bond among these foreign brides – many of them have been trained in Japanese language programs, as caregivers, and some of them have been employed as professionals in various organizations. Such empowerment programs have enhanced their self-esteem, which has changed their family lives and the local community. Participating in various social activities is crucial to being equal members in a society.

The Great Hanshin-Awaji earthquake of 1995 had a major impact on both newcomers as well as early immigrants in our society. Most of the affected people were family units who shared the same heritage, and aids were accordingly designed to support these families. In the area affected by the Great East Japan Earthquake, foreign brides of Asian origin in Japanese families posed a major problem. Although they belonged to a different culture, they expected to be treated like their Japanese counterparts as they believed they played an important role in passing down traditional Japanese family culture just as a Japanese family member would. However, circumstances have changed their lives after the disaster; they have started using their mother tongue, and find many ways of giving expression to their culture. The experience of the disaster and the recovery process has created a bond among these foreign brides – many of them have been trained in Japanese language programs, as caregivers, and some of them have been employed as professionals in various organizations. Such empowerment programs have enhanced their self-esteem, which has changed their family lives and the local community. Participating in various social activities is crucial to being equal members in a society.
The labor demand for day-laborers decreased since the early 1990s. As a result, the number of homeless in major Japanese cities increased. After the establishment of a new law to help homeless people become financially independent in 2002, many people who were homeless or considered unable to work because of age or disability received welfare and took up residence in urban underclass areas.

Kotobuki, Yokohama’s urban underclass area, currently houses the highest rate of welfare recipients—approximately 80%—of underclass areas in Japan. The number of welfare recipients in the area has especially increased this decade. As a result, the area has become the center of the socially vulnerable.

In light of this social change, the local government, the social welfare council, and nursing care business offices developed a community welfare system in 2011. This system mostly focuses on officially recognized residents, not on those who are homeless. In 2006, Yokohama City reduced its special temporary welfare support for homeless and then cut it entirely in 2012. This caused greater difficulties for the homeless in the neighborhood, creating a highly concentrated district of welfare recipients.

So far, urban underclass areas are important for the homeless with regard to not providing access to social resources—for example through forging relations with supportive groups and getting free meals. As urban underclass areas have gradually changed into places of concentrated welfare recipients, those who do not receive welfare support and are homeless now face even greater pressure.

Displacement and Politics of ‘Transitory Space’ for Resilience: A Case of the Great East Japan Earthquake

Forced displacement induced by disaster makes various types of “transitory spaces” in the process of reconstruction. The aim of this presentation is to discuss about functions and politics of “transitory spaces” for disaster assistance in the age of population-shrinking/aging society based on a case study of the Great East Japan Earthquake and Tsunami in Iwate Sanriku coast. The first point is to rethink about “temporary housing” system established in the 20th century. In the history of disaster in Japan conventional relief act defines “sufferers” by the standard whether they lost their own “houses” or not. As a result after the dissolution of emergent shelters public assistance tended to be concentrated on temporary housings made by the municipal government. But in the case of the Great East Japan Earthquake and Tsunami this system did not adequately function because in the age of population-shrinking/aging society when power of kinship and community-based social structure more and more decreases having “house” do not necessarily mean that residents do not have “social vulnerability”. Inequality of assistance among sufferers in temporary housings and in their own houses became serious problem in the 2011 Japan disaster. To cope with such situation new types of social spaces emerged to mobilize multi-scale resources and make a balance and continuous condition on people’s condition of sufferers according to the case. This is the second point. This presentation will focus on a temporary “base point” of assistance which was constructed by individual affiliate labor union in Tono area, one of the inland cities in Iwate prefecture. On the background of urban precarity and de-centralization of provincial city this “base point” emerged as a nodal space for re-organizing collective infrastructure of life. Considering such politics of “transitory spaces” will offer a valuable hint to invent future system of social resilience.

Party Membership during Partisan Dealignment and Realignment Phases in Post-War Japan

This paper investigates whether an abrupt and drastic realignment trend (i.e. a revitalisation of political support) in Japan since 2000 has changed patterns of political membership, even though Japan had a quite similar political dealignment process (i.e. a constant and substantial increase of independent electorates) to advanced industrial democracies in the West until 2000.

Political scientists have pointed out that party membership has constantly declined in contemporary Western democracies. This substantial downward trend has been caused by the widespread political detachment from conventional party politics throughout the post-war period in Japan, scholars have rarely examined the association between dealignment and political membership, although a long-term dealignment trend throughout the 1960s to the 1990s was observed by newspaper opinion polls and social survey datasets. Furthermore, using the Japanese General Social Surveys (JGSS), this paper clarified that the dealignment trend inverted into realignment since 2000.

The data analyses using Japanese data in the World Values Survey indicated that party membership witnessed an increase of inactive members from 1981 to 2000, however, its explanatory power had been weakening throughout 1981 to 2005. In addition, logistic regression models suggested that political interest was a significant predictor throughout 1981 to 2005, however, its explanatory power had been weakening through the periods. Even though Japan entered into a realignment phase since 2000, the growth of partisanship has not led to an increase of party membership, rather, there has a great theoretical potential for contributing both the Western and Asian political membership studies. This is because it has not only a Confucian-style political culture, which is based on strong social ties in a local community, but also political norms highly valued in advanced industrial democracies, such as citizenship, independent individuals, and basic human rights.

Hospitalization of Ageing Populations: The Case of Japan

Hospitalization of ageing populations has been significantly increased in Japan in recent years, which has been triggered by many factors such as an increasing number of elderly people, a change in the economic situation, and an increase in healthcare costs. The extent of hospitalization varies significantly between regions and communities, and the rate of hospitalization has increased at a faster rate than the rate of hospital beds. This has led to a situation where the number of elderly people in hospital is increasing and the number of hospital beds is decreasing. In this presentation, we will discuss the current status of hospitalization in Japan, focusing on the factors that have contributed to this situation and the potential solutions to address it.

A Half-Open Door to Africa: Chinese and Japanese Migrants in the Twentieth Century South Africa

Over recent years, amid the increased presence of China and residents of Chinese descent in African countries, growing attention has been paid to experiences of Asian migrants in interdisciplinary fields of studies in South Africa. What has been revealed by exploring their histories is that, despite their small numbers, the existence of Chinese and Japanese migrants had a considerable impact on ‘white’ South African racial policies. By focusing on those who migrated from East Asia at the beginning of the twentieth century, this paper seeks to exemplify how they confronted the myths about both China and Japan and transformed the situation of their time into an enduring legacy in South Africa.

The paper aims to contribute to wider discussions on South Africa’s history of migration and the role played by Chinese and Japanese migrants in the context of the country’s geopolitical strategies. It also highlights the social and economic contributions made by these migrants to the region, their impact on South Africa’s economy, and the challenges they faced in adapting to their new environment.

Medicating the Male Obesity through Metabolic Syndrome - Some Social Aspects of the Japanese National Chronic Disease Prevention Program

The Japanese mandatory National Chronic Disease Prevention Program started in 2000. It aimed at improving the quality of care, though the price of each service was regulated as "legal price" by the government. However, it is not clear that such competitions can be realized, because different providers have different motivations in providing care services. Especially, non-profit organizations (NPOs) have altruistic motivations to meet the needs of local residents. Thus, the different motivations of providers may result in a competitive race among them rather than the effective competition over the quality of care.

This study investigates the structure and mechanism of segregation of providers' motivations in NPOs based on the analysis of the data from 12 in-depth interviews with care workers and a questionnaire survey of 34 NPOs. The findings are as follows: First, among the services of the LTCI, NPOs tend to undertake lower-priced domestic work, while for-profit providers take higher-priced services. Second, NPOs provide the older people with additional services in order to meet their needs outside of the LTCI rubric, even though the income from the additional services is smaller than the services under the LTCI. Third, the altruistic motivation makes NPOs' workers content with long working hours of additional services.

The NPOs have tendency to deliver their services in spite of small profit, as long as users need them. This allows for-profit providers to choose the services with larger profit, that is, cream-skimming. The different motivations of providers create the uneven and uncompetitive structure of the elderly care system in Japan.

We interviewed scientists, experts, doctors and public health nurses about the intention of the program and the difficulties in its implementation. Currently we are conducting the follow-up researches. 1) In spite of the fact that the program designates the whole population aged 40 to 74 as its target, the real target of the program is middle-aged men, especially working for small companies or self-employed. In that sense the medicalization of obesity is gender-biased. 2) We believe that the newly developed diagnostic concept, "metabolic syndrome," as its key concept to prevent cardiovascular diseases and type 2 diabetes, will have been played the central role in medicalization of obesity in Japan, where men's obesity has always been the focus of health professionals. 3) The program faced with serious difficulties and resistance in its implementation. Some of the difficulties are viewed as originating from the misunderstanding of one's health and its care. 4) There is also a marked contrast in the understanding of the program between public health nurses and general practitioners. Whether the reason for this lies in the professional interests of the two or in the gender biased concept of health for the two is not yet clear.

We like to place all of these issues in the context of medicalization of men's health in the post-industrial society where several traditional masculinity-related behaviors are viewed as problems and medicalized.

YAMANE, SUMIKA* (Yamagata University, sumikammm@nifty.com)

The Uneven Structure of Home Care Service Provision Between for-Profit and Non-Profit Organizations in a Quasi-Market System

The Japanese Long Term Care Insurance (LTCI) was implemented in 2000, aiming at promoting user's choice and the competition among different kinds of providers (i.e. such as for-profit, non-profit). It was expected that a quasi-market system would facilitate the effective competition among providers and improve the quality of care.

The findings are as follows: First, among the services of the LTCI, NPOs tend to undertake lower-priced domestic work, while for-profit providers take higher-priced services. Second, NPOs provide the older people with additional services in order to meet their needs outside of the LTCI rubric, even though the income from the additional services is smaller than the services under the LTCI. Third, the altruistic motivation makes NPOs' workers content with long working hours of additional services.

NPOs have a tendency to deliver their services in spite of small profit, as long as users need them. This allows for-profit providers to choose the services with larger profit, that is, cream-skimming. The different motivations of providers create the uneven and uncompetitive structure of the elderly care system in Japan.

Cross-National Survey on Well-Being and Social Relations

Well-being is an important issue in recent social survey research and many surveys focus on subjective well-being, happiness, and quality of life with some measures or scales on certain items in questionnaires. The measurement, however, is not free from differences on gender, culture, and other social conditions. As for social values and general response tendencies to questionnaire surveys, we have repeatedly reported regional variations in our longitudinal and cross-national surveys over half a century by the Institute of Statistical Mathematics (Yoshino, Nkaido & Fujita, 2009) (http://www.ism.ac.jp/~yoshino/index.htm and http://www.ism.ac.jp/ism_info_j/kokuminsei.html), under the paradigm of Cultural Linkage Analysis (Yoshino & Hayashi, 2002) and Cultural Manifest Analysis (Yoshino, Nkaido, Fujita, 2009).

The present study examined the relationships between well-being and social factors using our cross-national surveys, “a study of statistical science on health and culture: cross-cultural study on dynamics of social disparity and life,” carried out during 2002-2010 in four western countries (USA, Germany, France, UK) and three East Asia countries/region (Japan, South Korea, Taiwan). The survey was conducted on the target population of adult residents in each country/region, with the sample size of some 1000. Random Digit Dialing (RDD) telephone survey using CATI system was conducted in in the four western countries and Japan whereas a face-to-face interviewing was conducted in the South Korea and Taiwan. By multivariate analyzes, we show how social and cultural factors are related with several indices on well-being as well as the similarity and dissimilarity of these Western and East Asian countries. We discuss the characteristics and limitations by considering methodological issues.

Social Perceptions and Environmental Communication on the ‘Benefits’ and ‘Risks’ of Tidal Flat Restorations

This paper looks at how the ‘risks’ and ‘benefits’ of tidal flat restoration projects are communicated, perceived and negotiated by different stakeholders in case studies from Japan, the UK, Netherlands and Malaysia.

Various tidal flat restoration projects have been conducted in Japan and elsewhere in recent years in an attempt to revitalise fish stocks or preparing sea level rise. Coastal wetland restoration projects, such as coastal realignments or re-flooding farmland, still represent a new concept. Due to the need for long-term social support and investment in such schemes, it will become increasingly important to take into account the various perceptions that exist in the community from now on. Yet, at the moment it is often not clear 1) what kinds of environmental ‘risks’ and ‘benefits’ in tidal wetland restoration projects are perceived and communicated by project contractors and other stakeholders in the community; 2) in what way various stakeholders perceive the ‘benefits’ and ‘risks’ of their local restoration projects; 3) what the commonalities and differences among these discourses are, within and across different case studies, and 4) how the findings could make a contribution to future decision making and support for coastal wetland restorations in Japan and beyond.

This paper explores the above four points to examine the improvement conditions of participatory sustainability initiatives. This paper is based on data collected during a three-year government-funded research project (2011-2013) from stakeholder interviews and through document analysis of the environmental information provided to citizens and decision makers via various media.

Double Responsibilities of Care: Emerging New Social Risks of Women Providing Both Elderly Care and Childcare in Japan

This paper is based on a both international and comparative research project exploring how experiences of emerging female sandwich generations are shaped by policy configuration, social and cultural contexts and their personal/family relationships in East Asia. The ageing of population, the decrease in average number of siblings and the rising average age of mothers at the time of child bearing, all to suggest that new types of sandwich generations who simultaneously provide care for their frail elderly relatives and young children/grandchildren may increasingly become common in developed countries. East Asian societies are not exceptions as facing with acute demographic and social changes. Through the comparative analysis of data from questionnaire surveys and semi-structured interviews, this paper investigate the new structure of social risk involved in the double responsibilities of care, work and generational relations with a specific focus on Japan. We will discuss both theoretical and practical implications of our research on double responsibilities of care, to wider social theory, care policy and practice.

Gender Difference in Older Parents’ Coresidence with Their Adult Children: A Comparison Between Japan and Taiwan

A comparative analysis of data generated from mixed research methods in each society, this paper will investigate how these sandwich generations experience a double responsibility of care, by analysing resources available to them from local policy configurations and from their personal and kin networks. The research will highlight increasing new risks emerging in East Asian societies in relation to women’s citizenship, care, work and generational relations.

Performing Cool Japan and Uncool Hybridity: Analysing ‘luogo’ (Lou Language)

‘Metrolingualism’ refers to young people’s use of new hybrid language or foreign languages/dialects, in popular culture or everyday interactions (Otsuji and Pennycook 2010). They are creative moves which challenge and loosen cultural, ideological, and ethnic/cultural codes is interpreted as uncool, illegitimate, unprofessional, undesirable, idiosyncratic, foolish, and fantastic, rather than cool, creative, liberating, desirable, ubiquitous, skillful, and down-to-earth.

Using discourse analysis, I discuss how the intricate mixing of the two linguistic-cultural codes is interpreted as uncool, illegitimate, unprofessional, undesirable, idiosyncratic, foolish, and fantastic, rather than cool, creative, liberating, desirable, ubiquitous, skillful, and down-to-earth.
Japanese Jewelry Market

Though jewelry market size in Japan in 1991 was three trillion yen (around thirty billion USD at current rate), its size is less than one trillion yen (around less than ten billion USD at current rate) in 2013. As far as the size of jewelry market size continues to shrink up to the present date, Japan had not had western style of jewelry market because Japanese wore “kimono” and western style of jewelry does not fit with kimono, Japanese does not wear western style of jewelry. After restoration of Imperial power in 1868, western style of clothes was getting popular in Japan and western style of jewelry started to be manufactured and sold in Japan. Along with western style of clothes population, western style of jewelry market continued growth. It means western style of jewelry market in Japan has only one hundred and fifty years’ history. In addition to that, generally the value of jewelry is difficult to judge for consumers. This is true not only for Japanese but also western people. In the process of new market of western style of jewelry growing, I will investigate how the knowledge of western style of jewelry was implemented and diffused or Not implemented and diffused to Japanese. I also will analyze how western style of jewelry market was formed in Japan during these one hundred and several decades and how the relationship among seller, purchaser and institution was transformed and affected each other from view of institution of jewelry and its contribution. As researches on jewelry from sociology points of view is very rare in Japan, I would like to make contribution by stating historical background of Japanese jewelry market and relationship of players and institutions.

Reconstructing Biopower: From an Analysis of Television Programs about Conducting Surrogacy

How does performance affect the human body in terms of biopower? This research analyzes a process where discourse about reproductive technology leads to its implementation to change actual bodies. From an examination of television programs in Japan, I show how culture impacts the materialistic sphere, which is mediated by performance regarding “America,” an icon of modernization for the Japanese. The Japanese national public broad casting organization, NHK (Nippon Hoso Kyokai), has aired programs about reproductive technology since the emergence of In Vitro Fertilization. At the beginning of the 1990s, the program “The Creation of” as a realization of scientific progressivism, but regarded the ethical aspects as unrealistic. In the discourse, the image of Europe was that of an agent of intelligence; on the other hand, the image of the U.S. is that of savageness. However, after a Japanese celebrity couple conducted surrogacy in the U.S., “America” became a normative model for the Japanese; there was a contrast between the undeveloped Japanese and the developed American in terms of modernization. The television programs implied surrogacy stands for emancipation from the traditional Japanese convention to oppress women to construct a modern family. Moreover, they constructed a solemn image of the children taken from the U.S. by utilizing imaginary which evolves memories of the imperial corruptions. These images raised a positive public opinion toward surrogacy, which led the government to rush to legalize it. However, after foreign mass media revealed that a Japanese male had conducted surrogacy in India with a purchased egg (known as Manji’s case), NHK stopped discussing surrogacy and the Japanese government postponed the legalization of surrogacy. The Manji’s case showed the Japanese had already gone beyond the savage and modernized “America.” Therefore the Japanese lost their frame of reference.

The above examination indicates the decision to apply reproductive technology depends on culture.

YANG, ARUM* (Yonsei University, diddpq1@gmail.com)

Cultural Consumption, Class Mismatch, and Gender As a Determinant Factor

Studies of cultural consumption have a distinctive academic tradition after Bourdieu’s book “Distinction” (1984) where each class has their own cultural tastes and high class people are considered as high culture, giving them the authority of class distinction. A major question currently subject to debate is whether we can identify these hierarchy matches between class and culture. This paper examines this question, collecting and analyzing the results of cross-national empirical research. Research has shown there is considerable evidence contradicting the results of Bourdieu, even in France where Bourdieu conducted his own research (Lamont). It is due to the fact that existing class-based approaches put too much emphasis on the class, rather than focusing on diverse social groups and the meaning behind a person’s preferences for certain culture.

The Metaphor of ‘home/Family’ in Introduction of the Nordic Model in Taiwan

Welfare studies find specific characteristics in East Asian countries, such as development of welfare system is considered as introduced from top and the focus of the family in East Asian societies is linked with Confucianism. Different from former studies, this paper focuses on the reform of child care policies in Taiwan, which was initiated by women’s organizations and several feminist scholars. Moreover, feminist discourses in introducing the Nordic model in Taiwan highlight the family, which is not as conservative as it was considered in ‘Confucian Welfare States’.

Departure from feminist welfare studies, this paper aims to examine the active role women play in transformation of social welfare policies. The research methods consist of discourse analysis of feminist scholars to look for feminist biographies of current social welfare policies in Taiwan and interviews from key figures in child care policies reform.

I find feminist discourse stresses on de-familialization while using the metaphor of ‘home/family’ that regards the state as ‘the People’s Home’ and the local community as ‘the big communal family’. I will argue that Confucianism can be understood by state feminists who employ a legitimate cultural tradition in order to make the ‘importation/emulation of the Nordic model in an East Asian country possible. Secondly, I will examine how such a discourse highlighting the provision of child care by a strong collaboration between civil society and the state in a social context with high communication of child care in Taiwan. This will make the triangle model of ‘state-market-civil society’ complicated and help us to rethink the relation between civil society/family and the state. I will relate my analysis to former debates on Confucianism in welfare studies specifically and discussions of civil society and family in social theories generally.

Taiwan’s Higher Educational Reform in a Global Context: The Paradigmatic Shift from Modern to Postmodern

Through theoretical approach, this paper aims at analyzing Taiwan’s higher education reform since 1990’s under the influence of globalization. Firstly, this paper lays bare the definitions and criticisms of globalization while dealing with the related issues. Then, it describes the transformation of the conceptual development from the modern humanistic idea of higher education to the postmodern non-centre idea of higher education in a global context. Next, it mentioned issues and problems of Taiwan’s higher educational reform since 1990’s presented a fundamental paradigmatic shift from modern to postmodern in a global context. Finally, it provides some suggestions about higher educational reform for Taiwan in a global context.

A Study on Female Industrial Structure and Gender Segregation of China

[ABSTRACT] In the first decade of the 21st century, China achieved stable and rapid economic development, and made new progress in industrial restructuring: the modern service industry and emerging strategic industries have provided more employment opportunities for laborers including women. To analyze the female industrial structure and gender segregation in industrial structure, data retrieved from the Third Wave Survey on The Social Status of Women in China in 2010. It was found that if viewed from the perspective of gender structures in different industries, females are mostly concentrated in sectors with lower levels
of income and social security, where gender segregation and gender parity coex-
isted. Compared with 10 years ago, the proportion of employed women in farming, 
forestry, animal husbandry, fishery and water conservation shows a substantial 
decline, while the increased ratio in wholesales and retail, and in public adminis-
tration and social organizations are the two highest. The proportion of women in 
industries with higher degrees of monopoly is low, and the declining tendency 
reflects the intensified gender discrimination and gender differentiation in mo-
npoly industries; the proportion of females in the modern service industry as 
well as the degree of gender parity in the industry have been increasing, making it 
possible for more and more women to obtain higher incomes.

From Green Energy Governance to Green Economy: A Case Study 
of a County in Southern Taiwan, 2009-2013

After a lot of negotiations, conducted by Ping-Tung Government in Southern 
Taiwan, among solar PV companies, Tai-power Company, Central Government 
and local farmers, 25MW solar farms were installed on the damaged lands of 
orchards and fish farms in Lin-Bian and Jia-Dong, two towns in central Ping-
Tung, in which the government carried on post-disaster reconstruction in the 
wake of Typhoon Morakot on 8th August 2009. Meanwhile, under these highly 
ground-mounted solar panels, there were organic vegetable farming and ecolog-
ical fish farming set up. Inspired by the example of agricultural/solar farms in 
Lin-Bian and Jia-Dong, companies of various green energies came to Ping-Tung in 
search of different socio-technical experiments.

Since April 2013, a hydrogen fuel cell company has allied itself with local B&Bs, 
gas stations and convenience stores, offering hydrogen-powered scooters to 
promote a "low-carbon tour." Now, this company is preparing to get fuel cell 
scooters into mass production. Meanwhile, small-scale wind turbines are planned 
to be installed in central Ping-Tung, together with the existent solar farms and 
hydrogen fuel cell systems, to conduct a 'smart grid' experiment, which has been 
listed in the Smarter Cities Challenge, 2013 by IBM Company. Also, in northern 
Ping-Tung, there is another 'smart grid' plan to connect solar farms, wind farms, 
bio-gas plants with pig farms, and micro hydropower systems.

The author of this paper has investigated and analyzed the performance of 
green energy in Ping-Tung by means of participative-observations and in-depth 
interviews. More specifically, adopting the concepts of green energy governance, 
social innovation, green economy and STS, this paper describes and explains the 
interviews. More specifically, adopting the concepts of green energy governance,

The Origins Of Conservative Democracy In South Korea: Nation-
Building, Democratic Transition, and Middle-Class Politics

After more than twenty years since the democratic transition in 1987, South 
Korea was faced with an ironic political scene, in which a daughter of the former dicta-

tor Park Chung Hee, Park Geun Hye, was elected as the new president in the 
winter of 2012. This paper argues that the middle class largely shaped the post-de-

cratization trajectory in Korea by resisting any significant social reforms and 
preventing furthering social equality and redistribution. While the middle class is 
believed to be a strong supporter of representative/electoral democracy to have 
led a democratic transition in Korea, the middle class has also been the one that 
resisted significant socioeconomic reforms implemented by the center-left gov-
ernments including the Kim Dae Jung and Roh Mu Hyun administrations. This pa-
per examines the origin of conservative democracy in Korea in which the middle 
class played a key role as a status-quo political actor. To do so, this paper traces 
the historical process of nation-building and economic development, through 
which the middle class was emerged by the support of the authoritarian state 
and become an exclusionary social group that advanced its own class interest 
against the elites privileged. In addition, the current geopolitical situations that 
have confronted with North Korea for more than half a century also contribute to 
preventing any left-leaning policies from taking place and in turn to strengthen-

Contradiction Between Leisure Pursuits and Structures of 
Inequality

Applying the method of stratification research could be a more rational way 
of looking at matters, especially inspecting Leisure Pursuits from the perspective 
of structures of inequality. Leisure is not a simple individual behavior, and cannot 
be independent from social environment and the influence of time. Leisure 
structure is neither a matter in view of pure spiritual level nor a question of pure 
economics, but a resort of spirit and physical of human being which has close 
relationship with social political and economic structures.

Essentially, structures of inequality or limited resources decide the inequality 
of leisure consumption. The contradiction between leisure pursuits and struc-
tures of inequality is an objective existence. Idealists intend to stress the univer-
sality of leisure pursuits or the individual right of leisure, criticize and neglect 
the positive impacting of the existing of structures of inequality on leisure pursuits. 
However, the existing of the inequality of leisure consumption is not only facilitat-
ing the reasonable distribution and portfolios of resources to a large extent but also 
playing an important role in maintaining structures of inequality as well as the 
vigorous vitality of the social organism actually.

It will be beneficial for us, if we treat positively the contradiction between lei-
sure pursuit and structure of inequality, to treat the matter of leisure consump-
tion correctly and help us deal with many confusion and difficulties in real life, 
particularly those related to a series of questions of imbalances, such as the imbalances 
between leisure and individual rights, leisure and social economics, leisure and 
wealth distribution as well as leisure and spiritual resort etc.

Athletic Sport or Health Promotion: Development Dilemma 
Confronted in Globalization of Chinese Traditional Martial Arts

This study is to clarify the relationship between the two different purposes of 
Chinese Traditional Martial Arts as a sport: athletic sport and health promotion, 
and propose the author's own view on the development direction of Chinese Tra-
ditional Martial Arts in the context of sport globalization.

This paper reviewed 75 related published articles and academic papers and 
summarized the views. The author held ten semi-conducted interviews with Chi-

Asian Martial Arts enthusiasts.

Some hold that in the process of globalization we should focus on training elite 
players and develop athletic sport system for traditional martial arts, which will 
help traditional martial arts widely recognized by western cultures. This kind of 
thoughts results in an reality that Chinese Traditional Martial Arts practitioners 
refers to practice athletic Martial Arts. In university, Chinese Traditional Martial 
Arts Majors choose to practice athleticMartial Arts and attend contest of all kinds,
because this is the only way they can get authorized eligibility as first or second class national sportsmanship.

Others argue that since its functions of attacking and defending have been in degradation as modern weapons developed, Chinese traditional martial arts still can attract many people of different countries, ages, and backgrounds, not because of its athletic features, but because it contribute immensely to one's physical fitness and self-moral-cultivation, and the cultivation of both physical and moral health is the power source of its sustainable development in the context of sport globalization.

The author think that as to the development of Chinese traditional martial arts, a regular authorized eligibility certification system as the athletic sport has will standardize its technical requirements, and focus on the physical and moral health promotion will keep its diversified national features in its globalization in the world.

Asian Migration to the United States and within Asia in Comparative Perspective

More than one million Asians had migrated to America before 1965. Since 1965, Asia has been a major source of migration to the USA and more than 10 million Asians have arrived on U.S. soil. Most recently, Asia has surpassed Latin America as the largest source of immigration to the USA. Up to the mid-19th century, Asians mainly migrated to other Asian countries, and in contemporary time Asians happened to migrate to within Asian countries. Within the trends in Asian migration to the USA and within Asia how do sending countries of Asian migration to the USA and within Asia resemble and differ? Do the same or different types of Asians migrate to the USA and within Asia? What are the similarities and differences in causes of migration to the USA and within Asia? Are there similarities and differences in Asian immigrant transnationalism between the USA and Asian countries? How are Asian migrants to the USA and within Asia similar and different in patterns of adaptation to host societies? How do the impacts on host societies of Asian migration to the USA and in Asia resemble and differ? What is likely to happen to Asian migration to the USA and within Asia in the near future? Using a variety of data from the USA and international organizations and focusing on the post-1965 period, this paper seeks to answer these questions through comparison and to address the implications of the findings.

Mechanisms of Trust Formation Under Different Conditions of Political Identity

Individual political behavior is a manifestation of social behavior, and individual voting behavior indicated his/her political choices and political identity. After democratization in Taiwan, presidential elections show bipartisan polarization and reinforce general distrust of social phenomena. Therefore, this study intends to explore how people format their trust behavior when they interact with others of the same or different political identity groups. In stage 1, the computer randomly assigns trustees and trustees and does not show political identity of 2012 presidential candidates (Ma Ying-jeou and Tsai ing-wen). In stage 2, the computer displays political identity logo by random arrangement. In stage 3, the subjects can choose their preferred objects of the same or different political identity logo by themselves. There are three mechanisms of trust behavior formation under different identity condition. (1) Win-win mechanism: Win-win strategy is that both trustee and trustor attempt to maximize their weal and return through exchanging with the targets of the same or different political identity groups from the beginning round. (2) Identity mechanism: Under the condition of political identity choice by subjects, identity effect becomes strongly significant at the beginning of the first round on the third stage of the experiment, especially for that of Ma-Ma identity group. (3) Competitiveness: Effect is very significant in all three stages of trust experiment, especially in the second and third rounds of each stage. When people exchange with the same political identity groups, it will produce the phenomenon of polarization. When the trustee return high proportion profits to the trustor in the first round, the trustee will feedback more in the second round. However, if the trustee return low proportion profits to the trustor, the trustor will feedback less and less, even lower than exchanging with different political identity groups.

Saemaul Undong and Beyond: Upgrading the Opportunities and Capabilities of Women in 1970s' South Korea and Kenya Today

Capabilities and empowerment are no longer new concepts: they are well understood and widely seen as necessities for individual as well as community development. Practices in today's developing world, however, are not always successful. Nor have the successful practices of the past been much elaborated so as to provide practical lessons for today. This study attempts to fill this gap with the case of Saemaul Undong, a New Village Movement in South Korea in the 1970s, in combination with discussions of its applicability to Kenya, one of today's developing countries. Saemaul Undong has recently become an inspiring development model for many developing countries. It is known for its strong and committed leadership both at central and local levels, as well as the high rate of local participation. The rise of women as equally capable agents of change as men has been noted as one of its distinctive features. Indeed, Saemaul Undong is understood as a remarkable turning point for women in rural areas, which made them visible and active in formal activities beyond their own family and household. This newly explored social form is known to have effectively served rural and national development during the high growth periods of Korea.

The objectives and the structure of this paper are as follows. First, it explains the mechanism and processes of Saemaul Undong, which made women's involvement, or empowerment, possible within a society that had a strong Confucian character at that time. Second, it elaborates the strengths and weaknesses of the Movement in terms of women's capabilities and empowerment. Finally, the paper discusses the applicability of the findings to today's developing world. Our selected case country is Kenya, but discussing the applicability of the case is expected to provide practical lessons the developing world in general.

A Tale of Two Suburbs: Earthquake Recovery and Civil Society in Christchurch, New Zealand

This study followed two similarly affected, but socio-economically disparate suburbs as residents recovered from the devastating 6.3 magnitude earthquake that struck Christchurch, New Zealand, on February 22, 2011. More specifically, it focuses on the role of local churches, community-based organisations (CBOs) and non-governmental organizations (NGOs), here referred to broadly as civil society, in meeting the immediate needs of local residents and assisting with the longer-term recovery of each neighbourhood. Analysis of sixteen qualitative interviews with residents as well as key informants from local civil society in each suburb found that despite considerable socioeconomic differences, civil society in both suburbs has been vital in addressing the needs of locals in the short and long term following the earthquake. Institutions were able to utilise local knowledge of residents and damage in the area to a) provide a swifter local response than government, or civic defence and then help direct the relief these agencies provided locally; b) set up central points for distribution of supplies and information where locals would naturally gather; c) take action on what were perceived to be unmet needs; and d) act as a way of bridging locals to a variety of valuable resources. However, the findings also support literature which indicates that other factors are also important in understanding neighbourhood recovery and the role of civil society, including: local leadership, a shared, place-based identity, the type and form of civil society, social capital, and neighbourhood- and household-level indicators of relative vulnerability and inequality. The intertwining of these various factors has influenced how these neighbourhoods have coped with and taken steps in recovering from this disaster. It is suggested that a model that takes a multi-factorial approach in understanding community vulnerability and capacity within the Christchurch context be designed to more effectively explore further research in this area.

Culture As “Agon”: Agonological Features of Weberian Sociology

Culture as Agon: Agonological Features of Weberian Sociology

Max Weber treated the Greek concept of “agon” with great interest, in the final parts of his treatise of the “City”. However, if we focus on his interest on “agones” in general, the social fields of competition and social selection, we should rather say that this interest can be considered as his premier Leitmotiv, which permeates his comparative study of cultures.

* denotes a presenting author. Abstracts are organized by first presenting author's last name.
This page explores the advantages and the limits of this methodology on the cultural comparison of ogones (that will be coined "agonology"). Starting from Weber's concrete historical depiction of Asian competitions (especially, in his "Hinduism and Buddhism"), this paper moves in to the theoretical concerns. It argues that, it is much fruitful to point out the agonological features of Weberian methodology than just "achieve the cliches such as "cultural determinism", "idealism", "methodological individualism", or "conflict theory". Finally, briefly contrasting this Weberian agonological features with modern sociological theories of competition, such as Bourdieu's theory of symbolic violence, etc., we, will like to outline the future possibilities of this comparative agonological perspective.

This study, first of all, assesses the practicability, but the absence of sociology in obvious not only to recommend sociological theoretical aspects that has had a major impact on weakness of sociology in Iran. 

Residents Life Satisfaction in the Perspective of Social Empowerment

Social quality is composed by socio-economic security, social cohesion, social inclusion and empowerment/autonomy. In various degrees, these four components affect life satisfaction of residents in China. This article carries out an investigation of the data obtained from six cities in China, it analyzes the degree of empowerment and the impact on life satisfaction. Largely, social anomy reduces people's life satisfaction.

Feasibility and Possible Fields for Application of Clinical Sociology in Iran

According to some Iranian sociologists, the absence of sociology, and sociologists themselves, in relation with the society in one of the most important negative aspects that has had a major impact on weakness of sociology in Iran. There are so many social problems in Iran for which we need social solutions. Under the circumstances, the development of a home education in Russia and an increase in the number of families, who resort to the help of this form of education, become not only a private affair but also a social phenomenon, needed social analyze and comprehension. In Russia these are: efficacy and completeness of children and adolescents (who received a home education) socialization and adaptation in adulthood; compliance of the level of education and the society in whole.

Social Justice, a Key Concept in the Social Movements of the Last Hundred Years in Iran

Social Justice is a very important and widely used concept in the political and social history of many nations. As well as many countries, it has had a significant role at least in mobilizing people for social movements and in protesting against the existing political system in Iran. In analyzing the causes of many social and political processes and also the Constitutional and Islamic Revolutions in Iran, the realization of social justice is cited as one of the major and prominent indicators. It can be found in different kinds of resources and documents such as poems, speeches, political debates, rhetoric of social groups and so forth. Therefore a form of emphasis on the concept of social justice has existed in every single social movement in Iran based on its special arrangements and aspects which were shaped socially and politically.

This study aims to narrate the history of social justice in the social movements of the last hundred years in Iran to provide a better understanding of it during this very important period of time and to theorize this concept and its changes over this timeframe.

By making use of documentary method and interviewing some sociologists and social activists, a classification of usages of this concept and their differences, in the history of social movements in Iran, is presented.

Recreational Hunting in Africa: “Meat” or “Poison” for Local Community

Recreational hunting is one of the oldest known tourism activities using wildlife. Leader-Williams (2009) defined recreational hunting as the hunting where the hunter or hunters pursue their quarry for recreation or pleasure. Same as in colonial period, hunters, mainly from Europe and U.S.A., range over hill and dale in developing country to obtain trophy of big game and their pleasure.

Some researchers have suggested that controlled recreational hunting can benefit the development of local communities, thereby promoting the protection of wildlife resources as well as both ecological and economic sustainability. However, important debates remain regarding the social impacts of conservation and tourism on local communities.

This presentation aimed to introduce a social impact of recreational hunting on local community in Cameroon. Approximately two years of fieldwork, mainly based on field observations and interviews, showed that recreational hunting in North Province, Cameroon generated tax revenues of approximately 0.9 million US dollars in 2009/2010, that is, 200 times as large as that of local parks in National parks did in the same year. A part of economical benefits shared with local communities as profit sharing and employment opportunities. However, the local inhabitants were affected by regulations of their rights to use natural resources. Moreover, some villages experienced forced migration because of the beginning of hunting tourism in this area.

Recreational hunting brings to local community not only positive impacts such as profit sharing and employment opportunity, but also negative one as control of the livelihood of local people and forced migration. Even if recreational hunting can play an important role in community conservation and wildlife conservation with its great economic benefit, the independence of local people and their connection with wildlife should be considered to re-conceptualize “Sustainability”.

Ethnic Food As Tourism Resources

This paper aims to examine ethnic food as one of the tourism resources, based on field research conducted in ethnic town in Yokohama city. In Tsurumi ward, Yokohama city, historically many ethnic minorities including Okinawan, Korean, Chinese and Nikkei Latin American (Brazilian, Bolivian and Argentine etc.) have moved to work in industrial complex of coastal areas. Such immigrants have made this area multiethnic. I conducted participant observations to some ethnic groups (Okinawa and Chinese) in industrial complex of coastal areas. Such immigrants have made this area multiethnic. I conducted participant observations to some ethnic groups (Okinawa and Chinese) in this area.

In particular, this paper focuses on entrepreneurs of ethnic food business. For example, ethnic restaurant owners in this area are second generation migrant. They think their business not merely as a job but also as a cultural practice for keeping their ethnic culture. However, some ethnic owners have conflict because they must change flavor to suit Japanese customers’ taste although most of guests think their ethnic food authentic. Besides some first generation do not admit their work as a cultural practice. Multi ethnic condition makes the situation even more complicated.

Taking a tour through these multiethnic migrants and their business, this paper charts an exploratory excursion through arguments that address ‘ethnicity’, ‘identity’, ‘memory’, ‘authenticity’, ‘Invention of tradition’ and cross-cultural encounters within the ‘mixed’ spaces and contradictory imperatives of postcolonial migrant in Japan urban area.

An Analysis of Recent Internationalization of Education in Japan: A Case Study of Nepalese Students

In this paper, we discuss the experiences of Japanese language school students from Nepal, as a case study, to understand the emerging new trends and issues surrounding the internationalization of education system in Japan. In 2008, the Japanese government proposed the goal to recruit 300,000 international students by 2020. Due to the effort of the Japanese government and school systems, the number of international students has been increasing; however, the patterns of international students have been changing simultaneously. For example, Chinese and Korean students, who used to be the most popular group of international students, are now less likely to choose Japan as their destination country to pursue their education. Instead, the number of students from Nepal, Vietnam and Myanmar has been increasing in the last five years.

To explain the new trends, we discuss the push-pull factors for the changes. Also, the international students need to acquire Japanese language skills to be enrolled in the Japanese university system, the Japanese language school often serves as the first school for many international students. For this reason, we focus on the role of Japanese language schools to discuss students’ perspectives on life in Japan. Based on the case study of Nepalese students, we found that the most of them are “self-funding” students. Although they hope to pursue higher education and better career prospects, providing financial support to their families in Nepal has become the top priority. Nepalese students have to work double or even triple jobs to manage the heavy debt from study abroad, high living cost in Japan and support families in Nepal; consequently, many students face challenges to pursue their dreams. In addition, some of them expressed cultural differences and isolation from the society. Based on the analysis, we propose social implications of the emerging trend of international students.

YATES, DAVE* (University of Kent, SSPSSR, dy2@kent.ac.uk)

A Systemic Approach to the Construction of Urban Places

This paper reports on research undertaken across three markets in the centre of London, England. The research adopts an ethnographic approach that focuses on the ongoing process construction. By using in-depth/iterative interviews the work highlighted both the changing narrative that people construct ‘in the moment’ while also highlighting the role of researcher in place construction. This projects works on the premise that it is beneficial to understand places as complicated adaptive systems that are constituted by an array of heterogeneous parts. Places have physical locations and material forms but they are also in part, made up of the very people who experience the place. Understanding such complexity leads the researcher to focus on the ‘how’ of place, rather than the ‘what’, ‘where’, or ‘who’. Rather than attempting to understand place as unique, stable, concepts, this work builds on systems-theoretical approaches towards understanding of places that facilitates both change and permanency so important to architecture and community building theories.

*Study Choice, Gender and Ethnicity*

This study aims to explore ethnic differences in gender specific study choice patterns. The central research question is: to what extent do ethnic minorities present different gender-specific choice patterns in mathematics, science and technology (MST) and what are the reasons for such differences?

The study is based on the premise that pupils with non-western ethnic backgrounds differ in their evaluation of MST-studies from pupils with native ethnic backgrounds as a result of the difference in cultural values. To explore this premise, we first examined the effects of gender, ethnicity and grade averages on school profile choices of 265 pupils in higher secondary education in two schools in the Netherlands. This was followed by semi-structured interviews with 45 individual pupils about their choices.

In our sample 59% of male and 42% of female pupils have chosen a MST-profile, of which 39% of both male and female pupils have chosen this profile in combination with a Health-profile. Moreover, the combined grade average for mathematics and chemistry is shown to have the strongest effect on a positive choice for a MST-profile. Gender also has a significant effect, even after controlling for the combined grade average. Ethnicity however does not.

The interviews reveal that female pupils who choose a MST-profile often did so because of interest in a health related career. The high share of pupils and in particular female pupils with a MST-profile is partially also explained by the wish to keep options open for future educational choices since a MST-profile grants access to almost all fields of study in tertiary higher education. Ethnic background, despite not being significant, is thought to serve as a proxy for social class since pupils with non-western backgrounds have smaller social networks than pupils with native backgrounds through which they can acquire information about choices.

*Class Differences in Women's Work-Care Reconciliation in Contemporary Leeds*

This paper focuses on women's working lives in Leeds, England, where some of the UK's most affluent and most deprived localities are found. The authors compare the work-care reconciliation practices and attitudes of lower and higher educated working women and consider how differences and similarities in these are shaped by local welfare state arrangements and conditions in the local labour market.

The analysis, conducted within the EU-funded FLOWS project, is based on data from a survey of local women and focus group interviews with women who combine paid work with raising young children or looking after old, disabled or sick family members.

While working-class women in the UK have 'always worked', the second part of the 20th century brought middle-class women's mass entry into the labour force. In some other countries, this process was actively encouraged by state provision of publicly funded care services and other policies to support women's attachment to the labour force while raising young children and/or looking after older family members. In the UK's liberal welfare state, childcare and caring for older, sick or disabled adults have primarily been conceptualised as individual/familial responsibilities and care services are currently provided primarily by market actors, rather than by the state. The authors explore the relative importance of the national/local state, cultural preferences and market conditions on women's working lives, and consider how these shape social inequalities between women in different socio-economic circumstances.

*Gender Disparities in How Older Workers Reconcile Work and Care in England*

Carers in England and across the UK have been a focus of policy debate on work and care for several decades. In the 2000s, modest new employment rights (including the right to request flexible working) were introduced to support them to reconcile work and care, and municipalities received new funding from central government to help develop local services to address carers' needs. In national population censuses in 2001 and 2011, the Office for National Statistics collected data about caring responsibilities and these permit examination of the relationship between the (unpaid) care individuals give to their older, sick or disabled family members, friends or neighbours and paid work, age, gender and health. Based on analysis of these data, and supported by insights from two surveys of carers (the 2009/10 Survey of Carers in Households and the Carers, Employment and Services survey undertaken in 2006-7 at the University of Leeds), this contribution examines data on the intensity of caring responsibilities (using hours of weekly care provided as a measure of intensity) and participation in the labour market for men and women aged 45-64. The paper highlights gender differences in patterns of care and paid work, with a particular focus on the extent to which men and women in this age group appear to use part-time work and early retirement as ways of combining work and caring responsibilities. In interpreting these data, the authors also draw on qualitative and policy evaluation studies undertaken by the CIRCLE research group at the University of Leeds. These provide insights into older workers' motivations, preferences and behaviour in relation to work and care, and indicate the complex cultural, moral and institutional contexts which shape patterns of caregiving in later life.

*Forming Counter-Hegemonic Identity through Narration: Personal Stories, Historical Narrative, and the Transformation of National Identity in Taiwan*

Over the past four decades, Taiwan has undergone a dramatic political transition from authoritarian rule to democracy. Accompanying this transition is a major change of the sense of national identification when hegemonic Chinese nationalism has increasingly given way to local Taiwanese consciousness. A series of recent data show that the percentage of people who identify themselves as being Taiwanese has risen from 17% in 1992 to 57.5% in 2013, while the percentage of people who identify themselves as being Chinese drops from 25.5% to 3.6% in this period. Yet few researches have been made on how common people formed a counter-hegemonic national identity on the personal level during the period. To investigate this transformative dynamics, we draw on the theoretical perspective of "narrative identity" to analyze a large number of "letters to the editor" describing personal experiences of identity transformation which were published in two major Taiwanese newspapers during the period from 1994 to 2004, when the change accelerated sharply. We find that a special historical narrative which consisted of a distinctive historical outlook and story line and displayed unique values and emotions served as a common framework of reference for those who began to discredit Chinese nationalism to reassess their individual life history and make sense of their connections with the destiny of Taiwan. It was critical to the formation of the counter-hegemonic Taiwanese identity. We argue that counter-hegemonic identity is typically effectively created and sustained when an elite-derived historical narrative had popular resonance in the sense that it demonstrates a remarkable ability to explain the marginalized and suppressed life experience of ordinary people. Our analysis also shows that the act of narration or story-telling is a key mechanism through which linking individual to society, the present to the past, the micro to the macro, and agency to structure.

*Indigenous Mobility: Experiences and Narratives of Mobility and Immobility of Yami Indigenous Youth on Lanyu (Orchid Island), Taiwan*

Travel, mobility and diaspora are facts of contemporary societies across the globe and their implications are profoundly important. This paper attempts to articulate the significant connections between travel, mobility and diaspora in Taiwanese indigenous Yami society. It argues that the Yami youth from Orchid Island cross the Strait to urban Taiwan for diverse reasons relating to both mobile physical bodies and emotional displacement. The paper offers a range of mobility narratives as reflective accounts cultural diasporic encounters towards a deeper understanding of travel and mobility in contemporary indigenous society. Engaging with multi-sited fieldwork between Taiwan and Orchid Island, in-depth interviews with Yami youth, this paper explores the complexities of the forced 'migration' phenomena of indigenous young people and their experiences and narratives of travel and mobility. It addresses issues that arise when they are 'on the move' and feel a loss due to their emotional attachment to a place whether interpreted as home or homeland. Focusing on aspects of everyday life, this study illustrates the tensions and dynamics of travel, mobility and diaspora. It aims to open a dialogue among tourism studies, indigenous studies and mobility studies in which issues of diaspora and people being 'on the move' are investigated.
Initiatives Collectives De Création D’activités, Circuit Courts De Production Et Citoyenneté Au Travail Au Brésil

L’économie solidaire au Brésil regroupe des travailleurs (informels, chômeurs, pauvres des périphéries urbaines, travailleurs ruraux) ainsi que des organismes communautaires, des mouvements de foi et des syndicats de la CUT (la Centrale unique des travailleurs, principale confédération syndicale au Brésil). Elle a impulsé des formes de développement local reposant sur la notion de circuits courts de production et de souveraineté alimentaire. Ces formes prennent appui sur l’organisation en coopératives autogérées d’agriculteurs familiaux et sur la mobilisation des Communautés traditionnelles (Quilombos, etc.) qui réinvestissent leur savoir faire en matière d’exploitation écologique des ressources naturelles. Elles associent les Catadores, personnes qui ramassent et trient les matériaux recyclables. L’économie solidaire consiste aussi dans des « chaînes de valeur » qui regroupent, par exemple, des coopératives assurant la production du coton écologique jusqu’à la fabrication des vêtements, et leur commercialisation selon une politique de prix accessibles aux familles à faible revenus.

Ces initiatives collectives montrent que la redistribution de richesses s’opère en amont même de leur production, dans les choix de filière d’activité en relation avec les communautés locales. Ces initiatives donnent aussi un contenu concret à ce que peut être la citoyenneté au travail, qui consiste à remettre en cause les divisions traditionnelles entre concepteur et exécutant / intellectuel et manuel, et aussi entre travail marchand et travail de reproduction sociale. Ces réalisations questionnent les deux modèles d’organisation de l’autogestion et de représentation collective. L’étude de cas menée au Brésil auprès de syndicats et du Forum brésilien de l’économie solidaire indique que les initiatives se constituent comme des modèles alternatifs quand elles font appel à des formes participatives et délibératives de démocratie et non au processus habituel d’agrégation des intérêts par des syndicats, qui ont tendance à reproduire les pratiques dominantes.
Struggling to Climb the Organizational Ladder in Turkey

Depending on twenty in-depth interviews with men and women who graduated from top universities of Turkey and who have been working in corporate jobs for more than ten years, this paper reflects on the impact of gender on prestigious white-collar jobs. It aims to answer the question of to what extent gender has an influence on the experiences of a white-collar employee, what it means to be a white-collar employee for a woman, and what kind of factors prevent women from rising up in the corporate hierarchy. It points out that males talk about issues related to gender only when they are directly asked to respond on the impact of gender on work experience, whereas gender has a central role throughout the accounts of females, especially if they are married and have children. For married women with kids, it is not possible to talk about their jobs without talking about how they manage their domestic responsibilities. The paper argues that organizational cultures that emphasize staying at the workplace for extended hours make it very hard for women with kids to climb the organizational ladder, as child care is still primarily considered as women’s responsibility. Women who have reached senior management positions give up, as they get exhausted because of the double shift of paid work and child care. Although these women have above average family incomes and can afford to hire domestic help, because of the traditional ideology that emphasizes the crucial role of mothers for the socialization of kids, they give up their careers and shift to jobs that have regular work hours but no future prospects. Educated in the same way with their male colleagues to be successful and to have achievements, these women end up being unsatisfied with not only their jobs but also their lives.

Research on Public Attitude Towards Social Impact Assessment of Chang E Lunar Probe Program

For a long time, China evaluates engineering’s or project’s impacts mainly by assessing its economic contribution, always lacking social impacts. This study chooses Chinese Chang E Lunar Probe Program and conducts a survey by using questionnaires about public’s attitude towards Chang E’s social impacts. The results suggest that public’s attitude towards high-tech and non-direct-interest engineering’s social impact consists of military impact factor, political and economic impact factor, psycho-social impact factor and educational impact factor. Furthermore, public’s attitude towards Chang E’s social impact is related to age, education level and gender. Public’s attitude towards Chang E’s social impact are more positive than male’s, while the people with higher educational level are more positive than lower educational level. The paper demonstrates that organizational cultures that emphasize staying at the workplace for extended hours make it very hard for women with kids to climb the organizational ladder, as child care is still primarily considered as women’s responsibility. Women who have reached senior management positions give up, as they get exhausted because of the double shift of paid work and child care. Although these women have above average family incomes and can afford to hire domestic help, because of the traditional ideology that emphasizes the crucial role of mothers for the socialization of kids, they give up their careers and shift to jobs that have regular work hours but no future prospects. Educated in the same way with their male colleagues to be successful and to have achievements, these women end up being unsatisfied with not only their jobs but also their lives.

The Business of Housing God: A Case of Singapore Megachurches

Religion and business are often seen as inhabiting separate social spheres but in this paper I explore how they are combined and reconciled in the activities of megachurches. Through two case studies of Singapore’s largest megachurches, I examine how they combine religion and business, focusing on how these churches strategically source to and test the limits of marketing managerialism to manage growth and multiply financial rewards through church building projects. This explicit engagement in business practices not only raise the question of profits in ‘non-profit’ organisations but importantly, foreground the reconciliation of religion and business practices in the same discursive space. I demonstrate this reconciliation through the churches’ built environment-building projects which exemplify the deconstruction of space that characterises not only the religious, investment and consumption practices of these megachurches, but also of the language and practice of business. This not only extends understanding of neoliberal effects but demonstrates the forms and dynamics of marketing managerialism in a specific ‘non-business’ context. In doing so, they reflect the values of economic neo-liberalism which has been a driving force in global economies such as Singapore. Therefore this research is interested in questioning how neo-liberalism privileges business and the market to become the prime factor in shaping religious practices in contemporary churches such as the megachurch in the ‘intelligent island’ state of Singapore. Singapore is famous for being run like a giant corporation[1] and is an affluent country characterised as ‘neoliberal-development’[2]. This is reflected in the religious organisations operating within it, especially megachurches that have pressing space desires, contesting its burgeoning congregation in a highly urbanised and compact city.

Urban Transformation in a Transitional Economy: Is “Gentrification” an Analytically Useful Concept for Vietnam?

Despite the rapid transformation in the urban landscape of Vietnam, a simple and uncritical application of the “gentrification” concept out of the specific spatial and temporal context of the country is problematic. Not only does the phenomenon progress in a highly compressed temporal scale compared to similar processes in cities in the “global north”, it is also embedded within a paradigmatic shift of the entire socio-economic system. This paper attempts to explore the process of urban redevelopment in Vietnam and to critically examine whether this concept, with its origin from the “global north”, is capable of offering a conceptually robust lens through which the phenomena can be consistently analysed. This paper attempts to contribute to such discussion and explore the process of urban redevelopment in Vietnam and offer a critical examination on the applicability of the concept in cities of the global south, particularly within the context of a city in a transitional economy. To enhance coherence of the empirical data being compared, the city of Hanoi is used as the case study city. As the capital and a “political” city of Vietnam, Hanoi is undoubtedly commendable to the typical socio-political forces that are at work in the country. Vietnam examples of redevelopment projects in Hanoi against the context of the specificity of the socio-economic and political transformation of the country, this paper will offer a conceptually robust lens through which the phenomena of gentrification can be critically analysed in the specific context of Vietnam.

Civil Society Organizations and Cultural Repertoires of Evaluation in the Media Debate on Climate Change: Comparing France and the United States

National political cultures have an effect on how global political problems are constructed in media debates in different countries. Our starting point is that the repertoires of moral evaluation used to justify arguments related to the problem of climate change are likely to vary between countries, and that these differences may, in turn, affect policy responses. Civil society organizations, we argue, have a particularly important role in bringing moral evaluations into the debate. In this paper, we compare the argumentation of civil society organizations and their allies and opponents in coverage of UN climate change conferences in Le Monde and the New York Times between 1997 and 2011. We find that arguments are more often justified by appealing to civic values like equality, democracy and social and legal regulation in France, while monetary value plays a more important role as a justification for climate policy arguments in the United States. These differences are not due to differences in the selection of sources by journalists, but seem to reflect deep-seated cultural differences. In France, even business organizations often resort to the civic mode of argumentation while in the US, civil society organizations often justify their arguments in economic terms. Over time, we see convergence in both countries towards arguments based on the idea of ecological modernization; economic growth, technological progress and ecological values are increasingly seen as supporting each other. Radical ecologist and radical pro-market arguments are both becoming more marginalized.

Crowding in: Why and How Indian Civil Society Organizations Began Mobilizing on Climate Change

In this paper, we argue that a process of crowding in of civil society organizations (CSOs) into the field of climate change advocacy has occurred in India since around 2007. Both the number and the diversity of CSOs involved in this field of advocacy has greatly increased. Drawing on the Dynamics of Contention approach, We identify five mechanisms that explain why and how this process has unfolded: (1) The expansion of discursive opportunities in the global public sphere, (2) the event effect of Copenhagen COP 15 in 2009, (3) the network effects of expanding global civil society networks of climate change advocacy and the resulting flows of discourses and funding, (4) adoption and innovation of new action repertoires, and (5) the global political pressure effect leading to development of national climate policies and corresponding opportunities for CSOs to influence their formulation and implementation.

YLÄ-ANTTILA, TUUKKA* (University of Helsinki, tuukka.yla-anttila@helsinki.fi)

Populism As Politics of Personal Experience: The Case of Suvivirsi

In this paper, I will present one possible sociological interpretation of conserva-
tive populism, recently of rising popularity all over Europe. I will base my analysis on
Lauren Thévenot's sociology of engagements and use texts from candidates from the
conservative populist Finns party in the 2011 Finnish parliamentary elections as
empirical examples. In the texts, the candidates appeal to the shared national
experience of singing a traditional Christian spring hymn, Suvivirsi, as schoolchildren. I will argue that populism can be interpreted as an attempt to ex-
pand the gamut of acceptable political claims to include claims based on personal
experiences, where the physical and emotional proximity to significant persons
and objects is of crucial importance.

This is in contrast to a typical requirement in mainstream politics: to distance
one’s self from one’s demands. It is customary to present political claims as based
on universally accepted and abstractly communicated principles of justice such as
democracy, the market mechanism or technical efficiency, instead of mere per-
sonal preference. The populist mode of argumentation is in stark contrast partic-
ularly to typical Finnish expectations of politics, focused on efficiency.

To make this argument, I need to present four elements: first, Boltanski &
Thévenot’s theory of public justification; second, a brief overview of Finnish po-
litical practices; third, Thévenot’s sociology of engagements; and fourth, the case
of Suvivirsi and the populist and non-populist practices in which it is used in na-
tional political argumentation. I conclude with a discussion of the implications
of this interpretation, pointing out that nationalist politics made with reference
to personal affinities can be even more exclusionary than ones based on public
justifications. On the other hand, however, an acceptance of personal affinities
into politics is also a possibility for political movements of other types, not just
reactionary conservative nationalism.

Nuclear Energy and Safety: International and National Isomorphic
Pressures

Nuclear safety has often been an accident driven topic as the Three Mile Is-
land, Chernobyl and Fukushima disasters show. In addition to accidents, severe
economic and environmental challenges related to the construction of new nu-
clear power units and management of ageing plants and new technology, not to
mention decommissioning of existing older units keep nuclear energy and safety
among the relevant topics. Furthermore, the recent upgrading of safety require-
ments at the national and international level and harmonization attempts of nu-
clear safety regulation by the Western European Nuclear Regulators’ Association,
raise questions about the cultural features of nuclear safety regulation.

The aim of the paper is to explore how nuclear safety (that is an important
component of human and environmental health) has been dealt with in the inter-
national and national level in Finland and the UK after Fukushima and what kinds
of factors constrain learning. The data consists of the International Atomic Energy
Agency’s Safety Standards, Western European Nuclear Regulators’ Association’s
reports and the OECD Nuclear Energy Agency’s reports, the national final reports
of the Stress tests of Finland and the UK, national nuclear energy act and safety
guides. The method of analysis is content analysis.

The conceptual frame draws on the isomorphic pressures, which refer to the
phenomenon by which organisations become structurally or strategically homo-
geneous. Isomorphic pressures, stemming from national institutional patterns or
professionalisation of certain sector may play a role in the nuclear sector, since
they affect the what, how and who of safety-related action. Isomorphism is im-
portant to the extent that it may strengthen and spread effective understandings
of, and approaches to, safety, but it may also engender inability to detect specific
needs and requirements or it may lead to contrasting understandings and ap-
proaches among bodies involved in nuclear safety that are exposed to different
isomorphic pressures.

How Social Class and Education Affect Youth Transition in Japan?:
Youth Cohort Study of Japan

The purpose of this report is to clarify how social class and education influence
young people’s transition in Japan from Youth Cohort Study of Japan (YCSJ). In the late 90’s,
the life cycle after secondary school graduation have significantly changed. The
close connection between upper secondary schools and employers to smoothly
transition the graduates into work in Japan had been once highly praised, but the sys-
btem became less functional due to several factors (Mary C.Brinton, 2011, Lost in
Transition). Many young people cannot get permanent and secure jobs, so some of
them become ‘Freeters’ who only get temporal and insecure jobs to make a living.
Many empirical studies have taken place to find who are the most disadvantaged
among Japanese youth, trying to find what causes the dysfunctional transition
between school and labor market in the 2000’s. However, most of these studies
focused on the youth transition during only a certain period of time, and they are
not sufficient to clarify the complexity of youth transition. YCSJ has conducted a
panel survey of a group of youth for five years from their age of 20, so that YCSJ is
able to capture the dynamic young people’s transition in consideration of various
factors. Above all, we aim at unraveling how youth transition differentiated with
social class and educational opportunities.

A New Attempt At Organizing Irregular Workers In Korea:
Examining The Activities Of The Korean Women’s Trade Union

It is difficult to organize irregular workers, especially female irregular workers
in Korea, as many of them are employed by small enterprises, change their jobs
frequently and enter and leave the labor market according to economic fluctua-
tions. Therefore the Korean Women’s Trade Union (KWUT) has tried to build a new
model of trade union and a new idea of a labor movement which are different
from the enterprise unions for male regular workers in order to organize female
irregular workers who have been entirely excluded from the protection of labor
laws, the welfare system and the trade union. While the enterprise unions have
concentrated on protecting employment and improving working conditions of the
unemployed, the KWUT has been an independent women’s trade union which any working woman can join by herself without distinction of
industry, occupation or region, or whether she is unemployed or not beyond the
enterprise, and performed various activities. In this presentation, we consider the
activities of the KWUT as well as its implications.
The Rise of ‘Reflexive University Governance’ in the Risk Societies: Japan, the United Kingdom and the United States

Socio-economic upheavals after the Lehman Shock, and in European countries, the introduction of austerity measures have financially overshadowed the university sectors cross-nationally. The purpose of the paper is to identify how uncertainty and insecurity in the post-2008 period have re-shaped university government relating to risk management. The study examines university governance at the system and institutional levels in Japan, the United Kingdom and the United States.

The paper is both theoretical and empirical driven. The study takes the theoretical approach by utilising two conceptions of ‘peer reflexivity’ and ‘risk’ in the context of university governance. The former refers to the ‘cycle of peer feedback, self-monitoring, self-analysis and action. Higher education institutions are treated as learning organizations’ (Clark 1998; Dill 1999). This latter explores Becks’ (1992) and Giddens’ (1999, 1991) risk society. The study then proposes, a new concept, ‘peer reflexive governance’, which is compared with Foucault’s neo-liberal ‘governmentality’ (1988, 1991) to capture the characteristics of ‘peer reflexive governance’.

Regarding empirical analysis, the study takes documentation for data collection in order to identify the extent to which the institutions in three country settings are autonomous (not in direct state control modes), making the peer reflexive mechanisms feasible. The collected document includes acts, government White Papers, circulars and other official documents.

The paper argues that ‘peer reflexive governance’ has become significant in the insecure and uncertain environment in the post credit crunch period because the universities have become increasingly more self-aware, reflective, and reflexive than ever before. The universities have strengthened their self-monitoring mechanisms in order to respond to uncertainty and risks, shaping them into learning organizations. The practices of peer reflexive governance’ however, differ between Japan, the United Kingdom and the United States.

The study is significant because few literatures so far connect the conception of ‘risks’ to university governance.

Change in Juvenile Delinquency in Japan

In Japan we witness four peaks of juvenile delinquency after the World War II. Immediately after the war the Japanese police system was democratized. However, the police did not have resources enough to carry out the activities for prevention of juvenile delinquency. With the recovery of economic conditions the police established the system to prevent juvenile delinquency. Since then the police have carried out the net-widening of their activities for the prevention of juvenile delinquency. I will explain how the net-widening has been carried out.

Survey of Standardization in Tsuruoka, Japan

Survey of Standardization in Tsuruoka, Japan

Comparison of results from four surveys conducted at 20-year intervals YONEDA Masato, MIZUNO Yoshimichi, MAEDA Tadahiko, ABE Takahito.

The present study briefly reports the result of “Survey of Standardization in Tsuruoka” (hereafter abbreviated as SST). SST is a cooperative research project between National Institute for Japanese Language and Linguistics and the Institute of Statistical Mathematics since 1950, when the first survey was administered in central area of Tsuruoka, a local city in Tohoku district, Japan. Since then the project has been repeated at about twenty-year intervals (we administered the fourth survey in the fall of 2011). This project aims at describing the process of language standardization in Tsuruoka in both societal and individual levels.

SST is a combination of Area survey and Panel survey. In the Area survey, informants were sample randomly drawn in each survey occasion from the residential register of the target area. The aim of the Area survey is to capture the standardization process in societal level. In the Panel survey, respondents of the first, second and third Area surveys were followed up in the subsequent occasions and asked to answer to the same items. The aim of the panel survey is to investigate the typology of life-span linguistic change in individual level.

The sample size for the Area survey in fourth SST was 700 and number of respondents was 466 (response rate 66%). Panel survey in the fourth SST consists of three groups, four-time repeaters from the first survey, three-time repeaters from the second survey, and the two-time repeaters from the third survey. The total of the eligible sample for three groups was 437 and the number of respondents was 333 (response rate 76%).

In the presentation, we will report on selected results of the fourth survey on several items.

Japanese Language Education for Japan-Philippines Economic Partnership Agreement

This paper asks how Japanese language education for Filipino nurse candidates under JPEPA can be located in the Philippine socio-cultural settings, in order to provide academic grounding toward more meaningful policy making for both governments. The study aims to provide academic grounding toward more meaningful policy making for both governments.

Foreign nurses’ entry to Japan presents a unique pattern of migration from the point of view of language learning. It pertains to adults who learn a foreign language from the beginning; yet are required to reach a high level of proficiency. Historically speaking, adult migrants often meant either unskilled workers who are not required high level of language skills; or skilled workers who already know the language of the host country. In any cases, the movement often took place from a former colony to a former sovereignty. As for Japan and the Philippines, although Japan occupied the Philippines for a few years during World War II, linguistically speaking, there is a fairly strong tradition of Filipinos being a former generation of Filipinos today. Also, due to the eligibility constraints, it is unlikely possible to find an EPA candidate who has received higher education in Japan.

The paper illustrates the socio-cultural situation in language practice in the Philippines at large and points to the both governments’ weakness in systematic understanding and addressing it – a multi-lingual-ness with ambivalent relation with English as both colonial and global language; b) prominence of orality over literacy; c) weaker establishment of Japanese language education than other Southeast Asian countries in quantity and quality; and d) class issue in gaps in motivation and needs of Japanese language learning.

University Governance and the Academic Profession in “Rising” East Asia

The role of universities is increasing with the rapid growth of the knowledge economy across the world. At the same time, universities are also being called upon to change their governance and management structures in order to transform themselves into the core sector of the globally competitive knowledge industry. Salmi (2008) suggests that “world-class” universities and higher education systems require favorable governance with autonomy and academic freedom. Terms such as “entrepreneurial universities” (Clark, 1998) and “academic capitalism” (Slaughter and Leslie, 1999), however, imply that traditional “collegium” governance is at risk. Most East Asian higher education systems have been established and developed through strong intervention by national governments, and, therefore, granting of academic freedom and autonomy has been relatively slow and recent. Namely, the top universities in these “Post-Confucian States” (Marginson, 2011) are now achieving “world-class” status without experiencing the strong “collegium” governance pattern of the past. Japan could be an exception, having developed a strong academic freedom and autonomy led by the faculties since World War II. However, now, top Japanese universities are faced with stagnating performance in both research and education. As a result, there have been calls from business and government for drastic reforms of their governance to enhance their chances of survival in the growing competition with universities and other knowledge industries in Asia and around the world. By utilizing data from the Academic Profession in Asia (APA) survey among selected Asian countries in various development contexts gathered by Arimoto et al., the author examines the following questions: Is it possible to establish highly competitive universities without a strong tradition of collegium culture? If so, as seen in the emerging Asian countries, what are the implications for the mature university governance typically seen in Japan and Western Europe?
The role of universities is increasing with the rapid growth of the knowledge economy across the world. At the same time, universities are also being called upon to change their governance and management structures in order to transform themselves into the core sector of the globally competitive knowledge industry. Salmi (2008) suggests that “world-class” universities and higher education systems require favorable governance with autonomy and academic freedom. Terms such as “original universities” (Clark, 1998) and “academic capitalism” (Slaughter and Leslie, 1999), however, imply that traditional “collegium” governance is at risk. Most East Asian higher education systems have been established and developed through strong intervention by national governments, and, therefore, granting of academic freedom and autonomy has been relatively slow and recent. Namely, the top universities in these “Post-Confucian States” (Maring- son, 2011) are now achieving “world-class” status without experiencing the strong “collegium” governance pattern of the past. What Leads to High Participation in Tertiary Education?
The relationship between demographic change and investment in education is one of the topics that has attracted considerable attention from both policymakers and experts. Extended education increases the social and private costs of raising children, and has been considered a major factor in the decline of birth rates. At the same time, the growing knowledge societies require a high level of participation in higher and post-secondary education. Individuals tend to utilize advanced educational qualifications for migration to world cities and knowledge clusters, but also simply for securing stable jobs in their hometowns. The relationship between the growing patterns of tertiary education enrollment and demographic trends is not that simple. There are various approaches for achieving high levels of participation in tertiary education in different countries and economies; in cost sharing between the public and private sectors, in the distribution of resources within tertiary education systems and institutions, and in regulatory frameworks for sustaining and enhancing academic excellence and a minimum quality of education and training. In this study, the authors examine patterns of achieving high levels of participation in tertiary education, focusing especially on their relationship with demographic changes. Then, the authors identify the characteristics of these patterns in Japan and other East Asian countries where the higher education systems are financially highly privatized, but under the strong guidance of national governments. Lastly, the authors conduct a detailed case study on the reality of the high-participation tertiary education system in Japan as a country facing a very serious aging problem, and outline the implications for international discussion.

Food Sovereignty and the Politics of Food Insecurity in South Korea
Food Sovereignty and the Politics of Food Insecurity in South Korea

As South Korea has become one of the fastest industrialized countries in the world, it has also been one which experienced a dramatic decline in agriculture. Between 1970 and 2011, the share of agriculture in GDP dropped sharply from 25.4% to 2.3%. The collapse of agriculture has been accelerated by the global agri-food system and the government’s neo-liberal agricultural policies. As a result, food insecurity is one of the most important social issues in South Korea, today. Food insecurity can be understood not only as low grain self-sufficiency, 22.6% in South Korea; but also, as food safety problems. The Korean government, however, has prioritized overseas land exploitation and has recently strengthened neo-liberal agricultural reforms such as the FTA. Under these circumstances, the food sovereignty movement, which was originally advocated by La Via Campesina, has been discussed among the South Korean civic and peasant movement sectors. In order to establish food sovereignty, the peasant movement sector is urging the South Korean government to secure stable production, while the civic movement is advocating rights to food project. Considering the fact that consistent food insecurity has threatened not just the farmers’ livelihoods, but also the consumers’ dining tables, the concept and practical application of food sovereignty may bring many groups together. Building a consensus between civic groups and farmers’ movements seems to be more feasible in Korea, under these conditions. The aim of this paper is to analyze the various actors, and their dynamic interactions involved in food sovereignty, in South Korea. We investigate the mechanism of the politics of food insecurity and food sovereignty by examining two major cases in South Korea involving the full-tariff on rice, and the import ban on fisheries products from Japan, due to radioactive contamination.

Examining Factors Contributing Spontaneous Volunteerism in a Disaster Situation: The Case of the 2009 Red River Flood

Spontaneous volunteers play a significant role in times of disaster. Before governmental and organized voluntary disaster agencies arrive in sufficient strength, civilians often spontaneously mobilize to protect their lives and belongings in the early period of disaster. This study uniquely examines the characteristics of spontaneous volunteers at three different levels of flood stage risk during the 2009 Red River flood in Fargo, North Dakota’s response to the 2009 Red River flood threat. The Red River crested at a record level on March 28, 2009. More than 20,000 civilians volunteers spontaneously mobilized and gave of their time to respond to the threat of Red River flooding. Unaffiliated volunteers signed-up at coordination sites throughout the city and filled more than 3 million sandbags and piled these sandbags along the riverfront. Sign-up data from 11,553 volunteers were geo-coded to connect volunteers to the local area’s 96 census block groups. Data on these census block groups were then compiled from the American Community Survey (ACS) 5 year data (2006-2010). Factors in terms of socio-economic and geographical characteristics of spontaneous volunteers are examined before, during, and after the flood stage at the 2009 Red River Flood. Findings show that education, race, age, occupation, and geographic factors are significantly associated with volunteerism along with different levels of risk in the case of the 2009 Red River Flood.

Brain Circulation and Transnational Identity of Asian Students Studying in Asian Countries

This paper is based on an empirical comparative analysis of study-broad students from Korea, China and Japan. By focusing on the phenomenon of regionalization of higher education, the study compares international students’ mobility within Asia, construction and transferability of human resources, and formation of transnational identity. The study specifically focuses on Korean, Japanese, and Chinese students studying in institutions of higher education in Korea, Japan and China. This study is based on a survey study among Asian students studying abroad in South Korea, Japan and China. The survey was conducted in Korea from October 2012 to December 2013 among 405 students; in Japan from October 2012 to February 2013 among 319 students; and in China from December 2012 to April 2013 among 312 students.

The most significant research findings are as follows. With regard to students’ career plans, the three groups of international students showed high rates of those who plan to return home five years after studying abroad at around 40-50% and a relatively high rate of those who plan to migrate to a third country at around 20-25%.

Regarding the transferability of education, all three groups indicated high assessments of transferability. The data shows that all three groups believe that their education from home country is transferable in the host country and that their education through studying abroad is recognized in their home and a third country. While experiences of studying abroad positively increased awareness for regional community and transnationalism, it did not meaningfully affect the students’ national awareness. Such result illustrates that national identity remains central to Asian international students. This result is interpreted as stemming from the continuation of close connections between the individual and the nation.
state as Northeast Asia experiences a conservative shift and territorial and histori-
cal disputes are reignited.

The New ICTs and Gender Inequality in Korea

This presentation aims to explore the implications for gender inequality of the increased access to and usage of mobile ICTs, based on the data collected in Ko-
rea. Korea used to be no exception to the conventional digital divide in which women, compared to men, are disadvantaged in the use of ICTs. In recent years, how-
ever, there has been a remarkable increase in Korean women’s access to in-
ternet and, specifically, mobile internet technology. Women have surpassed men in the number and proportion of ‘smart’ mobile phone users. Among young gen-
erations, in particular, girls, compared to boys, tend to have access to the mobile phone earlier and use it more frequently and longer in duration of time. In 2011, Korean children are reported to own their first mobile phone at the average age of 10.4 years (fifth grade at elementary school), and 80% of the third graders at elementary school owned it.

What would be consequences in terms of gender inequality of this earlier and increased exposure to mobile internet technology represented by the ‘smart’ phone? On the one hand, the user friendliness of the new technology has the potential of narrowing or eliminating the gender gap in its professional and fi-
nancially lucrative utilization, and its mobility in time and space potentially brings the liberating effect for women both in employment and domestic labor. On the other hand, however, there are concerns that the easy availability and access to the mobile technology would lead to continued gender inequality, in which women remained mere consumers, and increased vulnerability to the new problems brought by the new technology, such as digital/mobile addiction. This presenta-
tion investigates the consequences of the new ICTs in gender inequality and their implications to cope with the gender inequality at present and in the future.

Cultivating Ethnic Solidarity in the Transnational Enclave: Co-
Ethnic Relations Between South Korean “Newcomers” and Korean-Japanese/ Korean-Chinese “Oldcomers” in the Korean Enclaves in Osaka and Beijing

Recently, scholars have noted that migrants exhibit distinct patterns of adapta-
tion characterized by frequent movement to their countries of origin. This influx of transnational migration has in turn, altered the structure of historically estab-
lished minority communities. My research investigates how changes in the ethnic community structure brought about by transnational migration have the shaped the ways ethnic minorities construct notions of ethnic identity, using ethnographic, interview and survey data conducted in the Korean enclaves in Beijing and Osaka.

The Korean enclaves in Beijing and Osaka are characterized by two distinct waves of Korean migrants: recent South Korean transnational migrants, and third- and fourth-generation Japanese/Korean Chinese minorities. As a result of the growing number of South Korean newcomers since the 1990s, the Koreanmigrants in Beijing and Osaka today have become increasingly connected—
both on the institutional and grassroots level—to the homeland. But rather than strengthen sentiments of ethnic identity, increasing contact to South Korea has led to the growth of formidable barriers in constructing a collective ethnic con-
sciousness within the Korean community. Damaged co-ethnic relations between the two waves of Korean migrants have significantly hindered their ability to mo-
bilize the rich transnational resources in the enclave for upward mobility. This paper brings to light the structural barriers Korean migrants encounter in cultivat-
ing ethnic solidarity in the transnational enclave. In doing so, I offer suggestions for social welfare policies that may aid transnational migrants in more effectively cooperating together to mobilize the resources of the enclave to better their life chances.

Lessons Learned from Great East Japan Earthquake - Birth Outcomes in the Catastrophe of Highly Aged Country

The Great East Japan Earthquake and Tsunami occurred in 2011/3/11 and this disaster revealed health care issues that Japan already had. One is the lack of attention for maternal health care in the highly aged society and the other is de-
creasing OB/GYN providers in the Tohoku area. It was hard to see pregnant peo-
lple and babies in the highly aged country like Japan, however, there were a few expecting mothers left in the cold, hungry and anxious in another place. They were not prioritized as a vulnerable population. Continuing research of 11 hospitals and 37 clinics in one prefecture in the devastated area showed that most of pregnant mothers stayed more than 3 evacuation shelters to find a safer place to live and half of the pregnant patients could not find a way to go out from the Tsunami area to have birth. With more than 200 patients who could succeed to transport to another prefecture, their average delivery time (weeks of gestation), weight of baby, preterm birth rate, low birth weight rate, amount of blood loss and another birth outcomes of this catastrophic area tells us the importance of the pre-hospital OB/GYN care team in disaster response and safety confirmation system for mothers and babies. We should strengthen the perinatal care in highly aged society where mothers are “minority”. There is a generation inequality in health care of highly aging society like Japan - perinatal health care is less concern than elder care. 10 obstetricians set up a project specialized for pre- and postnatal care, and carried out medical activities in these disaster-strick-
en areas by taking care of pregnant and postpartum patients from April 1st until September 3rd, 2011. With dispatched specialist after natural disaster and built the visiting system and correct birth outcomes and neonatal health outcomes.

Who Takes Part in Anti-Nuclear Actions? a Case Study of the Organizations of Evacuated People from Fukushima Plant Area and Their Attitudes Concerning Nuclear Energy

It is often assumed that the people of Fukushima, especially those who lived near the nuclear plants, are increasingly aware of the impracticality of Japan’s nuclear energy policy as they have been replaced by active opposition or evacuation zones. In this paper, the author asks whether the assumption is valid in any case, and if it isn’t, what are the reasons for the cases that goes against the assumptions. This study will examine some of the reactions of the recently taken organized organiza-
tions based on the areas bordering the Fukushima prefecture and other prefect-
ures in the more distant.

First it is shown that, as long as each organization represents the people who lived in the same municipality before the devastating event of March 2011, the extremes of both now passionate “anti” or “pro” opinions concerning the nuclear energy policy have been embraced by some of these organizations. Second, it is demonstrated why these people have taken either “pro” or “anti” stances in the process of the disaster followed by the nuclear accident, and the author points out that these attitudes are affected not only by their experiences
after the beginning of the disaster, but also by their life-styles before the disaster and their memories of these life-styles.

Third, the question of whether these organizations have simply endorsed or excluded some of these "anti-" attitudes or the "pro-" attitudes is discussed; rather, here we see the unexpected effect of the "anti-nuclear" discourse on the formation of these very people's doubts about the discourse; but even this adverse effect has not resulted in showing anti-"anti-nuclear" discourse. Hence scholars may expect that time will ease the unfortunate misunderstanding about the anti-nuclear opinions; however, this could take a generation, which may be too long a time for some witnesses.

Aging Problems in Suburban Neighborhoods: A Case of Hiroshima Region

The Japanese suburban neighborhoods that were developed in the 1960s to 1970s are standing at a crossroads; one path leads to sustainable communities to which young people move, while the other leads to "ghost towns" in which both young generations move out when they grow up and old people leave their houses because of residing in a nursing home. Regarding the demographic characteristics and changes in occupation of Japanese suburbs, a large number of housing estates are at risk of heading towards the second road. Aging and the increase in vacant houses is one of the most serious and urgent topics to be surveyed by scholars in a variety of academic backgrounds. This paper examine (1) aging problems in Japanese suburban neighborhoods with GIS methods, and (2) relationship between aging and increasing vacant houses in Hiroshima region; and (3) finally, we discuss generative process of vacant houses in local cities.

A Sense of Absence: A Reflection on Ethnography of Walking in Yokohama and Vancouver

This paper reflects on our ethnography of walking, part of our larger cross-Pacific project on the formation and regulation of communities of sex-workers, which we have been conducting since the summer of 2012 in former-brothel-distritcs of Yokohama, Japan and Vancouver, Canada, places that are commonly marked by absences of material and discursive traces and documentation of communities of sex workers. We discuss how we came to make sense of and engage with the places through our sense of the material absences but "ghostly" presence (Gordon 2008) of sex workers' bodies and brothels. We also discuss how our affective responses such as frustration, numbness, boredom and anger, which we experienced when encountered the production of those absences, enabled us, emplaced ethnographers, to make the absences visible and envision an ethical way to engage with the spaces whose communities were uprooted and memories have been marginalized, erased or forgotten.

Women's Hair Loss from the Perspectives of Body and Gender

This research aims to pursue the social cognition on women's hair loss (women's baldness) due to alopecia, and to clarify the structure of oppression on which they were placed from the perspectives of body and gender. Through this study, I want to point out that women's hair loss should be argued as a sociological object rather than just a medical disease.

Until recently, hair loss was mainly identified as alopecia in a medical or psychological research. By the previous studies, mental difficulties of women with alopecia are clarified (Eckert: F1976, Van der Donc et al.: F1994), and the usefulness of wearing wigs as the ways of coping is shown (Nakajima, Nakayama:2002). However, in these researches, it isn't clarified about the problem experience after wearing wigs.

So, this research uses Goffman's passing theory (Goffman: 1968) and analyzes the narrations of 14 bald women with alopecia area who wear wigs.

This study draws the following discussions. Firstly, the point of view of the concerned individual, wearing a wig itself is a disability for bald woman and it's based on the cultural norm which considers hair as the symbol of femininity. Secondly, one reason behind the production of the disability as being the existence of "close others" (family), who force or encourage the individual concerned to wear wigs.

As the encouragement by society and the intimate sphere to wear the disability is seen, another reason is being the existence of "close others" (family), who force or encourage the individual concerned to wear wigs.

In conclusion, women's hair loss is seen both as a physical abnormality (disease) and as a deviation from the gendered body's norm, and that these two consequences place the issue in a structure of double oppression.

Cultural Manifold Analysis (CULMAN) for Cross-National Comparative Survey

Cultural Manifold Analysis (CULMAN) for Cross-National Comparative Survey

The objective of this presentation is to show our paradigm called Cultural Manifold Analysis (CULMAN) for the comparability of cross-national surveys. This paradigm has been developed in the longitudinal and cross-national surveys on national character by the Institute of Statistical Mathematics (ISM) over the past six decades since 1953. First, I summarize our paradigm of cross-national and longitudinal surveys. Second, I summarize some Japanese social values and, among others, aspects of people's sense of interpersonal trust shown in our longitudinal survey of Japanese national character. (See http://www.ism.ac.jp/ism_info/e/koku_e.html)

Thirdly, I present cross-national comparisons of interpersonal and institutional trust as well as some basic social values based on our past surveys, including the Seven Country Survey (surveys of seven-countries (Japan, USA and five European countries)), the East Asia Values Survey (EAVS) (2002-2005), the Pacific-Rim Values Survey (PRVS) (2004-2008) and the Asia-Pacific Values Survey (APVS) (2010-2014). (See http://www.jsps.go.jp/j-grantsinai12_kiban/ichiran_22/e-data/e33_yoshino.pdf). The results show that East Asian countries have already departed from traditional Confucianism and that people share more common social values beyond the distinction of East and West. Fourthly, I present an overview of data on Japanese immigrants in Brazil, Hawaii and the U.S. West Coast in order to study the interaction between the environment and ethnicity. Finally, some comments are provided for our future research.

The Representation of Wdding News in Taiwan: Critical Thinking About Romantic Love, Capitalist Ideology and Gender Politics

This research explores the representation of weddings news in mass media in Taiwan. Focusing on the gender/sexual politics, the researcher examines how wedding events are reported on mass media. In terms of textual analysis, the researcher discusses the gap between the wedding news representation and the
social reality. Additionally, the implied ideology is examined. Hopefully, the result could be transformed into teaching materials for the graduate course of sociology of gender.

Wedding as an event affects and is affected by a combination of external and internal constraints and expectations. In modern Taiwanese society, weddings are big money, and most people want to get in on the act. Thus it may be said that wedding consumption is related to emotion as well as interpersonal relations. The researcher is interested with how wedding is reported on mass media and how these representations will affect people's cognition and attitude.

Heterosexual relations and gender stereotype roles in the wedding events have been depicted in certain ways. These images also convey illusion of romantic love ideology. Popular culture plays a key role in naturalizing the capitalist as well as the gendered pattern. The present research attempts to analyzed the wedding news to explore the implied gender ideology.

We are living in an age often portrayed as being dominated by consumer capitalism and the products of capitalist popular culture. It is important to acknowledge the influence of the mass media in shaping people's identities and daily lives. Combining gender analysis with sociological inquiry, the researcher believes that the study on the representation of wedding news could provide some insights for the teaching practice of critical media literacy, gender equity education and relationship education in universities.

YOUKHANA, EVA* (University of Bonn, eva.youkhana@uni-bonn.de)
The Power of Religious Objects in Transnational Migration

Since the economic crisis in Spain hit most migrant households as the most vulnerable, religious institutions such as the Catholic Church, are becoming increasingly important. Their houses act as reference points by which the immigrant community is kept together. Tangible assistance is offered and transnational communication structures and family bonds are sustained. Being assisted by local Saints, the Catholic Church serves as a place of remembrance to produce and reproduce senses of belonging that date back to the early colonial era. Social relations of migrants are manifested in a symbolic way which symbolizes the power and glory of the former Colonial regime. Giving the example of the congregation of San Lorenzo in an immigration neighborhood in Madrid, it is shown, which role and agency religious artifacts play in re-producing collective identities and allocating social and financial resources. By focusing on the object itself (not necessarily its symbolic representation) the functions and cultural meanings of the figure in different historic contexts become apparent. The religious staging around the object of the Saint show spatially and chronologically comprehensive chains of interaction which reflect deep seated power relations between the immigrant and the host communities.

YOUNG, ARIEL* (Uppsala University, ariel.young@statsvet.uu.se)
Economic Crisis: Toward the Erosion or Stability in Individual Welfare State Preferences?

Understanding voter preferences for the welfare state and how they are formed has become an important basis for making claims about either the erosion or continued stability of the welfare state.

In the past decade evidence has mounted to point towards a relationship between individual measures of economic hardship risk and support for the welfare state. However, most of the research has been constrained to limited time-series data that evaluates this relationship under relatively stable business cycles which seldom affects individuals belonging to more secure economic groups (high skill, high income). In light of the increasing global economic instability that places these individuals at greater risk, it becomes important to determine if they will respond differently and change the direction of aggregate support for the welfare state.

This paper will examine in detail how different class groups respond to increasing risk, in particular more economically secure groups, and identify if recent findings of increased aggregate support as well as class convergence in Sweden hold or if they resemble a recent study that demonstrated a decline in welfare state support in the United States following the 2008 economic crisis.

The leverage of this study is based on the use of (1) exogenous properties of the 2008 economic crisis, (2) a Swedish survey that reflects respondents' welfare state preferences and socio-economic attributes that spans seven consecutive years sampling approximately 3000 respondents per round, and (3) a design which employs a difference-in-differences method to compare individuals across municipalities. Municipalities are sorted according to those that experienced an immediate substantive spike in unemployment and those that experienced little change, which resembles a treatment and control group respectively. This design reduces endogeneity to make stronger claims for causality, improves estimation of increased economic risk on more economically secure groups, and consequently overall changes in public preferences.

Racemaking in New Orleans: Racial Boundary Construction and the Prospects for Social Change

This paper explores how an ideologically diverse group of affluent, white American college students respond to and process evidence of white racism and racial and class inequality in their immediate environment. It is based on an ethnographic study of Tulane University students living in post-Katrina New Orleans. Although participants' responses to racial and class inequality within and without New Orleans support their racial attitudes and ideologies are anything but uninfluenced by their experiences in New Orleans. Drawing on anthropological and sociological theories of racialization, we suggest that students' socio-political inactivity is linked to their continuous construction and reinforcement of racial boundaries between themselves and local African American residents of New Orleans. Importantly, although there are some differences, these boundaries are constructed by participants who subscribe to different racial ideologies (e.g. color-blind racism, racial progressivism), we find the outcome to largely be the same. White Tulane students distance themselves socially from African Americans in the city, reinforcing social boundaries while deterring students from desire to combat structural inequalities. The findings offer valuable insights into racial boundary making processes and the socio-political implications of such boundary construction in the United States.

Communal Entrepreneurship in Shanghai Commercial Streets: The Cases of Tianzifang and Minxinglu

This paper presents the cases of Tianzifang and Minxinglu commercial streets. In both sites, commercial development implicates two broader social processes - the global rise of gentrified neighborhoods, and rapid urban sprawl sustained by state and local authorities. Despite the illegality of shops and the inaction of state authorities, this peculiarly anarchist arrangement nonetheless facilitated the commercial success of local streets. Such practices of Jugaifei also received popular support, thanks to the increasing availability of consumable goods.

Our second key concept is immigrant entrepreneurialism, which can also be found in both cases. In the case of commercial streets, people from rural regions operated businesses to meet the daily needs of local residents. While the former type of commercial streets is tailored to middle-class consumption, the latter satisfies the otherwise unmet needs for consumable goods in the neighborhood.

We conclude with a discussion of CE, which is the core spirit of commercial streets in Shanghai; it enabled the intersection of residents, community, and entreprenuers, leading to the communalization of street commerce.

Weibo and Inequality in Disaster Coverage

The disasters today have the characters of uncertainty and inequality. This article focuses on the two big earthquakes happened in the last five years in Sichuan province, China. It explores the way to reduce the inequality in disaster coverage by researching the changes of the form of news report.

In the disaster coverage, especially in the early stage, the traditional media started to use its weibo account which formed a new mode of news report. This is different with their works in the Wenchuan earthquake five years ago. By interviewing 15 journalists who partic-
ipated in reporting the Wenchuan and Lushan earthquake, this article finds out the discrepancy in using the traditional media and new media. It also elaborates that a new form of inequality emerged due to the digital divide, while weibo is eliminating traditional inequality.

(Weibo is a SNS like Twitter)

Religion as an Alternative Source of Help for Immigrants to Maintain Their Mental Well-Being?

A number of studies have shown that religious participation is positively related to immigrants’ mental well-being in the West, thus making religious venues “places of refuge” for immigrants and religion their “balm for the soul.” A study in Canada in 2007 found that immigrant status is associated with lower rates of use of mental health services, which is likely caused by cultural and linguistic barriers to care. In this paper, I attempt to find if religion is an alternative source of help for immigrants when they suffer from psychological distress and whether religious participation is associated with lower rates of use of mental health facilities among immigrants. The goal of my research is to help policy makers better understand how immigrants adapt in their host countries when facing barriers to access to certain important resources, in this case, culturally and linguistically appropriate mental health services.

I will conduct my analysis within the Canadian context, where there is universal health insurance. My analysis will be based on data provided by the Canadian Community Health Survey: Mental Health and Well-being. The variable mental well-being is defined by the “psychological well-being manifestation scale” in the survey. Consisting of 25 questions ranging from “self-confidence” to “pace of living” on five scales, these measurements are combined into one continuous variable. Religious participation can be defined by the two questions on how religious respondents participate about themselves, and their frequency of attending religious activities. The survey also contains a section on health care utilization, thus making it possible for me to analyze the relationship between religious participation and the use of mental health services.

Declining Marriage Rates Under Globalization: Homogeneity Or Heterogeneity?

Around the world, marriage is undergoing massive changes. The United States has called on “saving marriage” (Popone, 1993; Furstenberg, 2005), the Middle East is experiencing a marriage crisis (Rashad, Osman, and Roudi-Fahimi, 2005), Latin America is seeing the rising substitution of cohabitation and single motherhood in place of marriage (Esteve, Garcia-Roman, and Lesthaeghe, 2012), and China is seeing more “sheng nu” meaning “leftover women”, a group of single women with high qualification and high income. A series of questions arise from these changing trends of marriage: Does globalization affect marriage the same way in the developing countries as it does in the developed countries? What causes declining marriage rates under globalization? Do these changing trends mean marriage as an institution is weakening or even disappearing? What does a marriage mean in different regions under globalization? Previous research focuses on either the declining marriage rates in the developed countries (Cherlin, 2004 and 2013; Trot, 2010) or the “flight from marriage” in the developing countries (Jones, 2005). What is missing in the current literature is a comparative perspective on this phenomenon, which can help us better understand marriage as an institution characterized by a heterogeneity (its complexities) not a homogeneity (an individually driven phenomenon). This paper explores the declining marriage trends occurring in different regions (i.e. the United States, Latin America, the Middle East, and the Southeast Asia), and compare and contrast their similarities and differences, and analyze the implications for the significance of marriage as an institution. I argue that delayed marriages and declining marriage rates in the developing countries do not indicate marriage as a traditional institution is eroding, replaced by other modern alternative living arrangements. Instead, marriage is still viewed as a significant institution and its traditional characteristics are reinforced by family and economic contexts under globalization.

YUAN, RUI* (Chinese University of Hong Kong, ryuan@swk.cuhk.edu.hk)

Effects of Social Capital on the Developmental Outcomes of College Adolescents: Evidence from Shanghai, China

It has been suggested that individuals are faced with more transitions and life-decisions in adolescence and young adulthood than at any other stage of life. Overseas studies have also suggested that during these time periods social ties might change. However, domestic research has spared disparate efforts in the investigation into college students’ psychosocial development undergirded by the deficit-based model. Drawing upon a sample of 1153 university students in Shanghai, China, this study investigated how family social capital, friendship qualities, associational social capital, linking social capital, and adolescents’ agentic personality influenced multiple developmental outcomes of college students in mainland China. The results of a structural equation modeling analysis provided a good fit for the sample as a whole. The overall findings support the hypothesis that higher levels of agentic personality were associated with better developmental outcomes of college students, including higher levels of resilience, self-efficacy, and self-esteem. Agentic personality also mediated the effects of family social capital, friendship qualities, associational social capital, and linking social capital on developmental outcomes.

The study advances the theory of social capital by incorporating its various dimensions into one conceptual framework, thus unraveling the mechanism of how family social capital, friendship qualities, associational social capital, and linking social capital influence the college students. It also advances the theory by testing it in a non-western socio-cultural context, thus potentially fortifying its universal applicability. Moreover, it is desirable that more programs for enhancement of agency building could be devised to foster emerging adults’ agentic personality. Family education, positive peers groups, associational participation, and linking mentoring are also anticipated to promote their optimal development.

YUASA, YOICHI* (Kanto-Gakuin University, yuasa@kanto-gakuin.ac.jp)

A Sociological Analysis of Linking Renewable Energy with Rural Regeneration

A feed in tariff system that was introduced after Fukushima nuclear accident has let people think that there are big business chances in the renewable energy market. Then, a lot of companies have tried to join to the market as electricity generator. In this presentation, we will examine the way of linking this market rising up with regenerations of rural economy from sociological perspecti-. Because electricity generators need to sizable land for a facility, they install it in rural area. Rural areas where suffer from economic recession welcome it. However, if installers are only big companies whose main offices are in big cities such as Tokyo, economic benefits for rural areas will be limited.

Our research group aims to link installs of renewable energy facility with spontaneous developments of rural areas. Based on this scheme, our group has researched and supported several projects that people living in rural area install renewable energy facilities.

In the research, we have found that small entrepreneurs encounter a lot of barriers to install renewable facilities. Typical one is the negative attitude of local banks to financing them. Financing local companies by local banks is essential to the vitalization of regional economy. For promoting this finance, an analysis from sociological concepts such as social networks are useful.

To date, with overcoming barriers, lots of projects are ongoing by local people in Fukushima and other parts in Japan. For example, in Minami-Soma where is partially polluted by radioactive substances, farmers have installed PV panels on their farmlands. This project is called the ‘solar-sharing’ and will bring profits to farmers. In this case, a social network has played an important role.

We will take some projects by local people and show the way in which people overcome financial and other barriers.

YUASA, YOICHI* (Kanto-Gakuin University, yuasa@kanto-gakuin.ac.jp)

Disregards to Principles on the Distribution of Risk and Bads

Geological disposal is the primary option for most countries where have high-level radioactive waste. All countries except for Finland, however, have not found any sites for geological disposal facilities due to objections from the population. Japanese government is facing same problem. We must dispose nuclear wastes regardless of continuation/stop of nuclear electricity. How can or should we tackle this problem?

The essential sociological perspective is the distribution of risks/bads. This perspective was suggested by Ulrich Beck in his Risk Society (1986). He has insisted that the concept of class is not effective for understanding the logic of this distribution anymore. To his argument, lots of works have asked whether it is true or not. The logic of the distribution of risk/bads has been a focus of sociological studies.

In this presentation, we will show two disregarded principles on the distribution of high-level radioactive waste. These principles are deduced from an analysis of conflicts on general wastes in Japan. Based on these principles, we will analyze a site finding scheme and its result of geological disposal facilities in Japan. Japanese government is looking for communities where spontaneously accept the facility now. For getting a spontaneous candidacy, the government established a governmental body called NUMO (Nuclear Waste Management Organization of

Japanese Wave of Sub Cultures

The aim of the paper is to use methodological viewpoint of the visual turn of sociology to understand the object of Japanese Animation and Manga and the phase of their ‘globality.’ The data that will be dealt with is the one from the extended survey research on Manga and Anime conducted by Association of Japan Sub-Culture Studies at Kobe University (headed by the author).

Comparing the research results that have already been conducted by Europe- an Manga Network in European countries a few years ago and that of conducted by the Association of Japan Sub-Culture Studies in Asian countries in the last year, paper will describe a view as to the similarities and differences in the process and phase of ‘accepting’ (and rejecting) Manga and Anime as cultural production in those areas.

Empirical researches from which the data of the paper generated, have been conducted in the areas such as in Hangzhou (Zhejiang)in China, Hong Kong, Taipei and the survey research has been done using questionnaires as well as interviews with the participants / fans in the events of Manga / Anime festival in those cities / areas.

Observing those processes of acceptance/ rejections, and the ways of penetr- ating individual people’s daily life paper suggests the transformed nature of our con- temporary way of life in terms of the visual and the social are constructed simulta- neously in localized ‘cosmopolitan’ consciousness from below.

Same Blood or Cultural Other?: The Paradoxical Racialisation of Korean Chinese Migrants amid South Korea’s Multicultural Turn

This paper addresses the fusion, rupture and transformations in the notions of race, nation, and culture by attending to the contradictory but reciprocal relation- ship between racial nationalism and the ‘cultural’ deployment of multicultural rhetorics. Focusing on the South Korean context, the contemporary racialisation of Chosŏnjok (Korean Chinese) migrants in tandem with the rise of the autochtho- nous far-right is examined as an illuminating case study. South Korea, a country that considered itself to be racially homogeneous, has begun to experience the influx of labour and marriage migrants from less developed countries since the 1990s. More than half of these migrants come from China and among them, the majority is Korean Chinese who have been rhetorically constructed as part of the Korean nation by the state and the major anti-Chosŏnjok (Korean Chinese) policies. Yet Chosŏnjok migrants and the survey research has been done using questionnaires as well as interviews with the participants / fans in the events of Manga / Anime festival in those cities.

Observing those processes of acceptance/ rejections, and the ways of penetr- ating individual people’s daily life paper suggests the transformed nature of our con- temporary way of life in terms of the visual and the social are constructed simulta- neously in localized ‘cosmopolitan’ consciousness from below.
effect than abortion in reducing births in South Australia. The abortion rate is still lower than in the rest of Australia as calculated from Medicare data, even though this is an underestimate because it includes only fee-paying patients. There remains a need for continuing emphasis on better contraceptive use, including better emergency contraception.

An international comparison of the recent abortions data for South Australia, UK and USA revealed that the prevalence of abortion in South Australia was marginally lower than that in the UK and USA.

The Chechen and Japanese Values in a Globalization Context: The Comparative Analysis

In the modern world the globalization process strengthens an interference of cultures and values, actualizes contradictions of secular and religious, traditions and the modernity, requirement of defining a vector of a society development.

Object of research - the Chechen and Japanese values in conditions of globalization.

Methods: cultural and action approaches, methods of the sociological, comparative analysis.

Results. In Caucasus, as well as in Asia, Japan in the hierarchy of values the key place take the values of family, collectivism, respect for seniors, mutual aid, solidarity, group unity. The Chechen values, despite religious and language distinctions in Caucasus, are considered as a part or a segment of the Caucasian and Russian values. During the post conflict period in the Chechen Republic, as well as during the post-war time in Japan, high interest to social and cultural values and norms is observed, responsibility for preservation and revival of traditions and customs is shown. In the Chechen and Japanese society there is a similarity and distinction in the ratio of collectivism and individualism, display of paternalism, reflections on globalization calls. Transformative changes in Russia cause social activity, among young and persons of middle age enterprise, initiative, requirement for a competition is more often observed. The Internet, mobile communication, other information means make changes to functioning of traditional norms. In this context interesting is the aspiration in Japan to adapt traditions for new conditions.

Conclusion. Caucasus is on crossing of the European and Asian cultures. Japanese social practice of combination of traditions and the modernity serves as a model for others in carrying out transformations in social and cultural spheres of life. However in each region and country it is necessary to develop a strategy of modernization taking into account social and cultural specificity.

Work Values in a Modern Linguistic Space

In the modern world, in the conditions of globalization many languages and cultures undergo changes. Social factors make the mediated impact on languages that is shown in contexts of their use, new word meanings.

The purpose of our research is the study of work values in the English, German, Russian and Chechen idioms taking into account social and language contexts, the language situation in the Chechen republic.

Methods. The comparative, semantic, corpus, sociolinguistic analysis of idioms, poll of the Chechen language speakers is carried out.

Results. In the basis of work values there are the material values focused on income, profit; spiritual and psychological values - self-realization in work, pleasure from work, understanding and feeling of the meaning of life, spiritual growth through work, creativity, social and career values - education, status in society. In an internal form of idioms the cultural values describing work traditions, customs, and the historical events forming work cultures of different countries were also reflected. So, in the English and German languages the value of official regulated work was accentuated, in German the value of an official duty was also specified. In the Russian contexts very similar social experience is fixed. According to the poll of Chechen language speakers at the present stage important are the values of income and success that can be connected with a post-war situation of revival, construction of work culture. In the frame of a language situation in Chechnya the idioms with the opaque internal form which fixed the facts and subjects of culture not taking place in the modern reality are less familiar and seldom used.

Conclusion. Thus, the study of contexts is necessary for revealing the influence of social factors on idioms and evaluation of the language situation in society.

La ponencia vincula el desarrollo de la individualización con el proceso histórico de diferenciación social que caracteriza a la modernidad y que se expresa en un amplio conjunto de creencias, prácticas y normas sociales que han sido propias de las sociedades industrializadas. Este punto de partida, eminentemente sociológico, se distingue de las polémicas de corte político que contraen el individuo con la sociedad o el Estado, y de los debates teóricos —epistemológicos— que privilegian ya sea al individuo o la estructura social como método de aproximarse a la realidad social.

Desde esta perspectiva el término “individualismo” responde a los procesos que se manifiestan de forma más evidente a partir del S XIX. En la cultura democrática moderna, el concepto adquirió un peso decisivo con Alexis de Tocqueville, quien lo introduce en el tratamiento de la esfera pública y logra diferenciar entre el mero egoísmo y el individualismo de corte democrático.

A partir de estos antecedentes, la ponencia explica los fundamentos de esta terminología en la obra de sociólogos clásicos y contemporáneos como Émile Durkheim, George Simmel, Norbert Elias, Zygmunt Bauman, Ulrich Beck, Gilles Lipovetsky y Robert Wuthnow. En los últimos apartados, se muestra la vinculación que esta temática puede tener con el pensamiento de algunos autores mexicanos como Samuel Ramos y Octavio Paz.

La Presencia De Las Mujeres En El Trabajo y Los Cargos De Dirección En México

Las mujeres en cargos de dirección del sector privado en México. Gina Zabludovsky Kuper

La ponencia mostrará cómo, a pesar del drástico aumento de la participación de las mujeres en el ámbito laboral y en las universidades, su presencia en los cargos de dirección y de liderazgo en las compañías privadas es todavía muy escasa y variará de acuerdo a una diversidad de circunstancias y como son el tamaño, género de la compañía, procedencia del capital, existencia de políticas de diversidad, y otras características del ámbito laboral.

Las fuentes de la investigación la constituyen los trabajos académicos sobre la temática, la interpretación de los datos estadísticos del país, la cuantificación y generación de la propia información a partir de los distintos directorios empresariales, el trabajo de campo realizado con base en entrevistas con directores(as) de recursos humanos y las mujeres ejecutivas de varias corporaciones. Con base a estos datos, el trabajo adoptará una estrategia comparativa que permita analizar la situación en México con las tendencias de otros países tanto en América Latina como en el resto del mundo.

Los puntos a tratar, son los siguientes:

1) Las presencia de las mujeres en la fuerza de trabajo, en los cargos de liderazgo y en la educación superior. Persistencia del “techo de cristal” y discriminaciones de género.
2) Los efectos sobre las oportunidades que tienen las mujeres de las políticas de flexibilidad, diversidad y de apoyo a la conciliación familia trabajo. Diferencias entre las empresas de capital extranjero y las nacionales.
3) Características familiares y diferencias generacionales de las mujeres directivas.
4) Feminización y masculinización de las ocupaciones.
5) Diferentes trayectorias laborales.
6) Principales retos y obstáculos de las mujeres en cargos gerenciales y ejecutivos.
7) ¿Hacia dónde vamos? Proyección hacia el futuro.

weakening of communal cohesion due to the recent economic crisis. In addressing these problems, Lefkadian "communal associations" employ different strategies to overcome their current predicament and counterbalance the "homogenizing" effects of globalization: Some, stressing the eternal qualities of traditional values, try to perform an almost religious "sanabatism" to old and unaffected identities through the ritualistic re-enactment of village customs and practices that promote group spirit. While others, introducing a "glocal" approach, adopt novel means and try to institutionalize new communal practices in order to appeal to youth. Thus, seeking to (re)establish communal bonds through "invented traditions", they renegotiate local identity and culture.

Private Provision, Public Care? Community Based Postnatal Care in Neoliberal Times

As with many other high-income welfare states, maternity care in Australia is available through a system of universal health coverage available to all citizens. However, Australia is distinctive in its parallel private health insurance sector which operates alongside and in competition with the public sector. The private health insurance sector has been heavily subsidised through a range of government policies. These schemes which have been criticised as costly and inequitable insolation as they favour the most affluent segments of the Australian population and those in metropolitan regions. In addition, concerns about the impact of this stratified system of care on maternal outcomes have been increasing. For example, women birthing in the private sector are at substantially higher risk of instrumental delivery, caesarean birth, induction of labour, episiotomy and epidural analgesia; their stay in hospital following birth is, on average, twice as long as women birthing in public facilities (Australian Institute for Health and Welfare, 2011). What do these differences mean for how women experience post-birth care following discharge from hospital? In this paper, we report on analyses from two Queensland studies of women's experiences of care in the community following childbirth, with a particular focus on the impact of public and private care provision. We report findings from a Queensland survey of new mothers (N= 6,433) in terms of their experiences of care in the community, and their confidence and satisfaction with their health care. In addition, we report the findings of qualitative interviews with 70 new mothers and 49 health care professionals providing post-birth care in public and private health care sectors in Queensland. Together, these analyses demonstrate inequities in health care provision resulting from the current stratification between public and private systems of maternity care.

Tempelhof: A Battle for the Green Heart of Berlin

Tempelhof Airport, an iconic building with rich history in the middle of Berlin, was closed for traffic in 2008 and the airfield turned into a huge park, much loved by inhabitants from the adjacent neighbourhoods as well as by Berliners from further afield. However, after the Berlin Senat, as a governing body of the metropolis, announced its much-trumpeted “Masterplan” to redevelop the airfield, a wave of activism emerged. What was in stake was not only a loss of a unique place of biodiversity, positively mitigating the urban climate, but also an irreversible transformation of a site with special atmosphere: green lungs of Berlin and one of the largest green spaces within an urban landscape in the whole of Europe. Moreover, Tempelhof is a witness of 20th century history: Nazism, Berlin Airlift, Cold War and the 1989 Wende. Therefore, various kinds of creative activism appeared in order to save the park, consisting mostly of engaged volunteers and enthusiasts, yet of different educational and income backgrounds and age: from garden colony (established in the 1920s), fighting against the loss of social learning to public initiatives campaigning through legislation and rocketing rents. Thus, it is obvious that the perception of "urban renaissance" is dissimilar amongst different strata of society: it is not only the conflict of the power elites and citizens, but also of people who believe they belong to Tempelhof (and keep its memory) vs. those who do not.

This paper looks at how the topics of urban renaissance and public initiatives are related to themes of memory and collective place-making activities (developed by Karen Tilly and how their momentum reflects on Pierre Nora's concept of lieux de mémoire. What is the role of collective cultural and social memory in public engagement? What could be learnt from the case of Tempelhof?

ZAGORSKI, KRZYSZTOF* (Kozminski University, zagorski@kozminski.edu.pl)  
Kozminski University Index of Balanced Economic and Social Development (“IBESD”) for Poland

The paper presents a new Index of Balanced Economic and Social Development (“IBESD”), designed to evaluate Polish economy and society, with an emphasis on human conditions. “IBESD” is constructed in “beyond GDP” paradigm, on widely accepted assumption that traditional measures, such as GDP, are insufficient to evaluate socio-economic development. “IBESD” covers four domains: internal (national) economic, external (international) economic, internal (“micro” or subjective) social, and external (“macro” or objective) social. Each of them is measured as an aggregation of several simple indicators. All four medium level indices of four domains show almost parallel changes, so they can be aggregated into a general “IBESD” index. All of them, “IBESD” included, describe very well changes in Polish economy and society during 2000-2011. Their trends may be explained by general knowledge of economic cycles in Poland and they are surprisingly highly correlated with the ultimate measure of human conditions, operationalized as an aggregation of psychological well-being (state of mind and emotions) and suicide indicators. Economic and social components of “IBESD” show the same pattern of changes, with a slight delay and greater amplitude of social changes. That indicates “leading” role of economic aspects in relation to social ones and great sensitivity of social indicators to economic ones. As far as social aspects are concerned, the trend of subjective evaluations of current conditions repeats, with small delay, the “leading” trend of expectations for future social conditions. This delay does not appear, however, during the present economic crisis, when predictions and evaluations similarly react to dramatized economic news. “IBESD” was designed in a theoretical context of balanced development. It confirms the theory that rapid development is associated with diminishing balance between its different domains.

Discourse on Youth’ Sexual and Reproductive Health-Stigmatized in Lahore Pakistan

INTRODUCTION: Pakistan is facing various challenges to deal with issue of youth’ Sexual and Reproductive Health (SRH). Although youth represent large number of population, yet are deprived to seek proper education and treatment to cope with their SRH needs. Subject of human sexuality is associated with strong ideology, moral views and traditions. Being Muslim country where, to discuss the topic of SRH is a societal taboo, less research is done. Moreover, poor infrastructure coupled with non-co-operative, behaviour of family/community and healthcare providers discourages youth’ practices to access particular services. Thus need for this study has arisen to understand youth development, enabling to provide appropriate information about sexuality and reproductive health to youth of Pakistan.

METHODS/APPROACH: Research on “Assessment of awareness of youth living in Lahore regarding Reproductive health” was conducted in 2009, funded by Small Scale Research Grant under Bill and Melinda Gates Foundation at John Hopkins University and organized by Population Council. Potential participants for study were youth (males and female of 15-24 years), parents, teachers, representatives of youth organizations, service-providers and Govt. officials/policy-makers. Qualitative research technique was adopted through 40 In-depth interviews and 12 Focus-Group Discussions alongwith combining two techniques (Dynamic Contextual-Analysis and Formative-Research).

RESULTS:  
Research provided a deep insight into lives and thinking of youth. Results show that youth are quite aware about subject although there are still some concerns about access and understanding of correct/authentic knowledge. It highlighted gaps in access to information from reliable sources and non-co-operative behaviour of family and community.

CONCLUSION: Research concluded that there is major difference of perceptions and awareness-level amongst females and males. Lack of reliable knowledge about sexuality/reproduction, unpreparedness for physical/emotional changes, over-exposure of information via internet, scarcity of youth-based interventions and ambiguity of key-stakeholders’ roles are major constraints.

HIV/AIDS Prevention Among Female Sex Workers, Lahore, Pakistan

Background: Although commercial sex is illegal in Pakistan, yet the number of FSWs[1] is increasing. Pakistan is almost in the grip of an Asian epidemic, where HIV/AIDS is spreading like a silent killer. One of its main reasons is the high rate of transmission among sex workers and their clients, due to lack of awareness, limited access to healthcare and preventing services, socio-cultural barriers and taboos.

Description: FSW Service delivery project to respond spread of HIV/AIDS was launched in collaboration with Punjab AIDS Control Program and Contech International in Lahore during 2012-13. Comprehensive package of HIV services and provision of counseling and support to the FSWs were the key project interventions. DISH[2] Centers (including FSWs friendly-DICs[3]) established in high concentration areas of FSWs, focusing their typingology including home, street, kot-khana and hotel-based FSWs. Extensive trainings were imparted to peer educators and community workers and these resulted in multisectoral and multi-agency activity. The last community network (VCN) was formulated by bring together more than 100 volunteer peer-educators. Innovative strategies including provision of Primary Health Care (PHC), STIs management, Inter-Personal Counseling sessions with 9,500 FSWs and Behavior Change Communication (BCC) interventions was applied for awareness and promotion of safe-sex practices. Moreover, law enforcement agencies, local GPs/CBOs, sex-workers network operators were also sensitized to create enabling environment.

Challenges: Major challenges e.g. community and service-providers stigma regarding sex-workers, substantial use and limited access to healthcare services, availability of prevention commodities, HIV-testing, illegality of sex-workers and non-cooperative attitude of law agencies were addressed.

Conclusion: A mix of multiple interventions involving key stakeholders is beneficial to bring change in knowledge and behavior of community and vulnerable populations. Offering both outreach and drop-in services proved the best way of involving sex-workers and the services would be more effective with this coordinated approach.

The Politicized Schooling: Institutionalization Educational Decentralization in Indonesia’s New Democracy

The paper discusses the effect of new democratic environment on the implementation of a globalizing policy of educational decentralization in Indonesian municipalities. It identifies the new policy has created a new organizational arena in which different governance arrangements arise, behind the policy’s original will.

The Indonesian education decentralization policy was enacted in the early 2000s following one of the world’s most radical political decentralization projects. The central education Ministry has transferred most of its authorities to municipal administrations which leadership is established through a democratic election. This new policy also offers greater school autonomy as well as invites wider civil society participation. While much research on education policy heavily emphasizes the role of formal institutions, this paper highlights the involvement of non-formal sectors that nonetheless play more dominant function. Analyses are done through developing two neo-institutionalist’s concepts: “organizational field” and “governance and exchange relations.”

Using the former, this paper proposes that the new democratic field has left the reformed education system trapped in a democratic network of constraints, involving numerous organized interests like political parties, teacher unions, education corporations, and rent seeking entrepreneurs. New alliances between autonomous schools and private suppliers do enable schools to attain their immediate outputs. However, school principals cannot simply enjoy such autonomy for they have to sustain a patron-client relationship with the municipal officials who appoint them.

Furthermore, employing the latter concept, the researcher goes beyond the boundaries between institutional and technical environments in analyzing the effect of national organizational arrangements. Such relations do to some extent reflect the technical aspect of mandated civil society participation and help educational organizations avoid a loosely coupled management. As they become routine, however, new institutionalized practices are established. And as a result, the effort for their fulfillments tends to overlook the substantive changes originally intended from the policy.

ZAMORA, GERARDO* (Universidad Pública de Navarra, g.zamora.monge@gmail.com)

Addressing Social Justice Issues Around the Economic Crisis in Spain

Against the backdrop of a deep economic and financial crisis worldwide, welfare regimes in countries of the European Union are undergoing drastic changes driven by austerity policies. In the case of Spain, such changes affect an already weak welfare state and the large support networks woven around the family. Extreme unemployment rates, weaker job security conditions or rising poverty rates coexist with recent, dramatic changes in values around the family, gender roles or individuals’ rights.

Given its length, it is feasible to expect that the crises may be influencing changes in the country’s demographic dynamics and its value system. This presentation examines three aspects of this shift: the extent to which the crises have affected births. Recent research in other countries suggests a reversal in the traditional pattern of childlessness in women: now less educated women are more likely to stay
childfree/childless than the more educated (studies on men and childlessness keep being less abundant, though). Moreover, research findings from European countries suggest low fertility may be correlated to unemployment risk and job insecurity. How are births being affected in Spain? Secondly, an inquiry on how older never-married women and men, regardless of their sexual behaviour or identity, face difficulties due to the crisis. Within a familial welfare regime, never-married older individuals (and some childfree ones) build support networks in a slightly different fashion than do parents/married older adults. Such networks tend to be more diverse, but also more vulnerable to health/independence/dependency negatives events. Thirdly, a question on whether salient social justice issues are being dealt with or not when looking at the two previous points: is becoming a parent a choice increasingly being reserved for the more educated and privileged individuals? Are childfree/childless and never-married individuals suffering cumulative inequalities just for the still prevailing stigma of such conditions?

Childfree/Childless Individuals, Population Ageing and Sexual Identities

In many societies, either as a single person or as a couple, individuals who choose not to have children are increasing in number and as a share of the population. Also, many individuals and couples do not have children not because it is their choice, but because of other social and individual factors. Both situations confront normative sexualities, and question the normative links between sexuality and reproduction. In parallel, a large group of individuals have been denied social (and thus legal) recognition concerning the access to parenthood; therefore, a great part of these individuals have remained childless/childfree, whether voluntarily or not. This is the case, for instance, of many lesbian, gay, bisexual, transgender, intersexual or queer (LGBTIQ) individuals aged 60 and older, or even younger. Both LGBTIQ parents and non-parents confront and question, too, normative sexualities and the links with normative reproduction.

How are these social processes affecting demographic changes, such as population ageing? Have they been affecting such changes? Does the study of childless/childfree individuals in their fifties and sixties shed some light on how to address the challenges faced by societies in the future decades, when family structures will have changed so much and childlessness will become more visible? Will the increasing choice of a childless/childfree life blur the boundaries between certain features of the so-called sexual identities? Can there be an identity based on childless/childfree choices? Will this affect sociological research perspectives on demographic changes? Is this relevant for policies addressing population ageing?

This paper analyses waves 1, 2 and 3 from the Survey of Health, Ageing and Retirement in Europe (SHARE). It compares parents and childless/childfree individuals in terms of health, social expectations, and other variables. The paper analyses, too, results from 10 in-depth interviews with LGB individuals aged 50 and older, most of whom are non-parents.

ZAMORA VARGAS, DANIEL* (Free University of Brussels, daniel.zamora.vargas@ulb.ac.be)
When Exclusion Replaces Exploitation: Structural Unemployment and the Retreat of Class Politics

The rise of mass unemployment in Europe in the late 70s and early 80s changed the conditions of the political struggle and debate in the west industrialized societies, producing a strong economic and political inequality within the working class. While the conflict between capital and labour had structured the analysis of the post-War years (with strong unions and labour parties), the 70s and 80s witnessed a shift of attention to the unemployment crisis and in particular its unequal effects (as evidenced by the centrality of debates around exclusion, urban marginality, and unorganized struggles). This simultaneously political, sociological, semantic and ideological turn is deeply rooted in the changes that have taken place within the parameters of the last forty years. The increasing unemployment, which is itself increasingly concentrated on parts of the population (both socially and geographically) resulting in the emergence of a vast stratum of what Marx called “surplus population”, is a key elements in understanding this evolution. This evolution also created the conditions of possibility for both the conservative political strategies aimed at limiting access to the Welfare State as well as the decline centrality of “the working class question” among authors and critics on the left like André Gorz or Herbert Marcuse. In this new ideological framework, the “exploited” is defined by its exclusion and its increasingly precarious relation to work. Making use of new statistical data on unemployment in Europe, our paper will explore how the political struggle and debate was progressively framed around the question of the “excluded” and the underclass in a way that

made less relevant the question of exploitation and changed the political agenda.

This evolution is of fundamental importance – theoretically and practically – for the advancement of critical theory and for understanding inequality under neoliberalism.

Sociological Dilema of Iranian Sociology: Critic of Critics

Abstract: The purpose of this paper is to study the situation of sociology in Iran focusing especially on examining the lack of sociological theorizing. For thirty years the development of positivism and experimentalism has dominated, emphasizing quantitative methodology. The impact of this is that theorizing about Iranian society has been forgotten. To understand the reason for this we have performed a meta-analysis of discourses of social actors in social sciences. Findings indicate that this can be explained by social choices and not social chance, individualism, or a lack of cooperation or creativity. Findings also suggest that what is important is the manner in which they spoke, perhaps even more that what they actually said.

The Early Employment Inequalities of Disabled Postsecondary Graduates in Canada

Disabled youth have become an increasingly important at risk group for educators and policymakers in Canada. Youth with disabilities are more likely to drop out of high school and are significantly less likely to pursue higher education. Yet, many universities are now reporting that nearly 10 percent of their graduating students self-identify as having a disability, and educational achievement-based programs designed to accommodate students needs are growing across campuses. While accessibility within postsecondary education may be improving, existing studies suggest that youth with disabilities still face inaccessible workplaces and hiring discrimination. In fact, perceptions of disability by employers and colleagues have been shown to have stronger effects on workplace outcomes than lack of accommodations in the workplace. Drawing on Statistics Canada's 2005 National Graduates Survey, we explore three major research questions. First, did increased access to disability supports at the postsecondary level, how do disabled individuals with postsecondary credentials fair in the labour market relative to their non-disabled counterparts? Second, what types of credentials appear to moderate the effects of disability on workforce outcomes? That is, how do the transition outcomes of disadvantaged groups compare across fields, faculties, and types of programs? Do these relationships vary across levels of education (college, trades, undergraduate degrees, graduate degrees)? Finally, do disabled graduates experience similar inequalities across economic and non-economic transition outcomes (earnings, education-job match, job satisfaction, employment, full-time employment)?

The Communist Legacy As a Self-Transforming Social and Semiotic Structure

This paper will focus on the problem of the contested meanings of the legacy of communism in Central and Eastern Europe and the relationship between moral and political assessment of the communist past and the modes of its interpretation in academic debates. Post-communist societies are commonly perceived in terms of the legacy of the communist period, which is seen as a crucial factor defining both their general path of development and shaping their internal social hierarchies. At the same time, elements of the communist legacy are imbued with strong moral and emotional judgments. In the majority of cases, this legacy's connotation is clearly negative and is used to color most of the past and current outcomes of the socio-economic development in countries of the region. Moreover, contemporary social actors, for a variety of reasons, are often viewed as being
tainted by the communist legacy; as products of the communist institutions and path-dependent effects. Analogically, diverse discourses that may be perceived as harmful are seen as direct outcomes and/or new forms of communism “new-speak”. This highly moral and political nature of the communist legacy, which is an important component of the reservoir of moral metaphors of public discourses in the countries of the region, makes debates on the nature and scope of the “real” or structural impacts of the communist past extremely difficult. The paper will demonstrate how constantly re-negotiated meanings of communism, and the boundary between “negative” and “positive” (if any) aspects of the communist leg- acy, impact the way in which the role of the past is interpreted in academic de- bates. Examples will be taken from discussions of regional inequalities and from sources that examine the roots of economic and social backwardness of Poland and other countries in the region.

L’objectif de ma communication consiste à explorer le lien entre l’expérience de l’immigration et la construction de l’identité ethnique, à partir d’un cas concret (une famille d’origine nigérienne émigrée/immigrée au Canada). Les théories de l’identité, qui ont connu un boom depuis les années 1970, ont certes rompu avec l’essentialisme des premières approches, mais perpétuent souvent (à leur insu) une forme de substantialisation des identités ethniques (Bruinker, 2000; Jenkins, 2010). On reconnaît volontiers ces dernières comme étant mouvantes et dy- namiques, mais on s’attarde très rarement sur leurs incohérences, leurs ruptures, leurs contradictions (Bajoit, 2009; Collod, 2007). Par ailleurs, l’ethnicté (comme l’immigration) est souvent traitée sous l’angle soit de l’intégration (le fameux concept du vide-ensemble), soit du déracinement (crise d’identité), soit encore du rapport intergénérationnel (crispation ou dissolution de l’ethnicté; ethnicté sym- bolique). La socioanalyse (Sayad, 1991; Bajoit, 2009), en remettant l’individu au centre de la recherche et en privilégiant la méthode de la biographie reconstituée, permet de comprendre l’identité ethnique (les discours dichotomiques) dans ses contradictions les plus profondes, ses ambivalences, ses évolutions (au cours d’une vie), ses mécanismes de dissimulation, etc.

Pour ce faire, il faut nécessairement saisir l’expérience de l’immigration dans toute sa complexité; autrement dit, dans les rapports qu’elle implique avec le pays d’origine : souvenirs, fantasmes, nostalgie, désillusion (du retour); avec la famille élargie : entre culpabilité et sentiment de devoir s’acquitter d’une dette; avec la so- ciété d’accueil : promesses (réelles ou d’escroou) d’une nouvelle vie ou de nouvelles possibilités, discriminations (raciales, sociales, économiques, etc.), sentiment de have the lowest level of SWB. Older people from English-speaking countries such as USA, Canada, New Zealand and United Kingdom have, by contrast, the highest level of SWB. These results allow suggesting that the degree of modernization influences the level of SWB very strongly. For older people the country in which they live, the level of democracy, GDP per capita, freedom and tolerance are very important. In contemporary society late life period is a time for self-realization, new activities, new leisure and new emotions. If society understands the needs of older people and provides the opportunities for their realization, society can overcome the challenges caused by population aging. Only in this case we can say about such a conception as “successful aging”.

Successful Aging: Cross-National Analysis of Subjective Well-Being in the Late Life Period

This paper aims to identify and analyze the life course and contextual factors that influence the level of subjective well-being (SWB) of 60+ aged people. Our research is based on the results of 5-th waves of World Value Survey. We have investigated the level of SWB of older people on individual and country level. The results of research demonstrate that the strongest predictors of SWB in late life period are satisfaction of financial state, health state and sense of control, i.e. belief of individuals that they control their live, control what happens to them. Besides, the important factors of SWB of older people is an ability of older people to establish and maintain friendly relations with other people (members of family, friends and etc.), i.e. to invest their own recourses to positive emotions and im- portant relationships for themselves. Older people from ex-communist countries have the level of SWB more than people from post-communist countries such as USA, Canada, New Zealand and United Kingdom have, by contrast, the highest level of SWB. Older people from English-speaking countries such as USA, Canada, New Zealand and United Kingdom have, by contrast, the highest level of SWB. These results allow suggesting that the degree of modernization influences the level of SWB very strongly. For older people the country in which they live, the level of democracy, GDP per capita, freedom and tolerance are very important. In contemporary society late life period is a time for self-realization, new activities, new leisure and new emotions. If society understands the needs of older people and provides the opportunities for their realization, society can overcome the challenges caused by population aging. Only in this case we can say about such a conception as “successful aging”.

The Schooling Of Emotion and Memory: Analyzing The Emotional Styles Of A Teacher’s Pedagogical Practices

In this paper, we explore the intersection between emotions and memories using data from a case study of a teacher’s pedagogical practices in a conflict-troubled society. The aim of this study are: to examine the construction of emotional style(s) in a teacher’s pedagogical and interactional practices whilst teaching the memories of ethnic conflict and war; and, to investigate whether these emotional styles are stable or dynamic over time in the classroom. In general, the study shows that individual emotional experiences are connect- ed with larger historical, political and social structures, which, in turn, supply the meaning and motivation by which the particular emotional styles are enacted in the classroom. The implications of this study are discussed.

The Reverse Panopticon Metaphor: The Autocratic State’s Fear of Being Recorded

In the aftermath of the catastrophic earthquake that occurred in the Chinese province of Sichuan in 2008, the artist and activist Ai Weiwei launched an independent ‘citizen investigation’ movement that challenged the government’s failure to gather accurate data on the number of deaths, especially the deaths of schoolchildren who had fallen victim to shoddy school building construction. Through a case study of this movement and its suppression by the Chinese State, this paper aims to analyze how new media facilitate the power dynamics between the autocratic state and social movement actors.

To analyze this campaign, the paper uses David Whiteman’s ‘coalition model’, developed to evaluate the impact of political film affect social movement actors, and redefines this model. First, activist documentary film that is disseminated via the internet and makes use of the internet at various stages of the creative process does not merely influence the dominant public sphere, but, rather, it creates new public spheres, including a local ‘grievance community’, as well as an activist community. It creates new internet spaces to discuss issues addressed by the documentary. Second, the documentary film production and distribution become key processes of movement mobilization in this context. Third, various state agencies’ responses to social movement actors illustrate a pattern of the autocratic state’s fear of being recorded. The prison Panopticon metaphor is therefore reversed in the process: the governor who is monitoring all members of the autocratic state’s fear of being recorded.

This study signifies discursive social movements in the digital century in a party-state with multiple strict controls and heavy censorship on expression and association.

Asian Values Revisited after 20 Years: Value Shift in China, Japan, South Korea, and Taiwan

1 Introduction

This paper focuses on the value shift occurring in four East Asian societies resulting from socioeconomic modernization and political democratization. Proposed in the first half of the 1990s, the notion of “Asian values” describes the socio-cultural characteristics of East Asia (i.e., conformity, hierarchy, harmony, and the priority of collective interests). In reexamining Asian values in China, Japan, South Korea, and Taiwan against the background of overwhelming social transformation in this region, this paper addresses two issues: (1) the differences of Asian values in the public and private spheres in four East Asian societies and (2) whether citizens in these four societies detach from the Asian traditional culture and thus Asian values.

2 Methods

The theoretical discussion includes an examination of the empirical evidence provided by the Asian Barometer Survey. Three waves of surveys administered over the past 10 years in four East Asian societies have offered an abundance of information to test the value shift in this region.

3 Results

Revisiting Asian values 20 years after its initial proposal has revealed two major findings. First, no remarkable gap exists between the Chinese and other East Asian societies’ citizens in terms of Asian values in the private sphere. Second, although citizens in Japan, South Korea, and Taiwan have abandoned authoritarian political values, this value shift has not been observed in China.

4 Conclusion

The value shift is more significant in the public/political sector in East Asia. Even though Asian values in the private sphere are popular in all four East Asian societies, modernization and political democratization have facilitated declining Asian values in the public sphere in Japan, South Korea, and Taiwan. Not only do the Chinese cherish traditional family and social values, as do the citizens in other East Asian societies, but they also uphold authoritarian political values.

Internet Protest: The New Form of Civil Activity Against Injustice in Chinese Context

Internet protest has become a new form of civil activity against injustice in China. This article will examine why it happens, who involve the activities and the outcomes of the new form of protest. Furthermore, this paper will analyze the democratic implication to the new form of civil activity against injustice in Chinese context.

What Preconditions Industry-Level Collective Bargaining in China?

As indicated in a fair amount of existing literature, China has been seeing a tendency of fast growing collective bargaining in general and industry or regional level bargaining in particular. Significant cases have constituted a fact of the centralization of the bargaining structure in China as opposed to the established knowledge that collective bargaining in China is largely institutionalized at the firm level. The decentralization is not only news in China’s industrial relations studies, but also somewhat counter-intuitive in the context of the worldwide decentralization of collective bargaining structure since the late 1980s and early 1990s.

This counter-intuition has raised the question of what has led to China’s centralization of collective bargaining, or more generally, what factors precondition relatively centralized bargaining (e.g. industry-level bargaining). No systematic study has provided a theoretical framework that helps us perceive this issue.

This study tracks multiple industry-level bargaining cases in a same city in China. It examines various of institutionalization processes of industry-level bargaining, as well as distinct roles of relevant players—unions, workers, employers’ associations, individual employers, and government officials. The industry-level bargaining scenario it has revealed in this city, being admittedly somewhat regionally characterized, illustrates the power dynamics that relevant players interact with each other in the sphere of collective bargaining in China (political/institutional factors). It also shows that economic/industrial factors matter—different industries have had very different institutionalization processes of the bargaining.

Tourism As Ritual: A Space-Time Model

Tourism is considered as secular ritual and important topic of the anthropological study due to its symbolizing of individual life, and its indicating of the sacred-profane shift of away-home and at-home status. Based on the spatial study of tourism system and the temporal analysis of tourism ritual, this study attempts to develop a space-time model of tourism, and finds that tourism is the complex of space and time and secular ritual in modern society, and the space-time presentation of rites of passage in modern mobile world. For tourism, spatial movement is more distinctive than time elapsing, therefore, space is primary while time is secondary; the spatial characteristics of tourism is far beyond the micro-spatial territory of non-religion rites of passage, thus tourism can be the complement rites of passage in a world on the move.

Getting Access to Justice from Bottom up? Social Capital and Resolution of Civil Conflicts in Rural China

Civil disputes in rural China have long been considered as a threat to social stability and order. Previous studies focus on the formal institutions, especially the state power beyond the village in resolving civil disputes, relatively ignoring the natural informal institutions within the villages. This research, therefore, will try to explore...
the possibilities of resolving civil disputes from bottom up. Using a national survey dataset (CGSS2005) from China’s 410 villages, this study aims to examine the impact of social capital on rural residents’ preference and actual choice of resolution in virtual and actual civil disputes, respectively. The social capital in the village refers to the features of social organization, such as trust, norms and networks that can improve the efficiency of a policy by facilitating the coordination. The author argues that increase in social capital can significantly increase the probability of mediation. First, the abundant associations provide more platform and agency for the residents to resolve their civil disputes; Second, the networks on the community level could give rural residents more choices when they face disputes. Considering the high cost of administrative and legal ways of resolution, the macro networks are cheaper and more available for ordinary villagers. Third, the social trust increases the interaction and dependence with each other so that villagers may be more willing to resolve their disputes by resorting to the informal parts. This research is of great importance for discovering the informal institutions indisputes resolution and provides insightful evidence for rethinking the state-society relationship in authoritarian China.

ZHANG, JUNDAN (JASMINE)* (University of Otago, jasmine.zhang@otago.ac.nz)
“No Gods, No Shangri-La”: Rethinking Tourism In An Environmental Discourse
Currently, environmentalism and the conservation movement still largely are situated within a positivist epistemological paradigm that is built on a tradition of Western scientific analogy. Consequently, the value of the current concepts of ‘the green economy’ and ‘sustainable development’ often are not challenged from non-Western political and ethical perspectives. Drawn from a study in a remote Tibetan village called Nizu, in Shangri-La County of northwest Yunnan province, China, I pose the question; “what role does tourism play in the formulation and distribution of power and reshaping knowledge in terms of how humans relate to ‘nature’?” From a political ecology perspective, I will identify an environmental discourse within which tourism is embedded. By describing how tourism acts as a medium for mediating the material needs and cosmological beliefs in the village, I will challenge the idea that tourism is an imported product from the West and a solution to poverty. Furthermore, I argue tourism is a way for cosmological and political practice to reconnect with ‘nature’.

Tourism, Politics and Beliefs in Nizu Village in Shangri-La, Southwest China
While most of the literature in tourism studies focuses on the problems relating to tourism development at World Heritage Sites, little attention is paid to places that somehow failed to be included in the list of World Heritage Sites. This paper will talk about tourism, politics and beliefs in a Tibetan village called Nizu, with a reputation as the ‘backyard of Shangri-La’ in relation to the famous tourism destination Shangri-La County, Southwest China. Geographically located within the Three Parallel Rivers Region, which is a natural World Heritage Site, the 2003 application of Nizu village to be included in the Three Parallel Rivers WHS failed due to the governmental plan for a copper mine north of the village. The location of the village is within the region of the Three Parallel Rivers National Park, which is a national park designated in 2003. The park is home to the Nizu village, which is a Tibetan village located in the Three Parallel Rivers WHS. The village is surrounded by mountains and rivers and is characterized by its traditional lifestyle. The village is located in the Shangri-La County of Yunnan province, China.

Labour Dispatch, the State, and Contested Labour Regulation in Post-Socialist China
The aim of this paper is twofold. First, it problematizes the common assumption of the core-periphery labour markets dualism as a “natural” economic trend or fact, inquiring into the processes through which this boundary is itself defined and contested. Second, it seeks to examine the enduring (albeit evolving) impact of revolutionary and socialist legacies (notably, the populist mass line) on the subsequent labour politics in post-socialist China. Through an in-depth study of the legal-political mobilization of labour dispatch workers in the context of a state-constitutive and legislative process associated with it, this paper argues that the simultaneous dynamism of dualization and labor movements in post-socialist China has been the result of active state policies and regulations to strike a balance that draw boundaries among its working population. On one hand the market-oriented labour reform has significantly increased labour market flexibility and led to widespread job insecurity. On the other hand, there has been a persistent but evolving dualism between employment status and the state’s perceived “natural” economic trend. The argument proceeds from the premise that the Chinese state is a “natural” item, following the arguments that the Chinese Communist Party’s continuing public adherence to its populist mass line while persisting in the one-party authoritarian rule, has recurrently incited contestation, negotiation, and boundary-drawing by the state and its agencies, employers, and different groups of workers. The study is based on fieldwork conducted in one of the key sites of the state’s involvement in the evolution of the core/periphery dualism, a key site for the spread of the oppositional economy. This paper argues that, in this context, the Chinese state has not only created a “natural” core/periphery dualism, but has also been part of creating it.

Collective Journalism Is In Formation? Common Net-Users Challenging Professional Journalism Online and Offline
With the development of social ICT (Information and Communication Technologies), the media landscape has achieved dramatically transformation. Utilizing the social ICT, common people obtain the power to control the media and utilize it for self-expression, discussion and opinion exchange, thus exerting a practice of journalism. There are several success sites/examples of participatory journalism or citizen journalism, such as Ohmynews. In China, public-organized citizen journalism has become more powerful since the 1990s. In analysis of its role in promoting flexibility. Yet the ongoing battle over the subsequent Amendments to the law in response to popular discontent channeled by the official trade union, suggests that the Chinese labour politics is not a “settled” fact. The Communist Party’s continuing public adherence to its populist mass line while persisting in the one-party authoritarian rule, has recurrently incited contestation, negotiation, and boundary-drawing by the state and its agencies, employers, and different groups of workers. The study is based on fieldwork conducted in one of the key sites of the state’s involvement in the evolution of the core/periphery dualism, a key site for the spread of the oppositional economy. This paper argues that, in this context, the Chinese state has not only created a “natural” core/periphery dualism, but has also been part of creating it.

A Study on the Method of Public Participation Based on Discourse-Power Model Among Different Stakeholders: A Case for Avoiding NIMBY Risks of Waste Transfer Stations in Nanjing, China

Promoting sustainable development of the world is a common of different countries. Because of sustainable development and public participation are inextricably linked, to promote sustainable development, it should to enhance the public participation. The “NIMBY” phenomenon which means that not in my backyard is an increasing prominent urban problem in China to threat sustainable development. NIMBY risks are the kinds of negative external effects of urban facilities. However, in China, with its rapid urbanization rate, city services still need to be optimised, and many public facilities must be established. Thus, the remission of avoiding NIMBY risks is an important action which can help to improve social equality and justice. NIMBY conflicts are a type of social conflicts among different stakeholders including governments, experts, planners, developers, media, residents from different locations, etc. To solve it, we need to coordinate the interests among different stakeholders in an efficient way.

This study constructs a method of public participation based on discourse-power model among different stakeholders for avoiding NIMBY risks and also the related approaches to realize them in Nanjing. Firstly, it classifies the different interests groups basing on the spatial zoning of different negative impact areas and the services area of waste transfer stations by using GIS-based spatial quantitative analysis approach. Secondly, it introduces the concept of discourse power, establishes a discourse-power model based on different interests groups, and analyses the game relationship among them. Thirdly, it builds a mechanism of distribution and implementation of discourse power, to clarify different discourse power among stakeholders. This study attempts to improve an ordered public participation on avoiding NIMBY risks to guarantee a scientific, participatory, and operational urban governance.

Data Envelopment Analysis on Assessing the Efficiency of Japanese Film Release Market from 1955 to 2011

The film industry, as one crucial component of the leisure and entertainment industry, has received much attention in decades due to its great contribution to the economy and culture. Undoubtedly, with the presence of a big domestic market and excellent works, the Japanese film industry is playing a crucial role both to Japan and the world.

This study examines economic performance of Japanese film release market quantitatively from the perspective of input-output by applying the method of DEA based on the data from 1955 to 2011, and tries to interpret the change in light of historical development. The results demonstrate a wide range of efficiency among the individual units, and suggest a new perspective to recognize the performance of Japanese film industry for years.

Specifically, the models adopted in this study are Charnes, Cooper, and Rhodes model (CCR, 1978) and Banker, Charnes, and Cooper model (BCC, 1984), which are frequently used models of DEA. Technical efficiency (CCR efficiency) measures a DMU’s ability to convert inputs to outputs given the size of the DMU. On the other hand, by decomposition of CCR efficiency scores, BCC scores (Pure Technology Efficiency) and Scale Efficiency (SE) is calculated to examine whether the scale of the industry has any impact on its efficiency. The input includes number of screens, number of Japanese films released, number of imported films released, and average admission fee. On the other hand, the number of admission and box office receipts is output. The results also present the change of inefficiency slacks on basis of different model, which helps to improve the potential improvement room for input. Based on the above calculation, possible reasons for the changes of efficiencies and also some managerial implications and helpful insights are provided to competitors, investors and researchers.

ZHANG, YI* (Chinese Academy of Social Sciences, zhangyi@cass.org.cn)

China’s Aging Population and Challenges It Is Facing

According to Chinese population projections, the paper analyzes future aging process of different historical periods. Findings indicate that unless the family planning policy reforms in future decades, the bottom of population pyramid will shrink dramatically, and growing life expectancy will progressively expand its top. By the year 2050, the aging population over 65 will account for 25% of the society. Considering the reduction of children population, the population in the labor force between 15-64 years old will also decrease.

This population transition will bring some very serious problems in the near future: Firstly, China will face the shortage of labor force if automatic standards of production process can’t be improved, especially in the low-end industries. It means migrant workers’ income will keep increasing and the labor cost in the production process will be getting higher. It will produce some negative effect on China’s international competitiveness.

Whereas aging process will accelerate, the adult population will save money for their future aging, restricting the consumption rate. It will affect the domestic spending policy. On the one hand, the decreasing of children population will lower family’s expenditure rate, on the other hand, the lower level social security will prevent the people in the labor force from contributing more to savings in their productive years.

With the population transition and the changing Chinese family structure, the aging people will face the shortage of social support network, especially due to lack of family members’ support. The linkage between mother and children’s family will weaken because of population migration. Thus Chinese aging population will have to depend on their spouses for their care. If they lose their spouse, the aging people will have to be send to beadhouse to be cared for. But up to now, China has not prepared enough beadhouses for their aging population.

ZHANG, XIAONAN* (Xi’an Jiaotong Liverpool University, xiaonan_zhang@xjtlu.edu.cn)

Formalize the Informal? the “Pacification” of Favelas in Rio De Janeiro

According to a series of nationwide sample data, the paper analyzes the changed trend of Chinese class structure, finds that the population of middle class is becoming more and more, the population of working class is surpassing the counterpart of farmer class. With the expansion of higher education, the population of middle class will be the first biggest class in the near future, but the new middle class is still smaller. However, farmer class will be shrunk dramatically when urbanization is speed up. This kind of social transformation will affect the distribution of most Chinese society’s social policy.

ZHANG, YUE* (University of Illinois at Chicago, yuezhang@uic.edu)
DEMOKRATIA IN EVERYDAY LIFEWORLD

In this article, the author argues that there is a tendency to realize a high degree of demokratia in Western everyday lifeworld. Depending on one year ethnographic fieldwork in a Dutch village, the author uses the method of anthropography in order to provides a frame to observe the tendency. The article is divided into three parts. In the first part, the author explains that Everyday lifeworld is the horizon of social life, in which human being as ordinary practicer lives its own meaningful life and realizes its own desires, wishes and hopes with emotions. The author identifies three principles, equality, togetherness and openness, as the principles of “Demokratia”. In the second part, the observing frame of the phenomena theorized as demokratia in everyday lifeworld will be provided. The frame includes the gestures in daily interaction, the dialogue in daily lifeworld, and the form of collective action in daily lifeworld. In the last part, the author argues that the nature of “Demokratia in everyday lifeworld” is the habitus of practical reason. Playing together could be the possibility of “Demokratia in everyday lifeworld” in the future. To disclose the ruling relationship in everyday lifeworld should be one of the main sociological issues.

Awards and Conservation of Intangible Heritage

In 1804, Napoleon Bonaparte rewarded for the French “Honneur et Patrie”, which became the first modern awards institution affirming nations as the unit of selection and pride. Then such awards systems spread throughout the modernizing world and fostered the formation of world’s fairs, such as modern Olympics and UNESCO, which almost accepts all countries as its membership. Specific to the awards systems of intangible heritage which promoted by UNESCO. On one hand, such an institution can provide a platform for the people’s consensus to protect ICH, but on the other hand, for different countries and areas to implement the same awards way, could if really accomplish the protection aim? It is noteworthy that each country and area form the culture logic and mode in their own history, when the local culture rule meets the global culture awards, actually it’s difficult to reach the expected aim. Today UNESCO carries out a series of awards ways all of the world, including “Masterpiece”, “Nominations”, “Medals”, “Living National Treasures” and “Heritage Funds”, in fact, when China operated these awards ways specifically, which led to the “cultural crash” will usually make the counter result that awards really wants.

As the Guizhou Miao ethnic group's Yalu King Epic for an example, The paper will research the culture awards in the conservation of intangible heritage, emphasize the importance of the local culture logic and rule in intangible heritage awards, make sure the awards could really protect the intangible heritage.
the organization's future. Under different situations, GPOs will choose different paths. Some will professionalize, and become paid staff NGOs; some will remain informal and wait for better opportunities; some will take a clear stand to resist future attempts of formalization; and some will dissolve or break into different organizations. Government policy only starts to influence GPOs once they decide to seek registration.

The Rise of Income Inequality in Urban China, 1996-2010: Increasing Returns to Education, State Sector Shrinkage, and Composition Effects

Income inequality in urban China has experienced a rapid growth over the past two decades. To account for the rise in income inequality, previous studies have provided three major explanations: widening regional gaps, increasing returns to education, and growing residual inequality. Since the mid-1990s, however, the composition of the urban labor force has been considerably reshaped by three large-scale structural changes: (1) the expansion of higher education, (2) the shrinkage of state sector employment, and (3) a surge in rural-to-urban migration. In this article, I discuss how the recent rise of income inequality can be driven by these institutional and demographic shifts. Based on data from two national- ly representative household survey data, I use variance function regressions to decompose the growth in income inequality from 1996 to 2010 into four components: changes in between-group income gaps, changes in within-group income variation, and two types of composition effects (distribution effect and transfer effect). The decomposition results indicate that changes in between-group income gaps explain around 40% of the rise in inequality, while more than half of the total growth can be attributed to composition effects.

Participation and Cooperation: An Approach to Productive Aging for Institutional Care Service in F Resident

Institutional care service is an important part of the elderly welfare system aiming at improving the quality of life of the elderly. In the resource-input type of the welfare service, care-givers tend to treat the older people as vulnerable groups and to ignore their abilities and value. Based on the materials obtained from the observations and interviews in F Social Welfare Institution, the “functioning” of the elderly is defined to buy their first houses in this period, i.e. the young generation born in the late 1970s and post-1980s. This paper we consider why it is not yet routine to discuss websites in primary care consultations and the consequences for inequalities in health.

How Home Ownership Becomes a Measurement of Inequalities: Analysis of Home Ownership of the Young Generation

Since the beginning of the 21st century in contemporary China, house prices have been increasing rapidly especially in metropolitan cities like Beijing and Shanghai. The problems of ‘unaffordable houses’ are most significant among people who want to buy their first houses in this period, i.e. the young generation born in the late 1970s and post-1980s. This paper aims to examine how home ownership influences life and work chances in contemporary China. It uses data from both national surveys and survey of the university graduates. The empirical analysis will start with home ownership rate with regard to type of employer, age, household registration and residential areas, which this paper argues to be four most important factors for the segregations in home ownership. The core analysis focuses on the young generation, concerning their differences in expenditure (leisure, holiday and education), car ownership, savings, subjective feelings as well as marriage and work by owning a home or not and living in a metropolitan city or not. The main arguments are people without home ownership are in a relatively disadvantageous position in life quality and even the marriage and labor market, so in the metropolitan cities in China, home ownership has become an important index of socio-economic status or to measure social inequalities.

Contesting Imaginaries: New Urban Spaces of Xi’An

The development of heritage tourism in historical cities of China is regarded as a vital ingredient of urban regeneration by state and local governments. In Xi’an, the imperial capital of thirteen dynasties of Chinese history, the construction of a modern landscape catapulted the city from an isolated entity to the globalized world system. Guided by a fifty-year governmental city plan, the densely populated inner city of Xi’an is currently being transformed into a functioning replica of the Tang-era Imperial City to reconstruct the glorious past of Chinese civilization. Guided by the project plan, a large number of buildings in Xi’an were demolished and local residents were relocated to other districts of the city. Meanwhile, historic monuments were transformed to cultural theme parks. Antique markets and high-end residential buildings were built to attract middle-class immigrants from other cities of China.

This study will examine the multiplicity of imaginaries that are produced and negotiated by actors involved in urbanization, and the way these imaginaries shape new urban spaces of Xi’an. I will analyze the role of the main actors in this dynamic process: how the municipal government implements urban regeneration and how citizens pursue their own personal identities; how real estate investors, empowered by local administrations, utilize cultural resources and real estate property for commercialization and consumption; how immigrants inhabit newly created urban spaces to search for leisure lifestyles and cosmopolitan identities; and how the traditional residents negotiate, resist and manifest their identity through daily practices. The complex associations of these actors co-construct new urban spaces through contestation and meaning-making.

Moving beyond the macro-perspectives of political economy and economic geography, the research will engage with Xi’an as an important ground for testing urban transition of social and spatial landscape, and examining social inequality in the rapid development of modern China.

How the Internet Is Transforming Health Experiences: Reflections from a Decade of Qualitative Research on Experiences of Cancer, Chronic Illness, Infertility and Bereavement

This study explores how people talk about the internet and how attitudes and caution about different types of websites have changed over the last decade, drawing on comparative qualitative analysis of narrative interview studies, conducted during the years 2002-2012. In the early 2000s patients’ narratives suggested that only particularly engaged, expert and activated patients sought health information online. By 2010 the web had become an almost unremarked, routine part of people’s experience (eg ‘of course we all looked it up straight away’). The internet has transformed how people make sense of and respond to symptoms, decide whether to consult, make treatment choices, cope with the impact of diagnosis and connect to others. Increasingly doctors are aware of this and recommend useful sites to their patients yet, even in 2012, respondents express reluctance to talk to their doctors about what they find online, fearing that such revelations might damage the relationship. GPs have reported feeling threatened (having a ‘heartbeat moment’ when faced with a patient who uses the internet).

People want more than information online, they also want to find reflections, insights and practical advice from other patients. UK doctors may want more evidence about the health effects of using the internet but patients and the public are routinely online, even if they do not mention it in the consultation. In this paper we consider why it is not yet routine to discuss websites in primary care consultations and the consequences for inequalities in health.
of what can be labelled the „conservative“ block of the Western elite. „Conserva-
tive“ means that its primary interest is the conservation of the status quo: the role
of a small elite through a democratic capitalist system. Attempting to achieve this
goal in a dynamic environment with major challenges (the spreading of the com-
munist ideology, the breaking up of the colonial system etc.), it needs to adapt inno-
vative methods, like the creation of supranational institutions.

In the descriptive part I focus on nationality, age, gender and occupation of the
participants. In the second, analytic part, I present the connections between
different sectors of the industry as well as positions of political power that the
participants hold. In a further step I attempt to describe the shift in this network
between the 1950s and today. The official lists of current participants of the Bil-
derberg meetings allow researchers to draw an adequate picture of this network
in its current form. From previous research on the topic of the change in the elite
it can be expected that the major changes have occurred regarding the dominant
industries. Little changes are to be expected regarding the nationality, the
gender and the age of the participants.

Between Voicelessness and Empowerment – A Biographical
Approach to Life Stories of Complex Traumatised Mothers

Regarding currency and scope of sexualised violence against children my re-
search takes a look at the long-term consequences for victim-survivors of these
human rights abuses. With this perspective the social positioning of highly men-
tally burdened survivors comes into consideration. This paper is based on a bi-
ographical-sociological approach of the life stories of women, who are all patients
of a traumapsychiatric diagnostic hospital and who were abused in their childhood.
I would like to contribute first empirical results of my PhD project. Due to the fact
that all the women I interviewed have children my results point to the major dif-
ficulties of being diagnosed, treated and seeing oneself as mentally ill and at the
same time being a mother who is not supposed to be mentally tainted in any way.
In my presentation I would like to illustrate that there is a strong self devaluation
regarding the women's motherhood that leads to a form of voicelessness of the interviewees
in its current form. From previous research on the topic of the change in the elite
it can be expected that the major changes have occurred regarding the dominant
industries. Little changes are to be expected regarding the nationality, the
gender and the age of the participants.

Yokohama, 1860-1923: Confinement and Clashes, Exchange and
Hybridization

Yokohama, meaning “broad beach”, was Japan’s biggest free trade port opened
in 1859, under so-called “unequal treaties” with Western powers. It became Ja-
pan’s most important venue of economic exchange with the world, technological
and cultural imports, hybridization and innovation - such as Japan’s first railway
link to Tokyo, first daily newspaper, first brewery, first gas-powered street lamps
and first waterfront urban park. Yokohama provided space for international
communities - American, European as well as Filipino, Korean and Chinese. The paper
analyses some of the processes - confinement and clashes, exchange and hybrid-
ization - that ultimately led to the “rise of Asia” out of (semi-)colonial dependency.

Reducing or Re-Producing Inequalities? Grand Narrative of
Diversity and Its Influence on the Minority Learner

European societies increasingly implement diversity education as part of a civic
education curriculum in order to provide young people with competences in deal-
ing with different forms of diversity. The presentation analyzes policies and praxis
approaches pertaining to education for diversity at both the supranational level
of European Union and Council of Europe as well as at the level of member states
(Germany, Estonia, Russia, and Sweden). The presentation shows that in Europe
school education for diversity simultaneously pursues two separate goals: while
generating a grand narrative of celebrating European diversity those same mate-
rials and policies stipulate that issues of inequality are to be dealt with separately.
Based on the conceptualization of diversity with reference to heterogeneities
and inequalities, the presentation shows how inequalities tend to be covered
over in positively connoted conceptions of diversity. Comparing educational pol-
icieties, school curricula, and teaching materials, the presentation reveals the ways
in which diversity and inequalities are decoupled in curriculum and educational
practice, and poses following questions: What happens if diversity is only treated
as a matter of celebration? Turning to the minority learners, experiencing exclu-
sion, the presentation demonstrates, how diversity celebration narrative disem-
powers minority learners, contributes to more uncertainty, social closure and
self-exclusion of those learners, who do not find themselves within diversity cel-
bration.

Capabilities, Critique and Sociology

This paper discusses the implications of the double dimension of capability, a
normative and descriptive concept, for sociology and its relationship to critique.
Using a capability approach means endorsing a critical stance. But the resulting
critical standpoint is as much a matter of concept, as of theoretical and method-
ological implementation. Therefore different ways of bringing together capabili-
ties, critique and social sciences are at hand.

The conceptualization of capabilities along freedom and power of achievement
offers a common normative background. Beyond equal distribution of resources,
its makes out of equal freedom to choose and achieve, i.e. to convert resources
into valuable realizations, a yardstick for assessing social inequalities.

Once settled this common background, conversion factors bring into play the
second dimension of capabilities, namely the descriptive one, which is diversely
taken up. Economists have worked a lot on measures and descriptions of capa-
bilities. Sociologists should contribute to this debate with their own means. The
paper argues that the sociological design of inquiry may offer an as important
source for critical social sciences. Along the lines opened by J. Dewey's logic
of inquiry, it is own how the capability concept may fuel a critical pragmatism
based on the confrontation of different levels of analysis: institutional semantics
(the public policy level), which designs how things should be, its implementation
(or- ganizational level) and the outcomes it actually produces in people's lives (the
biographical level).

Finally, the paper gives an insight into the analytical and critical perspectives
opened up by a capability approach focusing on the interactions between insti-
tutions, organizations, and individuals on issues such as freedom, responsibility,
empowerment and employability, core-concepts in the reforms of European Wel-
fare-states.

Comparative Analysis of Changing Family Formation – Different
Life Course Regimes and Developmental Paths Identified in
European Countries

The paper contributes to the comparative analysis of life course dynamics and
cohort changes in Europe. Varying forms of data collection and preparation often
hinder quantitative comparative analyses; therefore, international survey pro-
grams like the Generations and Gender Survey (GGGS) have been initiated. I added
data from the National Educational Panel Survey (NEPS, research methodology
very similar) for West Germany to compare developmental paths with regards
to family related life courses between four European countries (Germany (NEPS),
Italy, France and Norway (GGGS)). I use sequence analysis to examine life course
patterns of nearly 40,000 respondents and identify life course regimes and chang-
es between them. The empirical patterns are finally related to classifications of
country changes and developmental paths as provided by concepts of welfare regimes
(e.g. Esping-Andersen).

Findings show, that Northern and Western European countries follow a similar
sequence of regimes, starting from a traditional life course regime, marked by a
slow process of cohabitation and marriage and subsequent fertility among
the majority of respondents. Afterwards, they pass through a ‘semi-traditional’
regime with unmarried cohabitation preceding traditional family formation.
Finally, they reach a ‘post-modern’ life course regime, in which life courses with
first birth(s) to unmarried, cohabiting couples are more frequent than other life
course forms. The process of change starts in Norway and France, while in West
Germany the transformation from the second to the third regime is retarded. Italy
follows a different developmental path: The change towards a semi-traditional
regime is much slower and the regime is characterized by a postponement of the
traditional process of family formation.

Overall, the concept of family related life course regimes is helpful to under-
stand, compare and classify life course dynamics. The sequence of the regimes
can be interpreted as developmental paths; developments are not determined,
differing speeds and changes in directions are possible.

The Aesthetics of Banality 

Be it Breton’s fascination for an adorned wooden spoon or Valéry’s ambiguous affection for a sea shell and not to mention the rapturing experience of cracking the crust of Crème Brûlée described by the movie character Amélie Poulain, all these seemingly ordinary objects are said to be surrounded by a sacred aura offering the possibility to sense the (assumed actual) mysterious depth hidden behind the surface of banality. Whilst the avantgardists at the beginning of the 20th century conjured the magic of the overlooked in terms of a countercultural model, we are positing that the epiphany of the unimposing has to be regarded as a prevalent model of popular culture symbolizing a nostalgic search for the utmost real.

According to sociological approaches referring to material culture and with respect to coeval cultural theorists we will first reconstruct the emergence and the changing cultural valuation of the discourse about the cultural significance of the insignificant, claiming that the contemporary search for the meaningfulness of banal artifacts serves as a prime example for the reenchanted conquest of the quotidian. In particular the new aesthetics continuously stress the fact that the aesthetics of the marginal are laying at the core of the condition postmoderne: on the one side with regard to the construction of the banal as a category of sensuality and on the other side with respect to diverse strategies of aestheticism creating the auratic effects of trivial things. Hereon we will secondly shed light on the consequences of this discourse on the study of material culture suggesting that we won’t be able to expose the cultural significance of mundane objects properly, if we don’t account for the factor that these “actual significatory structures” are themselves part of a prevalent model of the aesthetics of banality.

Multi-Level Governance in the Adaptation to Climate Change in Australia - the Latrobe Valley 

The planning and political negotiation processes of sustainable energy production in Australia are burdened processes. A number of different players from Commonwealth, State Government and regional level got involved to transform the Latrobe Valley region that has the dirtiest coal fired power stations in Australia.

We examined the interwoven processes of strategic planning and governance, the set-up of the Latrobe Valley Transition Committee and the development of a Roadmap to transform the region as well as the funding of concrete projects to provide new jobs within the region. What has been seen by many as a smooth and successful process came to a halt when the political conditions changed.

At the same time it became clear that allegedly smooth process had some weaknesses. Collection of processes had been driven by funding promises of Commonwealth and State Government the region did not develop an independent vision of the transformation of the region. With the loss of funding it became obvious that there is a need to develop such a vision to further drive the process. However, good networks have been developed that might be strong enough to push forward where major funding resources are no longer available.

This paper will discuss the conditions of climate change adaptation and the advantages and challenges multi-level governance structures provide for regional planning and governance.

A Multiple Imputation Approach To Address The Problem Of Nonignorable Nonresponse and Misreporting Patterns In Income Data 

When people are asked to report their monthly income they are likely to refuse to answer. If they answer, they tend to round their income to the nearest fifty, hundred or thousand, or they even completely misreport the value of income. It is well known that the propensity to misreport or to refuse to answer income questions depends on individual characteristics. For example, people with migration background are normally more likely to refuse to answer. Thus, commonly income data collected by personal interviews show nonignorable nonresponse and abnormal concentrations of reported values at certain “heaping points”. Using such data to compute, e.g., distribution characteristics like sample quantiles or proportions usually causes severe bias. In order to allow to adequately modeling such kind of incomplete and heaped data, we introduce a general method that allows addressing both, the issue of incomplete data and the problem of rounding. To impute missing values, we suggest using the proven method of multiple imputation by chained equations. The method requires determining a univariate imputation model for each variable with missing values. We suggest specifying the imputation model for the income variable such that it describes the true distribution of the income variable simultaneously with the heaping pattern present in a data set. Monte Carlo simulations are used to validate the novel approach. To illustrate the capacity of the approach we conduct a case study using income data from the adult cohort of the German National Educational Panel Study.

Relationships Between Gender Role Attitudes, Role Division, and Perception of Equity Among Heterosexual, Gay and Lesbian Couples in Israel 

Abstract

The purpose of the present study was to investigate the relationships between gender role attitudes, household tasks, and the perception of equity among heterosexual, gay and lesbian couples. One hundred and twenty-four participants (54 heterosexuals, 30 gay men and 40 lesbians) were tested. It was found that same-sex couples had more liberal attitudes toward gender roles than did heterosexual couples. In addition, significant differences were found between the spouses in their responses regarding role division in housekeeping in each group. The responses of heterosexual spouses correlate more closely with each other regarding the role of each of the spouses than was the case for same-sex couples. However, the role division among lesbian couples was more egalitarian than that of heterosexual couples. In addition, heterosexual women consider their married life less equitable than heterosexual men do. Similarly, one of the gay spouses considers the relationship less equitable than the other spouse does. The results are discussed in terms of their relevance to theories of social perception and cultural backgrounds.

Varieties of Policy Design in Swiss Family Policy Adaptation to New Social Demands: Bounded Possibilities of Childcare Services for Social- and Gender Equality 

This paper deals with the question of who ends up with what in the process of welfare state adaptation to new social demands in post-industrial societies. To answer this question a new typology of childcare policies on the basis of the social outcomes of those policies in terms of redistribution and gender equality will be developed. The implications of childcare policies on these two dimensions of inequality are of particular interest, given that the internationally literature agrees since a long time that we need a new typology that helps to understand the trade-offs between distributive and socio-cultural goals. Empirically, I focus on the specific design of childcare policies that are institutionalised in ten Swiss municipalities since the 1990s. To this end, I first classify the different policy designs of childcare policies according to their degree of professionalisation and the use of childcare services by parents. Second, I develop a new typology of childcare policies that allows to illustrate the potential implications of the design of such policies on gender equality and social redistribution. Whereas some municipalities have institutionalised public support for childcare services with low quality standards, which are provided by daily mothers, others have implemented highly professionalized crèches with rigorous quality standards. However, these offers are used differently by parents from different income classes. Whereas the low quality childcare services are used more frequently by parents from low income classes, the more professionalized offers are used more frequently by parents with middle and high income. This segregation in the use of services is notable, not only with regard to the criteria of social redistribution: it is even more striking in regard to the scientific social investment discourse, where it is stated that the reduction of poverty should be obtained by public investment in human capital, beginning with pre-school children.

Predicted and Observed Child Health Indicators in Haiti: Exploring the Impact of the 2010 Earthquake at National and Regional Levels 

The 2010 Haitian earthquake caused catastrophic damage within the impact zone and had a profound effect on social, economic and political conditions within in Haiti since the disaster. Regional variations in the severity of disaster impact.
and the social and economic consequences have been encountered. The 2010 Haitian earthquake occurred within a country with a history of poor child health indicators and outcomes. The indicators include child nutritional status, immunization status, and diarrheal disease treatment. Despite the low performance on many child health indicators, data from Demographic and Health Surveys (DHS) have shown national-level improvements in key child health indicators in the three surveys conducted prior to the earthquake. These improvements continued in the 2012 DHS despite the 2010 earthquake and cholera outbreak. The purpose of this study is to determine national and regional differences in child health indicators in the influence of the disaster on child health indicators. Simple extrapolation method was employed to calculate the estimates. The results show a difference between expected and observed values, with observed values indicating poor health outcomes for children compared what was predicted based on the previous three time points. Further, regional variations were apparent and linked to proximity to the earthquake area, country, and family composition. The results provide evidence of the effects of the disaster on child health in Haiti.

**ZUCKER, GREGORY** (The Graduate Center, CUNY, gzucker@gc.cuny.edu)

*Is Georg Lukacs’ Critique Of Neo-Kantianism Justified?*

A recurrent theme in the work of Georg Lukacs is a critique of the prevailing currents of sociological theory and method of his time. For Lukacs, Marxism provides a sociological theory that surpassed social theory modeled on the neo-Kantian distinction between facts and value. Several scholars have argued that Lukacs’ commitment to Marxism blinded him to the contributions made by other social scientific approaches. In effect, Lukacs is charged with dismissing all other social scientific approaches on the basis of his alleged dogmatic Marxism. Moreover, Lukacs is accused of identifying any non-Marxian approach to the social science as reactionary. This paper revisits Lukacs’ critique of social theory as well as the ways it has been dismissed. In this paper, I wish to argue that the nature of Lukacs’ critique has been misinterpreted and warrants renewed consideration. Reexamining Lukacs’ critique of neo-Kantianism reopens debates over claims that Lukacs’ notion that prevailing currents of social theory overlook the problems of alienation and reification.

**RC36-619.2**

**ZUCKER, GREGORY** (The Graduate Center, CUNY, gzucker@gc.cuny.edu)

*Reification and Racism*

Both historians of social theory and practicing social theorists have drawn attention to the prevalence of racist thinking in nineteenth and early twentieth century social theory. They have been increasingly aware of the ways such thought and theory are embedded in social theory’s development and questioned the extent to which the vestiges of such thought still inform contemporar y social theory. This paper examines an overlooked chapter in the critique of racist social theory. In particular, it focuses on the seldom-studied work of Georg Lukacs, *The Destruction of Reason*. In that work, Lukacs develops a critique of racialism and a theory of social alienation. The paper argues that the critique Lukacs develops can contribute to the examination of racism in social theory. Further, it argues that Lukacs’ critique should be reconnected to the concept of reification, which Lukacs developed earlier in his career. This allows intellectuals to interpret the experience of racial prejudice under capitalism as a form of reification. In this respect, this paper attempts to move toward developing a social theory that can employ the concept of reification in the understanding of racism.

**ZUEV, DENNIS** (Independent Scholar, tungus66@gmail.com)

*In and Beyond the Visual Gaze of the Tourists: Humanizing Antarctic Wilderness*

The objective of this study was to unwrap the Antarctic tourism imaginary and go beyond the oral-visual narratives of tourists in order to understand which other senses and how are activated when touring in Antarctica. What is the ground master plot at the core of the Antarctic tourism imaginary? To summarize, most of the visualization of Antarctica and Antarctic experience rotates around the theme of “humanized nature”; the penguins are seen as human-like creatures, the icebergs are spoken about as the perfect examples of abstract art and whalebones are static reminders of once prolific whale-hunting industry. Antarctica is the only land that has no myths of origin but compensates this with the heroic stories of its first explorers. In contrast to the “gaze” centered approach to tourism, Antarctica tourism presents an example of multisensuous, non-ocularcentric geography. Deepest affectual encounters of tourists come from engaging various senses: interviewees talked about the powerful sounds of calving glaciers and meditating brush ice, the awful smells of penguin and seal colonies, the caresses of Antarctic wind, of refreshing Polar plunge and thick morning mist, which concealed the land and upon seeing which people would start to cry.

*Self-Transformation Of Russian Youth Through Work and Travel Program In The USA*

In this study I wish to examine the mechanisms of personal transformation among Russian youth through the contact with America as an imaginary and real-life entity in the course of the program “Work and Travel.” I delineate several families of transformation: relational transformations, physical transfigurations and attitudinal transformations. I argue that the transformations that occur with individuals during the contact with another culture or as a consequence of the trip are part of the (de)civilizing process of the individual. One of the practical questions behind the study is whether after being a guest in the other culture young people become positive towards others being guests in their home culture.

Some of the effects of the trip have civilizing effect in the sense that they touch the structures of habitus and modes of knowledge. Through lived-in experience young people transit to the stage of reevaluation of their distance with parents and intimate partners. One of the important configurational changes is the reevaluation of the relationship with parents who initially serve the primary instance in regulating the trip (through financial and emotional support).

The physical changes in perception of one’s body and emotional management are reflected with ambiguous reaction: the body reaction to the contact with the fast-food culture resulting in weight gain increases reification of American civil- ization, however the behavioural patterns of everyday communication can be adopted and attempted to be transplanted in home culture. One of the leading emotional changes concern the feeling of embarrassment for the behavior prac- ticed in restaurants in a majority-black neighborhood of Brooklyn, New York, suggest that the global migrations of cuisines help to create more complex social, racial, and local identities.

**RC37-633.4**

**ZUKIN, SHARON** (Brooklyn College, zukin@brooklyn.cuny.edu)

*Globalizing the Local: Restaurants, Racial Identity, Gentrification, and Immigration*

The globalization of cuisines takes place in sites ranging from the family dinner table to fast food franchises, with the integration of new products, new production techniques, and new taste criteria into traditional formulas. Located between the private, domestic space of the family and the public, mass-market space of McDonalds, neighborhood restaurants and modest takeout food shops provide a middle ground of individual action and collective provisioning where globalization reshapes local identities. Much of the globalization is carried out by demographic changes, with the entry of immigrant and “creative” entrepreneurs who both re- place old restaurant owners but open new kinds of restaurants and food stores. But globalization is also encouraged by the entry of menus that define traditional cuisines in new ways, repositioning them, on the one hand, in a new global culi- nary order and, on the other hand, in changing local markets. Recent changes in restaurants in a majority-black neighborhood of Brooklyn, New York, suggest that the global migrations of cuisines help to create more complex social, racial, and local identities.

*Memory, Nostalgia and the Creation of “Home”: An Okinawan Woman’s Journey*

This study looks at how elderly Okinawan women return migrants created and re-created perceptions of “home” upon their return to Okinawa through the life stories of an Okinawan woman presently living in Naha, Okinawa. Married to Fili- pino base workers during the American Occupation of Okinawa, these so-called “war brides” spent a considerable number of years in their husbands’ country, assimilating into Filipino culture as well as negotiating their identities as Okinawan women amid wartime sentiments against the Japanese in post-war Philippines. Upon returning in their sixties to Okinawa, these women have been returning to Okinawa, creating a significant community – albeit small in number – of Okinawan women return migrants.

For this paper, I seek to explore how migration, memory, and nostalgia came to define these women’s identities as return migrants in an Okinawan that saw the effects of the war and dislocation of its people, the experience of being vis-à-vis the Japanese mainland (i.e. the current base-related issues) by focusing upon one woman’s life history. Along with this interview that was carried out in October 2012 (as well as subsequent conversations with her), data culled from fieldwork, interviews with other Okinawan returnees, and interviews with family members of these women are to be utilized as well. The migration of Oki-
nawan women to the Philippines during the immediate post-war years is a lesser known phenomenon in contrast to the migration of “war brides” to the United States. While similarities present themselves in these two migration streams, circumstances widely differ, and thus it is hoped that this research would be a contribution to existing on Okinawan women’s international marriages and overseas migration during the post-war years.

RC05-101.3

ZULUETA, JOHANNA* (Japan Society for the Promotion of Science/Hitotsubashi University, zulueta@soka.ac.jp)

Okinawan and Beyond: Okinawan Women and The Re/Creation Of Diasporic Identities

Studies on Okinawan women migrating to the Philippines during the postwar years are scant and not accorded much attention by scholars looking at Japanese/Okinawan migration. Furthermore, the role of women in the maintenance and re/creation of diasporic identities have been significantly overlooked. These Okinawan women married Filipino men who worked on U.S. bases in Okinawa during the early years of the Occupation Period (1945-1972). Many of these women went with their husbands to the Philippines and settled there, raising families and living new lives. Upon migration, many of these women consciously assimilated into Philippine society. Despite this, they still acknowledge their Okinawan selves by passing on aspects of Okinawan culture to their offspring, creating in the process, a diasporic Okinawan identity that contains both Philippine and Okinawan characteristics.

I argue that these migrant women are active agents in the transmission of Okinawan culture, at the same time promoting the culture of their husbands and their adopted land, thus creating a distinct “Philippine Uchinānchu” identity. This particular identity is continuously being maintained and re/created not only within familial and contiguous boundaries, but also across space and time, through various activities these women engage in. I also argue that these women engage in this process of re/creating as they fashion out their sense of a “home” away from home. The creation and re/creation of an Okinawan diasporic identity also relates to a re-definition of Japanese identity, which tends to conflate nationality, ethnicity, and race, and continues to leave Okinawans in an ambivalent position vis-à-vis a Japanese identity.

This study analyzes data gathered from interviews with these women, as well as from participation in meetings/gatherings of the Philippine-Okinawan Society in Manila. Interview data from their children are also pertinent sources of information about their mothers and thus will be utilized in the analyses.

Anti Doping Code and Controls: Social Sorting For Fair Play?

Viewing doping controls in the lights of social sorting, puts a new perspective on the subject. Besides touching on issues such as data protection, citizens rights of informational self-determination, privacy and the right to be let alone, those controls foster forms of social sorting, albeit ones that claims to sort out particular subjects in the name of fairness. As much as doping practices are a problem to a culture of fairness and good sportsmanship, so are the controls.

From existing research, it is apparent that the athletes’ perspective is missing in the discussion. The athletes are the object of the public debate, rather than the subject. Athletes that are convicted (or even only suspected) of doping practices are blamed and condemned - often by the same people that were generating the pressure under which the decision to take illegal performance enhancing substances was made. Doping and its controls therefore operate in a twofold field of social sorting: one that sorts out the guilty - and one that sorts out the losers, which may turn to illegal measures to improve their situation.

From interviews with athletes, officials and doping controllers on doping control practices, I will highlight what forms of social sorting are generated through doping controls, how they are perceived and what discourses are being formed.

I want to draw the attention to other issues within the debate on doping, such as have not received wide attention and are not likely to, as athletes more and more are put under a general suspicion within the system that is generating a massive pressure and puts athletes at risk. Social sorting is by no means an intended consequence, but a “collateral” effect that does play a major role on how these controls are perceived and hence legitimised.

PITTI, ILARIA (University of Bologna)

Italian Young People and the Choice of Emigration: Economic Crisis’ Weird Effects

In Italy, as well as in other European countries, the economic crisis and the austerity policies have exacerbated the structural national problems, worsening the already difficult situations of the whole population and, in particular, of the youngest generations. In a country where the unemployment rate touches the 35% among the 18-24yo young people and where the demographic, socio-economic and political disparities between young and adult generations lead to a worrying decrease of the social visibility of the first ones, emigration becomes again an option for many Italian young people. Although still quantitatively limited, it’s emerging among them a new migration trend which involves the Italian young people emigrations through the analysis of 25 in-depth interviews - collected between January and June 2013 in Sydney and Melbourne - to a group of European countries such as Australia, where the emigration phenomenon acquires new peculiar characteristics in terms of adaptation plans and future projects. The proposed contribute aims at exploring the new features of the old phenomenon of young people emigrations through the analysis of 25 in-depth interviews - collected between January and June 2013 in Sydney and Melbourne - to a group of Italian young people aged between 18 and 26yo, emigrated in Australia in the last two years. Trying to situate the emigration project within the framework of the interviewees’ transition to adulthood, the analysis will focus on the reasons pushing them to emigrate, on their adaptation strategies and on their future plans. The first results highlight the weight of personal, familiar and socio-demographic characteristics on the choice and especially on the results of immigration, which does not mitigate the starting social inequalities: within the transitions to adulthood, emigration becomes an opportunity of realisation for the strongest and a ‘trap’ for the weakest. Finally, as immigration has a mirror effect on the society, the interviewees’ stories stress the difficulties of a country that seems no more able to invest on its present and future.
