Digitalisation is changing the conditions for historical research on postwar Scandinavian knowledge societies. In the last few years, vast amounts of topical source material – such as books, governmental reports, parliamentary minutes, and newspapers – have become digitalised and text-searchable. This new digital infrastructure has shifted the outer bounds of what is possible by enabling us to use new methods for distant reading, such as text mining and topic modelling. In practice, however, most historians do not employ these new techniques. Yet, digitalisation has profound – if seldom acknowledged – effects on traditional research as well. For example, the traditional practice of collecting source material from microfilmed newspapers no longer requires weeks in the library but a day or so in front of a computer screen. This is a poignant example of what Lara Putnam has referred to as “shifting the center of the easy”, a phenomenon I believe most active historians have experienced first-hand over the last years. Yet, to date, few of us have turned our experiences into writing. Hence, in this chapter I seek to substantiate, and methodologically reflect upon, the practical implications of working with digitised source materials. I do so by discussing and demonstrating how the recent digitalisation of newspapers has made journalists more visible as knowledge actors. This is a way of answering calls for historians of knowledge to broaden the repertoire of actors involved in societal circulation processes.

Journalists, to be sure, are by no means invisible in Scandinavian historiography of the postwar era. On the contrary, their texts enjoy a somewhat privileged position, as most historical accounts of the period partially draw upon newspaper material. Yet, compared to other public figures of the era – such as politicians, intellectuals, scholars, and scientists – journalists are rarely studied as historical actors in their own right. They are indirectly present in our studies through their texts, but their activities hardly ever receive closer analytical attention. Hence, I would argue that journalists are but semi-visible. To redress this situation, we need to start following them closely in their tracks, which is now practically possible. A few years ago, it was not. The advent of text-searchable digital newspaper archives, such as the Norwegian bokhylla.no and the Swedish newspaper database tidningar.kb.se, serves a necessary prerequisite for this kind of research.
In this chapter, I demonstrate and discuss this new visibility by highlighting the trajectories of two Swedish journalists: Barbro Soller (1928–2020) and Tom Selander (1923–1978). They are studied in relation to the so-called “ecological turn” – that is, the emergence of modern environmentalism in the late 1960s and early 1970s. Neither Barbro Soller nor Tom Selander is unfamiliar to environmental historians; however, their turn to environmental journalism in the 1960s has not been studied in depth. One reason for this is that such a venture, until recently, would have been a very time-consuming prospect – as none of them have a personal archive. Hence, their prospective historian would have had to trawl through years of microfilmed newspapers in order to assemble a sufficient body of source material.

This situation contrasts sharply with more visible actors of the ecological turn, such as diplomat Rolf Edberg (1912–1997) and scientist Hans Palmstierna (1926–1975). Their personal archives, including a vast array of correspondence, are veritable treasure troves for historians. Moreover, both Edberg and Palmstierna used subscription services to receive clippings whenever their names were mentioned in the press. This was a widespread practice up until the 1990s among certain groups of elite actors in Sweden. Through press clippings and correspondence, it is possible to follow them very closely. Hence, the visible elite provides historians with both ample and conveniently accessible source material to draw upon. Consequently, their visibility tends to become even further pronounced by posterity.

The recent digitalisation of newspapers does not in itself change this situation. Archival conditions can but shape, not determine, how historians conduct their research. Moreover, the actual implications of digitalised newspapers on historical research are quite hard to determine based on our publications, as we rarely discuss this “invisible method”. For example, we commonly do not distinguish between how we have accessed newspaper material; that is, whether we have used originals, microfilmed copies, clipping archives, or digital archives. Yet, the various forms we use most certainly have consequences for the text corpuses we find and the way in which we process them. In the case of digitalised newspapers, the most significant feature is that they are text-searchable. Hence, as Lara Putnam emphasises, words and concepts become more available than ever before. Consequently, historians are able to get a quick overview of when certain terms came into use or fell out of fashion. This has fuelled a trend towards conceptual history that has been accentuated in, and by, the data-driven field of digital history. Yet, digitalised newspaper archives contain much more than searchable terms – there are plenty of actors to search for as well, such as the journalists involved in the making of the ecological turn.

**Visible journalists and the moulding of archives**

The cases of Barbro Soller and Tom Selander represent a good starting point for discussing the new visibility of journalists, as well as the more general question of the systematic biases of text-searchable archives. These two journalists
The emergence of environmental journalism

are among the most visible in the digitalised Swedish newspaper archives of the 1960s. The reason for this is twofold. First, the newspapers they wrote for – *Dagens Nyheter* and *Svenska Dagbladet* – have survived up until today and have financed the digitalisation of their own archives. Other large and influential Swedish newspapers of the 1960s have not survived, such as *Stockholms-Tidningen* and *Arbetet*. This is important, as *Dagens Nyheter* and *Svenska Dagbladet* have made their archives available to their subscribers. Hence, for a fee, they are accessible to anyone anywhere, in contrast to the national database tidningar.kb.se, which is only available at the National Library in Stockholm and from certain computers in university libraries. Second, both Barbro Soller and Tom Selander are rather unusual names. For that reason, when you enter their name into the search engine, you do not get a flood of irrelevant results. Historical actors with common names, say “David Larsson” or “Anna Nilsson”, do not fare as well. In fact, Barbro Soller and Tom Selander are actually easier to trace than Hans Palmstierna. This is because the latter had a younger sister – Gunilla Palmstierna-Weiss (b. 1928) – who was a vocal activist against the Vietnam War in the 1960s and thus occurred more frequently in the press than her older brother. In addition, the name “Hans” is a common Swedish pronoun, equivalent to “his”, which further blurs the search results. To be sure, Hans Palmstierna is still possible to follow – after all, he is no David Larsson or Anna Nilsson – but his case illustrates that the historical context determines what is text-searchable. Moreover, it shows that simplistic quantitative measures are to be used very cautiously, if at all, when we follow historical actors.

The case of Barbro Soller further accentuates the necessity of contextual knowledge. When searching for her name in the digital archive of *Dagens Nyheter*, there are some scattered hits in 1964 and 1965, just over a dozen in 1966, and a lot more from 1967 onwards. Taken at face value, this result is quite surprising, as the scholarly literature unanimously declares that Barbro Soller started working for *Dagens Nyheter* in 1964, which she also did. However, as stated in one of the search results from 1964, during her first years at the newspaper, she mainly wrote under the signature “Barbara”. Luckily, the name Barbara was rather uncommon in Sweden at the time, yet the search result for the three-year period 1964–1966 gives more than 1,000 hits, most of which are irrelevant. Hence, as in the case of Hans Palmstierna, the mapping of Barbro Soller’s activities requires quite some groundwork. However, it is crucial that some quick searches in the digital archive can convince a researcher that this groundwork is a worthwhile pursuit. Compared to the trawling of microfilm – which would have to be rather meticulous in order to find all articles written by the signatures Barbara and Barbro Soller – the digitalised newspaper archives are very practical.

However, the new digital infrastructure does not render older systems obsolete. On the contrary, they can make them even more useful. In my work on Tom Selander, I accessed all the material from the digital archive of *Svenska Dagbladet*. I did not physically leave my office. Yet, the prerequisite for this was old index cards that were scanned and sent to me by mail by the current...
editor. Through these index cards, I knew exactly which dates Tom Selander wrote essays in the section “Under strecket”, in total 73 times, between 1947 and 1977. Simply searching for “Tom Selander” over these years results in 2,195 hits. Hence, the index cards of Svenska Dagbladet were instrumental for making my research feasible.

On a more general level, the practice of indexing Swedish press material was rather thorough in the 1960s. One key resource for historians is Svenska tidningsartiklar, which indexes a large number of articles by topic and name. For example, this index makes finding reviews of books a fairly simple procedure, at least for scholars with access to a university library with microfilmed newspapers. An even more powerful resource is the press clipping archive at the Sigtuna Foundation. This is one of Sweden’s largest collections of press clippings from the twentieth century, and it is conveniently structured in boxes sorted by topic and by name. Moreover, two times a year, scholars may apply for scholarships to stay for a week with room and board at the Sigtuna Foundation to work in the archive. This generous infrastructure has formed the basis for many dissertation projects. However, as Johan Jarlbrink has pointed out, the Sigtuna clipping archive is by no means a neutral conveyor of the past. There are systematic biases and blind spots that researchers are well advised to keep in mind. For example, serious essays by intellectuals on the cultural pages of newspapers are prevalent, whereas more mundane forms of journalism are not. This is mirrored in the indexes of Svenska tidningsartiklar. However, systematic biases are by no means unique to index services. All archives – not least fully text-searchable digitalised newspapers – shape historical research in specific ways, primarily, I would argue, by making certain practices easy and efficient.

In my own research on the ecological turn, I have worked with all the previously mentioned archival forms. To me, this has clarified that what is visible for historians depends a great deal on the archives we work with. In 2014, when I started, there were no digital newspaper archives and I had limited knowledge of the relevant personal archives. Hence, I conducted my first studies by trawling microfilm over periods where I could reasonably expect to find something of interest. This was a tedious method. However, I also learnt a great deal about how much text newspapers of the time actually contained. To me, this was a sobering experience. Later on, when I began working with material from the Sigtuna Foundation and digital newspaper archives, I kept in mind that – after all – this was but a tiny fraction of what newspapers were about. My experiences of searching for needles in a haystack is important, since in the wake of digitalisation, it has become easy to find needles without ever experiencing the haystack. Lara Putnam describes this as the rise of decontextualised reading. For us as historians, there are many risks involved in these developments, and we need to discuss these more seriously. However, this should not stop us from pursuing some of the new lines of research enabled by the digitalisation of source material. In the following, I demonstrate one such possibility by highlighting the role of journalists as knowledge actors in the ecological turn in Sweden.
Barbro Soller’s early years at Dagens Nyheter, 1964–1966

Barbro Soller is widely recognised as the first full-time employed environmental journalist in Sweden. This was established by Monika Djerf Pierre in her 1996 dissertation Gröna Nyheter, which has served as a key reference for environmental historians and media scholars alike ever since. The topic of her dissertation, however, is not the Swedish press but environmental journalism in television news, from the early 1960s up to the 1990s. Barbro Soller plays a special role in this audio-visual history as well, as she in 1972 became the first formally employed environmental journalist on Swedish television. In this role, she pioneered a new form of critical investigative journalism. Yet, Djerf Pierre’s rich account touches upon much more than television news. Based on an interview with Barbro Soller conducted in the early 1990s, she establishes that Soller became the first full-time employed environmental journalist at Dagens Nyheter in 1964.16 Djerf Pierre did not have any reasons not to trust Soller on this account; however, memories are fragile and three decades is a long time. What happens if we go to the digital newspaper archive and search for Barbara in 1964?

The search results in 317 hits, many of which are irrelevant, as there were quite a few international luminaries named Barbara at the time. However, we also find many articles written by Barbro Soller, and we get visual and textual evidence that she was part of the “DN team” of 182 journalists.17 To the readership, Soller is presented as a general reporter, which, indeed, she seems to have been. In 1964, she wrote about classical music, art exhibitions, celebrities visiting Stockholm, wildlife, and a multitude of other topics. She reported about the boxer Floyd Patterson, Charlie Chaplin’s visit to the Vasa Museum, as well as the ambition of a local choir to travel to America.18 Hence, it is a stretch to say that she was a full-time employed environmental journalist in 1964.

However, there are merits to Barbro Soller’s memories. In the spring of 1964, she indeed wrote a number of featured articles on mercury-poisoned eggshells. These instalments ran in February and March 1964 and made the frontpage of Dagens Nyheter (which few of her other articles did at the time). In these pieces, she reported on new research findings and conducted interviews with leading scientists.19 Moreover, she also wrote about the activities of young field biologists, biological school excursions, and a national conference on the problem of noise.20 In sum, in 1964 Barbro Soller was a general reporter at Dagens Nyheter, who took a special interest in environmental problems, wildlife, and biology. However, she seems to have been just as interested in classical music and wrote regularly on visiting celebrities.

This particular phase of Barbro Soller’s career stretches from 1964 to 1966. Up until then, her topical focus varied and included articles on youth gospel choirs, the working day of a professor, and lifeguards in Swedish seaside resorts.21 One distinctive feature of her journalism was longer essays on animals. These kind of texts were frequently complemented with rich colour photographs and published in Sunday supplements. I would describe them as
a form of apolitical nature journalism. In October 1967, Soller even got her own Q&A section in the newspaper named “Ask about animals” (“Fråga om djuren”).

However, Barbro Soller’s position in Dagens Nyheter grew stronger and in the spring of 1966, she did her first high-profile feature series, the topic being the looming hunger crisis in India. Dagens Nyheter advertised the series in advance, and all three instalments dominated the frontpage of their respective issue. The series was a collaboration between Soller and photographer Stig A. Nilsson (1930–2003), who travelled together with her in India for a month. Interestingly, the publication coincides with a change of signature – from Barbara to Barbro Soller-Svensson. Still, this shift was gradual, and throughout the mid-1960s, she altered between her three different signatures.

Barbro Soller’s journalistic role in the India series was that of the engaged reporter. Here, she was part of a larger trend, towards a form of journalism that was more personal and activist in nature. Media scholars describe this in terms of a change in journalistic ideals during the 1960s, from objective reflection to critical investigation. This shift was intertwined with a larger process of professionalisation for journalists in Scandinavia, marked by a weakening of the ties between the press and the political parties.

Barbro Soller and the ecological turn

The fall of 1967 was a formative moment in Swedish environmental history. During this period, the environmental debate took off. An absolutely crucial factor was that a number of well-respected Swedish scientists raised the alarm concerning an ongoing environmental crisis. Public attention was drawn to the notion that proverbial environmental hazards, such as biocides, mercury poisoning, and sulphur emissions, did not constitute isolated problems. Rather, they were part of a complex and interrelated web of environmental degradation, which constituted a serious threat to the survival of man. Leading actors, such as Rolf Edberg and Hans Palmstierna, linked various environmental issues to other global concerns, notably the looming threat of overpopulation, which Soller had discussed in her India series the year before.

Barbro Soller’s own transition from being a general reporter to becoming an environmental journalist seems to have taken place during the fall of 1966. By early 1967, she wrote exclusively about environmental issues and the natural world. Her primary signature was still Barbara, but her role had changed. In the yearly presentation of the “DN team”, she was introduced as one of the foreign correspondents. However, judging by what she actually wrote, I would say that she had now indeed become Sweden’s first full-time employed environmental journalist. As such, she was instrumental for the societal circulation
of environmental knowledge. She served as a link between the public at large and the concerned scientists, who in the mid-1960s rarely directly entered the public fray. During the first half of 1967, Barbro Soller wrote extensively about mercury in fish, warned of the poisoning of Lake Mälaren, discussed the implications of delayed political investigations of oil damage, and interviewed Rolf Edberg. In addition, she continued to write apolitical nature journalism about wildlife and new ethological research findings.

Barbro Soller’s journalistic activity intensified in the fall of 1967, and it was during these eventful months that she finally adopted “Barbro Soller” as her main signature. An important topic at the time was the discovery of dangerous levels of mercury in Swedish freshwater fish, which resulted in a ban on selling fish caught in about 40 Swedish lakes. In addition, Svante Oden’s alarm of acid rain demonstrated the international dimensions of environmental pollution. For Soller, the heated debate resulted in more contacts with scientists, politicians, and governmental agencies. However, she did not engage in investigative environmental journalism in 1967, but that was about to change.

**Barbro Soller’s “New Filth-Sweden”**

Barbro Soller’s public breakthrough as an environmental journalist was the ambitious series of articles titled, “Lort–Sverige 30 år senare” (“Filth-Sweden 30 Years Later”) in 1968. It ran in *Dagens Nyheter* from March to June and covered a number of environmental issues. The title of the series paraphrased Ludvig Nordström’s (1882–1942) well-known social report book *Lort-Sverige* (1938), which had exposed the harsh and filthy living conditions of the poor in the 1930s. Nordström’s book had a profound impact on the formation of social democratic policy and the expansion of the modern welfare state. Soller’s main argument was that the sanitary problems had not disappeared; they had just been relocated. Swedish homes were cleaner in 1968 than in 1938 – but as a result, Swedish nature had become polluted. For the air, soil, water, and wild animals, the consequences of rising affluence were dire.

The feature series was yet another collaboration between Barbro Soller and photographer Stig A. Nilsson. They travelled through Sweden together in the spring of 1968, just as they had travelled through India two years earlier. Soller’s texts and Nilsson’s pictures exposed polluting activities and environmental decay. All seven instalments were frontpage material, at times with colour photographs. Every piece began by Soller alluding to Ludvig Nordström, thereafter linking his description of Sweden in the 1930s to subsequent developments. In the series, Soller had a special focus on the environmental consequences of modern conveniences, such as cars, water closets, washing machines, and dishwashers. For example, she portrayed a modern “villa family” in Värmland and got the State Institute for Building Research to measure the environmental impact of their affluent lifestyle. On the frontpage, the young couple stood in front of their new house, holding their two kids. The caption read “Modern machines make life comfortable. But at what cost?”
“Lort-Sverige 30 år senare” also included reports on agriculture and industry. Soller contrasted the problems of lice and flies in the 1930s with the widespread use of pesticides in the 1960s. In 1968, the environmental debate on biocides was well-established, but Soller wanted to report on how the farmers themselves experienced this new situation. The frontpage displayed a colour photograph of a man in protective clothing and a mask standing in front of a cart full of chemicals. In the text, Soller told the story of how this man – the director of a machine station – was responsible for the weed control of about 6,000 hectares. It demonstrated that agriculture had become an industry-scale phenomenon with major environmental consequences.39

The last instalment of the series focused on the paper and pulp industry in the city of Sundsvall. Soller examined the activities of Svensk Cellulosa (SCA), one of Sweden's largest corporations at the time. She told the story of how Ludvig Nordström was impressed by the factory smokestacks when he arrived in Sundsvall. To him, it was a symbol of industrial progress. To Soller, it was a massively polluting industry. She discussed how SCA used the ocean as a dumpster, not taking into consideration the long-term consequences of the disposal of chemicals.40 The following day, the entire series was lauded in the editorial section of Dagens Nyheter. The piece emphasised the need for a discussion on how the costs for environmental restoration and preventive measures should be distributed in society. There was an emerging environmental consciousness in Sweden, but it had to be followed by a new willingness to take economic responsibility. Politicians, large corporations, agricultural sectors, scientists, and the people had to work together to redress the situation.41

In 1968, Barbro Soller’s article series reached the large number of readers of Dagens Nyheter. In 1969, it reached a new audience, as Rabén & Sjögren (the same publishing house that Hans Palmstierna worked with) published the series in a revised form as the paperback Nya Lort-Sverige (“New Filth-Sweden”). The book was richly illustrated by Stig A. Nilsson’s black-and-white photographs, which served as visual evidence of Soller’s arguments. The cover featured a spring scenery from a forest, where coltsfoot rose through litter. Inside, Soller started off by portraying Stockholm as a city for cars, unfit for pedestrians. Particularly illustrious was a photograph of a man holding up a white filter that had turned black in an hour of morning traffic.42

Nya Lort-Sverige received positive reviews and was printed in a second edition in 1970. However, compared to the major environmental bestsellers of the era, such as Hans Palmstierna’s Plundring, Svält, Förgiftning (1967) and Gösta Ehrensvärd’s Före–Efter (1971), Soller’s book was not a huge commercial success. However, the article series established her as an environmental journalist with an independent critical agenda. In the spring of 1969, she and photographer Stig A. Nilsson produced a new ambitious feature series for Dagens Nyheter, where they sought to uncover the inner workings of the Swedish meat industry. The series “Djurfabriken” (“The Animal Factory”) ran from March to June but was not promoted as heavily as “Nya Lort-Sverige”. For example, only the first instalment appeared on the frontpage. This feature series marked
the end of Barbro Soller’s years at Dagens Nyheter. However, it was but the beginning of her long career as an environmental journalist. In the following, I examine another journalist who changed course in the 1960s.

**Tom Selander and the future of humanity**

Unlike Barbro Soller, Tom Selander is no longer a household name for environmental historians. However, in the late 1960s and early 1970s, he was instrumental in the Swedish public debate on the future of humanity. In my own research on the ecological turn, he is frequently present through reviews, essays, and article series. However, I had not been able to find much information about him through online searches or biographical lexica. Yet, when asked in 2018 to contribute to the centennial jubilee of the daily essay section in Svenska Dagbladet, “Under strecket”, I decided to use this opportunity – and the newly digitised newspaper archive – to follow Tom Selander. The index cards provided by the editor guided my gathering of source material. This combination of old and new search engines made it possible to find, and read, 73 essays written by Tom Selander from 1947 to 1977. It was a practical method for following a journalist’s intellectual development over three decades.

What I knew of Tom Selander, apart from his interest in future studies around 1970, was that he was the son of poet, author, and botanist Sten Selander (1891–1957). The father was a well-known and versatile public intellectual, who was on the Swedish Academy and was the president of the Swedish Society for Nature Conservation. Environmental historians have portrayed him as a precursor to modern environmentalism in Sweden. In the 1940s and 1950s, Sten Selander regularly wrote for Svenska Dagbladet, not least “Under strecket”. Hence, between 1947 and 1957, the readership met two generations of Selander. Sten wrote about literature and nature, while Tom explored the political landscape of continental Europe. Tom took a special interest in youth, school issues, and the world awaiting his own generation. In 1954, Tom got a permanent position at Svenska Dagbladet as a foreign correspondent in Bonn. Throughout the 1950s, he reported about current European events, often in the form of travelogues.

However, in the early 1960s, Tom’s essays took a new direction. It began with an enthusiastic review of a local historical account of the island of Möja in the Stockholm archipelago. The book portrayed the coming of modernity at the turn of the century, and Tom reflected upon the vast cultural rift separating him and his contemporaries from the world that had vanished so recently. In the wake of this essay, Selander started writing about sailing, especially adventurous sailing. He wrote vividly about Joshua Slocum (1844–1909), the first man to sail around the world by himself. Tom Selander’s essays from the early and mid-1960s contain a mild form of civilisation criticism, which resembled his father’s stance in Det levande landskapet i Sverige (1955). During these years, Tom turned his back on the political world, which had captivated him in the past.
In 1967, however, Tom's journalism took yet another turn. The reason being that he travelled to India, just as Barbro Soller had done in 1966. In a four-series instalment, he reported on extreme poverty, overpopulation, and the massive political challenges ahead.50 Thereafter, Tom Selander no longer wrote about sailing. He took an intense interest in global concerns and the future of humanity. Initially, his essays centred on foreign aid and the need for economic development; however, his newfound interest led him to engage in the emerging field of future studies.51 He interviewed 24 Swedish so-called “future experts”, including Hans Palmstierna, and published his findings in the article series “Sverige år 2000” (“Sweden in the Year 2000”), which ran from December 1968 to March 1969. Two months later, Rabén & Sjögren published the series as a paperback.52

Tom Selander’s interest in future studies characterised his essays in the 1970s. He was an avid reader and introduced a wealth of international literature and debates to a Swedish audience.53 He travelled as a reporter to the United States to witness first-hand how future research was carried out. In the spring of 1972, he produced a new ambitious interview series “Överleva, men hur?” (“Survive, but How?”), which intervened in the heated Swedish debate on Gösta Ehrensvärd’s Före–Efter: En diagnos (1971).54 Until his death in 1978, Tom Selander served as a link between international scientists, global developments, and the readers of Svenska Dagbladet.

The daily essay section “Under strecket” has been characterised by Johan Östling as a special form of “knowledge arena”. In the 1960s and 1970s, it linked certain intellectuals, scholars, and scientists to a wider readership.55 Svenska Dagbladet was a conservative newspaper that differed from the liberal Dagens Nyheter, which undertook a distinct turn to the left over the course of the 1960s.56 Hence, for young people in the 1960s and 1970s getting engaged in new social movements – such as the environmental movement – Tom Selander was not a household name. He was not visible to them, even though he wrote extensively on the Club of Rome, Barry Commoner (1917–2012), and the attempts to replace GDP with QOF (Quality of Life).57 However, in the digitised newspaper archives of the 2010s, his role in the ecological turn is more visible than ever.

The digitised turn

The impetus for this chapter has been Lara Putnam’s seminal article “The Transnational and the Text-Searchable: Digitized Sources and the Shadows they cast”, which was published in American Historical Review in 2016. Putnam argues that digitalisation has caused a discipline-wide transformation, as historical scholarship at heart is about “finding and finding out”.58 Google, Google Books, JSTOR, and various forms of library databases – such as Libris in Sweden – now profoundly shape these activities. In a discipline-wide perspective, the development of new digital methods is rather marginal. “Shifting the outer bonds of the possible”, Putnam claims, “matters less than shifting the center of
The emergence of environmental journalism

In this chapter, I have demonstrated that certain journalists are now easy to follow. We can map their careers and writings, without ever leaving our offices. Hence, the digitalisation of topical source materials frees us from certain spatial constraints. While practical and efficient, there are many risks involved. Putnam warns of decontextualised reading, especially in relation to source material from historical contexts about which we know very little. Previously, such material was only accessible by travelling to distant libraries and archives. During these travels, historians have been prone to interact with others – scholars, librarians, and archivists – who knew a great deal more than the historian about the specific context. Today, search engines generally circumvent these actors, to the detriment of historical scholarship.60

Moreover, Putnam points out that digitalisation and the transnational turn are parallel processes. She argues that this is not a mere coincidence. Rather, she stresses that the ideal of transnational history gained strength in tandem with the digital infrastructure, which made it easier to conduct transnational history. Putnam highlights “side-glancing”: that is, a quick search to determine what is going on in your topical area in another scholarly community.61 Traditionally, the strongest communities have been organised nationally, and in my experience, they still are – even though the critics of this paradigm are vocal, not least in Scandinavia.62

Still, there are certain strengths in the traditional organisation of historical scholarship. One is that there is a large amount of shared contextual knowledge: of past events and processes, of historical actors and networks, of source materials, and of archives and archival practices. This type of knowledge is not, at least in my experience, typically present in international research networks. Hence, for empirically oriented historians, the national paradigm – with all its problems and pitfalls – is still very valuable in practice.

However, these types of scholarly communities are not a given. They can evolve, prosper, decay, and transform. The new digital infrastructure opens up many new possibilities for us to conduct empirical transnational research. This should be embraced. However, if the digital infrastructure is not intertwined with a social infrastructure – where historians from various communities and contexts discuss, help, criticise, and collaborate with each other – decontextualised readings are prone to prosper. This will not do our profession any good.

Moreover, the new digital infrastructures are not quite as accessible as historians would like them to be. For example, the Norwegian bokhylla.no – a terrific service – is not available to me in Lund. I need to be at a Norwegian library. Today, such national constraints are the norm; still, free international access would hardly spur a surge among Swedish historians to study the Norwegian past. Most of us do not have the contextual knowledge necessary nor do we have colleagues in the corridor to ask for directions. Hence, one could argue
that the centre of the easy is still the university library, the research seminar, the teachers who educate us, and the local contexts we inhabit.
